

COOLEY'S CYCLOPEDIA
OF
PRACTICAL RECEIPTS

AND
COLLATERAL INFORMATION
IN THE
MANUFACTURES, PROFESSIONS, AND TRADES,
INCLUDING
Medicine, Pharmacy, and Domestic Economy:

DESIGNED AS A COMPREHENSIVE
SUPPLEMENT TO THE PHARMACOPŒIA
AND
GENERAL BOOK OF REFERENCE

FOR THE MANUFACTURER, TRADESMAN, AMATEUR, AND
HEADS OF FAMILIES.

FIFTH EDITION

REVISED AND PARTLY REWRITTEN BY

RICHARD V. TUSON, F.C.S.,

PROFESSOR OF CHEMISTRY IN THE ROYAL VETERINARY COLLEGE, FORMERLY LECTURER
ON CHEMISTRY AT THE CHARING CROSS HOSPITAL.

LONDON
A. CHURCHILL, NEW BURLINGTON STREET

PREFACE.

THE design of the present work is briefly, but not completely expressed its title-page. Independently of a reliable and comprehensive collection formulae and processes in nearly all the industrial and useful arts, it affords a description of the leading properties and applications of the substances referred to, together with ample directions, hints, data, and varied information, calculated to facilitate the development of the practical value of the book in the shop, the laboratory, the factory, and the usehold. Notices of the substances embraced in the *Materia Medica* our national pharmacopœias, in addition to the whole of their preparations, and numerous other animal and vegetable substances employed in medicine, as well as most of those used for food, clothing, and fuel, with their economic applications, have been included in the work. The synonyms and references are other additions which will prove invaluable to the reader. Lastly, there have been appended to all the principal articles referred to, brief, but clear directions for determining their purity and commercial value, and for detecting their presence and proportions in compounds.

The sources from which I have derived the vast mass of materials forming this volume, are such as to render it deserving the utmost confidence. I have invariably resorted to the best and latest authorities, and have consulted almost innumerable volumes, both British and foreign, during its compilation. Secondary channels of information have been scarcely ever relied on, when original authorities were within my reach. A large portion of the work has been derived from my personal experience and observations in the departments of applied chemistry and hygiene, and from the processes of various laboratories and manufactories, many of which I can the more confidently recommend, from having personally inspected or witnessed their employment on an extensive scale. An indiscriminate adoption of matter, without examination, has been uniformly avoided, and in no instance has any formula or process been admitted into this work, unless it rested on some well-known fact of science, had been sanctioned by usage, or come recommended by some respectable authority. The settlement of doubtful or disputed points often occupied me a greater number of hours, and not unfrequently, a greater number of days, than that of the lines of letter-press which convey the results to the public. In all cases precedence has been

PREFACE TO THE FIFTH EDITION.

ALTHOUGH, in preparing a fifth edition of this work, it has been directed to a thorough and complete revision, every endeavour has been made to carry out the original intentions of the author. The arts and sciences are, however, so continuously undergoing change that, in order to bring the information given up to the level of the knowledge of the present day, very many excisions, alterations, and additions have been rendered necessary. Thus, in the chemical portions of the work subjects of practical importance have been retained, corrected, and added to, while those which possess only a purely scientific interest have, for the most part, been expunged; to the name of every substance of polished composition a formula has been attached, and the articles on chemical doctrine have been re-written. In carrying out this part of my duty I have been most efficiently aided by my talented assistant, Edmund Neison.

As the value of this Cyclopædia to the pharmacist will, it is hoped, be increased by the additions which have been made from the British, French, and United States Pharmacopœias.

The length and number of the articles on the recognition and treatment of disease have been reduced, as it was thought that those of previous editions might, in many instances, be productive of more harm than benefit to those for whom such information was compiled, especially emigrants and others not within the reach of the surgeon or physician.

Every article on excisable or duty-bearing commodities has been fully revised or re-written by my able and experienced friend, Mr. William Harkness, of the Inland Revenue Department.

In the previous editions the use of different types was not only extensive, but apparently indiscriminately indulged in, consequently the

AMES OF THOSE WHO HAVE CONTRIBUTED TO, OR
ASSISTED IN THE REVISION OF, THIS EDITION.

IN ATTFIELD, Ph.D., F.C.S., Professor of Practical Chemistry to the Pharmaceutical Society of Great Britain.

MORTLEY AKE, Assistant Professor in the Royal Veterinary College.

JOYD BULLOCK, F.C.S.

J. BARRETT, B.Sc., F.C.S.

JANTON, F.R.C.S., Surgeon to Charing Cross Hospital

JOSEPH COBBOLD, M.D., F.R.S., Lecturer on Parasitic Diseases in the Middlesex Hospital, and of Botany in the Royal Veterinary College.

JOHN DAREY, F.C.S.

DE VRIES, of the Hague.

WILLIAM HARENESS, F.R.M.S., Assistant Chemist in the Laboratory of the Inland Revenue Department, Somerset House.

W. HEATON, F.C.S., Lecturer on Chemistry at the Charing Cross Hospital.

JOHN NEISON, F.C.S., Principal Assistant in the Laboratory of the Royal Veterinary College.

JOHN PHILLIPS, F.C.S., Director of the Laboratory of the Inland Revenue Department, Somerset House.

WILLIAM PRITCHARD, Professor of Anatomy in the Royal Veterinary College.

J. SANSON, M.D. Lond., M.R.C.P.S., Physician to the Royal Hospital for Diseases of the Chest.

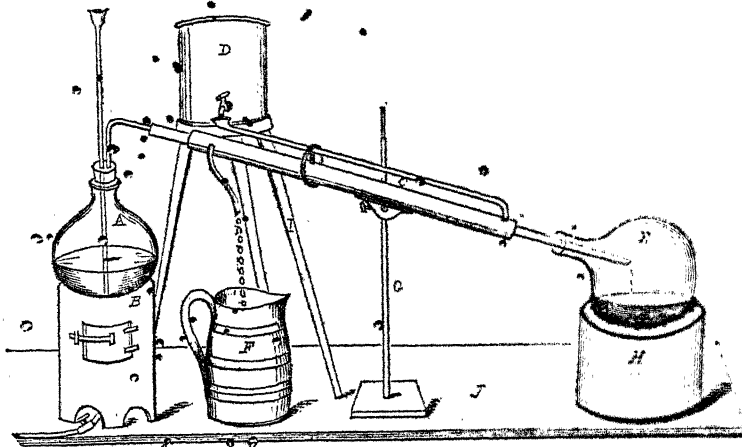

J. SIMONDS, Principal of, and Professor of Pathology in, the Royal Veterinary College.

JOHN SPILNER, F.C.S.

J. STENHOUSE, LL.D., F.R.S., formerly Lecturer on Chemistry in St. Bartholomew's Hospital.

any trace of 'free sulphuric acid' on evaporation. After sufficient repose it is carefully decanted for use. An excellent commercial STRONG ACETIC ACID is thus obtained, without distillation, owing to the insolubility of sulphate of soda in acetic acid; and from which GLACIAL ACID may be procured by refrigeration. If,

however, the process be badly managed, or the proportions of the ingredients be not carefully observed, the product will be contaminated with either a little sulphuric acid or saline matter. It is also important to the success of this process, that it be performed in a cool apartment, and in well-cooled vessels. Per-

(C.) A Liebig's Condenser.
(The other reference letters are self-explanatory.)

fectly pure acetic acid may easily be obtained by rectification from this acid. The above plan of superseding a troublesome distillation is one of the greatest improvements yet introduced into the manufacture of acetic acid.

4. (Liebig's process.) Pure acetate of soda, thoroughly dried and finely powdered, 3 parts, is placed in a capacious retort, and pure concentrated sulphuric acid, 9·7 parts, poured over it through the tubulature. One eighth of the acetic acid passes over by the heat developed by the reaction of the ingredients. The heat of a sand bath is next applied and continued until the contents of the retort become quite liquid. The distillate, carefully rectified, yields two parts of pure acid, containing only 20 per cent. of water. On exposing the latter portion which comes over in a closed vessel to a temperature below 40° Fahr., crystals of hydrated acetic acid are deposited. The weaker, or liquid portion, being poured off, the crystals are again melted and re-crystallised by cooling. The crystals of the last operation, separated from the liquid, and carefully drained in a cool and closed vessel, are perfectly pure HYDRATED ACETIC ACID.

Obs. The above is an excellent process for obtaining a chemically pure acid. The excess of sulphuric acid left from the process may be recovered by distillation; or the whole residuum may be employed in a second distillation with fresh acetate.

Although a retort is recommended by Liebig for the distillation, and is usually adopted, on the small scale, for the purpose, a flask closed by a cork perforated by two tubes, as exhibited in the engr., will be found more convenient and safe; as the product is thus less likely to be contaminated by the 'spitting' of the ingredients over the brim of the vessel. The heat of a diffused gas-flame, may also be often advantageously substituted for a sand bath.

5. From ACETATE OF POTASH:—

1. *Acetate of potash* (fused and powdered) is placed in a still, or other suitable vessel, and 50% of the strongest sulphuric acid ('oil of vitriol' of fully 1·84 sp. gr.) being added, the mixture is distilled to dryness, as before. The product is 50 to 51% of the weight of the acetate employed, with a sp. gr. of about 1·0735 to 1·074, containing about 66% of anhydrous acetic acid, or nearly 80% of ordinary glacial acid. By rectification from a little dried acetate of lead a perfectly pure acid of almost any strength may be obtained. The ingredients are nearly in equiv. proportions.

c. From ACETATE OF LEAD:—

1. (Ure.) Take of dried acetate of lead, 4 parts; strongest oil of vitriol, 1 part. Distil slowly to dryness. Nearly equal to the last.

2. (Liebig.) Acetate of lead, 3 parts; sulphuric acid, 8 parts: as before.

3. (Dollfus' Concentrated Acetic Acid.) Take of dried acetate of lead, 12 oz.; sulphuric acid, 6 oz.; distil 7 ounces.

d. From ACETATE OF LIME:—

1. (Christ.) Raw acetate or pyrolignite of lime (prepared by Völkell's process), 100 parts; is mixed with hydrochloric acid (20 Baumé, or sp. gr. 1.1515), 120 parts; and after 12 hours, distilled in a copper vessel, with a gradually applied heat. The product is 100 parts or *lbs.* of acetic acid of 8° Baumé (sp. gr. 1.0556), containing about 47% of hydrated acid, only slightly coloured and empyreumatic, fit for various manufacturing purposes. The advantage of this process is the low price of hydrochloric acid, and the product not being contaminated with sulphuric or sulphurous acid.

Obs. It will be found that pyrolignite of lime generally contains 60% to 70% of neutral acetate; but should it contain either more or less, a proportionate quantity must be employed. When the proper proportions are used the distillate gives only a scarcely perceptible turbid cloud when tested with nitrate of silver. If the hydrochloric acid used has the sp. gr. 1.16, a less quantity being employed, the product will have the sp. gr. of 1.058 to 1.061, and will then contain from 48 to 51% of the monohydrate, or 41 or 42% of anhydrous acetic acid. The resin sometimes found floating on the mixed ingredients should be carefully removed, by skimming, before distillation.

As acid of the above strength is rarely required, and as the distillation is more easily conducted when the ingredients are less concentrated, a little water may be conveniently added either before or towards the end of the distillation. Hence the following proportions have been recommended:—

2. (Völkell.) Acetate of lime (as last), 100 parts; hydrochloric acid (sp. gr. 1.16), 90 to 95 parts; water, 25 parts; mix, and proceed as before. *Prod.* 96 to 98 parts of an excel-

lent acid, well adapted to trading purposes, having a sp. gr. about 1.050, and containing nearly 40% of hydrated acetic acid. It has been correctly remarked, that the acetic acid produced with hydrochloric acid, is always of better quality than that produced with sulphuric acid; being not only less coloured, but also entirely free from sulphurous acid. The distillation uniformly proceeds with ease and regularity, and the whole of the acetic acid passes over between 212° and 248° Fahr.; by which the danger of contamination with other products, resulting from a high degree of heat, is obviated.

3. An Acetic acid sufficiently strong and pure for many ordinary purposes may be obtained without distillation, by pouring strong sulphuric acid, 50 parts, diluted with water, 5 parts, on well-dried acetate of lime, 100 parts; digesting, with occasional agitation in a close vessel, decanting the clear liquid, and straining the remainder.

II. From the Acetates by dry distillation with a sulphate:—

a. From ACETATE OF LEAD:—

1. Acetate of lead (dried), 5 parts; and sulphate of iron (gently calcined), 2 parts; are separately powdered; and after thorough mixture, carefully distilled, by the heat of a sand bath, into a well-cooled receiver. An economical process for a strong acid, under certain circumstances; but one now seldom adopted.

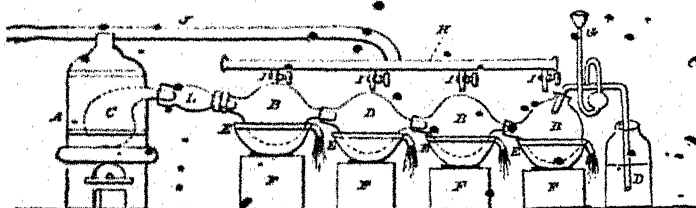

2. (Bardollier's Strong Acetous acid.) Dried acetate of lead, 10 oz.; calcined green vitriol, 12 oz.; as the last.

b. From the ACETATES OF COPPER:—By substituting acetate or diacetate of copper, in equiv. proportions, or better with excess of the sulphate. Seldom used.

c. From ACETATE OF POTASH, as the last.

III. From the Acetates *per se*:—

a. From ACETATE OF COPPER:—AROMATIC V.†; SPIRIT OF VERDIGRIST; SPIRITUS VENERIST, L.; ESPRIT DE VENUS, FR.; ACI-

A. Furnace.

B B B B, Glass receivers.

D, Bottle containing vinegar.

E E E E, Basins containing water.

F F F F, Supports for basins.

G, Water safety-tube.

H, Supply-pipe of cold water.

I I I I, Cocks to supply water to the basins.

J, Water main.

K, Adapter connecting retort and globes.

DUM ACETICUM, Ph. L. 1787.). *Process.* Carefully dry crystallised verdigris (diacetate of copper) by a very gentle heat, and introduce it into a large stone-ware retort

(see engr.), the bottom of which has been previously coated with a mixture of clay and horse-dung, to render it more capable of standing the fire. Next place it in a suitable fur-

ration with hydrate of calcium 1·023, the sp. gr. of the pure vinegar would be 1·009, and that due to foreign matter ·005. For—

$$·028 - ·023 = ·005$$

and—

$$1·014 - ·005 = 1·009$$

The reason why *proof-vinegar* is called, in commerce, No. 24, is that 1 fl. oz. of it requires exactly 24 gr. of pure *anhydrous carbonate of soda* to neutralise it. *Weaker vinegars* are represented in the same 'notation' by the Nos. 22, 20, 18, &c., according to their respective strengths estimated by their saturating power.

ACÉTOLATS. [Ff.] *Syn.* *ESPRITS ACÉTIQUES.* In *French pharmacy*, medicated vinegars obtained by distillation.

ACÉTOLES. [Fr.] In *French pharmacy*, medicated vinegars obtained by maceration.

ACETOUS FERMENTATION. See ACETIFICATION.

ACETUM. [L.] Vinegar.

ACETYL. *Syn.* **ACETYLE.** A name originally given to a hypothetical body, having the formula C_2H_2 , and regarded by Berzelius as the radical of the acetates and their congeners. The *acetyl* of Gerhardt (C_2H_3O) is, however, according to that chemist, the true radical of the acetates. Williamson, in order to remove the confusion of terms occasioned by the application of the same name to two compounds of different composition, proposed the title of *othyl* for the radical C_2H_3O .

ACHAR. See PICKLES.

ACHILLE'INE (-kil-). A peculiar bitter principle obtained from *achille a millefo'lium* (Linn.), or yarrow.

A'CHOR (-kôr). [Gr.] See SCALD-HEAD.

ACHROMATIC (âk-rô-). *Syn.* **ACHROMATIQUE.** Fr. In *optics*, devoid of colour; bodies that transmit light without decomposition, and consequently, without the formation of coloured rings or fringes; applied to compound lenses, prisms, &c., and to instruments fitted with them.

ACHROMATISM. *Syn.* **ACHROMATISME.** Fr. In *optics*, the state of being achromatic; the absence of coloured fringes in the images of objects seen through a lens or prism.

Light is not homogeneous, but decomposable by refraction, absorption, or reflection, into coloured rays of unequal refrangibility. A ray of white light, in passing through a glass prism, is entirely separated into the coloured rays forming the '*prismatic spectrum*;' and when it passes through a lens, an analogous resolution into coloured rays still occurs, though not so readily observed, and that to an extent often incompatible with distinct vision. Now, if a *convex lens* be regarded as a number of prisms united by their bases round a common centre, and a *concave lens*, as a similar number of prisms with their apices in contact, the action of lenticular and pris-

matic glasses on light will be reduced to a common principle. A beam of light thrown on a simple converging lens not only suffers refraction at the spherical surface (**SPHERICAL ABERRATION**), but the different coloured rays of which it is composed, from the causes mentioned, being unequally bent, or refracted, diverge from their original course (**CHROMATIC ABERRATION**), forming as many foci on the axis of the lens as there are colours, and fall separately, instead of together, on the eye or object which receives them. Hence arise the coloured fringes or halos that surround objects viewed through ordinary glasses, and which form the great impediments to the construction of *perfect* lenses. This effect, like the refractive power and focal distance, varies in degree in different diaphanous substances.

The correction of the *chromatic aberration* of lenses is commonly effected by combining two, or more, made of materials possessing different 'dispersive' powers. Thus, the spectrum formed by *flint glass* is longer than that formed by *crown glass*, for the same deviation. When the two are combined, so as to form a compound lens, the one tends to correct the 'dispersion' of the other. On this principle **ACHROMATIC GLASSES** are generally formed in this country. A *convex* lens of *crown glass* is combined with a weaker *concave* lens of *flint glass*, the latter counteracting the dispersion of the former, without materially interfering with its refractive power. The resulting combination is not absolutely achromatic but is sufficiently so for all ordinary purposes. According to Dr. Blair, a compound lens *perfectly* achromatic for the intermediate, as well as for the extreme rays, may be made by confining certain fluids, as *hydrochloric acid*, between two lenses of *crown glass*. In order to produce nearly perfect achromatism in the object-glasses of telescopes, microscopes, cameras, &c., a *concave* lens of *flint glass* is commonly placed between two *convex* lenses of *crown* or *plate glass*, the adjacent surfaces being cemented with the purest *Canada balsam*, to prevent the loss of light by reflection from so many surfaces.

Obs. The production of perfect achromatism in lenses is a subject not less fraught with difficulty than with practical importance to the astronomer, the mariner, the microscopist, and the photographer; and it has hence engaged the attention of the leading mathematicians and artists of Europe up to the present time. All the larger object-glasses lately manufactured are said to consist of only *two lenses*; the resulting achromatism proving sufficiently exact for all useful purposes. Those of recent production have come chiefly from the workshops of Dollond, of London, and the opticians of Bavaria and Switzerland. The *achromatism* of prisms depends upon the same principles, and it is effected in the same way as that of lenses.

ACICULAR. Needle-shaped; slender or sharp pointed; *epicular*; in *botany*, applied to leaves, and in *chemistry*, to crystals. The last are also sometimes termed **ACICULE**.

ACID. *Syn.* **ACIDUM**, L.; **ACIDE**, Fr.; **ACIDO**, Ital.; **SÄURE**, G. In *familiar language*, any substance possessing a sour taste. In *chemistry*, substances are said to be acid, or to have an acid reaction, when they are capable of turning blue litmus red. In *chemistry*, also, the term acid is applied to a very large class of compounds containing hydrogen (hydrogen salts), and in which one or more atoms of that element may be replaced by an equivalent quantity of a metal or other basic radical; *e.g.*—

1. The one atom of hydrogen in hydrochloric acid (HCl) may be replaced by sodium, producing the salt sodium chloride (NaCl).

2. The one atom of hydrogen in nitric acid (HNO₃) may be replaced by silver, producing the salt silver nitrate (AgNO₃).

3. One atom of hydrogen in acetic acid (HC₂H₃O₂)¹ may be replaced by the basic radical ammonium (NH₄), producing the salt ammonium acetate (NH₄C₂H₃O₂).

Acids which, like those mentioned in the foregoing examples, contain one atom of replaceable hydrogen are called *monobasic*; those which contain two such atoms (*e.g.* sulphuric acid, H₂SO₄; tartaric acid, H₂C₄H₄O₆)¹ *dibasic*; those which contain three such atoms (*e.g.* phosphoric acid, H₃PO₄; citric acid, H₂C₆H₅O₇)¹ *tribasic*; and so on with acids of higher basicity. Acids of greater basicity than unity are frequently termed *polybasic*.

Besides containing replaceable, or basic hydrogen, acids are further characterised by the property of combining with alkaloids to form salts; *e.g.*—

Dibasic Acids. See **ACID**.

Fatty Acids. Acids separable from fats or oils; *e.g.* stearic acid, oleic acid, butyric acid, &c.

Inorganic Acids. Same as **MINERAL ACIDS** (which *see*).

Mineral Acids. Acids chiefly or wholly derived from the mineral kingdom. In *medicine*, sulphuric, hydrochloric, and nitric acids, are commonly so called.

Monobasic Acids. See **ACID**.

¹ Symbols indicating the number of atoms of replaceable hydrogen occupy the foremost position in the formulae of acids, as shown in the text.

Organic Acids. Acids formed by, or derived from, organic substances; *e.g.* acetic acid, tartaric acid, uric acid, &c.

Polybasic Acids. See **ACID**.

Pyro-acids. Acids resulting from the decomposition by heat of other acids; *e.g.* gallic acid, when heated, yields *pyro-gallic acid*.

Tribasic Acids. See **ACID**.

ACIDIFICATION. [Eng., Fr.] *Syn.* **ACIDIFICATION**, L. In *chemistry*, the act, process, or state of acidifying, or of making, becoming, or impregnating with acid.

ACIDIMETER. *Syn.* **ACIDOMETER**; **ACIDIMETRUM**, &c., L.; **ACIDIMÈTRE**, Fr. An instrument or apparatus employed in acidimetry.

The *ordinary acidimeters* of the chemist are small tubes, constructed to hold exactly 1000 grains of distilled water, at 60° Fahr., within the limits of their scale, which is accurately graduated into 100 divisions. They are used to contain the *alkaline solutions* (**TEST-LIQUORS**, **NORMAL** or **STANDARD SOLUTIONS**) employed in the following processes.

Beaumé's Acidimeter, and others of the same class, are **HYDROMETERS**, and are described under that head.

ACIDIMETRY. *Syn.* **ACIDOMETRY**; **ACIDIMÉTRIE**, &c., L.; **ACIDIMÉTRIE**, Fr. The estimation of the strength or quantity of acid, in a free state, contained in any liquid. It is the *reverse* of 'alkalimetry.' Acidimetric assays are understood to refer to the relative strengths of the same acids (*i.e.*, the quantity of real acid of the same kind contained in the solutions examined), and not to the comparative strengths of acids of different composition or names.

Acidimetric processes. These are founded chiefly on the capacity of the acids to saturate the bases; and, in some of the liquid acids, on the specific gravity.

a. **VOLUMETRICALLY** :—

1. The *sample of the acid* to be examined (100 gr., or any convenient aliquot part thereof) is placed in a suitable glass vessel, and if it be one of the stronger acids, diluted with six or eight times its weight of water, or if solid (as oxalic, or citric acid), dissolved in a like quantity. This liquid is then *exactly* neutralised with an alkali.

This point is usually determined, by the addition of a small quantity of litmus solution, which turns just blue when the solution is neutralised, but when a carbonate is used for the alkaline solution, the acid must be boiled a short time after each addition to expel the carbonic acid. The quantity of the alkaline solution consumed for this purpose, represents an *equivalent quantity* of acid, and thus gives us the *acid content* of the sample under examination. The common practice is to dissolve *one equivalent* of the *alkaline test* in grains or grammes in water, and to make

up the solution to *exactly* 1000 parts by measure (i.e., 1000 'water-grains' or grammes), so as to accurately fill the 100 divisions of an *acidimeter*; when the *quantity*, in grains or grammes, of the *sample tested*, bears the same proportion to the *equivalent number* of the acid under examination, that the *number* of *acidimeter divisions* of the *test-liquor* consumed bear to the *per-centage* of acid sought. Thus:—suppose 50 gr. of a sample of *sulphuric acid*, take 25 *acidimeter divisions* (300 parts or water-grains measure) of the *test-liquid* to neutralise it, what is its content of real acid?

The equivalent of sulphuric acid is 49 (half its atomic weight); so, by the rule of proportion,

$$50 : 49 :: 25 : 24\frac{1}{2}$$

It therefore contains $24\frac{1}{2}$ parts of real sulphuric acid, in 50.

If the 1000 parts or grain-measures, instead of the number of the acidimeter divisions, be taken for the calculation, it will, of course, be necessary to point off the first right-hand figure of the result as a decimal. Thus; repeating the above example—

$$50 : 49 :: 250 : 24\cdot5$$

Or, since the *equivalent* of the *test-liquid* is 100, it will bear the same proportion to the *equiv.* of the acid examined, as the *number* of the *acidimeter divisions* of the test-liquid consumed in neutralising 100 gr., do to the *per-centage* sought. Thus:—50 gr. of *hydrochloric acid* take 45 *acidimeter divisions* to effect neutralisation, what is its real strength?—The *equiv.* of hydrochloric acid is 36\cdot5: therefore—

$$100 : 36\cdot5 :: 45 : 16\cdot425\frac{1}{2}$$

and, since only 50 gr. (instead of 100 gr.) were examined,—

$$16\cdot425 \times 2 = 32\cdot85\frac{1}{2}$$

Some operators prefer employing 100 gr. instead of the *equivalent* weights of the given tests in making their *test-solutions*, in which case *each* gr. or 1000th part represents $\frac{1}{1000}$ th, and *each* acidimeter degree 1 gr. of the alkali or carbonate employed; when a similar proportion will obtain to that first above given.

In *technical analysis* it is more convenient if the *number* of *acidimeter divisions* of the 'test-liquid' consumed express the *per-centage* strength of the acid, *without* further calculation. For this purpose the *number* of *grains* of the acid taken, for the assay should correspond to the *equivalent number* of *each* acid (see Table I., below); or to some convenient aliquot part of it, as the $\frac{1}{2}$, $\frac{1}{3}$, or $\frac{1}{10}$ th; the *per-centage* answer, in the last case, being doubled, quadrupled, &c., according to the aliquot part taken. The reason of this is obvious.

For the test-solutions, ammonia, and the dry and crystallised carbonates and bicarbonates of potash and soda, are used, and are made by dissolving in water their constituents except ammonia, of which 1000 grains, or one litre, of solution of specific gravity 0\cdot992 contains exactly one equivalent.

53 grains (or grammes) of pure anhydrous carbonate of soda, prepared by gradually heating to redness the crystallised salt, constitute one equivalent (half the atomic weight), and 69 grains (or grammes) of pure dry carbonate of potash. Of the crystallised salt 1\cdot43 grains of carbonate of soda will be required, and 8\cdot4 grains (grammes) of the crystallised bicarbonate of soda, and 100 of the crystallised bicarbonate of potash. Occasionally solutions containing in one thousand parts, 50 of pure carbonate of lime or chalk, or 28 of pure caustic lime, are used.

Besides these, a process known as Kiefer's is practised, and an *ammoniacal solution of oxide of copper* is employed as the 'test-liquor,' and the 'point of neutralisation' is known by the turbidity observed as soon as the free acid present is completely saturated.

The *normal solution* or *test-liquor* is prepared by adding to an aqueous solution of *sulphate of copper*, pure ammonia water, until the precipitate, which at first forms, is just redissolved, carefully avoiding excess. Or better, by adding a rather strong solution of *sulphate of copper*, to a quantity of a rather strong *solution of ammonia* containing exactly 17 gr., or one equiv. of pure ammonia, as long as the precipitate which forms is redissolved on agitation; the resulting liquid being afterwards diluted with pure *distilled water*, until it accurately measures 1000 water-grains, or fills 100 divisions of an acidimeter, at 60° Fahr. In either case, the strength of the resulting 'test-solution' must be carefully determined by means of *standard sulphuric acid*, and adjusted, if necessary.

This method answers well with all the stronger acids (*excepting oxalic acid*), even when dilute; and it has the advantage of not being affected by the presence of a neutral metallic salt with an acid reaction, as sulphate of copper, or of zinc.

Besides this process a solution of lime in sugar may be used, as proposed by M. Peligot, and made as follows:—

Pure caustic lime is carefully slaked by sprinkling with water, and 50 grains (or grammes), made up by water to a milky solution, and 100 grains of pure sugar candy dissolved in 1000 grains of water, are added, and the whole well shaken. It is allowed to settle in a closed bottle, and the clear solution poured off and diluted, until 1000 grains neutralise exactly 100 grains of pure hydrochloric acid of sp. gr. 1\cdot1812. Of course it only answers with acids whose calcium salts are readily soluble in water.

TABLE I.—Weights of the respective acids equivalent to the given weight of the principal bases, hydrogen being taken as unity.

17 gr. of pure ammonia. ¹	51 Acetic acid (anhydrous).
31 " anhydrous soda. ²	60 " " (crystallised or glacial).
40 " hydrate of soda. ²	99 Arsenious acid (dry).

are exactly neutralised by

b. GRAVERMETRICALLY:—

The *test-liquors* or *standard solutions* of the above methods are made up so as to weigh exactly 1000 grains, instead of 'measure' 100 acidimeter-divisions. Every grain of the *test-liquor* thus represents $\frac{1}{10}$ th gr. of alkali; and every 10 gr., 1 gr. of alkali; or respectively, $\frac{1}{10}$ th per cent., and 1 per cent. The vessel used for containing the solutions is carefully weighed whilst empty, and 1000 gr. being placed in the opposite scale, the *test-solution*, containing *exactly* one equivalent of base, is poured in, and the whole made up with distilled water (if necessary) so as to restore the balance to an equilibrium. After the

process of neutralisation, the acidimeter, with its contents, is again placed in the scales; its previous weight still remaining there. The number of grains required to restore the equilibrium of the balance (*i.e.*, the loss of weight), gives the *exact weight* of the *test-liquor* consumed. In all other respects the process is the same as in the 'volumetrical method' already described.

Another method for estimating the strength of the sample of acid is by weighing the amount of carbonic acid expelled during saturation. (Method of Fresenius and Will.) This depends on the weight of gaseous carbonic acid which a given weight of the acid-sample under

¹ 1000 water-grains measure of pure liquor of ammonia, sp. gr. 0.992, contain exactly 17 gr., or 1 equiv. of pure gaseous ammonia. A standard liquor of this strength may be most conveniently prepared by cautious dilution of a stronger solution, until a hydrostatic bead, corresponding to the sp. gr., floats indifferently in the middle of the new solution, at 60° Fahr. By keeping two hydrostatic beads in the solution—the one made barely to float, and the other barely to sink—we shall always be able to detect any change of strength or temperature which it may suffer; since the "loss of a single hundredth part of a grain of ammonia per cent., or the difference of a single degree of heat, will cause the beads to" vary their positions. To preserve its integrity it must be kept in a well-stoppered bottle. (See below.)

² These substances, as well as 'test-solutions' containing them, must be perfectly free from carbonic acid, and must be carefully preserved to prevent the absorption of

carbonic acid from the atmosphere. Mohr states that a dilute solution of either of them is best preserved in a flask or bottle well closed with a cork fitted with a small bulb tube (resembling a chloride of calcium tube), filled with a finely triturated mixture of sulphate of soda and caustic lime, and bearing a very thin open tube in the exit aperture. Fresenius and most other foreign chemists, prefer 'test-solutions' of pure soda. With test-solutions containing caustic alkalies, exact neutralisation of an acid is not only more easily effected, but more readily perceived, particularly when either solution is tinted with litmus.

³ Prepared by gradually heating the pure crystallised carbonate to redness. From being uniform in composition, and easily procured or prepared, they are much employed; preference being usually given to the soda-salt.

⁴ The crystals must be free from attached water, but not the least effloresced.

examination is capable of expelling from pure bicarbonate of soda (or of potash), which is estimated by the *loss of weight* in the acidimeter, or apparatus, after the gas, rendered perfectly dry by passing through sulphuric acid, has escaped into the air.

Oper. A determined amount of the acid under examination is accurately weighed into the flask *A* (see engr.); and if it be a concentrated acid, or a solid, it is mixed with or dissolved in 6 or 8 times its weight of water. The little glass tube (*e*) is then nearly filled to the brim with *pure bicarbonate of soda*, in powder, and a fine silken thread is tied round the neck of the tube, by means of which it can be lowered down into the flask (*A*), so as to remain perpendicularly suspended when the cork is placed in the latter; the cord being held between the cork and the mouth of the flask. The flask (*B*) is next about half filled with oil of vitriol, and the tubes being arranged in their places, as represented in the engr.; and time having been allowed for the mixture of acid and water to cool completely, after the increase of heat caused by mixing, the whole apparatus is very accurately weighed. The cork in the flask (*A*) is then slightly loosened, so as to allow the little tube containing the bicarbonate of soda to fall into the acid, and is again instantly fixed AIR-TIGHT in its place. The evolution of carbonic acid now commences, and continues until the acid in the flask (*A*) is neutralised. When this takes place, which is easily seen by no bubbles

Fahr.), and kept there, with occasional agitation, until the renewed evolution of gas has completely ceased. The little wax stopper is then taken off the tube (*a*), the apparatus taken out of the hot water, wiped dry, and suction applied, by means of a perforated cork, or a small India-rubber tube, and the mouth, to the end of the tube (*d*), until the sucked air no longer tastes of carbonic acid. The whole is then allowed to become quite cold, when it is replaced in the balance (the other scale still containing the original weights), and weights added to restore the equilibrium.

The loss of weight represents the exact quantity of dry carbonic anhydride, or anhydrous carbonic acid gas, that has been expelled from the bicarbonate of soda, by the action of the acid in the sample examined.

The quantity of real acid it contained is then deduced by the following calculation:—
One equivalent of gaseous carbonic anhydride, or anhydrous carbonic acid (= 44) bears the same proportion to one equivalent of the acid in question, as the amount of the carbonic anhydride expelled does to the amount of the acid sought. Thus, suppose a dilute sulphuric acid expels 3 gr. of carbonic anhydride, the arrangement is—

$$44 : 49 :: 3 : 3.349$$

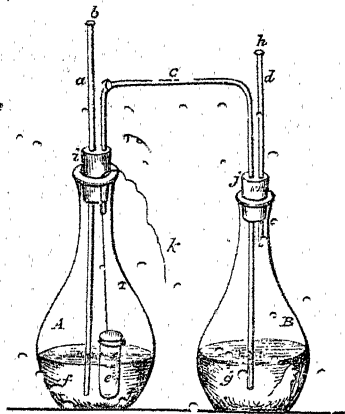

Consequently the sample operated on contained 3.5 (nearly) grains of true sulphuric acid.

Instead of the above calculation, we may multiply the weights of the respective acids required to expel 1 gr. of carbonic acid (as exhibited in the following table) by the number of gr. of dry carbonic acid evolved during the above operation. The product represents the per-centage strength, when 100 gr. of the acid have been examined. When only 50, 25, 20, or 10 gr. have been tested, this product must, of course, be doubled, quadrupled, &c., as the case may be.

TABLE II.

	Multipliers.
Acetic acid (anhydrous)	1.159
" " (hydrated or glacial) . . .	1.244
Citric acid (crystallised)	1.523
Hydrochloric acid (dry or gaseous)	.829
" " (sp. gr. 1.16)	2.478
Nitric acid (anhydrous)	1.227
" " (sp. gr. 1.5)	1.523
" " (sp. gr. 1.42)	2.045

" " (sp. gr. 1.8485)	1.114
Tartaric acid (anhydrous) . . .	1.500
" " (crystallised)	1.705

Even this easy calculation may be avoided, in technical analysis, by simply taking for the assay, such a weight of the respective acids as is capable of disengaging exactly 10 gr. of dry carbonic acid from the bicarbonate. In this case, the loss of weight in grains, from the operation, multiplied by 10, at once indicates the exact per-centage strength sought.

(*A*.) A wide-mouthed flask, capable of holding 2½ to 3 oz., containing sample for trial (*f*).

(*B*.) Ditto, capable of holding 1½ to 2 oz., partly filled with oil of vitriol (*g*).

(*a, c, d*.) Tubes fitting air-tight in the flasks by means of the corks (*h*) and (*j*).

(*b*.) Piece of wax fitting air-tight on the end of (*a*).

(*e*.) Small tube capable of holding about 1 drachm of powdered bicarbonate of soda or potash.

(*h*.) Open end of the tube (*d*).

(*k*.) Silk cord fastened to the tube (*e*).

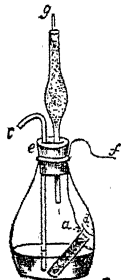

being emitted on shaking the apparatus, the flask *A* is put into hot water (120° to 130°

The proper weight of any acid to be taken to give per-centage results, is found by simply dividing ten times the equiv. of that acid by 44. For, taking sulphuric acid as an example, as— $44 : 49 :: 10 : 11.1318$, or 11.13 nearly.

On this principle are obtained the weights to be taken, as given in—

TABLE III.	Grains.
Acetic acid (anhydrous)	11.59
" " (hydrated or glacial) . . .	13.64
Citric acid (crystallised)	15.23

" " (sp. gr. 1.845)	11.14
Tartaric acid (anhydrous)	15.00
" " (crystallised)	17.05

2. A convenient modification of the preceding method of acidimetry consists in using the common apparatus figured in the margin, and employing fused chloride of calcium to dry the evolved carbonic acid gas, instead of concentrated sulphuric acid. The mode of conducting the process and obtaining the results is precisely the same as in that last explained, and need not therefore be repeated. In this case, however, suction must be applied to the small tube (g), instead of (d) in the preceding engraving.

(a.) Wide-mouthed flask, containing the sample for examination, hermetically stopped by the cork (e), and supporting the tubes (b) and (c).

(b.) Bulbous tube, containing fragments of fused chloride of calcium, terminating in a capillary tube (g).

(c.) Bent tube, reaching nearly to the bottom of the flask (a).

(d.) Small tube containing bicarbonate of soda.

(e.) Cork fitting bottle (a), and the tubes (b) and (c), hermetically.

(f.) Silken thread, suspending the small tube (d).

Obs. These methods, though apparently complicated, are not difficult to perform, when once well understood. The application of heat after the completion of the operation is indispensable, as if it were neglected, from 0.3 to 0.4 of a gr. of carbonic acid would be retained in the liquid. The bicarbonate of soda must be pure, and perfectly free from any neutral carbonate or sesquicarbonate of soda. To ensure this, the bicarbonate of commerce is reduced to a uniform powder, put into a glass jar, and covered with its own weight of cold distilled or rain water, and allowed to stand for twenty-four hours, with frequent stirring. It is then placed upon a funnel, the tube of which is stopped with loose cotton, so as to

allow the liquid to drain off. It is next washed several times with small quantities of cold distilled or rain water, and after being dried, by pressure between some sheets of blotting paper, without the aid of heat, is kept for use in a well-closed glass bottle. Before use, it may be tested to ascertain its purity. If pure, it neither reddens turmeric paper, nor gives a brick-red precipitate with a solution of bichloride of mercury. Pure bicarbonate of potassa may be used instead of bicarbonate of soda; but in either case it is always proper to use an excess, so as to have some undecomposed carbonate, after the operation has ended. The presence of a little sodium chloride or sulphate in the bicarbonate will not interfere in the least, but the absence of every trace of neutral carbonate is a *sine quâ non*.

The two above methods of estimating the amount of acid are only superior to the generally used methods first described, when the presence of colouring matter interferes with the reaction of the litmus used to show the point of neutralisation.

Observations. When great accuracy is required in conducting the neutralisation of the solution in estimating volumetrically with litmus as an indicator, it is proper to prepare and keep standard solutions of sulphuric acid and oxalic acid, with which occasionally to try the alkaline test-liquor. The only difficulty in the process is to avoid over-saturation of the acid-sample. Great care must be taken not to exceed the precise point of neutralisation of the acid. After adding each portion of the test-liquor, the solution should be well stirred up, and as soon as the effervescence becomes languid the greatest caution must be observed in adding more. The proper point is arrived at when the liquid ceases to redden litmus, and does not alter the colour of turmeric paper; if it turns the latter brown, too much of the test-liquor has been added, and the operation becomes useless. Towards the end of the experiment, when great precision is required, a gentle heat may be applied, in order to expel the free carbonic acid in the liquor; but otherwise this is unnecessary. The peculiar soapy odour gradually acquired by the liquor as it nears saturation, will materially assist the operator when testing vinegars, and some of the other vegetable acids. A good method is to tint either the acid-sample or the test-liquid with a few drops of litmus, as noticed under ACETIMETRY; when the reddish shade will gradually deepen into 'purple,' or the purple into 'red,' as the point of saturation is approached; and the blue colour will be perfectly restored as soon as this point is reached. Dr. Ure recommends keeping the ammonia-test ready tinged with litmus; and the same applies to other test-liquors.

In commerce, the strength of acids is frequently reckoned with reference to a standard, termed 100 acidimetric degrees. This is taken from the circumstance that 91 gr. of commer-

cial oil of *vitriol*, of a sp. gr. of 1.845, exactly saturate 100 gr. of dried carbonate of soda. An acid requiring only 35, 50 or any other number of grains of the carbonate to saturate it, is in like manner termed so many degrees strong; the number of grains representing in each case an equal number of degrees. This method originated with the French chemists, and though only conventional, and principally confined to commercial purposes, is especially adapted to practical men but little conversant with chemistry, yet very ready in retaining or calculating anything on the centesimal scale, from its similarity to monetary language and reckoning.

ACIDITY. *Syn.* ACIDITAS, L.; ACIDITÉ, Fr.; SAÛRE, Ger. In chemistry, the state of being acid. In physiology, &c., the impression given to the organs of taste by tart or acid substances. Sourness. See FERMENTATION, MALTIQUORS, WINES, &c.

Gastric Acidity. Acidity of the stomach; a common and well-known symptom of weak or disordered digestion.

Treat., &c. Small doses of absorbents or antacids, three or four times daily, to which some tonic bitter, as calumba, cascarrilla, chamomile, gentian, or orange-peel, may be added. Stomachic stimulants, as capsicum, ginger, mustard, or wine, &c., taken with, or after, meals, are also useful. The diet should be light and nutritious; and acescent vegetables, over-ripe fruit, and weak new beer or other liquors, avoided as much as possible. The bowels should be kept regular, but not open, by the occasional use of mild aperients; as rhubarb, aloes, castor oil, senna, or mercurial pill, or compounds containing them. Excessive looseness or diarrhoea may be checked by a few doses of carbonate of soda, chalk-mixture, or astringents.

In INFANCY this affection is usually accompanied by restlessness, continual crying, drawing up of the legs forcibly towards the body, hiccups, vomiting, diarrhoea, scur eructations, griping pains, green stools, and debility; often followed, when the irritation is considerable, by convulsions. The treatment consists in relieving the bowels of all offending matter by a few doses of rhubarb and magnesia. The looseness or diarrhoea may be checked by a few small doses of carbonate of soda or chalk-mixture, or better, in an infant which is fed, by lime-water (1 or 2 fl. oz.) mixed with as much milk. Two or three drops of caraway, cinnamon, dill, or peppermint water, on sugar (not with the food), will tend to promote the expulsion, and prevent the undue generation of gases. The flatulence usually disappears with the acidity. The occasional administration of 1 to 3 gr. of quicksilver with chalk ('gray powder'), will frequently remove the complaint, and prevent its recurrence, when all other means fail. The diet of both nurse and infant should be carefully regulated. See ANTACIDS, DYSPEPSIA, &c.

ACIDULÆ. [L. pl.] In medicine, mineral waters rich in carbonic acid.

ACIDULATFD. *Syn.* ACIDULATUS, L.; ACIDULÉ, Fr. Blended or flavoured with an acid; taste slightly sour. See KAIK (Acidulated), DROPS, LOZENGES, &c. In chemistry, the addition of an acid to a neutral or alkaline liquid until it reddens blue litmus paper.

ACIDUM. [L.] An acid.

ACOLOGY. *Syn.* In medicine, the doctrine of, or a discourse on, remedies, or the materia medica.

ACONITE (-nite). *Syn.* ACONITUM, L.; ACONIT, Fr.; AKONITUM, EISENHUT, STURMHUT, Ger. Monkshood; wolfsbane. In botany, a genus of exogenous plants. *Nat. ord.*, Ranunculaceæ; *Sex. syst.*, Polyandria Trigynia. They are characterised by showy purple or yellow helmet-shaped flowers growing in panicles, deeply cut leaves, and perennial (usually) tap-shaped or tapering roots. The whole plant is highly poisonous, the roots being more poisonous than the leaves. In medicine and materia medica, the plant ACONITUM NAPELLUS (which see).

Symptoms. Numbness and tingling in the mouth and throat, which are parched; followed by giddiness, dimness of sight, and (sometimes) delirium, but seldom complete coma; there is numbness and tingling of the limbs, a loss of power in the legs, (in some cases) frothing at the mouth, severe abdominal pains, nausea, vomiting, and diarrhoea; tremors or twitchings of the voluntary muscles, (sometimes) convulsions (in animals, but not in man); sharp cries; pupil (generally) dilated, very rarely contracted; pulse, fitful and sinking; skin, cold and livid; difficulty of breathing; general prostration; loss of sensation or feeling; insensibility, general trembling, fainting, and sudden death. The eyes are often glaring; and, in some cases, the patient is completely paralysed, yet retains consciousness to the last. The case generally proves fatal in from 1 to 8 hours. If it last beyond this period there is hope of recovery. (Fleming.)

Treatment. See ALKALOIDS.

ACONITE LEAVES (B. Ph.). *Syn.* ACONITI FOLIA, L. The fresh leaves and flowering tops of *aconitum napellus*, Linn., gathered when about one third of the flowers are expanded, from plants cultivated in Britain.

Char. Leaves smooth, palmate, divided into five deeply cut wedge-shaped segments; exciting slowly, when chewed, a sensation of tingling. Flowers numerous, irregular, deep blue, in dense racemes.

Prep. Extractum aconiti.

ACONITE ROOT (B. Ph.). *Syn.* ACONITI RAPIS, L. The dried root of *aconitum napellus*. Imported from Germany, or cultivated in Britain, and collected in the winter or early spring before the leaves have appeared.

Char. Usually from one to three inches long,

not thicker than the finger at the crown, tapering, blackish-brown, internally whitish. A minute portion, cautiously chewed, causes prolonged tingling and numbness.

Prep. *Aconitia*, the active principle; Linimentum Aconiti, 1 ounce to 3 fluid ounce; Tinctura Aconiti, 54 grains to 1 fluid ounce.

ACONITI FOLIA. See ACONITE LEAVES.

ACONITI RADIX. See ACONITE ROOT.

ACONITIA. $C_{20}H_{27}O_5N$. (B.P.) *Syn.* ACONITIA, L. An alkaloid obtained from aconite.

Take of

Aconite root, in coarse powder, 14 pounds.	
Rectified spirit	
Distilled water	
Solution of ammonia.	of each
Pure ether	a sufficiency.
Diluted sulphuric acid	

Pour upon the aconite root three gallons of the spirit, mix them well, and heat until ebullition commences; then cool and macerate for four days. Transfer the whole to a displacement apparatus, and percolate, adding more spirit, when requisite, until the root is exhausted. Distil off the greater part of the spirit from the tincture, and evaporate the remainder over a water bath until the whole of the alcohol has been dissipated. Mix the residual extract thoroughly with twice its weight of boiling distilled water, and when it has cooled to the temperature of the atmosphere, filter through paper. To the filtered liquid add solution of ammonia in slight excess, and heat them gently over a water bath. Separate the precipitate on a filter, and dry it. Reduce this to coarse powder, and macerate it in successive portions of the pure ether with frequent agitation. Decant the several products, mix, and distil off the ether until the extract is dry. Dissolve the dry extract in warm distilled water acidulated with the sulphuric acid; and, when the solution is cold, precipitate it by the cautious addition of solution of ammonia diluted with four times its bulk of distilled water. Wash the precipitate on a filter with a small quantity of cold distilled water, and dry it by slight pressure between folds of filtering paper.

Characters and Tests. A white, usually amorphous, solid, soluble in 150 parts of cold, and 50 of hot water, and much more soluble in alcohol and ether; strongly alkaline to reddened litmus, neutralising acids, and precipitated from them by the caustic alkalies, but not by carbonate of ammonia or the bicarbonates of soda or potash. It melts with heat, and burns with a smoky flame, leaving no residue when burned with free access of air. When rubbed on the skin it causes a tingling sensation, followed by prolonged numbness. It is a very active poison.

ACONITIC ACID. (Identical with *Pyrocotic Acid*.) An acid extracted by Peschier from *aconitum napellus*, and by Braconnot from *equisetum fluviatile*. It exists in these plants chiefly in the form of aconitate of calcium.

Properties. A white, colourless, semicrystalline mass.

ACONITIN. See ACONITIA.

ACONTIN. See ACONITIA.

ACONTUM. [L.] Aconite. The pharmacopœial name of *aconitum napellus* (see below).

Aconitum Ferox. (Ind. P.) *Habitat.* Temperate and sub-Alpine Himalaya, at 10,000 to 14,000 feet elevation, from Gurhwal to Sikkim.

Official part. The dried root (*Aconiti ferocis Radix*), in common with those of other Himalayan species, viz., *aconitum napellus*, *a. palmatum*, and *a. luridum*, constitutes the drug well known in the bazaars of Upper India under the Hindostani name of *Bish* or *Bikh*.

It occurs in the form of tuberous roots of a more or less conical form, from two to three inches in length, and from half an inch to one inch in thickness at their upper end. They have usually a shrunken appearance, and are covered with a dark shrivelled bark; fracture shining and resinous; sometimes waxy, varying in colour from pale to deep brown. Some specimens are white and spongy; and these, it is asserted, are superior in activity to the more compact kinds. Inodorous; taste at first slightly bitter, leaving a peculiar sense of numbness on the tongue and fauces. Active principle, *aconitia*.

Medical properties and uses. Similar to those of *aconitum napellus* of Europe. *Preparations.* This root may be advantageously used for the manufacture of aconitia, the proportion of this alkaloid being much larger than in the European drug; and also for the preparation of Linimentum Aconiti. From its greater activity, however, it is unsuited for the preparation of this tincture, which is intended for internal use.

Aconitum heterophyllum. (Ind. P.) *Habitat.* Western temperate Himalaya, at 8000 to 13,000 feet elevation; from Indus to Kumaon. *Official part.* The dried root (*Aconiti heterophylli Radix*). Ovoid tuberous roots, tapering downwards to a point, from one to one and a half inches or more in length, and from three eighths to half an inch in thickness. The surface, which is covered with a thin greyish epidermis, is slightly wrinkled longitudinally, and marked here and there with root scars. It is inodorous, and of a bitter taste, devoid of acidity. Does not contain aconitia. It may be readily distinguished from other roots sold in the bazaars under the same vernacular name (*Atis*) by its characteristic bitterness. *Properties.* Tonic and antiperiodic. It may be administered internally with safety, as it contains no poisonous principle. *Therapeutic uses.* In convalescence after debilitating diseases, and in intermittent and other paroxysmal fevers, it has been found an efficient remedy. *Doses.* Tonic, 5 to 10 grains thrice daily; antiperiodic, 20 to 30 grains of the powdered root every three or

four hours, irrespective of the presence of pyrexia.

Aconitum Napellus. [Linn.] *Syn.* ACONITUM, Ph. L., E., & D.; ACONTE NAPÉL, CHAPERON DE MOINE, Fr.; EISENHUT, BLAUERSTURMHUT, Ger. Early blue wolfsbane, or deadly aconite. *Hab.* Various parts of Europe; grows wild in England, flowering in June and July. The *fresh and dried leaves* (ACONITI FOLIUM), Ph. L. & E. The *root* (ACONITI RADIX), Ph. L. & D. This is the species of aconite ordered in the pharmacopœias, and commonly used in medicine. When chewed it imparts a sensation of acrimony, followed by a pungent heat of the lips, gums, palate, and fauces, which is succeeded by a general tremor and chilliness. The juice applied to a wound or the unsound skin, affects the whole nervous system. Even by remaining long in the hand, or on the bosom, it produces unpleasant symptoms. Fatal cases of poisoning, by eating the root in mistake for horseradish, have been common of late years.

The *leaves* should be gathered as soon as the flowers appear. The *root* should be taken up in autumn. When the whole plant is employed, it should be gathered as soon as the flowers begin to open. The strength (richness in aconitia) varies considerably with the time of the year. 1 oz. of the 'fresh root' contains $\frac{1}{4}$ to $\frac{1}{2}$ gr. of aconitia; 1 lb. of the dried English root contains from 12 to 36 gr. (Hera-path). The *leaves* possess the greatest activity just before flowering; the *root*, after it. The root is at all times fully six times as strong as the leaves or herb. The wild plant contains much more aconitia than that which is cultivated. The herb, and all its preparations, lose their efficacy if long kept. The powder, more particularly, cannot be relied on.

Properties, Antidotes, &c. See ACONITE.

Tests, &c. See ACONITE.

Uses, &c. In small doses aconite is narcotic, powerfully diaphoretic, and sometimes diuretic; in larger ones, the symptoms are similar to those produced by aconitia. It acts as a powerful sedative on the heart's action, and destroys sensibility without disturbing the mental faculties. It has been given in chronic rheumatism, gout, paralysis, scirrhus, scrofula, cancers, venereal nodes, epilepsy, amaurosis, intermittents, &c.; but its exhibition requires the greatest possible caution. As a *topical benumbant* it has been used with great advantage in painful affections depending on increased sensibility of the nerves. Externally, it "is most valuable for the cure of neuralgic and rheumatic pains. In *neuralgia*, no remedy, I believe, will be found equal to it. One application of the tincture produces some amelioration; and after a few times' use, it frequently happens that the patient is cured. In some cases, the benefit appears almost magical. In others, however, it entirely fails to give permanent relief." "I do not think that in any (case) it proves injurious." "When it succeeds,

it gives more or less relief at the *first* application. When the disease depends on inflammation, aconite will be found, I think, an unavailing remedy." "In *rheumatic pains*, unaccompanied with local swelling, or redness, aconite is frequently of very great service." (Pereira, iii, 691.) *Dose*, of the *powder*, 1 to 2 gr., gradually increased to 6 or 8. Dr. Stork was the first who gave wolfsbane internally, about the year 1762. It has since been successfully employed in Germany in cases of chronic rheumatism, gout, &c., some of which were of long standing and had resisted every other remedy. In England it has been less extensively used.

Aconitum Paniculatum. Panicle wolfsbane; a species formerly ordered in the Ph. L.; and, with *a. napellus*, also in the Ph. U. S. It is less active than the official species.

ACORN. *Syn.* GLANS QUERCUS, L. The seed or fruit of the oak. In the early ages of the world, acorns probably formed one of the principal articles of the food of man. (Ovid, *Met.*, i, 106; Virgil, *Georg.*, i, 8; &c.) In modern times, during periods of scarcity, they have been consumed as food on the Continent. Besides starch, they contain a peculiar species of sugar, which crystallises in prisms, and is unfermentable; they also contain tannic and gallic acids. Mannite and dulcose are the substances which it most nearly resembles. (M. Dessaignes.) During the autumn, acorns are said to be sometimes poisonous to cattle and sheep. Supposed cases of so-called acorn poisoning are best treated by withdrawing the supply of acorns, or removing the animals from the pastures on which the acorns fall, and by the administration of aperients, alkalis, and stimulants.

ACORUS CALAMUS. See SWEET FLAG.

ACOTYLEDONS (-ko-te-lé-'). *Syn.* ACOTYLEDONES (-dôn-éz; L., prim., Gr.), Jussieu; ACOTYLÉDONS, Fr.; OHNE SAMENLAPPEN, Ger. In *botany*, plants whose seeds are not furnished with distinct cotyledons or seed-lobes. *Acotyledonous plants* form one of the two great divisions of the vegetable kingdom, according to the natural system. They are remarkable by increasing chiefly in length, by additions to their end; and not by additions to the outside, as in Exogens; or to the inside, as in Endogens. They are also termed **ASEXUAL** and **FLOWERLESS PLANTS**, and answer to the **CRYPTOGAMIA** of the Linnean system. See ACROGENS, CELLULARES, THALLOGENS, &c.

ACOUSTICS (-kow'-). The science of audition and sound; that branch of *physics* which treats of their causes, nature, and phenomena. The doctrine of the production and transmission of sound is termed **DIACOUSICS**; that of reflected sound **CATACOUSICS**.

Acoustics. In *medicine*, remedies employed to relieve deafness.

ACRID. *Syn.* ACRE, ACÉRIS, L.; AORE (acre), Fr.; BEISSEND, SCHARF, Ger. In *chemistry* and *medicine*, sharp, pungent, acrimonious. **Acrid**

substances are such as excite a sensation of pungency and heat when tasted, and which irritate and inflame the skin; as *mustard*, *turpentine*, *cantharides*, &c.

ACRIDITY. *Syn.* ACRETÉ, Fr.; AGRITUDO, L. The quality of being acrid.

ACRIMONY. *Syn.* ACRIMONIA, L.; ACRIMONIE, ACRETÉ, Fr.; SCHARFE, Ger. In *medicine* and *chemistry*, the quality or property of inflaming, irritating, corroding, dissolving, or destroying other bodies.

ACROGENS. *Syn.* ACROGENÆ, L.; ACROGENES, Fr. In *botany*, acotyledonous or cryptogamic plants, in which stems and leaves, or an organisation approaching leaves, are distinguishable; which have stomata or breathing pores on their surface, are propagated by spores, and increase by the growth of the stem at the point only. *Ferns* and *club-mosses* are examples of this class of plants.

ACROSPIRE (-spire). *Syn.* ACROSPIRA, L.; PLUMULE, Fr.; BLATTKEIM, Ger. The shoot or sprout of a seed, when it begins to grow; the part of a germinating seed termed the plumule, or plumula.

When the growth of a seed begins to be developed, the germ, from which the stem originates, shoots forth under the form of a delicate curved fibre, which, gradually bursting its covering, makes its appearance at the end of the seed. The fibrils of the *radicle* first sprout forth from the tip of the grain; a white elevation appears, that soon divides into three or more radicles, which rapidly grow larger, and are succeeded by the plumula, which peeps forth at the same point, in the form of a pale green leaflet, which, twisting thence beneath the husk to the other end of the seed, ultimately bursts its prison-house, and becomes a perfect leaf. See GERMINATION and MALTING.

ACTINIC RAYS. See ACTINISM.

ACTINISM. *Syn.* ACTINIC RAYS; CHEMICAL RAYS. A term given to a supposed principle accompanying the heat and light of the sunbeam. Actinic rays chiefly exist beyond the violet extremity of the solar spectrum, and are characterised by the power of exciting chemical change, e.g., the decomposition of certain silver salts (in photography); the combination of a mixture of chlorine and hydrogen, &c. The so-called vital functions of animals and plants are also greatly influenced by the actinic or chemical rays.

ACTINOGRAPH. An instrument for registering the intensity of the chemical influence (*actinism*) of the sun's rays.

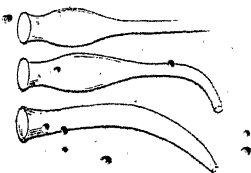

ACTUAL. Real, effectual, absolute; as opposed to that which is merely virtual or potential. In *surgery*, a red-hot iron, or any other heated body, used as a cautery, is termed the **ACTUAL CAUTERY**; whilst a caustic or escharotic so employed, is called the **POTENTIAL CAUTERY**.

ACTUAL CAUTERY. See ACTUAL.

ACUTE. *Syn.* ACUTUS, L.; AIGU, Fr.;

HEFTIG, KETZIG, SPITZIG, Ger. Sharp, pointed, sensitive. *Applied to the senses*, as *acute hearing*, *eye-sight*, &c. In *pathology*, diseases, exhibiting violent symptoms, and whose course is short, are said to be *acute diseases*.

ADAPTER. In *chemistry*, a tube placed between two vessels (commonly a retort and receiver) for the purpose of uniting them, or increasing the distance between them, so as to facilitate the condensation of vapour in distillation. (See *figure*.)

ADDER'S TONGUE. *Syn.* COMMON ADDER'S TONGUE; OPHIOGLOSSUM VULGATUM, Linn. A perennial plant, of the *natural order* Filices (DC.), growing wild in England. It is found in our woods and pastures, and flowers in May and June. It was once used to form a celebrated traumatic or vulnerary ointment, and is still highly esteemed among rustic herbalists.

ADEPS. *Syn.* LARD. See ADEPS PRÆPARATUS, FAT, and LARD.

ADEPS BENZOATUS. *Syn.* BENZOATED LARD.

ADEPS PRÆPARATUS. *Syn.* AXUNGE; PREPARED LARD.

ADHESION (-hē-zhūn). *Syn.* ADHESIO, L.; ADHESION, Fr.; ANHÄNGUNG, ANLEBUNG, Ger. The act or state of sticking or being united.

Adhesion. In *physics*, the force with which bodies remain attached to each other when brought into contact; e.g., ink *adheres* to paper, paint *adheres* to wood, &c. It differs from 'cohesion' in representing the force with which *different* bodies cling together; whereas cohesion is the force which unites the particles of a homogeneous body with each other; e.g., particles of iron *cohere* and form a mass of iron; particles of water *cohere* and form a mass of water, &c.

Adhesion. In *pathology*, the morbid union, from inflammation, of parts normally contiguous but not adherent.

Adhesion. In *surgery*, the reunion of divided parts, by the adhesive inflammation; as when incised wounds heal by what is termed the 'first intention.'

ADHESIVE. *Syn.* ADHESIVUS, L.; ADHESIF, Fr.; ADHÄSIVE, VERWACHSEND, Ger. In *pharmacy*, &c., having the quality or property of sticking or adhering. Hence *adhesiveness*.

ADIPOCERE (-sère). *Syn.* GRAVE-WAX; ADIPOCE'RA, L.; ADIPOCERE, Fr.; FETTWACHS, Ger. A substance resembling a mixture of fat and wax, resulting from the decomposition of the flesh of animals in moist situations, or under water. It is chiefly *margarate of ammonium*. Lavoisier proposed to produce this substance artificially, for the purposes of the

arts. Attempts have since been made to convert the dead bodies of cattle (carrion) into adipocere, for the purposes of the candle-maker and the soap-boiler, but without success. Besides, dead animal matter can be worked up more profitably than in making artificial adipocere.

Hatchettine or *dog-fat*, is sometimes called 'adipocere'; and *rock-butter* is a substance nearly similar to it.

ADJECTIVE. *Syn.* ADJECTIVUS, L.; ADJECTIF, Fr. In *dyeing*, depending on another, or on something else; applied to those colours which require a base or mordant to render them permanent. See DYEING.

ADJUVANT. [Eng., Fr.] *Syn.* ADJUVANS, L.; AIDANT, &c., Fr. Assistant; helping. (As a substantive—) In *prescriptions*, see PRESCRIBING (Art of).

Æ (æ). [L.] For words sometimes written with this initial diphthong, and not found below, look under E.

ÆGIRINON (-jī-). [Gr.] See OINTMENT.
EGYPTIACUM (-jīp-tī-). [Lat.] *Syn.* UNGUENTUM ÆGYPTIACUM, L. Oxymel or liniment of verdigris. The name originated with Hippocrates, who is said to have learned its composition in Egypt.

ÆOLIPILE (-pile). A hollow ball of metal, having a slender neck with a very small orifice, contrived to exhibit the conversion of *water* into *steam* by the action of heat, and to account for the natural production of winds. It was known to the ancients, is mentioned by Vitruvius, and was studied by Descartes and others. It has been used in *surgery* to produce *eschars*, in the same cases as moxas; the effect of the steam being limited by means of a piece of perforated pasteboard. When filled with alcohol, and the jet of vapour inflamed, it is sometimes employed as a blowpipe. M. Soyer used an apparatus of this kind to supply the heat in his portable furnace. The liquid, however, which he employed, was camphine.

ÆER (ā-ēr). [L., prim. Gr.] Air.

ÆERATED (ā-ēr-rāte-ēd). In *chemistry*, &c., impregnated with *carbonic acid*. See ALKALI, LEMONADE, WATERS, &c.

ÆÆRIAL (ā-ēr-ē-āil). Belonging to the air or atmosphere; produced by, consisting of, depending on, or partaking of the nature of the air.

ÆÆRIFICATION (ā-ēr-e-). *Syn.* ÆÆRIFICA'TIO, L.; ÆÆRIFICATION, GAZÆIFICATION, Fr. In *chemistry*, the conversion of a body into gas.

ÆÆRIFORM (ā-ēr-) *Syn.* ÆÆRIFORMIS, L.; ÆÆRIFORME, GAZÆIFORME, Fr.; LUFT-FORMIG, &c., Ger. In *chemistry*, air-like, gaseous.

ÆÆROLOGY. *Syn.* ÆÆROLOGIA, F.; ÆÆROLOGIE, Fr.; Ger. In *physics*, a discourse or treatise of the air. In *physiology* and *hygiene*, the doctrine of the air, more especially with regard to its salubrity and action on organised beings.

ÆÆROMETER. *Syn.* ÆÆROMETERUM, L.; ÆÆROMÈTRE, Fr. An instrument used in *aërometry*.

ÆÆROMETRY. *Syn.* ÆÆROMETRIA, L.; ÆÆROMÉTRIE, F.; LUFTMESSKUNST, &c., Ger. In *chemistry* and *physics*, the art of measuring gases, and of determining their densities.

ÆÆRONAUTICS. *Syn.* ÆÆRONAUTIQUE, Fr. The art of sailing in, or of navigating the air. See BALLOONS.

ÆÆROPHOBIA. [L.] *Syn.* ÆÆROPHOBIE, Fr. In *pathology*, a dread of air (wind); a common symptom in hydrophobia, and occasionally present in hysteria and phrenitis.

ÆÆROSTATICS. *Syn.* ÆÆROSTATICA, L.; ÆÆROSTATIQUE, Fr. That branch of *pneumatics* which treats of air, and other elastic fluids, in a state of rest.

ÆÆROSTATION. [Eng., Fr.] *Syn.* ÆÆROSTATIO, L. The art of weighing the air; aerial suspension and navigation. See BALLOONS.

ÆÆRUGO (ē-). [L.] The rust of brass, bronze, or copper; verdigris.

ÆÆSCULIN. $C_{21}H_{21}O_{13}$. A crystalline fluorescent substance existing in the bark of the horse-chestnut (*æsculus hippocastanum*) and of other trees of the genera *Æsculus* and *Paria*. In the above-named sources *Æsculin* is associated with another fluorescent body called *Parin*.

ÆÆTHER. See ETHER.

ÆÆTHERÆA (-théré-). [L. pl.] Ethers.

ÆÆSTHETICS (ēz-). *Syn.* ÆÆSTHETICA, L. Medicines or agents which affect sensation. See ANÆSTHETICS and HYPERÆSTHETICS.

ÆÆTHIOPS. See ETHIOPS.

ÆÆFECTION. [Eng., Fr.] *Syn.* ÆÆFECTION, L. In *pathology*, a term nearly synonymous with disease.

AFFINITY. *Syn.* CHEMICAL AFFINITY; AFFINITAS, L.; AFFINITÉ, Fr.; VERWANDTSCHAFT, Ger. If oil and water be shaken together they produce no change upon one another, as is proved by their separating into two layers with their properties unaltered, when the mixture is allowed to remain at rest for a short time. Such bodies are said, in chemical language, to have *no affinity* for one another. If iodine and metallic mercury be rubbed together in a mortar they will unite in *definite proportions by weight*, and form a combination possessing *properties totally distinct from those of its constituents*. Thus, iodine is a greyish, metallic-looking solid, convertible into a violet vapour by heat, perceptibly soluble in water, and capable of producing a blue compound with starch. Mercury is a metallic, silvery looking liquid. The product of their union (*biniodide of mercury*) is a scarlet powder, destitute of metallic lustre, convertible into vapour by heat, without the production of violet fumes, insoluble in water, and incapable of developing a blue colour with starch. Again, the greenish-yellow and intensely poisonous gas, chlorine,

unites in *definite proportions by weight* with the soft, wax-like, and highly poisonous metal sodium to produce the white crystalline solid chloride of sodium (common salt), a compound which, except in very large quantities, is not only not poisonous, but actually beneficial to health.

Such combinations are called *chemical compounds*, and the force which binds their constituents together is distinguished from all other attractive forces by the term *affinity* or *chemical affinity*. (See MIXTURE.) Bodies united by affinity are also said to have *united chemically*.

Affinity is in most cases exerted between *different substances*, in which respect it resembles *adhesion*; but bodies united by adhesion, *e.g.* ink to paper, paint to wood, &c., unlike those united by affinity, suffer no change of properties.

Affinity is exerted at immeasurable distances, therefore substances to be submitted to its influence must be brought into (apparently) actual contact. This condition is frequently fulfilled by the vaporisation, fusion, or solution of one or more of the bodies to be submitted to its action.

In many instances substances which have no affinity for one another at ordinary temperatures manifest this power when heated.

Whenever *chemical union* takes place, heat is invariably evolved; conversely, the decomposition of a chemical compound is always accompanied by an apparent loss of heat or reduction of temperature.

Finally, the most striking phenomena characteristic of, and accompanying, chemical affinity are, development of heat, change of properties, and union in definite or constant proportions by weight.

AFFUSION. In *chemistry*, the washing of a precipitate, &c., for the purpose of removing soluble matters. In *medicine*, affusion is of three kinds:—

1. *Lotions*, which consist in washing a part of the body with a sponge or rag soaked in a liquid.

2. *Aspersions*, which consist in throwing a liquid drop by drop, like rain, upon the body.

3. *Shower baths*, which consist in allowing a number of small streams of water to fall from a height upon the surface of the body. If the water fall from a considerable height, affusion is then termed *douché* by the French.

AFTER-DAMP. *Syn.* CHOKE-DAMP. Carbonic acid gas resulting from explosions of air and *fire-damp* (light carbonated hydrogen) in coal mines.

AFTER-PAINS. Those following child-birth. The only remedy is *patience*; they may, however, be frequently alleviated by small doses of *morphia* or *liquor opii sedativus*. Heated cloths and warm fomentations are sometimes useful, particularly if assisted by moderate but sufficient pressure on the

abdomen, by means of a broad bandage. They seldom follow with severity the first birth.

AFTER-WASH (-wəsh). In the *art of the distiller*, the liquor in the still after the spirit has been drawn over.

AGARIC. [Eng., Fr.] *Syn.* AGARICUM, AGARICUS, L.; BLÄTTERSCHWAMM, PILZ, SCHWAMM, Ger. In *botany*, a genus of *fungi*, of numerous species, embracing the mushrooms and champignons. Of these plants, some are edible; others poisonous. The term is also commonly applied to the *boletus* found on oaks (TOUCHWOOD), and on larches (MALE AGARIC).

Fly-agaric. *Syn.* FLY MUSH'ROOM; AGARICUS MUSCARI, Linn.; AMANITA M. One of the most narcotic and poisonous of our fungi, producing, in *small doses*, intoxication and a pleasing species of delirium; for which purpose it is commonly employed in Kamshatka. (Hooker.) It possesses the singular property of imparting an intoxicating quality to the urine, which continues for a long time after taking it. This secretion is, therefore, commonly saved by the natives during a scarcity of the fungus. "Thus, with a few *amanites*, a party of drunkards may keep up their debauch for a week;" and the intoxication so produced is capable of "being propagated through five or six individuals." (Langsdorff.) Water in which it has been boiled is poisonous; but the *boiled* fungus itself is inert. The liquid from it is used as a FLY-POISON; whence the name *mush-room* is derived. It may be known by its rich orange-red colour in autumn.

AGATE (-āte, -ēt). [Eng., Fr.] *Syn.* ACHATES (-kă-tēz), L. A semi-crystalline species of *quartz*, remarkable for its hardness, variety of colour, and susceptibility of receiving a high polish. It is an aggregate of various siliceous minerals, of which chalcedony appears generally to be the base. Carnelian, jasper, amethyst, and other similar minerals, often enter into its composition. The colours are often delicately arranged in stripes, bands, or clouds. Those which take an angular form, as the *Scotch pebble*, are called FORTIFICATION AGATES. It is the least valuable of the precious stones, and is chiefly made into rings, seals, beads, burnishers, &c., on account of its hardness. Its *powder* is used for cleansing and polishing iron, brass, &c., and to sharpen edge-tools.

AG'NAIL. See WHITLOW.

AGRYPNOTICS (-grīp-). *Syn.* ANTHYPNOTICS (-hīp-); AGRYPNOTICA, ANTHYPNOTICA, L. In *medicine* and *pharmacology*, agents or substances which prevent sleep; as *tea*, *coffee*, *digitalis*, *vinegar*, &c.

AGUE (-gū). See FEVER (Intermittent).

Ague-cake. The popular name of a tumour felt under the false ribs on the left side, formed by enlargement and induration of the spleen,

following protracted ague; also, sometimes, of indurations of the liver following ague.

Ague-drop. See **QUACK MEDICINES**.

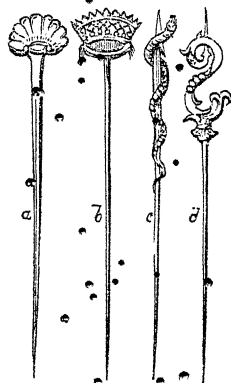

Ague-salt (-sôlt). Disulphate of quinine.

Ague-tree. Sassafras.

Ague-weed. The herb *thorough-wort* ('Eupa-
torium perfoliatum', Linn.).

AIGREMORE (эг'г-мор). [Fr.] Pulver-
ised charcoal in the state it is used to make
gunpowder.

AIGUILLETTE (ATTELETTE). [Fr.] In

Atelettes from Soyer.

cooking, a term applied to several small dishes, from the articles of which they consist being mounted on *silver needles*, or *skewers*, with ornamental handles or tops. (See *engr.*) They form one of the varieties of the 'hors-d'œuvres' of Soyer; and are commonly served on a napkin. The *skewers* should be about four inches long, and of the thickness of an ordinary packing needle. The person eating what is served on them, takes the head of the skewer between the thumb and fingers of the left hand, and picks it off with his fork. Those noticed by Soyer are—

Aiguillettes à l'Eperlan (*smelts*);

Aiguillettes aux Huitres (*oysters*);

Aiguillettes de Filets de Sole (*soles*);

Aiguillettes de Homard (*lobsters*);

Aiguillettes de Langue de Bœuf (*ox-tongue*);

Aiguillettes de Ris de Veau (*sweetbread of veal*);

Aiguillettes de Volaille à la Jolie Fille (*fowl*);—

all of which are prepared in a nearly similar manner, merely varying the sauces, &c., to suit the article and palate. See **ATTELETES**, **HORS-D'ŒUVRES**, &c.

AILMENT. Pain, indisposition; disease. Its use is generally restricted to the non-acute, and milder forms of disease.

AIR. [Eng., Fr.] *Syn.* **AER**, L. (from *ἀήρ*, Gr.); **LUFT**, Ger.; **ATMOSPHERIC AIR**; **THE ATMOSPHERE**. This name was formerly given

to any æriform body; thus, by the old chemists, ammoniacal gas was called alkaline air; oxygen,—dephlogisticated, vital, or empyreal air; carbonic anhydride (carbonic acid), fixed air; hydrogen, inflammable air; heavy carbonated hydrogen (olefiant gas); heavy inflammable air; nitrogen,—mephitic, phlogisticated, or nitrous air. At the present time the term air is usually restricted to the gaseous envelope surrounding the solid and liquid parts of our globe.

Atmospheric Air (or simply, **The Air**). The air chiefly consists of a *mechanical mixture* of four volumes of nitrogen and one volume of oxygen, or more accurately—

	By volume.		By weight.
Nitrogen	79.1	...	76.8
Oxygen.....	20.9	...	23.2
	100		100

The chief functions of the oxygen are to maintain respiration and support combustion, while the office of the nitrogen is to dilute the oxygen and control its energy.

Besides nitrogen and oxygen, aqueous vapour, carbonic anhydride, ammonia, and nitric acid are met with in the atmosphere, the last especially during and after thunder storms.

Vapour of water is essential to the respiration of animals and plants, in order that the organs concerned in this operation may be kept in a soft and moist condition.

Carbonic anhydride is evolved during combustion, putrefaction, and fermentation; it is also a product of the respiration of animals, and highly poisonous to them, even when diluted with large proportions of air. This gas is, however, greedily absorbed by plants, which decompose it; they assimilate the carbon and return the oxygen to the atmosphere, ready to be again consumed in supporting the life of the animal world.

Ammonia is derived from the putrefaction of animal and vegetable substances. It is from atmospheric ammoniacal compounds that plants obtain much of the nitrogen which is essential to the formation of many parts of their structure.

Nitric acid, like ammonia, is absorbed, and its nitrogen assimilated, by plants.

In addition to the gases and vapours already enumerated, as well as others which exist in minute-quantity, or which are of only occasional occurrence, Pasteur and other investigators have discovered in the air living germs which are capable of exciting putrefaction and fermentation, and which are competent, in some instances, to engender disease when they are injected into the blood of animals. In fact, the spread of infectious diseases, e. g., smallpox, typhus fever, cattle-plague, &c., is attributed to the presence in the atmosphere of the germs of such maladies. These germs are believed to be living beings, which develop and multiply at the expense

of the tissues of the larger animals into whose systems they have found entrance.

AL-. [Ar.] An inseparable article equivalent to the English *the*. It is found in many chemical and other words, derived from the Arabic; as, *alchemy*, *alcohol*, *alembic*, *almanac*, &c.

AL'ABASTER. *Syn.* ALBÂTRE, Fr.; ALABASTER, ALABASTRITES, ALABASTRUM, L. A soft, white species of calcareous and of gypseous stone, used by sculptors. There are several varieties, all of which may be ranged under two heads:—

1. CALCA'REOUS ALABASTER; ORIENT'AL A.; CALO-SIN'TER. A sub-variety of carbonate of calcium, formed by the deposition of calcareous particles in the caverns of limestone rocks. It has a foliated, fibrous, or granular structure, and a pure, soft, rich, semi-translucent whiteness, generally agreeably variegated with undulating zones or stripes of various shades of yellow, red, or brown. This variety is that most esteemed by sculptors, and for the manufacture of alabaster ornaments. The ancients used it for ointment and perfume boxes. At the baths of San Filippo (Tuscany), the process of its formation may be examined by the observer. The natural spring of boiling water holds carbonate of lime in solution by means of sulphuretted hydrogen, which, escaping into the air, leaves the lime as a precipitate, which is gradually deposited in a concrete form. (M. Alex. Brogniart.)

2. GYP'SEOUS or COMMON ALABASTER; GYPSUM. A natural hydrated sulphate of calcium, containing a little carbonate of calcium. That from the quarries of the Paris basin contains about 12% of the latter substance. When calcined or roasted, and powdered, it forms the substance known under the name of PLASTER OF PARIS. The more compact, fine-grained specimens of this variety are, like the preceding one, sculptured into almost numberless articles of ornament and utility, such as vases, clock-stands, statuettes, &c. The inferior kinds only are manufactured into the '*plaster of Paris*' of the shops. The best specimens are obtained from the lower beds of the gypsum quarries, and are white, and granular, not unlike Carrara marble. It takes a high polish; but from its softness and liability to become discoloured, articles formed of it require more careful treatment than even those of 'calcareous alabaster.'

Alabaster is WROUGHT, TURNED, and FASHIONED, in a nearly similar manner to the softer varieties of marble. The tools resemble those employed for the like operations in ivory and brass. Machinery is now often applied to this purpose.

Alabaster is POLISHED, first with *pumice stone*, and then with a paste or pap made of *whiting*, *soap*, and *milk or water*; and lastly with *dry flannel*. A better method, however, is to rub it first with *dried shave-grass* (equisetum), and afterwards with *finely powdered* and

sifted slaked lime formed into a paste with *water*. The surface is then 'finished off' by friction with *finely powdered tale*, or *French chalk*, until a satiny lustre is produced, or with *putty powder*, in a similar way to marble.

Alabaster is ENGRAVED with tools resembling those employed for other soft minerals. It is ETCHED by covering every part of the surface, except that to be acted on, with a solution of *white wax in oil of turpentine* (1 to 4), thickened with a little *finely powdered white lead*, and subsequent immersion in *water acidulated with acetic acid or hydrochloric acid*, for the calcareous variety; and in *spring water*, for 20 to 50 hours (according to the effect desired), for the gypseous variety. The varnish is washed off with *oil of turpentine*, and the etched parts carefully brushed over with *finely powdered gypsum*.

Alabaster is JOINED and REPAIRED by means of *white of egg*, or *rice glue*, thickened with *finely powdered quicklime*; or by a paste of newly baked and *finely powdered gypsum*, mixed up with the least possible quantity of *water*.

Calcareous alabaster is usually CLEANED with a brush and warm, *soap-and-water*, or with *tepid water* to which a few grains of *carbonate of soda* or of *ammonia* has been added; followed in either case by rinsing in *clean water*. Delicate objects in *gypseous alabaster* can only be safely cleaned with *benzol*, or with *pure oil of turpentine*. If necessary, the surface must be repolished. GREASE SPOTS may be removed from either variety with a little *benzol* or *oil of turpentine*.

Alabaster is occasionally STAINED or COLOURED, and, for the calcareous variety, in a similar way to marble, except that heat is not employed; and for the gypseous variety, in the manner noticed under PLASTER OF PARIS. The gypseous variety is also BRONZED and HARDENED in a similar way, so that adopted for casts in the latter substance.

Obs. Gypseous alabaster is dissolved by water; and the beauty of both varieties is almost irrecoverably destroyed by grease, coloured oils, varnishes, smoke, &c. It is, therefore, unfitted for garden ornaments, or other objects exposed to the rain or weather, unless it be painted or bronzed; and is even then very perishable. Contact with acids, alkalies, and ammoniacal and sulphurous fumes, also injure, and, if prolonged, destroy it. Even an unworked phial of smelling-salts placed on a mantel-piece beside an alabaster vase, will soon destroy its beauty. Thus, all delicate objects in alabaster should be protected by a glass shade.

Orient'al Alabaster (Factionous). *Figures, basso relievos*, &c., of considerable hardness and beauty, may be formed by imitating the process adopted at the Baths of San Filippo, before referred to.

Proc., &c. Moulds of *sulphur* are placed either vertically or obliquely in an open tub or cistern, having a freely perforated bottom. Surmounting the whole are two or more pieces

of wood in the form of a cross or star. The *sulphurous calcareous water*, falling on this cross; is scattered into spray or streamlets, and losing the gaseous portion which holds the lime in solution, deposits it in the form of ORIENTAL ALABASTER on the surface of the moulds. In from 1 to 4 months, according to the nature of the article, a sufficiently thick deposit is obtained. The object is then removed from the mould, and trimmed and polished. It is found that the more *vertical* the position of the mould, the finer is the grain of the resulting deposit. The water of the Spring of San Filippo may be exactly and easily imitated by the chemist; and the whole process offers a new and valuable ornamental art for the amusement and profit of the ingenious and enterprising.

ALAMODE (ălăh-môdé.) [Fr., à la mode.] According to the prevailing mode or fashion. In *cooking*, applied to several dishes, but more particularly to one of beef (**ALAMODE BEEF**), commonly shortened by the lower class of Londoners into "*alamode*." See **BEEF**, **STEWES**, &c.

ALANTINE. [Eng., Fr., Ger.] *Syn.* ALANTINA, L. A substance identical with inulin, found in the roots of *garden angelica* ('*angelica archangelica*,' Linn.).

ALBATA. [L., Eng.] A name given to several alloys resembling silver. See **ALLOYS**, **GERMAN SILVER**, &c.

ALBUMEN. [Eng., L.] *Syn.* ALBUMIN; ALBUMINE, Fr.; EIWISS, EIWISSTOFF, Ger. Literally, the white of egg; a peculiar nitrogenous substance which enters largely into the composition of animal bodies. It abounds in the blood, muscles, bones, coagulable lymph, vitreous and crystalline humour of the eye, fluid of atrophy, &c. The white of egg consists of nearly pure albumen dissolved in water.

A substance identical with albumen is found in many vegetables. It enters largely into the composition of all the emulsive seeds. According to Seguin, it exists in considerable quantity in all those vegetables and fruits that afford a vinous liquor without the addition of yeast.

Prep. The white of egg and the serum of blood, when strained through muslin, furnish albumen, in solution, in a sufficiently pure state for all the ordinary purposes of the arts. Pure **SOLID ALBUMEN** may be prepared as follows:—

1. Agitate strained white of egg with 10 or 12 times its bulk of alcohol, collect the precipitated flocculi on a muslin filter, and suffer it to dry at a temperature not exceeding 120° Fahr.

2. Add a little water to white of egg, mix, filter, exactly neutralise with acetic acid, and then largely dilute with pure cold water; the precipitate which falls may be collected on a filter and washed. Strained serum of blood may be used instead of white of egg, in both the above forms.

Comp., &c. The following is the composition of albumen according to Lieberkühn:—

Carbon	53.3
Hydrogen	7.1
Nitrogen	15.7
Oxygen	22.1
Sulphur	1.8
	<hr/> 100.

Chatin found iodine in the white of egg; it also contains chloride, sulphate, phosphate, and carbonate of sodium, phosphate of calcium, and traces of potassium in it; but, unlike the sulphur, none of these substances form a constituent part of pure albumen, though probably always present in white of egg.

Prep. Pure solid albumen (unaltered by heat) is nearly colourless, inodorous, and tasteless; scarcely soluble in water, but readily so in water containing an exceedingly small quantity of caustic soda or potash, and in a strong solution of nitrate of potassium. When dried by a gentle heat it shrinks into a translucent horny mass; and when exposed to a sufficient temperature, yields the usual ammoniacal odour and products of animal matter. Its solution (as white of egg) is solidified or coagulated by a heat of from 145° to 165° Fahr., forming a white, opaque mass; when very dilute, on boiling (only) it separates in fine light flocks. When thus coagulated, it is insoluble in water at a less temperature than 302° Fahr. (Wöhler and Vogel), unless alkalinised. Ordinary solutions of albumen give precipitates with sulphuric, hydrochloric, nitric, and metaphosphoric acids, with tannin and astringent solutions, and with most of the metallic salts; but are not affected by either acetic acid or tribasic (common) phosphoric acid. Alcohol, in quantity, also precipitates albumen. Strong oil of vitriol turns it black in the cold, but on applying a gentle heat, a gorgeous, red-coloured liquid is produced. Strong hydrochloric acid gives a deep violet-blue solution. White of egg or serum exposed in a thin stratum to the air, dries up into a pale, yellow, gum-like substance, and in this state may be kept for any length of time, retaining its property of redissolving when immersed in slightly warm water.

Tests.—1. Both heat and alcohol (or strong spirit) coagulate it:—2. A solution of perchloride of mercury, dropped into a fluid containing albumen occasions a white precipitate:—3. Subacetate of lead acts in the same way. Either of the last two will render turbid a solution containing only the 1-20000th part of fresh white of egg, or the 1-10,000th part of dry albumen:—4. Tannin and tincture of galls give yellow, pitchy precipitates:—5. If dry caustic potash or soda be triturated with either liquid or solid albumen, ammoniacal fumes are evolved, and the mixture on calcination yields ferrocyanide of potassium:—6. Its coagulability by heat, and its inco-

agail off the spirit c acid, distinguish it from casein begins to th

Uses, &c. Independently of its value as an alimentary substance, albumen is largely employed in photography as a glaze or varnish, for fixing colours in calico printing, as a cement, &c., and more particularly as a clarifier for wines, syrups, vegetable solutions, and other liquids. Its efficacy for the last purpose depends on its entangling the impurities in its meshes during coagulation, and either rising to the surface with them as a 'scum,' or sinking with them as a precipitate. When the liquid operated on does not spontaneously coagulate albumen, it is necessary to apply heat to it. In cases of poisoning by the mineral acids, corrosive sublimate, nitrate of silver, sulphate of copper, bichloride of tin, or sugar of lead, the white of egg (or indeed the yolk as well) is one of the best antidotes that can be administered.

Flake Albumen. *Syn.* ALBUMEN IN POWDER, SOLID A., SOLUBLE A., PLANTER'S A. *Prep.* Expose strained white of egg or serum of bullock's blood, in a thin stratum, to a current of dry air, until it concretes into a solid transparent substance, resembling horn. In this state it may be kept any length of time, or it may be further dried until brittle, and then reduced to coarse powder.

Use. It is extensively employed as a 'clarifier' in the sugar plantations of the West Indies, and elsewhere. It is prepared for use by soaking and stirring it with cold water until it is dissolved, when it is whisked to a froth in the usual way, and agitated with the liquid to be clarified.

Vegetable Albumen. This substance, long considered to be a distinct proximate principle peculiar to the vegetable kingdom, has been shown, by recent researches, to be identical with animal albumen. It is particularly abundant in carrots, turnips, cabbages, green stems of peas, and oleaginous seeds.

Albumen, Solution of (B. P.). Take of white of one egg; distilled water, four fluid ounces. Mix by trituration in a mortar, and filter through clean tow, first moistened with distilled water. This solution must be recently prepared.

ALBUMEN. In *botany*, the solid, fleshy, or horny substance found in many seeds, between the integuments and the embryo. It is the part that furnishes the flour of the 'cereals,' the flesh of the 'cocoa-nut,' and the great mass of the seeds of coffee and other vegetables. However poisonous the plants which produce it may be, this substance is never deleterious.

ALBUMENOUS. A term applied to albumen, fibrin, casein, and similar bodies.

ALBUMINOUS. *Syn.* ALBUMINOSUS, L.; ALBUMINÉ, ABUMINEUX, Fr.; ETWEISSTOFFHALTIG, Ger. Formed of, containing, or having the properties of albumen.

Albuminous Plants. In *botany*, all plants

whose seeds contain albumen in a separate state; as in the cereals, palms, &c.

Albuminous Principles or Substances. Albumen, casein, fibrin, gluten, &c.

ALBURNUM. [L.] *Syn.* ALBURN*; SAPWOOD. In *botany*, the white and softer parts of the wood of exogenous plants, lying between the inner bark and the heartwood. It consists of empty or nearly empty tubes or cells, which gradually acquire solidity by the deposition of resins, tannin, and other products of vegetation, and in time becomes wood. It is through the alburnum that the ascending sap chiefly flows.

ALCARAZZA. [Sp.]. A species of porous earthenware, of a vessel formed of it, made in Spain from a light, sandy marl, and but slightly fired. Their value as 'coolers' arises from the copious evaporation of the water, which gradually transudes. A similar ware and articles are made in France, under the name of HYGROCERAMEN; and in England, under the names of POROUS WARE, WATER COOLERS, WINE COOLERS, BUTTER COOLERS, &c. The following are forms said to be used in our potteries:—

Prep. 1. Take of sandy-marl, 2 parts; brine, q. s.; make a dough, and then knead in of common salt, in fine powder, 1 part. Bake the pieces slowly, and lightly.

2. Good clay, 2 parts; fine siliceous sand, 3 parts; brine, q. s.; common salt, 1 to 2 parts; as before.

3. Powdered clay, 2 parts; powdered charcoal, 3 parts (by weight); water, q. s. to form a stiff dough. The kilning must be so arranged that the heat is applied gradually, and the vessels exposed to a current of hot air; and it must be continued until all the charcoal is burnt out, carefully avoiding over-firing.

ALCHEMY (kīm-). *Syn.* ALCHYMY (-kīm-); HERMETIC ART*; ALCHEMIA, ALCHYMIA, L.; ALCHIMIE, Fr.; ALCHEMIE, Ger.; ALCHIMIA, It. The romantic forerunner of the modern science of chemistry. An imaginary art or science, having for its objects the discovery of—a substance (PHILOSOPHER'S STONE) capable of transmuting the baser metals into gold—a panacea, or universal remedy (ELIXIR VITÆ), by which disease and death were to be avoided by its possessor—an alkahest, or universal solvent—a universal ferment; and other like absurdities. A mixed metal formerly used for utensils was also called by this name.

ALCOHOL. C₂H₅O. [Eng., L.; B. P.] *Syn.* AL'KOHOL, Eng., L.; ALCOOL, ALCOHOL, Fr.; ALKOHOL, HÖCHST RECTIFIZIRTER WEIN-GEIST, Ger.; ALCOÖLE, It. A term commonly applied to one kind of spirit—that obtained by the distillation of any fermented saccharine liquid, and forming the characteristic principle of wines, beers, spirits and other intoxicating liquors.

Etym. Kohol, a Hebrew-Syriac word, is the name given to a preparation of powdered

antimony, used by Oriental ladies to paint their eyebrows. In course of time this term was applied to other fine powders, and ultimately to highly rectified spirits.

Hist., &c. Although the art of distillation was probably known at a comparatively early age of the world, the preparation of pure rectified spirit is a discovery of modern times. It was not until the 13th century, that Raymond Lully first showed the way to concentrate spirit by means of *carbonate of potash*; after which date pure concentrated spirit gradually rose into note as an article of trade and commerce in Europe. In the 16th century its distillation was in common practice in these countries. (Burns.) By means of *chloride of calcium*, Dr. Black obtained alcohol of sp. gr. 0.800 (about A.D. 1760); and Richter afterwards procured it of a sp. gr. so low as 0.796 at 60° Fahr. (Crell's 'Annals,' 1796.) Lavoisier first demonstrated the composition of alcohol (about 1780). Its analysis was subsequently perfected by M. Saussure, jun., and confirmed by MM. Dumas and Boullay, and Gay-Lussac; and by many others since.

Nat. hist. Alcohol is peculiar to the organic kingdom, being exclusively produced, in the natural way, by the process of fermentation.

Sources, &c. Dilute alcohol may be procured, by the ordinary process of distillation, from all fermented liquors. When drawn from wine (as in France), it constitutes BRANDY; when from the refuse juice of the sugar-cane, it is called RUM; when from malt, grain, or molasses (as in England), it is called MALT, RAW-GRAIN or MOLASSES SPIRIT; and when from rice or palm-wine, ARRACK. Brandy, rum, Hollands, and whiskey, contain only about half their volume of alcohol; and gin much less. When distilled from any of these spirituous liquors, the alcohol contains, besides water, variable quantities of essential oils, ethers, and other flavouring matters, which, by one or more redistillations with charcoal or lime, it for the most part loses, and then becomes commercial spirit of wine. By a further rectification from chloride of calcium, lime, carbonate of potash, or any other substance having a strong affinity for water, the water is retained, and a strong spirit passes over containing not more than 10 per cent. of water. By repeating the process, and using the proper precautions, it may be obtained almost entirely free from water, and is then called absolute or anhydrous alcohol.

Preparation I. Of Absolute Alcohol.—

a. Alcohol (highly rectified spirit), of 85° (sp. gr. .835 to .822), is mixed, in a tubulated retort, with about half its weight of fresh-burnt quick-lime, in coarse powder; and the whole, after securely stopping the neck with a cork, and agitation, is allowed to repose for several days. The alcohol is then carefully distilled off, drop by drop, by the heat of a water bath, until the weight of the distillate

nearly equals that of the . . . 53.3 in the spirit operated on. . . 7.1 the product should be .795 or .796, by carefully repeating the process with the distillate and a fresh quantity of lime, and prolonging the last digestion with the latter for several weeks, *absolute alcohol* of the sp. gr. .79381 at 60° Fahr. may be easily obtained.

b. (Drinkwater; Fownes.) The strongest rectified spirit of wine is digested in a stoppered bottle for several days, with about half its weight of anhydrous carbonate of potash, in powder, frequent agitation being had recourse to; the alcohol, after repose, is then decanted, and treated with sufficient fresh-burnt quick-lime to absorb the whole of the spirit. After 48 hours' digestion, the spirit, when distilled, will have the sp. gr. .793 at 60° Fahr.

c. (Liebig; Ure.) Alcohol of about 90° is saturated with fused chloride of calcium, in powder, and after repose for a few hours in a stoppered bottle, is submitted to distillation as before. The product should nearly equal the quantity of dry alcohol in the sample. Ure recommends equal weights of the spirit and chloride to be taken; and the process to be stopped as soon as about half the volume of the spirit employed has passed over, or the distillate acquires a higher sp. gr. than .791 at 68°, or .796 at 60° Fahr.

d. (B. P. 1867.) Take of *rectified spirit*, 1 pint; *carbonate of potash*, 1½ ounce; *slaked lime*, 10 ounces. Put the carbonate of potash and spirit into a stoppered bottle and allow them to remain in contact for two days, frequently shaking the bottle. Expose the slaked lime to a red heat in a covered crucible for half an hour, then remove it from the fire, and, when it has cooled, immediately put the lime into a flask or retort, and add to it the spirit from which the denser aqueous solution of carbonate of potash, which will have formed a distinct stratum at the bottom of the bottle, has been carefully and completely separated. Attach a condenser to the apparatus, and allow it to remain without any external application of heat for twenty-four hours; then applying a gentle heat, let the spirit distil until that which has passed over shall measure 1½ fluid ounce; reject this, and continue the distillation into a fresh receiver until nothing more passes at a temperature of 200° Fahr.

II. Of Hydrated or Commercial Alcohol.—

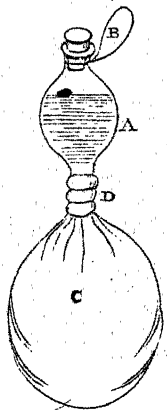

a. (ALCOHOL, Ph. L. 1836.) Take of *rectified spirit* (sp. gr. 0.838), 1 gal.; *chloride of calcium*, 1 lb.; proceed as above, and distil 7 pints and 5 fl. oz. Sp. gr. of product 0.815. It contains about 7% of water, by weight, and 5% by volume.

b. (ALCOHOL, Ph. D. 1826.) *Rectified spirit*, 1 gal.; *pearl-ashes* (dried and still hot), 3½ lbs.; mix, digest in a covered vessel, with frequent agitation, for seven days; then decant the clear portion, and add to it of *chloride of calcium*, 1 lb.; agitate to effect solution, and

distil off the spirit until the mixture in the retort begins to thicken. Sp. gr. of product 0.810. It contains about $5\frac{1}{2}$ of water, by weight.

c. (Without distillation.) *Rectified spirit* is agitated, in a closed vessel, with *anhydrous carbonate of potash* (prepared by heating the salt to redness, and still slightly warm), until the powder sinks to the bottom undissolved; the carbonate is then added in considerable excess, and the agitation repeated at short intervals for some hours or even days; lastly, after sufficient repose, the clear upper portion is decanted.—*Obs.* If a clean spirit, and pure carbonate of potash (or at least one perfectly free from *caustic* potash, or any other impurity soluble in strong spirit), be used, an alcohol sufficiently pure and free from water for many common purposes may be thus obtained; otherwise the product contains a little potassa, &c., which can only be removed by distillation. For some purposes, however, this would not be objectionable. Sp. gr. about 812.

III. (Soëmmering.—VARNISH-MAKER'S ALCOHOL.) The bladder of an ox or calf, thoroughly cleansed from fat, and washed and dried, is nearly filled with *rectified spirit*, and then securely fastened and suspended in any dry situation, at a temperature of about 122° Fahr. In from six to twelve hours, when the heat is properly maintained, the spirit is generally sufficiently concentrated, and in a little time longer is rendered *nearly* free from water (anhydrous), or of the strength of 96 to 98%.—*Obs.* The same bladder will serve for more than one hundred operations. If not kept very nearly full, a portion of the spirit escapes through the empty part. To prevent this accident, a bottle with a double neck, of the shape represented in the engr., may be

A, A bottle with two necks, the upper furnished with a ground-glass stopper.

B, Loop of cord to hang the apparatus up by.

C, Bladder containing spirit, filled by means of the bottle A.

D, Neck of bladder accurately secured to the under neck of the bottle A.

employed; by which means the bladder may be kept constantly full during the process. After the first or second time of using, the bladder gives alcohol sufficiently pure for all

ordinary purposes. Before hanging the apparatus up, it is better to enclose it in a coarse potato-netting, to prevent any accident arising from the strain on the neck of the bladder. Soëmmering recommends both the inside and outside of the dry bladder to be smeared over 2 or 3 times with a strong solution of isinglass; but this is not necessary to the success of the process.

IV. *Rectified Spirit.* (B. P. 1867.) *Spiritus Rectificatus.* Alcohol with 16 per cent. of water; obtained by the distilling of fermented saccharine fluids. Sp. gr. 0.838.

V. *Proof Spirit.* (B. P. 1867.) *Spiritus Tenuior.* Take of rectified spirit, 5 pints; distilled water, 3 pints. Mix. Sp. gr. of product 0.920.

Prop. of Alcohol. Light, transparent, colourless; highly volatile and inflammable, burning with a pale blue and smokeless flame; very mobile; odour, agreeable; taste, strong and pungent; miscible in all proportions with water, with the evolution of heat, and temporary expansion, but ultimate condensation of the mixture, some hours elapsing before the union is complete, and the normal temperature restored. The mixture has a higher sp. gr. than the mean of its constituents; and this is greatest when 54 vols. of alcohol are mixed with 49.77 vols. of water, the resulting compound measuring only 100 volumes. It absorbs water from moist air; dissolves resins, essential oils, camphor, bitumen, soaps, sugar, carbonic and boracic acid, iodine and the iodides, lime, ammonia, soda, potash, the alkaloids, wax and spermaceti (when boiling), all the deliquescent salts (except carbonate of potassa), and various other substances. It curdles milk, coagulates albumen, and (in quantity) separates both starch and gum from their mucilages. It boils, in the air, at 173° Fahr., when in the anhydrous state. When diluted with water its boiling-point rises in proportion to the amount of water added. It boils, *in vacuo*, at 56° Fahr. Every volume of boiling alcohol yields 488.3 vols. of vapour at 212° Fahr. Its sp. gr. is 0.793811 at 60° Fahr., that of its vapour being 1.6183. It has never been frozen; when cooled to -166° Fahr., it acquired the consistence of castor oil, but did not solidify. It contracts by cold; between -15° and +99° Fahr., this occurs with great regularity, at the rate of .0047 part of its volume for every degree of the thermometer. Its evaporation, like that of ether, produces intense cold. The products of its combustion are carbonic anhydride and water. It acts as a powerful antiseptic on organic substances immersed in it, and is in consequence extensively employed in the preservation of anatomical preparations. With the acids it forms ethers.

Phys. eff. Alcohol is a narcotico-acrid poison. In small doses it occasions excitement and intoxication; in larger ones, delirium, somnolency, coma, apoplexy, and death. It

acts as a violent nervous stimulant, and, by abstracting water from the soft tissues of the stomach and primæ viæ, destroy their organisation. It is alike poisonous to all animals;—2 drs. will kill a dog. *All strong spirits* act in the same way, the effect being proportionate to the state of concentration and the quantity taken. On *plants*, it acts as a rapid and fatal poison.

Ant., &c. Copious internal use of tepid water, with cold affusions to the head and spine, and injection of cold water into the ears. In the absence of vomiting, a strong emetic should be given, or the stomach-pump used. *Ammonia* may be used as a stimulant, and, added to water just in sufficient quantity to flavour it, is one of the best antidotes. The head should be kept elevated, and bleeding had recourse to, if cerebral congestion threatens.

Tests in case of death. 1. The odour of the contents of the stomach and ejected matters, and their ready inflammability. 2. The spirit may be separated by digestion with water, filtration, the addition of carbonate of potash, and distillation.

Comp., &c. Its per-centage composition is—

	Dumas and Boullay.	Brande and Ure.	Ure, sp. gr. 0·813.
Carbon . .	52·37	52·18	47·85
Hydrogen . .	13·01	13·04	12·24
Oxygen . .	34·61	34·78	39·91
	99·99	100·00	100·00

This nearly represents 2 equivalents of carbon, 3 eq. of hydrogen, and 1 of oxygen. The atom of alcohol is now regarded as a multiple of these numbers, and formed by the breaking up of one atom of *grape sugar* ($C_{12}H_{22}O_{11}$) into 4 eq. of alcohol, 8 eq. of carbonic acid, and 4 eq. of water. It was formerly regarded as a compound of 1 eq. of olefant gas, and 1 eq. of water; but it is now generally viewed as HYDRATE OF THE OXIDE OF ETHYLE ($C_2H_5 \cdot HO$), or a compound of ethylene and water ($C_2H_4 \cdot H_2O$). Grape sugar alone yields alcohol; cane sugar, before it undergoes the vinous fermentation, being first converted into this substance by contact with the ferment.

Purity. The presence of water is shown by the specific gravity (see ALCOHOLOMETRY); the absence of other foreign matter by the following tests:—

1. Its colour and transparency is not affected by the addition of a little colourless oil of vitriol (Liebig), or by a solution of nitrate of silver, and subsequent exposure for some time to solar light (Vögel), unless either essential oil or organic matter be present, when it assumes a reddish tinge. 2. It should be neutral to test papers, colourless, leave no residue on evaporation, and be miscible, in all proportions, with water and with ether. 3. Its boiling-point should never be less than 170° Fahr. ;

a lower temperature suggests the presence of wood spirits, or acetone, or one of the ethers. To detect wood spirit (wood naphtha) see *Nesler's Test*. For the reverse of this adulteration—the evasion of the duty by the introduction of spirit, under the disguise of naphtha, turpentine, &c.—see those articles. 4. The presence of water in alcohol may be detected, not only by the sp. gr., but also by white anhydrous sulphate of copper turning blue when dropped into it. 5. Potassium placed on alcohol does not take fire, unless a considerable per-centage of water be present.

Tests, &c. 1. It may generally be recognised by its volatility, inflammability, odour, taste, miscibility with water, power of dissolving camphor and resins, and other qualities already described. 2. If a few fibres of asbestos be 'moistened' with a saturated solution of bichromate of potash in oil of vitriol, and exposed to the smallest possible portion of hot alcohol-vapour, it is almost instantly turned green, owing to the formation of oxide of chromium. In practice, the asbestos may be inserted in the neck of a retort, or even of a bulbéd glass-tube containing a few drops of the suspected solution, when the effect occurs as soon as distillation commences. Ether and pyroxylic spirit produce a nearly similar result; but the 'first' of these is distinguished from alcohol by its not being miscible with water in all proportions; and the 'other,' by *Nesler's Test*; whilst both may be readily distinguished by their peculiar and characteristic odour. 3. Dissolve 3 pts. crystallised carbonate of soda in 10 pts. water. To this solution add 1 pt. of liquid to be tested, and heat to about 160° Fahr. Lastly, add iodine in small pieces, till it has entirely dissolved, and the liquid has become colourless. If alcohol be present, iodoform will make its appearance on cooling, and sink to the bottom in the form of a yellow powder. As a similar result is obtained with wood spirit, this must be proved to be absent before applying this test.

The only reliable method of proving that a sample is ethylic alcohol is the production of ether, by acting on the suspected liquid with sulphuric acid. See ETHER.

Uses. In the arts, alcohol is used by the varnish-maker, to dissolve resins; by the perfumer, to extract the odour of plants, and dissolve essential oils, soaps, and other similar substances; by the pharmacist, to prepare tinctures and other valuable medicinals; by the instrument-maker, to fill the bulbs of thermometers required to measure extreme degrees of cold; by the photographer, in the preparation of collodion; by the chemist, in analysis, and in the manufacture of numerous preparations; by the anatomist and naturalist, as an antiseptic; and by the physician, for various purposes and applications as a remedy. It is also frequently burnt in lamps, and in parts of the world where it is inexpensive, it

is employed in the manufacture of *vinegar*. Its uses, when dilute, as in the 'spirituous liquors' of commerce, are well known. In *medicine*, it is employed both *concentrated* ('*alcohol*,' '*rectified spirit*') and *dilute* ('*proof spirit*,' '*brandy*,' '*gin*,' &c.), as a caustic, irritant, stimulant, tonic, &c. It has also been used in a multitude of other cases, and has been applied to an almost infinite variety of other purposes.

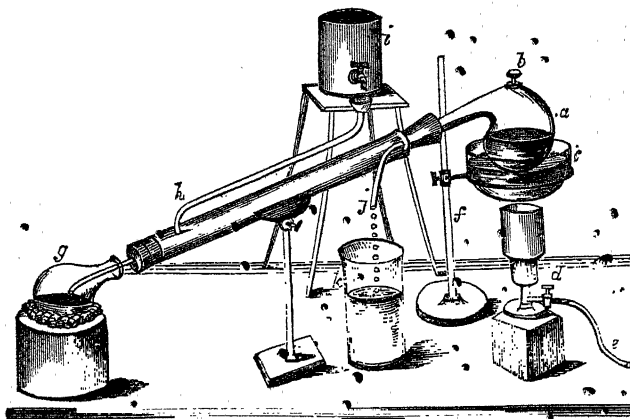

Gen. commentary. The selection of any one of the processes given above for the preparation of alcohol, must greatly depend on the convenience or position of the operator. *Chloride of calcium*, and *quick-lime*, from their powerful affinity for water, and easy application, are the hygrometric substances most generally employed; but the processes involving the use of the other substances and methods already noticed, have all of them advantages under particular circumstances. Gay-Lussac has recommended the use of *caustic baryta*, instead of lime; and others have employed dry alumina, as an absorbent of the water prior to distillation. Common *proof spirit* may be concentrated until its sp. gr. falls to about 0.825, by simple distillation in a

water bath; at which sp. gr. it contains only about 11½ of water, by weight, and is then nearly as volatile as pure alcohol.

A convenient apparatus for the preparation of alcohol, on the small scale, is that figured in the *engr.*, and which will be self-explanatory to every one competent to use it. The tank (a) should be supplied with ice-cold water; and the receiver (g) should be covered with cloths kept continually wet with water of the same temperature. The capsule or basin (c) is a water bath heated by the little gas furnace (d). On the large scale, for commercial alcohol, a copper still, fitted with a glass refrigeratory and receiver, is commonly employed.

By surrounding the capital of a still, or other like apparatus, by a water bath kept at the proper temperature, the alcoholic richness or content of the product may be regulated to the greatest nicety, for any desired strength.

The different statements of chemical authors as to the boiling-point, specific gravity, &c., of alcohol, already noticed, may be referred to their having either experimented with samples which have not been *absolutely* anhydrous, or to their not having made the proper correc-

tions for temperature, and for the different materials of which their vessels and instruments were composed—some probably having been made of glass, and others of brass or some other metal. In some instances the differences are more apparent than real, as in the *Tables* by Tralles and Lowitz; in the former of which, water, at its lowest sp. gr., is taken as the standard. Until recently, the only known source of alcohol was the fermentation of saccharine solutions. Its production by synthesis, though often attempted, is, however, erroneously said to have always failed. It had long been employed as an occasional source of bicarburetted hydrogen (olefiant gas) at a high temperature; but M. Berthelot succeeded

in reproducing it, from bicarburetted hydrogen, by agitating the latter, in a closed vessel, with *sulphuric acid* and *metallic mercury* ('*Journ. de Chimie Med.*, 1855, p. 179); and Henry Flennel, nearly thirty years before M. Berthelot's discovery, found that pure olefiant gas is absorbed by agitation with concentrated sulphuric acid, with the formation of sulphovinic acid, and that by subsequent dilution with water, and distillation, alcohol passes over into the receiver.

ALCOHOLATE. *Syn.* ALCOHATE; ALCOHOLAS, L. A salt in which alcohol appears to replace the water of crystallisation, as is the case with certain chlorides, nitrates, &c. Some of them may be formed by simple solution and

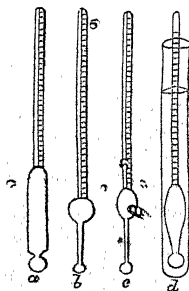

crystallisation of the salt in alcohol (Graham). They are all very unstable, being readily decomposed by water.

ALCOHOLIC. *Syn.* ALCOHOLICUS, L.; ALCOHOLIQUE, &c., Fr.; ALKOHOLISCH, °Ger. Pertaining to, containing, of the nature of, or made with, alcohol.

ALCOHOLICA. [L.] *Syn.* ALCOOLIQUE, Fr.; WEINGEIST-VERBINDUNGEN, Ger. In pharmacy, liquids containing, or preparations made with, alcohol, as a characteristic ingredient.

ALCOHOLISATION. [Eng., Fr.] *Syn.* ALCOHOLISATION, L.; ALCOOLISATION, &c., Fr.; ALKOHOLISIERUNG, Ger. In chem. and pharm., the development of the characteristic properties of alcohol in a liquid, or the use of it either as an addition or a menstruum; also the act or process of obtaining alcohol from spirit by rectification.

ALCOHOLOMETER (-lōm'-). *Syn.* ALCOHOLMETER (-hōl'-; -hōm'-); ALCOHOLOMETRUM, L.; ALCOOLMÈTRE, ALCOOMÈTRE, ALCOHOLMÈTRE, &c., Fr. An instrument or apparatus used in alcoholometry. Alcoholometers are simply 'hydrometers' adapted to the densities of alcohol, either concentrated or dilute. Some of these, as BAUME'S, CARTIER'S, &c., merely indicate the number of degrees corresponding to the state of concentration of

the liquid. Others, of a like construction, as those of RICHTER (a), TRALLÉS (b), and GAY-LUSSAC (c), have their stems so graduated as at once to indicate the *proportion per cent.* of alcohol present, either by weight, or by volume, at some standard temperature. (See *engr.*) A third class, as those of the Abbé BROSSEAU-VIDAL, FIELD, &c., are essentially thermometers, with scales which indicate the boiling-points of spirits of different strengths, instead of the common thermometric degrees; whilst to a fourth class belong the alcoholometer of M. SILBERMANN, which is based upon the known rate of expansion of alcoholic liquors by heat, expressed in alcoholometric degrees; and that of M. GEISLER, which depends on the measurement of the tension of the vapour of the liquid, as indicated by the height to which it raises a small column of mercury. In SYKES' HYDROMETER, used by officers of the Revenue, the scale of the instrument is enormously extended by the use of movable weights, with each of which it becomes, in fact, a separate instrument, adapted to a certain range of specific gravities.

A very convenient alcoholometer for ordinary purposes (d) has been lately produced by some of the instrument makers. It is of the usual form, but its stem on one side exhibits

the per-centage richness of the sample in alcohol by volume; and on the other, the per-centage by weight. Thus, both results may be obtained at one trial. This instrument is sometimes called RICHTER'S ALCOHOLOMETER, in England. A further improvement, still more recently introduced, is a similar 'double-scale' instrument, showing the degrees of Sykes on one side, and carrying a small spirit-thermometer in the bulb, to which a scale is fixed ranging from 35° to 82° Fahr.

ALCOHOLOMETRY. *Syn.* ALCOHOL'METRY (-hōl'-; -hōm'-); SPIRIT TESTING; ALCOHOLMETRIA, L.; ALCOOLMÉTRIE, ALCOOMÉTRIE, &c., FF. Is chemistry, the art or process of ascertaining the richness of spirits in alcohol. In commerce, the determination of the quantity of spirit of a certain strength, taken as a standard, present in any given sample of spirituous or fermented liquors. In England, this standard is called "*proof spirit*."

Hist., &c. The great importance of being able accurately to determine the strength of spirits in the United Kingdom, on account of the high duties levied on them, has induced the Government authorities, at various times, to investigate the subject. In 1790, the matter was referred to Sir C. Blagden, then Secretary to the Royal Society, who instituted an extensive series of experiments to determine the *real specific gravities* of different mixtures of alcohol and water. The results of his labours and researches were put forward, with 'Gilpin's Tables,' in 1794, but no practical measures appear to have been taken in consequence. In 1832 a committee of the Royal Society, at the request of the Lords of the Treasury, examined into the accuracy of the *Tables*, and the construction and application of the instrument (SYKES' HYDROMETER) now used by the Revenue officers, on which they reported favorably, and declared that they were sufficiently perfect for all practical and scientific purposes. The errors introduced into calculations of the strength of spirits by these *Tables* were found to be quite unimportant in practice, and did not, in any one instance, amount to unity in the fourth place of decimals. This method adopts the *specific gravity* as the test of the strength of spirits, and is founded on the fact that alcohol is considerably lighter than water, and that (with proper corrections for condensation and temperature) the sp. gr. regularly increases, or decreases, according to the relative proportions in which the two are mixed.

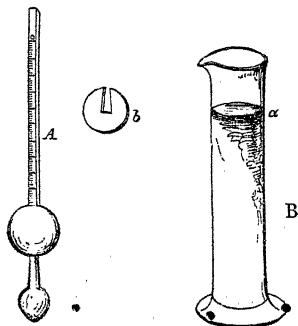

Several other methods of alcoholometry have been proposed, founded upon—the variations in temperature of the vapour of alcohol of different strengths—the heat evolved by its admixture with water—its dilatation by heat—the tension of its vapour—the insolubility of carbonate of potash in alcohol—its vola-

tility, boiling-point, &c. &c., the more important and useful of which are noticed further on. The method adopted by the *Boards of Inland Revenue and Customs* is, however, the one which is almost exclusively employed in trade and commerce in Great Britain, not only on account of its simplicity and correctness, but for the purpose of the results exactly coinciding with the results obtained by the Revenue officers.

METHODS OF ALCOHOLOMETRY.

1. *Methods based on the specific gravity, or per-centage strength, by VOLUME :*—

a. With SYKES' HYDROMETER. *Revenue system.* The engraving below represents Sykes' hydrometer, as made by Mr. Bate, under the directions of the Commissioners of Inland Revenue and Customs. It consists of a spherical ball or float, with an upper and lower stem, and is made of brass, which (in the more expensive instruments) is usually coated

with gold, to prevent corrosion from damp, and the acidity so generally present in spirituous liquors. The upper stem (A) is about four inches long, and is divided into ten parts, each of which contains five subdivisions. There are nine movable weights of the form (b), of different sizes, numbered respectively 10, 20, 30, &c., to 90, each of which represents so many of the principal divisions of the stem, as its number indicates. In use, one of these weights is slipped on to the lower stems; and thus, by means of them, the instrument acquires a range of above 500 divisions, or degrees, extending from the Revenue 'standard alcohol' (sp. gr. .825) to water. It is so formed as to give the sp. gr. with almost perfect accuracy, at 62° Fahr. When loaded with the weight 60 it sinks in *proof spirit* to the line marked (P) on the narrow edge of the stem, at 51° Fahr.; and, by further placing the square weight or cap (also supplied with the instr.) on the top of the upper stem, it floats exactly at the same point in distilled water. This weight or cap is found to weigh 43.66 grs., which is practically 1.12th of the

total observed weight of the instrument, and its poise 60, and hence shows the difference between the gravity of proof spirit and water, as explained hereafter. The whole is fitted up in a neat mahogany case, accompanied with a thermometer, and a book of *Tables* containing corrections for temperature, &c.—*Process.* A glass tube of the form of fig. (B) is filled to about the mark (a) with the sample for examination; the thermometer is then placed in the liquor, and stirred about for two or three minutes (observing not to breathe upon the glass, nor hold it in the hand), and the temperature noted. The hydrometer is next immersed in a similar manner, and gently pressed down in the liquor to the (0) on the stem with the finger; it having been previously loaded with any one of the nine weights that will cause it to float with the surface of the spirit at some point on the graduated part of the scale. The indication at the point cut by the surface of the liquor, as seen from below, added to the number of the weight with which the float is loaded, gives a number which must be sought in the book of *Tables*, which is *always* sold with the instrument. In this book, at the page headed "*Temperature as observed by the thermometer*," and against the part of the column appropriated to the *given indication* (weight), will be found the strength per cent., expressed in degrees *over* or *under proof*, by VOLUME, in whole numbers or decimal parts. In reading off the indication, to ensure accuracy, it is necessary to allow for the convexity of the liquor at the part where it immediately rests against the stem.

Obs. In an instrument requiring so much care and skill in its manufacture, the purchaser should be careful to procure a *perfect* one. A very slight blow, friction from continual wiping with a rough cloth, and other apparently trivial causes, tend to injure so delicate an instrument. The shape of the weights occasionally vary; some being intended to be attached to the hydrometer at the bottom of the spindle, and others to rest on its top. The first plan is, perhaps, the best, as it tends to make the instrument float with greater steadiness in the liquor; but, at the same time, it renders its adjustment by the maker a matter of greater difficulty.

In employing this instrument, the Revenue officers are instructed to take, the *nearest* degree *above* the surface of the mercury, when it stands between any two degrees of the thermometer; and the division on the scale of the hydrometer next *below* the surface of the liquid, when it cuts the stem between any two lines; thus giving the difference in favour of the trader, in both cases.

By means of the *Table* at page 43, the hydrometer indication, or the degrees *over* or *under proof*, of the Revenue System, may be converted into '*real specific gravities*,' by mere inspection; and the corresponding '*per-centage richness in alcohol*' of any

sample may be found, either by WEIGHT or VOLUME.

The specific gravities in this Table are such as, on being referred to Gilpin's Tables, will give the expressions of proof strength, answering to whole indications of the Revenue hydrometer. Intermediate values at fifths of indications may be had by taking proportional differences between the nearest tabular numbers. Thus, to find the specific gravity that should stand opposite to Indication 70.6, we first obtain the difference between the densities standing in a line with Indications 70 and 71 respectively, and then say, as 1.06 :: .00192 : .00115, and $.94135 + .00115 = .94250$, the specific gravity required.

b. With GLASS ALCOHOLOMETERS. That of Tralles, and most others of a like description, (as made in England), gave the *per-centage strength*, by VOLUME, with tolerable accuracy, at the standard temperature of 60° Fahr. Gay-Lussac's ALCOOMÈTRE, which closely resembles that of Tralles, is adjusted for the

temperature of 59° Fahr. (15° Cent.). All of these, to give at once accurate results, must, of course, be employed at the 'normal temperature' of the instrument. As, however, in practice, the experiment cannot be conveniently performed at any 'fixed' temperature, but only at that of the atmosphere, it is obvious that certain corrections are constantly required in order to obtain results of any value. Perfect accuracy requires that Tables for every variation of the thermometer, founded on actual experiments, should accompany each instrument; as, without them, tedious and difficult calculations are necessary, which, in the hurry of the cellar and laboratory, or by persons inexpert at figures, are not easily performed. A series of such Tables were prepared by Gay-Lussac, and, with his instrument, are those which are almost exclusively used in France. For rough purposes, in the absence of Tables, or nicer calculations, it may be useful to know, that, for *commercial spirits*, at ordinary temperatures, a variation of—

By VOLUME,

5° Fahr. is equal to (about)	1.00%	of Alcohol;	or (about)	1.794%	of Proof spirit.
1° " " "	0.20%	" " "	" " "	0.359%	" " "
5° Cent. " " "	1.80%	" " "	" " "	3.229%	" " "
1° " " "	0.36%	" " "	" " "	0.646%	" " "

By WEIGHT,

5° Fahr. is equal to (about)	0.80%	of Alcohol;	or (about)	1.62%	of Proof spirit.
1° " " "	.16%	" " "	" " "	.32%	" " "
5° Cent. " " "	1.43%	" " "	" " "	.29%	" " "
1° " " "	.28%	" " "	" " "	.58%	" " "

Thus, by making the proper ADDITION to the *apparent strength per cent.*, when the *observed temperature* is BELOW the *normal temperature* of the instrument, or a corresponding SUBTRACTION, when it is ABOVE it, the *strength* of the sample, may be determined sufficiently near for all practical purposes.

The following Table, taken from Loftus's 'Inland Revenue Officer's Manual,' will be found of great value in making these corrections, and has the merit of being easily applied.

An example will show how this Table is to be used.

Example.—If a quantity of spirit is of the sp. gr. 894 at 73°, what will be its sp. gr. at 60°?

Here the sp. gr. being between 890 and 900, we must add .450 for each degree of temperature between 73° and 60°. The sp. gr. at 60° would, therefore, be $894 + (.450 \times 13) = 899.85$. When the temperature is below 60°, the correction for each degree must be subtracted. When, however, very accurate results are desired, and the necessary Tables are not

This Table has been copied, by permission, from Loftus's 'Inland Revenue Officer's Manual,' and its correctness verified by W. H. Johnston, Esq., Surveying General Examiner.

instrument, in the manner explained under **HYDROMETRY**.

c. From the **SPECIFIC GRAVITY**. The temperature having been taken by a thermometer, and the specific gravity ascertained by any of the usual methods, but preferably by means of an accurate glass hydrometer, it merely becomes necessary to refer to Table I, where, against the number expressing the specific gravity, the alcoholic content *per cent.*, by **VOLUME**, of the sample examined, will be found for 60° Fahr., subject to the corrections just referred to, when the temperature is either above or below this point.

If the *precise specific gravity* sought cannot be found in the Table, the difference between it and the next greater specific gravity must be taken for the numerator of a fraction, having for its denominator the difference between the greater and the next less specific gravity in the table. This fraction, added to the per-centage of alcohol in the fourth column of the table, opposite the greater sp. gr., will give the true per-centage sought. Thus, the sp. gr. .96051 is not in the table, and the next greater number is .96068; the former must, therefore, be deducted from the latter, and the difference (17) put as the *numerator* of the fraction, having for its *denominator* 191, the difference between .96068 and .95877. The fraction ($\frac{17}{191}$) .089, so found, added to the per-centage strength opposite .96068 in the third column, gives 33.989 as the true per-centage of alcohol in the given sample.

The per-centage by *volume* may be converted into per-centage by *weight*, by multiplying the former by .793811, the sp. gr. of absolute alcohol, and dividing the product by the sp. gr. of the sample. The quotient is the number of pounds of alcohol in 100 pounds of the given spirit. Thus:—Suppose 1000 grains by measure of alcohol to weigh 950.92 grains, and to contain (see Table I) 40.63 per cent. by volume of absolute alcohol, what per cent. by weight does the sample contain?

$.793811 \times 40.63 = 32.25254093$, and this product divided by $.95092 = 33.917$, the true per-centage by weight of absolute alcohol in the sample.

2. Method based on the *specific gravity*, or *per-centage strength* by **WEIGHT**:—

The specific gravity is ascertained and the Table used in precisely the same manner as in the "method by volume," already described.

The per-centage by *weight* may be converted into per-centage by *volume*, by multiplying the former by the sp. gr. of the sample, and dividing the product by the sp. gr. of absolute alcohol. This is merely the reverse of the operation described above.

Obs. The preceding methods of *alcoholometry*, as well as all others depending on the *sp. gr.*, refer to **UNSWEETENED SPIRITS** only; and are inapplicable to those holding sugar in solution, or any other organic matter capable of

altering the sp. gr. For *sweetened spirits, fermented worts, wine, beer, &c.*, one or other of the following processes must be adopted:—

3. Other methods, adapted to either **SWEETENED OR UNSWEETENED Spirits, Tinctures, Fermented Liquors, &c.**—

a. By **DISTILLATION**, as originally proposed by M. Gay-Lussac. 300 parts of the *liquor* under examination (measured in a graduated glass tube) are placed in a retort or small still, and a quantity *exactly* equal to *one third* (i.e., 100 parts), carefully drawn over; a graduated glass tube¹ being used as a receiver, and the operation stopped as soon as the distillate reaches the hundredth degree. The 'alcoholic strength' of the *distilled liquor* is then ascertained by any of the usual methods, and the result divided by three, when the *per-centage* of alcohol in the original liquor is at once obtained. If, from want of attention, more than 100 parts should be distilled over, the number which expresses the *relation of the volume of the distilled product to the original bulk of the liquor tested*, must be employed as the *divisor*. Thus, if 106 parts of *liquor* have distilled over (instead of 100), containing 33 $\frac{1}{2}$ of alcohol, the 300 must be *divided* by 106, which gives 2.83, and the 33 $\frac{1}{2}$ by this 2.83, which gives 11.66 $\frac{1}{2}$, the *true proportion of alcohol* in the original liquor. The strength at 'proof' may be calculated from this in the usual way.

To ensure accurate results, the acidity (if any) of the liquor must be neutralised with *carbonate of sodium*, prior to distillation. It is also advisable to add 8% or 10% of common salt to the liquor in the retort or still; this, by raising the boiling-point, causes the whole of the spirit to pass over into the receiver before the distillate has reached the required measure. This applies more particularly to weak liquors. With those of greater strength (as the stronger wines), it is better to distil over 150 parts, and divide the result by 2 instead of 3. To liquors stronger than 25% by volume of alcohol, or above 52% to 54% under proof, add about an equal volume of water to the liquor in the still, and draw over a quantity equal to that of the sample tested; when the alcoholic strength of the distillate gives without calculation, the *true strength* sought. To liquors stronger than 48% to 50% (14 to 12, u. p.), add thrice their *bulk of water*, and do not stop the process until the volume of the distillate is double that of the sample tested, when the *per-centage* obtained must also be doubled. In each case a proportionate quantity of salt is employed.

REVENUE METHOD. The following is the method adopted in the Inland Revenue and Customs Laboratories for the estimation of the per-centage of alcohol in wines, liqueurs, &c.

¹ Mulder, in his "*Chemistry of Wine*," recommends this receiver to be shaped like a bottle, with its neck, or tubular part, bent at right angles *above* the line of its scale; and that it should be set in the centre of a glass jar kept filled with *very cold water*.

A *measure flask* is filled up to a mark on its neck, with the wine, which is then carefully transferred to a distilling flask or retort, the traces of wine remaining in the former vessel being rinsed out with small quantities of distilled water, and the rinsings added to the wine in the latter vessel. About two-thirds of the contents of the retort are then distilled over into the clean *measure flask*, and made up to the original bulk with distilled water, at the same temperature as the sample was previous to distillation. The strength is then taken by

Sykes' hydrometer, and this (if u. p.) deducted from 100, gives the per-centage of *proof spirit* in the wine. Thus:—

Strength of distillate = $74.6 \text{ u. p.} = 25.4 \text{ per cent. proof spirit.}$

b. From the TEMPERATURE of the VAPOUR, as originally proposed by Gröning. The bulb of a thermometer is thrust through a cork into the head of the still, or other vessel employed, and the temperature of the vapour in which it is immersed being noted, is sought in the following table:—

TABLE III.—Showing the Alcoholic Content, by VOLUME, of Boiling Spirits, and of their Vapour, from the Temperature of the latter, as observed by a Thermometer. By GRÖNING.

Temperature of the Vapour. Fahr.	Alcoholic content of the Distillate per cent.	Alcoholic content of the Boiling Liquid per cent.	Temperature of the Vapour. Fahr.	Alcoholic content of the Distillate per cent.	Alcoholic content of the Boiling Liquid per cent.
170.0	93	92	189.8	71	20
171.8	92	90	192.0	68	18
172.0	91	85	194.0	66	15
172.8	90½	80	196.4	61	12
174.0	90	75	198.6	55	10
174.6	89	70	201.0	50	7
176.0	87	65	203.0	42	5
178.3	85	50	205.4	36	3
180.8	82	40	207.7	28	2
183.0	80	35	210.0	18	1
185.0	78	30	212.0	0	0
187.4	76	25			

This method is admirably adapted to the purposes of the *distiller* and *rectifier*, as it furnishes a ready means of approximately determining the strength of the *spirit passing over*, at every part of the process of distillation, as well as that of the *wash* left in the still.

c. From the BOILING-POINT, as originally proposed by M. l'Abbé Brossard-Vidal. This method is founded on the fact, that the *boiling-points* of mixtures of alcohol and water, unlike water alone, are scarcely disturbed by the addition of saline, saccharine, or extractive matter within certain limits. It hence offers a ready means of determining the proportion of alcohol present in *spirits, wines, fermented liquors, &c.*, with sufficient accuracy for all ordinary purposes. In applying it, a *thermometer*, with a large bulb and a narrow bore, and a *movable scale* graduated from 180° to 212° Fahr., is usually employed. Before using it as an alcoholometer, it is set, with its bulb immersed, in a small *metallic* boiler (brass or copper) containing distilled water, which is then raised to the *boiling-point*, and the 212° of the scale accurately adjusted on a level with the surface of the mercury, should it vary from that point. This is necessary on account of variations of atmospheric pressure causing corresponding variations of the boiling-points of liquids. It is then ready for several hours'

operations, and, generally, for an entire business day, without further adjustment. The little boiler is next filled with the *liquor* to be examined, and the lamp again lighted. The *temperature* as shown by the scale of the instrument at the commencement of full ebullition being ascertained, may be sought in one of the following *Tables*, against which the alcoholic content of the liquor will be found (nearly).—

TABLE IV.—Exhibiting the BOILING-POINTS of Mixtures of Alcohol and Water of the given strengths. By GRÖNING.

181.58	50	172	100

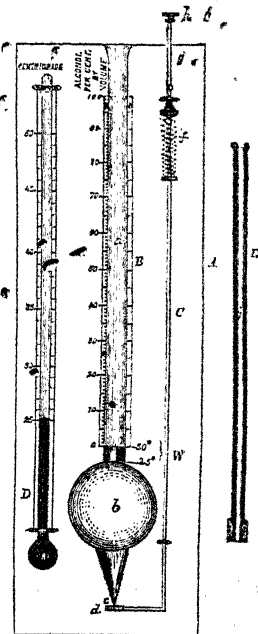

TABLE V.^c Showing the BOILING-POINTS of
'under proof' spirit. By Dr. URE.

Boiling-points. Fahr.	Per-centage strength.	Corresponding Sp. Gr.
178.5	Proof	.9200
179.75	10° U.P.	.9321
180.4	20° "	.9420
182.1	30° "	.9516
183.4	40° "	.9600
185.6	50° "	.9665
189°	60° "	.9729
191.8	70° "	.9786
196.4	80° "	.9850
202°	90° "	.9920

This method does not answer well with spirituous liquors *above* 'proof,' owing to the variations of their boiling-point being so slight as not to be easily observed with accuracy; but with liquors *under* 'proof,' and particularly with *wines, beer, and other fermented liquors*, due care being observed, it gives results closely approximating to those obtained by distillation, and sufficiently accurate for all ordinary purposes. In testing *strong* alcoholic solutions it is, therefore, proper to dilute them with twice their bulk of water; and *commercial spirits*, with an *equal* bulk of water; the results obtained being *doubled or tripled* as the case may be.

d. From the EXPANSION of the LIQUID when heated:—Silbermann's DILATATOMETER. The expansion of alcohol between 0° and 212° Fahr. is *triple* that of water; and between 77° and 122° Fahr., it is much greater. Between -14° and -98° Fahr., the rate of expansion is about the 90047th part in volume for every degree of Fahrenheit's scale. The measurement of this expansion has been proposed as a new and ready method of alcoholometry, adapted to nearly all spirituous and fermented liquors. Silbermann's instrument, which is based on it (see engr.), simply consists of a flat brass or ivory plate (A), on which are fixed a mercurial thermometer (D) graduated from 22° to 50° Cent. (=77° to 122° Fahr.); and the DILATATOMETER (B), which is a glass pipette open at both ends. A valve of cork, or vulcanised Indian rubber, closes the tapering end (c); this valve is attached to a movable rod (O) which is fastened to the supporting-plate, and connected with a spring (f) and a handle (g) bearing a four-threaded screw, by which the lower orifice of the pipette can be opened or closed at will. In use, the pipette is filled with the liquor under examination, to a little *above* the zero point (O) on the scale. This is effected by suction, by means of a little piston of leather (z), which fits tightly in the long and wider limb of the pipette; the valve (d) being pre-

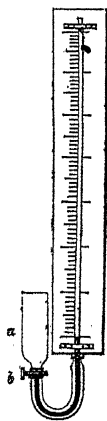

viously opened by turning the knob (h). The proper quantity of liquor being introduced, and the lower end closed, the piston is moved up

and down two or three times, for the purpose of drawing the air-bubbles and absorbed air out of the liquid, the presence of which would vitiate the results of the trial. To allow the piston to be withdrawn without any shock, or the danger of dividing the column abruptly, the rod attached to it is made hollow throughout. In using it, the operator applies the ball of his forefinger to the top of the piston-rod (E), in order to create a vacuum as he raises it; and then withdraws it, to readmit the air when he thrusts it down or removes it from the tube. The excess of liquid (if any) in the pipette, is then run off until its upper surface is exactly level with the zero (0) of the scale, at 25° C., to which it is raised by immersion in a water bath of that temperature, as observed by the thermometer; which is done by very cautiously turning the rod which depresses the valve. The whole apparatus is now again immersed in the water bath; and, held by the upper portion of the plate, kept in gentle motion with the hand, until the temperature rises to exactly 50° C., when the coefficient of expansion is obtained; and hence also the *proportion of alcohol*—the scale of the instrument being so graduated, from actual experiments previously made upon mixtures of known composition, as to give, at once, the *per-centage of alcohol by volume* (nearly).¹

¹ "Comptes Rendus," xvii, 413.

e. From the TENSION of the VAPOUR:—Geissler's ALCOHOLOMETER. This method, for which we are indebted to M. Geissler, of Bonn, depends on the measurement of the tension or elastic force of the vapour of the liquid, as indicated by the height to which it raises a small column of mercury.

The spirit, wine, or other liquor, of which it is desired to ascertain the strength, is put into the little flask (a), which, when completely filled, is screwed on to the 'curved glass-tube' which contains the mercurial column (which is inverted for the purpose), and is closed by the stop-cock (b). The instrument (see engr.), is then placed erect, and the flask and lower part of the tube immersed in a water bath, as in the previous method. The number, on the graduated scale of the instrument corresponding to the height of the mercury, at the boiling-point of the liquor under examination, gives the per-centage of alcohol by VOLUME (nearly).

This method furnishes approximative results with great facility and expedition; and, with proper care, these do not vary more than $\frac{1}{3}$ to $\frac{1}{2}$ of 1%, from those obtained by distillation. We find, that by having the diameter of the part of the tube at which the surface of the mercury is acted on by the vapour a little larger than that of the longer limb, and by previously abstracting the air from the sample, as in Silbermann's method, or even by agitation and exposure in an open vessel, the two may be made to correspond almost exactly.

f. From the DIFFERENCE between the Sp. Gr. BEFORE and AFTER ebullition:—Taberlé's METHOD and GENOMETER. The sp. gr. of the sample is first accurately determined by any of the usual methods. It is next carefully evaporated, in an open vessel, to one half its volume. The residuum, when cold, is made up with pure water to exactly its original measure at its original temperature, and the sp. gr. again ascertained. The difference between the two being due to the spirit originally present, furnishes the means of calculating a new sp. gr., from which the per-centage richness of the sample may be obtained by mere inspection of the Tables. The observed sp. gr. is the true one, whenever the liquor, after ebullition and restoration to its original volume, has the same sp. gr. as water (i. e., 1.000), at 60° Fahr. Taberlé employs a peculiar instrument, which he calls an GENOMETER; but its use is not essential to his method of alcoholometry. The results are, of course, only approximative, though sufficient for all ordinary purposes. Prof. Mulder, however, says that he prefers it to any of the previous methods; and that the results, with care, are almost as accurate as those obtained by distillation.

g. By means of CARBONATE OF POTASH:—

g. a. (Brande's Method.) The liquor for trial is poured into a long, narrow glass-tube (graduated ceptesimally), until the vessel is half-filled, and after the addition of about 12% or 15% of a strong solution of subacetate of lead, or a little finely powdered litharge, is agitated until the colour is entirely, or nearly removed. Anhydrous carbonate of potash, in powder, is next added, until it sinks undissolved, even after prolonged agitation of the liquid. The whole is now allowed to repose for a short time, when the ALCOHOL is seen floating on the top of the aqueous portion of the liquid in a well-marked stratum. Its quantity, read off by means of the graduations of the tube, and doubled, gives the per-centage richness of the sample in alcohol, by VOLUME.

This process answers well with cordials, wines, and the stronger ales; but with weak liquors it is not to be relied on. The whole operation may be performed in two to five minutes, and (with these exceptions) furnishes very reliable approximative results. In most cases the decolouring part of the process may be omitted. The alcohol thus separated has a sp. gr. of from .8064 to .8118, and contains 3% or 4% of water; but for ordinary purposes it may be regarded as pure alcohol.

4. Alcoholometry of MINUTE QUANTITIES of liquid. When only a few drops, or a quantity too small for the application of the preceding methods, can be obtained, an organic analysis may be had recourse to, and the quantity of absolute alcohol calculated from that of the resulting carbonic anhydride and water; care being previously taken to free the sample from other volatile bodies, if it contains any of them.

Gen. commentary. The DUTIES on spirits in England are charged on the number of proof gallons they contain, which is ascertained by gauging or weighing the spirit, and then trying its strength by Sykes' hydrometer. The percentage of proof spirit multiplied by the number of gallons, gives the net amount of proof spirit to be charged.

• PROOF STRENGTH is an arbitrary standard, adopted for the purpose of facilitating calculations, for which it is well suited; although pure alcohol would, for this purpose, be more simple. As defined by Act of Parliament, 58 Geo. III, c. 28, "proof spirit" is such, as shall, at the temperature of 51° of Fahrenheit's thermometer, weigh exactly twelve thirtieth parts of an equal measure of distilled water."

Taking, therefore, water at 51° Fahr. as unity, the sp. gr. of "proof spirit" at 51° Fahr. is $\frac{1}{2}$ of 1.000 or .92368. When such spirit is raised to the temperature of 60° Fahr., its density is .91984.

Spirit at "proof" contains very nearly equal weights of absolute alcohol and water; the exact proportions according to recent experiments are:—

By WEIGHT.	By VOLUME.		Sp. gr. at 60° Fahr.
	Bulk before admixture.	Bulk after admixture and condensation.	
Alcohol. Water. 100·00 + 103·08 49·24 + 50·76	Alcohol. Water. 100·00 + 81·80 57·06 + 46·68	175·23 100·00	} ·91984

The *standard alcohol* of the Revenue authorities, and that on which Gilpin's *Tables* are founded, is a spirit of the sp. gr. ·825 at 60° Fahr., which is said to contain, by weight, 89% of pure alcohol of ·796; and 92·6% of alcohol, by volume, which corresponds to about 62·5 o. p.

It is of great importance to the spirit-dealer to be able to estimate correctly the number of 'proof gallons' in any quantity of his commodities, or in the whole or any portion of his stock, as disagreeable errors frequently result from ignorance on this point. Calculations of this kind are extremely simple. Thus, when we find, by the hydrometer, that a given sample of spirit is 10½ *over-proof*, it means, that 100 gallons of such spirit contain as much alcohol as 110 gallons of proof spirit. In *over-proof* spirit, the per-centage o. p. always represents the quantity of water which the given spirit requires to reduce it to proof. By adding this per-centage over-proof to 100, we obtain a number, which multiplied by any number of gallons, and divided by 100, gives the exact number of proof-gallons which is contained in any quantity of the spirit referred to. Thus:—A puncheon of rum gauged at 91 galls., and shown by the hydrometer to be 21 o. p., contains—

21 o. p. of sample added to 100 . . . 121
No. of gallons of rum 91

100) 11011

No. of gal. of proof-spirit . . . 110·11

In like manner when a spirit is said to be 11 u. p., or *under-proof*, it means that 100 gal. of such spirit contains 11 gal. of water, and 89 gal. of 'proof spirit.' By deducting the per-centage under-proof from 100, we not only obtain the number of proof gal. contained in 100 gal. of such spirit, but, as in the last case, a factor which multiplied by any number of gal., and divided by 100, gives the exact number of 'proof gallons' contained in any quantity of the given strength. Thus:—An *allage* brandy-piece containing 45 gal. of spirit at 10 u. p., would have the proof value of—

Per cent. u. p. of sample 10, } 90
subtracted from 100

No. of gall. 45

100) 4050

Quantity of proof spirit . . . 40·50

Or exactly 40½ gallons.

The strength of absolute alcohol (sp. gr. ·7938) is estimated at 75½% *over-proof*. It therefore contains 175½% of 'proof spirit,' whilst *proof spirit* (sp. gr. ·91984) contains 57·06% of 'absolute alcohol,' both being by measure or volume. Thus—

$$\frac{\text{meas. of alc.} \times 175\frac{1}{2}}{100} = \left\{ \begin{array}{l} \text{equiv. meas.} \\ \text{of pf. spi.} \end{array} \right.$$

And—

$$\frac{\text{meas. of pf. spi.} \times 57\cdot06}{100} = \left\{ \begin{array}{l} \text{equiv. meas.} \\ \text{of abs. alc.} \end{array} \right.$$

From which we derive the 'constant multipliers' 1·7525 (or roughly 1½), and ·5706, applicable to any number of volumes or gallons. For—

$$\text{meas. of alc.} \times 1\cdot7525 = \left\{ \begin{array}{l} \text{equiv. meas.} \\ \text{of pf. spi.} \end{array} \right.$$

and—

$$\text{meas. of pf. spi.} \times \cdot5706 = \left\{ \begin{array}{l} \text{equiv. meas.} \\ \text{of alc.} \end{array} \right.$$

To ascertain what quantity of a spirit at any given strength is *equiv.* to or contains 100 lbs. of absolute alcohol, we have only to divide the constant number 2207·7 by the proof-value per cent. of such spirit.¹ Thus—for a spirit 12 u. p.—this would be

$$200 - 12 = 88\% \text{ of proof spirit;}$$

and—

$$\frac{2207\cdot7}{88} = 25\cdot1 \text{ gal. (nearly).}$$

That is, 25·1 gal. of such spirit would contain 100 lbs. of absolute alcohol.

By removing the decimal point one place to the RIGHT, we have the *equiv. measure* of 1000 lbs. By removing it one, two, or three places to the LEFT, we have it respectively for 10 lbs., 1 lb., and ½ lb.; from which the equiv. for all other weights may be easily obtained.

By reversing the above operation, the measure of alcohol corresponding to any given weight of spirit, at any strength, may also be easily found.

The weight of 1 gal. of absolute alcohol being 7·938 lbs.; that of 1 gal. of proof spirit, 9·2 lbs.; and that of the 'alcohol' in 1 gal. of proof spirit, 4·53 lbs.; the weight of any number of gallons or volumes of either,

¹This number is obtained thus:—

$$\frac{100}{\cdot79381} = 125 \text{ (nearly),}$$

and—

$$12\cdot6 \times 175\cdot25 = 2207\cdot7.$$

and their equivalents, may be easily found. Thus:—

$$\begin{aligned} \text{gallons of alc.} \times 7.938 &= \text{lbs. weight of alc.} \\ \text{pf. sp.} \times 9.2 &= \text{lbs. w. of pf. spt.} \\ \text{and—} \\ \text{gallons of alc.} \times 16.121 &= \left\{ \begin{array}{l} \text{lbs. weight} \\ \text{of pf. spt.} \end{array} \right. \\ \text{pf. spt.} \times 4.53 &= \left\{ \begin{array}{l} \text{content in lbs.} \\ \text{weight of alc.} \end{array} \right. \end{aligned}$$

In these cases a knowledge of the first four rules of *decimal fractions* is necessary, or, at least, advantageous; as the Excise officers carry their calculations to *two* figures of decimals, or $\frac{1}{10}$ ths. Their plan is to reject the *third* decimal figure when less than 5, but to carry 1 to the next figure on the left hand, when it exceeds 5. Thus, 5.432 is set down as only 5.43; but 5.437 is written 5.44. In the delicate chemical processes of the laboratory, even greater accuracy is observed:

Formerly, spirit was said to be 1 to 3, 1 to 4, &c., *over-proof*; by which it was meant that 1 gal. of water added to 3 or 4 gals. of such spirit would reduce it to 'proof.' On the other hand 1 in 5, or 1 in 8, *under-proof*, meant that the 5 or 8 gals., as the case might be, contained 1 gal. of water, and the REMAINDER represented the quantity of 'proof spirit.' This method of calculation has now long given way to the 'centigrade system,' which not only admits of greater accuracy, but is quite as simple. It should be adopted by every spirit-dealer in England, from being that which is employed by the Revenue officers, whose 'surveys' it is absolutely necessary that the trader should understand, in order that his own estimation of his stock and his business calculations should correspond with theirs.

Several other methods of alcoholometry, besides those already noticed, have been adopted at various times, but the majority of them possess so little accuracy, as to be quite inapplicable to the purposes of trade, and of the laboratory. Thus, the strength was at one time estimated by what was called the 'PROOF.' A little of the spirit was poured upon a small quantity of gunpowder, contained in a spoon or saucer, so as just to moisten it, and was then inflamed. If at the end of the combustion the gunpowder took fire, the spirit was held to be '*above proof*;' if it only languidly fizzed away, or slowly burnt, the spirit was said to be '*proof*;' but if the gunpowder failed to ignite, the spirit was esteemed '*below proof*.' Hence arose the terms 'proof' and 'proof spirit,' which have since been adopted by Act of Parliament. Another method was that of dropping oil into the spirit; if the oil floated, the spirit was considered to be '*under proof*;' if it sunk, it was rated as '*proof*' or '*over proof*.' The 'gunpowder test' is quite fallacious; for, if a certain quantity of a spirit is capable of firing the gunpowder, a little excess of a spirit 20% or 25% stronger will often fail to do so, so much water being formed as to

prevent the ignition. The '*PREUVE D'HOLLAND*' test, of the French, or the '*BEAD*,' is still frequently employed by persons unacquainted with the use of the hydrometer. It consists in shaking the spirit in a phial, and observing the size, number, and duration of the bubbles or *beads*, as they are called. The larger and more numerous these are, and the more rapidly they break and disappear, the stronger the spirit is presumed to be. This method is unreliable, as the presence of sugar or acid, even in minute quantities, will sometimes give to a weak sample the appearance of one many degrees stronger. LOVI'S BEADS are also often employed to ascertain approximately the strength of spirit, when a hydrometer is not at hand.

The insufficiency of most of the methods of alcoholometry here referred to, throws us back on the *Revenue System* (Sykes' hydrometer), or on the *specific gravity* for UNSWEETENED SPIRITS. For SWEETENED SPIRITS, as *cordials*, *wines*, *beers*, &c., there are none of the tests which give such accurate results as the DISTILLATION test, previously described as the Revenue Method.

The spirituous liquors of commerce being sold by *measure*, and not by *weight*, the methods of alcoholometry which give the results, per cent., by volume, are those we have chiefly explained. In the laboratory, the method by *weight* is that most generally employed in delicate processes and in analyses. By WEIGHT, the per-centage of alcohol remains the same for all temperatures, for the same sample; whilst by VOLUME, the per-centage varies with the temperature of the liquid. This variation explains the cause of many of the sudden apparent decreases and increases, which occur in large stocks of spirits. Persons purchasing spirits during very warm weather, and paying for them according to their apparent quantity and strength, lose considerably by selling the same spirit when the weather becomes colder, without being conscious of such loss from the hydrometer. The reason of this is obvious, for, whilst the relative proportions of the alcohol to the water continue the same, the *sp. gr.* and the volume alter with the temperature; the latter being increased by warmth, and decreased by cold, in exact opposition to the former. Accuracy requires, in all cases, that a spirituous liquor should be tested for its strength at the temperature at which it was measured; and measured at the same temperature at which its strength was determined.

A consideration of these facts has led some of the great houses to introduce the system of weighing their spirits, instead of measuring them, the weight of an imperial gallon at 60° Fahr. being taken as the standard gallon. This is the method adopted by the Inland Revenue, at all distilleries, for assessing the duty, and will be readily understood by the following example:—

	Cvts.	qrs.	lbs.
Gross weight of full cask =	13	2	27
Tare	2	2	5
Net weight of spirit =	11	0	22

or 1254 lbs. Let us suppose the hydrometer indication to be 43.0, the weight per imperial gallon would be 8.903 lbs. (see Table VI), an $1254 \div 8.903 = 140$ gallons.

** For further information in connection with *Alcoholometry*, see *ALCOHOL, BEER, BREWING, DISTILLATION, EBULLIOSCOPE, HYDROMETER, HYDROMETRY, LIQUEURS, MALT-LIQUEURS, ORGANIC ANALYSIS, SACCHARINE, SPECIFIC GRAVITY, SPIRIT, SUGAR, SYRUPS, TINCTURES, WINE, WORT, &c. &c.*

- **ALCOHOLS.** In *chemistry*, a term applied to compounds possessing a composition, formula, and chemical properties similar to those of ordinary alcohol. They form a series presenting an unmistakable symmetry, and differ from one another by well-marked gradations, as shown below:—

Methyl-alcohol (<i>wood-spirit</i>)	C	H ₄	O
Ethyl-alcohol (<i>ordinary alcohol</i>)	C ₂	H ₆	O
Amyl-alcohol (<i>fusel-oil</i>)	C ₅	H ₁₂	O
Capryl-alcohol	C ₈	H ₁₈	O
Cetyl-alcohol	C ₁₆	H ₃₄	O
&c. &c.			

Alcohols. In commerce, pure spirits of a greater strength than about 58 o. p. (sp. gr. .8385), or containing more than about 85% by weight, or 90% by volume, of pure alcohol, are commonly so called.

Alcohols. In *perfumery*, rectified spirit of wine, or commercial alcohol, holding essential oils or other odorous matters in solution.

Alcohols. In *Fr. pharmacy*, alcoholic tinctures and essences.

ALCOOLATIFS (alcoôlatifs). [Fr.] *Syn.* ALCOOLATIFS. In *Fr. pharmacy*, alcoholic solutions of *liniments, embrocations, &c.*, whether made by distillation, maceration, or solution.

ALCOOLATS (alcoôlats). [Fr.] In *Fr. pharmacy*, esprits; applied by Béal, Henry and Guibourt, and others, to medicated distilled spirits.

ALCOOLATURES (alcoôlatures). [Fr.] *Syn.* ALCOOLATURES. In *Fr. pharmacy*, alcoholic tinctures, elixirs, &c. M. Béal confines the term to vegetable juices preserved by alcohol.

ALCOOLES (alcoôlés). [Fr.] Tinctures; the '*teintures alcooliques*' of the Fr. Codex.

ALCOOLQUES (alcoôliques). [Fr.] *Syn.* ALCOOLQUES. In *Fr. pharmacy*, alcoholic or spirituous solutions. (Céral.)

ALCORNINE (-nin). [Eng., Fr.] *Syn.* ALCORNOCINE (-sin); ALCOERNEUM, ALCOERINA, L. A crystallisable substance, apparently intermediate between fat and wax, discovered by Biltz, in *alcornoco bark*.

ALCORNOCO. *Syn.* A-BARK; ALCOERNOQUE, Fr.; ALCOERNOO, A-BIND, Ger. The bark of an unknown tree of South America. It is astringent and bitter, and has been highly extolled as a specific in *phthisis*; but appears to possess little medicinal virtue. The bark of the young branches of the *cork-tree* (*quercus suber*), used in tanning, is also sometimes called alcornoco-bark; but possesses none of the characters of the former article.

ALDECAY. The galls on the leaves of *myrobalanus chebula* (Gaertn.), a forest-tree of Bengal. Equal to the best oak-galls.

ALDEHYD (-hid). [*al*-(*ccohol*)-*dehyd* (rogatus).] C₂H₄O. *Syn.* HYDRATED OXIDE OF ETHYLE; HYDRATE OF ETHYLE*; HYDROXIDE OF O*. Literally, dehydrogenated alcohol. In chemistry, a peculiar ethereal liquid, first obtained in a pure form by Liebig, from alcohol. It is produced under various circumstances, particularly during the destructive distillation of certain organic matters, and in several processes of oxidation. The following are the most convenient methods of preparing it:—

Prep. 1. (Liebig.) *Sulphuric acid*, 3 parts; is diluted with *water*, 2 parts; and as soon as the mixture has cooled, *alcohol* of 80°, 2 parts, is added; and, subsequently, *peroxide of manganese* (in fine powder), 3 parts. The whole,

after agitation, is then distilled at a very gentle heat, from a spacious retort into a receiver surrounded with ice, the connection between the two being perfectly air tight. The process is continued until frothing commences, or the distillate becomes acid; which generally occurs when about one third (3 parts) has passed over. The distillate is next agitated in a retort, with about its own weight of fused chloride of calcium, in powder; after which about one half only is drawn over at a very gentle heat (85° to 90° Fahr.), by means of a water bath. This rectification is repeated in a precisely similar way. The last distillate is ANHYDROUS ALDEHYD only slightly contaminated with foreign matters.

2. (Liebig.) *Aldehyd-ammonia*, 2 parts, is dissolved in an equal weight of *distilled water*; and, after being placed in a retort, *sulphuric acid*, 2 or 3 parts, previously diluted with rather more than its own weight of *distilled water*, and allowed to cool, is added. The whole is now distilled, by means of a water bath, into a receiver surrounded with ice, or (preferably) a freezing-mixture, the temperature of the bath at first being very low, and the operation being stopped as soon, or rather, before the water begins to boil. The distillate is then placed in a retort connected with a well-cooled receiver, as before; and after all the joints are made perfectly tight, powdered fused chloride of calcium, in weight equal to that of the liquid in the retort, is added through the tubulature. The heat produced by the hydration of the chloride causes the distillation to commence, after which it is carried on, by means of a water bath, at a temperature ranging from 80° to 82° Fahr. This rectification, being very carefully repeated, the last distillate is PURE ANHYDROUS ALDEHYD.

Prop. &c. Limpid, colourless, ethereal, neutral, inflammable; mixes in all proportions with alcohol, ether, and water; odour, peculiar, penetrating, and, when strong, exceedingly suffocating, the vapour, in quantity, producing spasmodic contraction of the thorax; boils at 72° Fahr. (70°—Ure, 75th ed.); sp. gr. .790 at 60°, and .800 at 32° Fahr.; sp. gr. of vapour, 1.532; by exposure to air it is gradually converted into acetic acid, and speedily so under the influence of platinum-black; heated with caustic potash, a brown substance resembling resin (ALDEHYD-RESIN) is formed; gently heated with protoxide of silver, or its solutions, *metallic silver* is deposited on the inner surface of the vessel, in a uniform and brilliant film, whilst ALDEHYDATE OF SILVER remains in solution; heated with hydrocyanic acid it yields ALANINE. By age, even in close vessels, it passes into one or more isomeric compounds (BIALDEHYDE; METAL-ALDEHYDE), with change of properties. Aldehyde for experiments should, therefore, be always recently prepared; and it must be kept in a well-stopped bottle, in a very cold place, and preferably, in ice.

Obs. Aldehyd is important for its assumed position in the acetyl-series, and the part which it plays in the process of acetification, &c. The word is now also commonly employed, by chemists, as a generic term for any organic substance which, by assimilating two atoms of hydrogen, yields, or would yield, a compound having the composition and properties of an alcohol; or which, by taking up one atom of oxygen, yields an acid. Many of the essential oils (as those of *almonds*, *cinnamon*, and *cumin*) are composed principally of bodies which may thus be called ALDEHYDS. One of the most valuable properties of these substances, is their strong tendency to combine with the bisulphites of ammonium, potassium, and sodium; and by which they may be separated from complex mixtures.

ALDEHYD-AMMONIA (-hid-). An ammonia-compound of aldehyd, discovered by Döbereiner and Liebig.

Prep. (Liebig.) *Aldehyd* (of process No. 1, above) is mixed with an equal volume of ether,¹ in a flask surrounded with ice, or (what is better) a freezing-mixture; and is then saturated with dry gaseous ammonia. The crystals which soon form, after being washed with ether, and dried by means of bibulous paper and a short exposure to the air, are PURE ALDEHYD-AMMONIA.

Prop., &c. It smells like a mixture of turpentine and ammonia; melts at 165° to 170°; volatilises, unchanged, at 212° Fahr.; decomposed by exposure to the air; very soluble in water; soluble in alcohol, and more or less so in most other menstrua, except ether; acids decompose it. With sulphuretted hydrogen it forms THIALDINE.—*Use.* Chiefly to make *pure aldehyd* (which see).

ALDER (awl'-). *Syn.* AL'DER-TREE; **ALNUS** (äl-), L.; A. GLUTINOSA (Gaertn.); BETULA ALNUS, Linn.; AUNE, ALUNE, Fr.; ERLE, Ger. A well-known English tree, chiefly growing in moist grounds near rivers. Its wood is used for hurdles, for various articles of turnery and furniture, and when converted into charcoal, for making gunpowder; it possesses considerable durability under water; but is otherwise of little value. *Bark*, and *leaves*, very astringent, and reputed vulnerary; decoction used as a gargle in sore throat, and, in double the dose of cinchona, as a febrifuge in agues; *bark* and *sap* used in dyeing and tanning. The following belong to different nat. orders and genera to the preceding:—

Black Alder. *Syn.* WIN'TER-BERRY; PRINOS VERTICILLATUS, Linn. A tree growing in the United States of America. *Bark*, febrifuge, tonic, and astringent; *berries*, tonic and emetic (Bigelow). It has been much recommended in dropsies, diarrhoea, intermittents, &c. *Dose* (of the dried bark), $\frac{1}{2}$ to 1 dr., 3 or 4 times a day.

Black Alder-tree. *Syn.* BERRY-BEARING ALDER-TREE; RHAMNUS FRANGULA, Linn. A large shrub found in the woods and thickets

of England, &c. *Wood*, BLACK DOG-WOOD; *bark*, bitter, emetic, purgative; used to dye yellow; *root-bark*, a drastic purgative; *berries*, purgative, emetic; *unripe berries* yield SAP-GREEN; *charcoal* of the wood esteemed the best for gunpowder.¹

ALE. *Syn.* BARLEY WINE*; **AILE**, Fr.; WEISS-BIER, Ger.; AEL, EALE, Sax.; CEREVISIA ALBA, C. LUPTULATA, A'TA*, AL'TA*, L. Pale-coloured beer, prepared from lightly dried malt, by the ordinary process of brewing. The ale of the modern brewer is manufactured in several varieties, which are determined by the wants of the consumer, and the particular market for which it is intended. Thus, the finer kinds of Burton, East India, Bavarian, and other like ales, having undergone a thorough fermentation, contain only a small quantity of undecomposed sugar and gum, varying from 1 to 5 per cent. Some of these are highly 'hopped,' or 'bittered,' the further to promote their preservation during transit and change of temperature. Mild or sweet ales, on the contrary, are less attenuated by lengthened fermentation, and abound in saccharine and gummy matter. They are, therefore, more nutritious, though less intoxicating, than those previously referred to.

In brewing the *finer kinds of ale*, pale malt and the best East Kent hops of the current season's growth, are always employed; and when it is desired to produce a liquor possessing little colour, very great attention is paid to their selection. With the same object, the boiling is conducted with more than the usual precautions, and the fermentation is carried on at a somewhat lower temperature than that commonly allowed for other varieties of beer. For *ordinary ale*, intended for *immediate use*, the malt may be all *pale*; but, if the liquor be brewed for keeping, and in warm weather, when a slight colour is not objectionable, *one fifth*, or even *one fourth* of 'amber malt' may be advantageously employed. From 4½ lbs. to 6 lbs. of hops is the quantity commonly used to the *quarter of malt*, for 'ordinary ales'; and 7 lbs. to 10 lbs. for 'keeping ales.' The proportions, however, must greatly depend on the intended quality and description of the brewing, and the period that will be allowed for its maturation.

The *stronger varieties of ale* usually contain from 6 to 8½ of 'absolute alcohol'; *ordinary strong ale*, 4½ to 6½; *mild ale*, 3 to 4½; and *table ale*, 1½ to 1¾; (each by volume);—together with some undecomposed saccharine, gummy, and extractive matter, the bitter and narcotic principles of the hop, some acetic acid formed by the oxidation of the alcohol, and very small and variable quantities of mineral and saline matter. See BEER, BREWING, FERMENTATION, MALT-LIQUORS, &c.

Devonshire White Ale. A liquor once generally drunk, and still in demand, in the neighbourhood of Kingsbridge and Modbury, Devon.

Prep. Ordinary *ale-wort* (preferably *pale*) sufficient to produce 1 barrel, is slowly boiled

¹ Some authorities recommend the use of twice this quantity of ether.

with about 3 handfuls of *hops*, and 12 to 14 *lbs.* of *crushed groats*, until the whole of the soluble matter of the latter is extracted. The resulting liquor, after being run through a coarse strainer, and become lukewarm, is fermented with 2 or 3 pints of *yeast*; and, as soon as the fermentation is at its height, is either closely bunged up for 'draught,' or is at once put into strong stoneware bottles, which are then well-corked and wired.

Obs. White ale is said to be very feeding, though apt to prove laxative to those unaccustomed to its use. It is drunk in a state of effervescence or lively fermentation; the glass or cup containing it being kept in constant motion, when removed from the mouth, until the whole is consumed, in order that the thicker portion may not subside to the bottom.

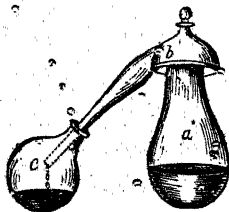

Medicated Ales. *Syn.* BRYTOLÉS; BRUTOLÉS, Fr.; CEREVISIÆ MEDICATÆ, L. In *pharmacy*, ale prepared by macerating medicinal substances in it, either at the ordinary temperature of the atmosphere, or when heated; infusions and decoctions, in which ale or beer is employed as the menstruum. The old dispensatories enumerate several medicated ales; such as CEREVISIA OXYDORICA, for the eyes; C. ANTI-ARTHRITICA, for the gout; C. CEPHALICA, for the head; C. EPILEPTICA, against epilepsy; &c. Preparations of this kind are now seldom ordered by the faculty, and their use is chiefly confined to the practice of empirics, and to domestic medicine. *Bark, rue, savine, anti-scorbutic plants, aromatic bitters, and stomachics*, are the substances most commonly administered in this way. Ale in which wormwood, gentian, orange-peel, and the like, have been steeped, taken warm early in the morning, is much esteemed as a restorative tonic by drunkards and dyspeptics. See BEER, PURL, &c.

ALEBERRY. A beverage made by boiling ale with *spice, sugar*, and *bread-sops*; the last, commonly toasted. A domestic remedy for a cold.

ALE'GILL (*g* hard). Ale or beer flavoured or medicated by infusing the *leaves of ground ivy* in it; pectoral, stomachic, and nervine.

ALE'WIFE. The *clupea serrata*, an American species of herring. Its proper name is *d'loof*, although the established pronunciation and common orthography is *ale-wife*.

ALEM'BIC. *Syn.* MOORS' HEAD†; ALEM'RUCUS, L.; ALAMBIC, Fr.; DESTILLIRKOLBEN,

Ger. An old form of distillatory vessel usually made of glass or earthenware, but, sometimes

of metal. The body (*a*) which holds the liquid for distillation, is called the *CU'CURBIT*; the upper part (*b*), the *HEAD OF CAP'ITOL*; (*c*) is the *RECEIVER*. It is still employed in the laboratory, in the distillation of articles that are apt to spurt over into the neck of the common retort, and thus vitiate the product.

ALEUPOMETER. *Syn.* ALEUROMÈTRE, Fr. An instrument for determining the quantity and quality of *gluten* in wheat-flour, invented by M. Boland. It essentially consists of a hollow copper cylinder, about 6 inches long, and $\frac{1}{2}$ of an inch internal diameter. This tube has two principal parts; the *one*, about 2 inches long, is closed at the lower end, forming a kind of *cup*, into which the gluten is placed; it screws into the remainder of the cylinder. The *cup* being charged with a *sample of gluten*, and the upper part of the cylinder being screwed on, it is exposed in an oven, or (preferably) in an oil bath, to a temperature of 350 to 380° Fahr.¹ From the length of the tube the gluten occupies in swelling, as measured by a graduated scale, its quality is determined. The 'crude gluten' of good wheat-flour augments to four or five times its original volume, when thus treated; but that from *bad flour* does not swell, becomes viscid and semi-fluid, and generally gives off a disagreeable odour; whilst that of good flour merely suggests the smell of hot and highly baked bread.

AI'GA. (-gā). [L.] Sea-weed. A common name of *grass-wrack* ('*zostera marina*'—Linn.), though not one of the algae.

AI'GÆ. (ā'jē). [L. pl.] *Syn.* AI'GALS; ALGÆ (DC.), AI'GALES (Lindl.); L.; ALGUES, VARECH, Fr.; ALGÆ, MEERGRASS, SEEGRASS, Ger. Sea-weeds. In *botany*, an order of *Thallogens* living in water or very moist places, nourished throughout their whole surface by the medium in which they live, having no distinct axis of vegetation, and propagated by zoospores, coloured spores, or tetraspores. Linnæus defines them—"plants, the *roots, leaves, and stems* of which are all in one." The *algæ* consist either of simple vesicles lying in mucus, or of articulated filaments, or of lobed fronds formed of uniform cellular tissue. Those that vegetate in *salt water* are popularly called *SEA-WEEDS* (*fu'ci*, L.) and *LA'VEE* (*ulvæ*, L.); those found in *fresh water* *CONFERVE*. One of their divisions (the *Zoöspermæ*) comprehends the lowest known forms of vegetable life, being merely adhering cells, emitting, at maturity, seeds or spores having a distinct animal motion. In *Oscillatorias*, the whole plant twists and writhes spontaneously; and *Zyemenas* actually copulate like animals. Some of the *Algæ* possess great beauty. In the lower grades the colour is green; in the higher, red or purple.

Prop., Uses, &c. None of the *Algæ* are ¹ Mr. Mitchell recommends the heat to be 420°; whilst Prof. Muspratt gives 284° Fahr. as the proper temperature; but of these, the *first* is too high, and the *other* too low. About 210 gr. are also ordered to be taken for examination; but the exact quantity is immaterial. (See Mitchell's "*Falsification of Food*.")

poisonous. Several are nutritious, emollient, and demulcent, from containing mullage (*carrageenin*), starch, sugar (*mannite*), and a little albumen, and are hence used as esculents. The *ash* from the *dried weed* varies in different varieties from 9% to fully 25%; and contains variable quantities of potassa, soda, lime, magnesia, iron, manganese, and silica, with sulphuric acid, phosphoric acid, chlorine, and a little iodine and bromine. (Schweitzer; Forchhammer; Gödechens.) *Sea-weeds*, their *charcoal*, and their *ashes*, have been long regarded as alterative and resolvent; and antiphthisic virtues have been attributed to them by Laennec and others. They were formerly much given in scrofulous affections and glandular enlargements; but their use is now almost superseded by that of iodine and its preparations. Dr. Stenhouse has proposed some of the algae as furnishing an economical source of mannite. The *sea algae* are used for manure; their *ashes* form *KELP*.

ALGAROBA. *Syn.* CA'BOR-TREE, ST. JOHN'S BREAD; CERATONIA SILIQUA, Linn. A leguminous tree of southern Europe, Palestine, and part of Africa. *Pods* (ALGAROBA BEANS), used for food, and to improve the voice; they contain a sweetish, nutritious powder, and are supposed to have been the 'locusts' on which St. John fed in the wilderness; their decoction has been used as a pectoral in asthma and coughs.

Algaroba or Algarovilla. The *astringent pods of prosopis pallida*, *p. siliquastrum*, and *Inga Marthæ* (South American trees), bruised and more or less agglutinated by the extractive exudation of the seed and husks. They are used in *tanning*, for which purpose they have been strongly recommended; indeed that of Chili, and of Santa Martha (New Carthage), is said to possess "four times the power of good oak bark" (Ure); and in *dyeing*, are only inferior to oak-galls.

ALIMENT. [Eng., Fr.] *Syn.* ALIMENTUM, L.; NAHRUNG, SPEISE, Ger. Food; nutriment; anything which nourishes or supports life.

ALIMENTARY. *Syn.* ALIMENTARIUS, L.; ALIMENTAIRE, Fr.; ZUR NAHRUNG GEHÖRIG, Ger. Pertaining to food or aliment; nutrimental; nourishing.

Alimentary Canal. *Syn.* ALIMENTARY DUCT; CANALIS ALIMENTARIUS, L. In *anatomy*, the cavity in the bodies of animals into which the food is taken for the purpose of being digested; the whole passage or conduit extending from the mouth to the anus. In some of the lower animals this is a simple cavity, with only one opening; when the same aperture which admits the food also gives egress to the excrementitious matter. In others, it is a true canal, with both a mouth and an outlet. Another step, and we find this canal is divided into a stomach and intestines. In the higher grades, a mouth, pharynx, and œsophagus precede the stomach. Birds have one or two sacculi or crops added to the œsophagus. The stomach of the ruminants consists of four sacs or parts,

each of which may be regarded as a separate stomach; that of the bottle-nose whale contains no less than seven of such sacs. The part below the stomach, forming the intestines, is also variously subdivided, complicated, and connected. In man, these subdivisions are termed—DUODENUM, JEJUNUM, ILEUM, CÆCUM, COLON, and RECTUM; the lower end or orifice of the last being called the ANUS. The existence of an alimentary canal is said to be the only true characteristic of an animal. Plants have no common receptacle for their food, nor canal for carrying away effete matter; but every animal, however low in the scale of being, possesses an internal cavity which serves it as a stomach.

Alimentary Substances. *Syn.* ALIMENTS; MATÉRIA ALIMENTARIA, L. Substances employed as food.

ALIMENTATION. [Eng., Fr.] *Syn.* ALIMENTATIO, L.; NAHRHAFTIGKEIT, Ger. The act, process, power, or state of nourishing, or being nourished.

ALIZAR. [Tur., *ali-zari*.] The commercial name of madder in the Levant.

ALIZARIN. $C_{10}H_6O_3 \cdot 2H_2O$. *Syn.* LAZARIC ACID. A red colouring matter obtained from madder.

Prep. 1. Exhaust madder with boiling water, and precipitate the decoction by sulphuric acid. Wash the precipitate, and, while yet moist, boil it with a concentrated solution of hydrate of aluminum in hydrochloric acid, and mix the solution with hydrochloric acid; red flakes of impure alizarin deposit. Dissolve this precipitate in alcohol or in dilute ammonia, and treat the solution with hydrate of aluminum. Boil the aluminum compound thus formed with carbonate of sodium, and, after freeing it from resinous impurities by digestion with ether, decompose it with hot hydrochloric acid. Wash the alizarin thus separated, dry it by simple exposure to air, and purify it by repeated crystallisation out of alcohol.

2. Sublime on a paper an alcoholic extract of madder. This method yields the purest alizarin.

Props. Red prisms; sublimes at 419° F.; odourless, tasteless, and neutral to test-paper; sparingly soluble in water, even at the boiling temperature; soluble in alcohol and ether; not decomposed by hydrochloric acid; dissolved, without decomposition, by strong sulphuric acid; soluble in solutions of the alkalis and their carbonates; acids precipitate alizarin from its alkaline solutions in orange-coloured flakes; alumina decolorises an alcoholic solution of alizarin, forming a red lake.

ALKALI. *Syn.* ALKALI, Fr.; LANGENSALT, Ger. This word has been used in various senses, but is now usually applied to four substances only, viz. the hydrates of potassium, sodium, lithium, and ammonium (the latter being supposed to exist in the aqueous solution of ammonia). In a more general sense, it is applied to the hydrates of barium, strontium, and calcium, which, for the sake of distinction, are called the *alkaline earths*. The

following properties are characteristic of the alkalis:—(1) They are soluble in water, the alkalis proper more so than the alkaline earths. (2) They change the hue of many vegetable colouring matters; thus, they turn reddened litmus blue, yellow turmeric brown, and syrup of violets and infusion of red cabbage green. (3) They neutralise the strongest acids. (4) They precipitate most of the heavy metals from solutions of their salts as hydrates or oxides. (5) They saponify the fixed oils and fats. (6) They exert a caustic or corrosive action on animal and vegetable substances.

ALKALIMETRY. *Syn.* ALKALIMÉTRIE, L.; ALCALIMÉTRIE, Fr. In chemistry, the estimation of the strength of the commercial alkalis; the art or process of determining the quantity or proportion of pure caustic alkali, or of its carbonate, in any given sample or simple solution. It is the reverse of 'acidimetry,' and it should be understood that it does not apply to alkalis occurring under any other form or condition than those just mentioned. Alkalimetric assays are now also frequently and conveniently extended to the estimation of the alkaline earths and their carbonates, as hereafter noticed.

Alkalimetric processes. These, like those of 'acidimetry,' are for the most part founded on—the capacity of the bases to saturate acids—the estimation of the quantity of dry carbonic acid liberated from a given weight of an alkaline carbonate under the influence of a stronger acid; and, in the case of the pure alkalis—the sp. gr. of their solutions. From any one of these results the exact amount of alkali, or of alkaline carbonate, present in a sample, is easily found or calculated. These processes are, indeed, precisely similar to those described under ACIDIMETRY; but here the unknown quantity sought is the *alkali*, instead of the *acid*.

Assay. The SAMPLE is drawn from as near the centre of the cask containing the alkali as possible, and at once placed in a wide-mouthed bottle, which is then closely corked up, and numbered. Before proceeding to the assay, the contents of the bottle are thrown on a piece of dry paper, the lumps crushed small, and the whole reduced to coarse powder as rapidly as possible. The number of grains required for the trial are then at once weighed, placed in a *trial* or *smell* glass tube, and agitated with about $\frac{1}{2}$ oz. of hot water. After a short time allowed for repose, the clear liquid is poured off into a beaker-glass or other vessel in which the trial is to be made. This process is repeated with a *second* and a *third* quantity of water, or until nothing soluble remains, shown by the last washings not affecting the colour of turmeric paper. The greatest care must here be taken not to waste the smallest portion of the liquid, which would render the results inaccurate.

To the solution in the beaker-glass, a little solution of litmus is added, unless the acid is

tinted with it, when it is unnecessary. The solution is now heated until near its boiling-point, and a piece of white paper or porcelain put behind it, to better show up the changes of colour. The alkaline solution is now treated with the standard test-acid, which is poured carefully from an alkalimeter or Mohr's burette, until the solution, after turning a purple red, suddenly assumes a pink colour. Neutralisation being thus effected, the operator allows the sides of the alkalimeter or burette to drain, and then either 'reads off' the number of divisions which have been consumed, or (if using the test-acid by weight) determines the quantity by again weighing the alkalimeter. The common practice is to allow two drops (= $\frac{1}{10}$ th of an alkalimetric division by VOLUME, or 2 gr. by WEIGHT) for over-saturation, which is, therefore, deducted from the 'observed quantity' of the test-liquor employed.

In testing solutions of the PURE or CAUSTIC ALKALIES, the colour, on neutralisation, suddenly changes from blue to pink or red, without any intermediate vinous or purple colour being produced.

The quantity of test-acid used gives the absolute or per-centage composition of the sample examined, according to the constitution of the test-acid used.

Standard Acids. The various test-acids in use as described below, each being used by different operators as they think best.

The most convenient *test-acid*, or normal solution, both for commercial and chemical assays, is perhaps dilute sulphuric acid, which, when intended to be used VOLUMETRICALLY, has the sp. gr. 1.032 at 60° Fahr., and contains in 100 alkalimetric divisions 1000 water-grains measure, or 1 litre, exactly 49 gr. (or grammes) of sulphuric acid; and when intended to be used GRAVIMETRICALLY, or by weight, has the sp. gr. 1.033, and contains in 1000 gr. (or grammes) weight exactly 49 gr. (grammes) of sulphuric acid; and, in both cases, consequently corresponds to 1 equiv. of every other base. These dilute acids are easily prepared by mixing 1 part of the concentrated acid with 11 or 12 parts of distilled water; the precise quantity depending on the strength of the acid employed, and must be so arranged that 1000 grains shall exactly neutralise 1000 grains of water containing 53 grains of pure anhydrous sodium carbonate.

This acid (as well as all those hereafter mentioned) may be kept faintly tinged with litmus, which is often more convenient than tinging the alkaline solution at the time of making the assay.

It will at once be seen that every alkalimeter-division of the first of the above acids, and every 10 gr. of the second, represent the $\frac{1}{10}$ th part, or $\frac{1}{10}$ of alkali whenever the equivalent weight¹ of the latter is taken for the assay. Every 1-10th part, of an alkalimeter-division (or every drop), and every grain weight (when a Schuster's alkalimeter is employed) then

¹ See Table II, at the end of this article.

respectively represents the $\frac{1}{10}$ of $1\frac{1}{2}$; and the result sought is obtained without the necessity of any calculation.

This is obvious—for if the equivalent of a pure alkali or, of its carbonate (*i. e.* one of 100%) requires an equiv. (100 alkalmeter-divisions, or 1000-gr.) of test-acid to saturate it, an alkali or alkaline carbonate of 75%, 50%, or 25%, will respectively require only 75, 50, or 25 divisions, or 750, 500, or 250 gr.; and so of other strengths in proportion. The only precaution necessary is always to take the *standard weight* for the assay answering to the equiv. of the denomination of the *percentage* result sought. Thus, in testing a carbonate of potash, we may either wish to determine its *percentage* richness in 'dry carbonate,' or in 'pure potassa,' the latter being usually the case. To obtain the first, we must take 69 gr. for the assay; and to obtain the second, 47 gr. With CAUSTIC ALKALIES, or mixtures containing them, the weight, in grains, taken for the assay, must always correspond to the equiv. of the *pure base*. See Table II, at the end of this article.

In *commercial assays*, when 100 gr. (or some aliquot part thereof) are taken for trial, the *percentage* result is obtained from the number of *alkalmeter-divisions*, or the number of grains, of the test-acid consumed, by the common Rule of Proportion. Thus:—A crude sample of *potash* having taken 90 alkalmeter-divisions of *test-acid* to neutralise it, would contain—

$$100 : 47 :: 90 : 42.30$$

or nearly 42½ per cent. of *pure potassa*. If only 50, 25, or 20 gr. are tested, the result must, of course, be double, quadruple, &c., as the case may be. Or the third term of the proportion may be multiplied by the denominator of the fraction representing the aliquot part. This, in the case of 50 gr. (repeating the above example), would be—

$$100 : 47 :: 45 \times 2 : 42.30\%$$

as before; but even these easy calculations may be simplified, as is shown below.

One of the advantages, and not the least, attending the use of test-acids corresponding to equivalents, is, that by means of the simple Rule of Three, the *percentage* quantity of *alkali* may be found, whether 100 or any other number of grains have been submitted to trial. For—The weight of the sample tested (in grains) bears the same relation to the equivalent weight of the alkali under examination, that the number of alkalmeter-divisions or of the grains of test-acid consumed, do to the percentage of alkali sought. Thus, with a sample of 33 gr. of pearlsh taking 35 alkalmeter-divisions or 350 grains (every 10 gr. being = $1\frac{1}{2}$) of test-acid for neutralisation, this would be—

$$33 : 47 :: 35 : 49.85\%$$

or nearly 50 per cent. of pure potassa. By substituting the equiv. of the dry carbonate of potash (69), for that of pure potassa used above, the quantity of that article corresponding to the same weight of the pure alkali may

be at once found. Repeating the last example this will be—

$$33 : 69 :: 35 : 73.18\%$$

or nearly 73½ per cent. The same applies to all the alkaline bases and their carbonates.

For commercial purposes, there is used, amongst others, an empirical solution, as a test-acid for potassa, soda, and ammonia, to save the necessity of calculation.

This is dilute sulphuric acid having a sp. gr. of about 1.071; 100 alkalmeter-divisions (1000 water-grains measure) exactly saturate 100 gr. of pure potassa, or 113 gr. of anhydrous carbonate of soda. The number of measures consumed, read off by mere inspection from the scale of the alkalmeter, gives the exact *percentage* of alkali in the sample examined, for POTASH; and by multiplying it by .66, that for SODA also. By employing .862 as the multiplier, it gives the like result for AMMONIA. In fact, occasionally, in order to save the necessity of any calculation, two 'test-acids' are frequently employed—the one for *potash* and the other for *soda*.

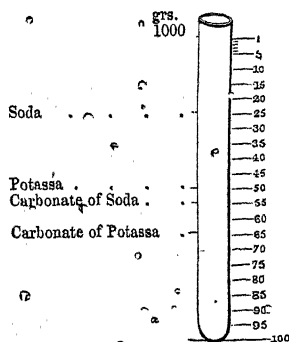

These are made by diluting sulphuric acid to a sp. gr. of near 1.071 and 1.086 respectively; 1000 grains, by measure, of the first, neutralising exactly 100 grains of pure potassa, or 113 of pure anhydrous soda carbonate, and the latter neutralising exactly 100 grains of pure soda, or 171 gr. of pure anhydrous sodium carbonate.

There is another system of preparing standard acids by means of a Faraday's alkalmeter. A strong acid is prepared by diluting sulphuric acid to a sp. gr. of 1.1268 at 60°, and 455.7 grains exactly neutralise 100 of anhydrous carbonate of soda.

The glass tube here referred to, and known as Faraday's ALKALIMETER, is graduated centesimally, in the usual manner; but opposite the numbers 22.1, 48.62, 54.43, and 65, are cut the words '*soda*,' '*potassa*,' '*carbonate of soda*,' and '*carbonate of potassa*,' to indicate the quantity of the *test-acid* to be employed for each of these substances. (See engr.) It is used by pouring the *test-liquid* into it until it reaches the line marked against the alkali, or carbonate, under examination, the remaining divisions being filled up with pure water, and the whole well mixed by placing the thumb on the orifice of the tube and shaking it well. The measure of the resulting dilute acid must then be very carefully observed, and more water added, if required, to bring it up to the zero (0) or 1000 gr. on the scale; careful agitation being again employed, as before. The *test-acid*, thus prepared, is then added, with the usual precautions, to the sample until exact neutralisation is effected. The quantity consumed for this purpose, read off from the graduated scale, expresses the exact *percentage* of the pure ALKALI, or of its CARBONATE, as the case may be, contained in the sample examined, provided 100 gr. have been taken for the assay.

Another method sometimes used is that of

M. Mohr, and practised as follows:—The alkaline solution, slightly colored blue with litmus, is strongly supersaturated with a standard acid (sulphuric or oxalic) of known strength, supplied from an alkalimeter in the usual manner; the last traces of carbonic anhydride being removed by boiling, shaking, blowing into the flask, and, finally, sucking out the air. A standard solution of caustic soda (of a strength exactly corresponding to

that of the test-acid already used) is now cautiously added, drop by drop, until the colour, rendered yellowish-red by the acid, just appears of a light blue. The difference between the quantity of the solution of the test-alkali and of the test-acid consumed, expresses the exact quantity of acid neutralised by the alkali, and hence, also its strength.

Besides the above methods, the alkaline carbonates are analysed, by the loss of carbonic anhydrid (carbonic acid) they suffer, by being decomposed by a strong acid. The best method in use is that of MM. Fresenius and Will, and depends on the same principle, and is performed in a similar manner and in a similar apparatus to that described under ACIDIMETRY; the only difference being that here the uses of the small tube (e) is dispensed with, and that the alkali is tested under the form of carbonate, instead of bicarbonate.

Oper. The smaller flask (B) is about half filled with concentrated sulphuric acid, and the sample of alkali, in solution (under the form of carbonate), being placed in the larger flask (A), water is added until it is about one third full. The tubes are then fitted into the apparatus quite air-tight; the end of the tube (b) is fastened with a piece of wax, and the whole is very carefully weighed. The apparatus is now removed from the scales, and a perforated cork, or a small piece of India-rubber tube, being temporarily applied to the end of the tube (b), a few bubbles of air are sucked out of the flask (B) by means of the lips; the consequence of which is, that on removing the mouth, the acid in (B) ascends to a certain height in the tube (c). If in a short time this little column of liquid

maintains its height in the tube, it is a proof that the apparatus is perfectly air-tight, and as it should be. Suction is now again cautiously applied to the tube (b) and a little of the acid in (B) made to flow over into the flask (A), the quantity being proportionate to the vacuum produced by suction, and capable of being regulated at will. No sooner does the acid come into contact with the carbonate in the flask (A), than the evolution of carbonic acid commences, and this, from the construction of the apparatus, having to pass through the concentrated sulphuric acid, is rendered quite dry before it can escape by the tube (d) into the atmosphere. Whenever the effervescence flags, a little more acid is sucked over, until the whole of the carbonate is decomposed; after which an additional quantity is made to pass into (A), so as to raise the temperature considerably, for the purpose of expelling all the gas absorbed by the fluid during the operation. As soon as this is effected, the wax is removed from the aperture (b), and suction applied to (b), until all the carbonic acid in the apparatus is replaced by atmospheric air. The whole is now allowed to cool, and (together with the piece of wax removed) is again accurately weighed. The loss of weight gives the exact amount of dry carbonic anhydride, or anhydrous carbonic acid, which was contained in the specimen, from which the weight of PURE ALKALI is readily estimated, as every 22 gr. of dry carbonic acid gas evolved represents exactly 31 gr. of pure SODA, 47 gr. of pure POTASSA, &c. &c.; these numbers being the equivalents of the respective substances from which the *per-centage* strength may be found by the rule of proportion, as before explained.

Thus, in the case of a 100-gr. sample of carbonate of soda which has lost 15½ gr. of carbonic acid, by the assay, this would be—

22 : 31 :: 15½ : 21.48%
or nearly 21½ per cent. of pure soda. If 53, the equiv. of anhydrous carbonate of soda, be taken, instead of 31 (the eq. of pure soda), the answer would have been, in the terms of that substance, 36.748%, or nearly 36¾ per cent. When an aliquot part of 100 gr. has been taken for the assay, either the result, or the third term of the proportion, must, of course, be multiplied by the denominator and divided by the numerator of the fraction representing such aliquot part.

By multiplying the weight of *carbonic anhydride* lost, by the numbers opposite the names of the respective alkalis and their carbonates in the second column of the following Table, the equivalent *per-centage* value of the carbonates examined may be obtained in terms corresponding to the various denominations named therein, when 100 gr., or any aliquot part of 100 gr., have been tested; the result, in the latter case, being, of course, multiplied as before.

By taking certain standard weights for the assay, the quantity of carbonic acid evolved

may be made to furnish the *per-centage* strength or value of the specimen in the terms of either the pure or carbonated alkalies, whether in their *anhydrous* or *hydrated* state. The numbers in the second column of the following *Table* represent the quantity in grains and decimal parts of each of the substances named in the first column, equivalent to one grain of *carbonic anhydride*. These numbers, as already mentioned, may be employed as factors for converting any numbers representing grains of that acid into the equivalents of these substances, true to 4 places of decimals; and further, they furnish us with the data for determining the exact number of grains which must be tested, so that the loss of weight in *carbonic anhydride* shall at once give us the *per-centage* richness of the sample in the terms of the denomination for which it

is taken. The numbers in the third column of the *Table*, formed by simply moving the decimal point of the numbers in the second column one figure further to the right, indicate the weights to be taken for the assay, so that the loss of weight, reckoned in tenths of a grain, exactly represents the *per-centage* strength in the terms sought. The weights corresponding to the numbers in the fifth column, give the same results, provided the loss of weight is reckoned in quarter-grains; those in the sixth column effect the same when the loss of weight is reckoned in half-grains; whilst those in the last column require that the gas eliminated should be counted in grains, and are simply the numbers in the second column of the *Table* multiplied by 100, or reproduced by moving the decimal point two figures to the right.

TABLE I.—*Multipliers and Standard Weights for the Principal Alkalies and their Carbonates. (COOLY.)*

NAMES, &c.	Factors or Multipliers for converting the weight of carbonic acid expelled into real strengths.	Quantity (in grains) to be taken, so that the <i>per-centage</i> value of the sample tested shall be shown in the terms of any of the denominations given, by the weight of the evolved Carbonic Acid reckoned—				
		in tenths of a grain.				
		Whole numbers and decimals.	Nearest common numbers.	in quarter-grains.	in half-grains.	in grains.

MAGNESIA (pure, anhydrous)9091	9.091	9 $\frac{1}{10}$	22 $\frac{1}{2}$	45 $\frac{1}{2}$	91

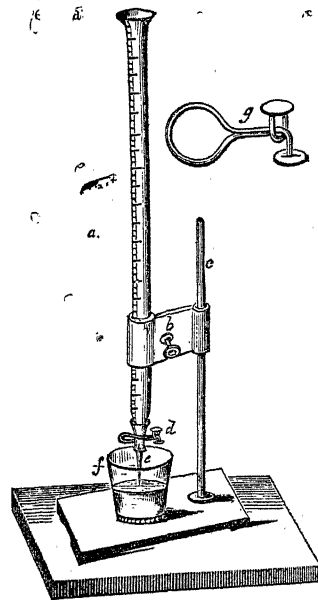

In this ingenious method of alkalimetry it is absolutely necessary that the whole of the alkali in the specimen tested should be in the state of neutral carbonate. If a sample of potash contains any caustic alkali (as the potashes and pearlsh of commerce generally do), Fresenius and Will direct it, previously to being tested, to be triturated with its own weight of pure quartzose sand, and about one third of its weight of carbonate of ammonia; and the resulting mixture, placed in a small iron capsule, or a porcelain crucible, to be moistened with water, and exposed to a gentle heat until it becomes quite dry, and all the ammonia is expelled. If the sample contains any bicarbonate or sesquicarbonate, it must be heated to dull redness before being placed in the apparatus and tested. In the case of crude soda (particularly *soda-ash*), the proportion of carbonate of ammonia should be equal to at least one half the quantity operated on. With both alkalies, if the sample contains sulphides, sulphites, or hyposulphites, the same method is to be followed, except that solution of ammonia, instead of water, is to be employed for moistening the powder. To remedy the error which would arise from the apparent amount of carbonic anhydride liberated during the assay, being swelled by the disengagement of 'sulphuretted hydrogen' or sulphurous acid from these substances, a small quantity of neutral (*i. e.* yellow) chromate of potash may be added to the alkaline solution in the flask (*A*); by which they will be converted into sulphates, sulphur, and water, which will remain in the apparatus, the carbonic acid only being evolved. "As most sorts of soda of commerce contain one or other of the substances (just) named, and as it is far more simple to add at once some chromate of potassa to the soda solution, than to test the latter for either of the three salts—it is always advisable to make it a rule, in the examination of SODA, to add some *chromate of potassa*." (Fresenius.)

If the sodium or other carbonate under analysis contains much chloride, the addition of more sulphuric acid than necessary must be avoided, and the carbonic anhydride expelled by gently heating over a water bath, and not by the addition of excess of acid.

To obviate the difficulties and to give greater precision and delicacy to volumetrical assays, the instrument known as Mohr's ALKALIMETER, or Mohr's BURETTE, and which is figured in the margin, may be employed. By means of it the test-acid in the graduated tube (*a*) may be added to the alkaline solution in (*f*), in any quantity at a time, however minute, by merely pressing the handles of the clamp (*d*) with the thumb and finger. The terminal tube (*e*) has its lower orifice very small, and it is connected with the burette by means of a small piece of vulcanised India-rubber tube, on which the clamp (*d*) acts. (See engr.) The inner cylindrical part of the arm (*b*) is lined with cork, to prevent injury to

the glass burette, and to hold it the more firmly.

Generally the alkali in the specimen examined may be in either the caustic or carbonated state, or it may consist of any mixture of caustic alkali, or carbonates; but it is

absolutely necessary for accurate results, that it should be free from sulphides, sulphites, and hyposulphites, as sulphuric acid acts upon these substances as well as on carbonates. The presence of chlorides does not interfere with the accuracy of the assay, unless a higher degree of heat is employed than that necessary for the expulsion of the absorbed carbonic acid. The SODA-ASH of commerce generally contains all these substances besides common salt, sulphate of soda, and insoluble matter, which do not interfere. Rough samples of POT-ASHES and PEARL-ASH also generally contain some sulphides, though not a large quantity. Various plans have been proposed to avoid this source of error. The best is that of MM. Fresenius and Will, given above, in which the value of the carbonates is estimated by their yield of carbonic anhydride.

The difference between an assay of a sample of the unprepared alkali and of another which has been treated as above, indicates the quantity of impurities contained in them under the forms just referred to. The presence of these substances in the commercial alkalies may be detected by the following tests:—

Sulphides. The addition of sulphuric acid causes the evolution of an odour like that of bad eggs. The sample in solution yields a black precipitate with acetate of lead paper.

But the most delicate test is the splendid violet-blue colour with nitro-prusside of sodium.

Sulphites and hyposulphites. A solution of the alkali, insufficient for saturation, being added to sulphuric acid tinged reddish-yellow with bichromate of potash, occasions a greenish tinge (owing to the formation of oxide of chromium), when these are present. Some hydrochloric acid added to a clear solution, after some time causes a turbidness and odour of sulphur.

Chlorides yield a copious curdy precipitate with nitrate of silver, soluble in ammonia, and reprecipitated by excess of nitric acid.

The amount of pure caustic alkali in a sample of alkali is best determined by Fresenius's method, as follows:—The total amount of pure alkali, both caustic and carbonated, expressed in per-cents. of carbonate of soda or carbonate of potassa, is ascertained by any of the usual methods. The apparent quantity of alkali per cent. is then determined, without previous treatment of the sample with carbonate of Ammonia, by the method of Will and Fresenius (p. 58). The difference between the results indicates the *per-centage* of dry caustic alkali present; or if the volumetric method be in use, it can be often fairly estimated by adding the first portions of the test-acid very gradually to the sample, carefully observing the effect. When the effervescence at length commences, the weight or measure of the test-liquor expended shows the quantity of pure caustic alkali under treatment (nearly). The result depends upon the fact, that little or no carbonic acid gas is expelled from the liquid on the addition of the test-acid, until the caustic portion is very nearly neutralised.

The quantity of WATER or MOISTURE, per cent., present in an alkaline carbonate, is indicated by the loss of weight which 100 gr. suffer on gentle ignition in a loosely covered iron dish or platinum crucible. So also with samples containing caustic alkali, except that here, the water of hydration (= 1 equiv. = 9) is not expelled from the 'caustic' portion, and must, therefore, be determined by calculation.

Other matters deserving the serious attention of the operator are—hitting the exact point of neutralisation, and—preparing the test-acids of the proper strength. The method of effecting the former correctly, has been already referred to in this article, and is also fully noticed under ALKALIMETRY and ACIDIMETRY.

Test-acids may be very simply prepared, by gradually diluting concentrated sulphuric acid with water until it is reduced to the proper strength; the dilution being made in a glass vessel containing a 'hydrostatic bead,' exactly corresponding to the desired specific gravity

of the dilute acid. When the proper point is reached, and the mixture has again acquired the normal temperature of 60° Fahr., the bead rises from the bottom of the vessel, and floats about indifferently in the middle of the liquid. The sp. gr. may then be carefully ascertained by means of an hydrometer or a specific gravity bottle; after which the strength must be accurately determined by means of a standard solution of either pure anhydrous carbonate of soda or pure caustic soda. An acid of any given strength or saturating power may also be prepared in the following manner:—49 parts of commercial sulphuric acid (oil of vitriol), sp. gr. 1.825, contain nearly 40 parts or 1 equiv. of anhydrous sulphuric acid; if we, therefore, wish to prepare a dilute acid containing in every 1000 grains weight, or measure, exactly 1 equiv. of hydrated sulphuric acid, we have only to make 49 gr. of such acid up to 1000 gr. weight or measure with pure water. After it has recovered the proper temperature, its sp. gr., or rather its saturating power, must be carefully tried, and, if necessary, readjusted. As, however, it very often happens that the oil of vitriol employed is not so strong as that above referred to, it is better first to test its strength with pure anhydrous carbonate of soda, and to calculate the quantity required by the Rule of Proportion. Every 53 gr. of the dry carbonate are equal to 40 gr. of 'dry sulphuric acid.' Suppose we find the oil of vitriol to contain only 72½ of hydrated acid, then—

$$100 : 40 :: 72 : 55\frac{1}{2}$$

or, instead of only 40 gr., fully 55½ gr. will be required, which are to be made up with water to 1000 gr., as before. Finally, the diluted acid must be very carefully re-tested, and if found correct, at once put into a well-stoppered bottle, and labelled, for use. Too much care cannot be taken to ensure the *test-liquid*, whether for alkalis or acids, being of the proper strength, of which the specific gravity alone is an insufficient proof. In practice, so small a quantity only of test-acid as that referred to above is, of course, seldom made; but as any larger quantities are mere multiples of the smaller one, the necessary proportions to be employed are easily calculated. The common plan is to prepare one or more gallons or quantities of 10 *lbs.* each, and to preserve the liquid in stoppered green glass 'Winchester-quart bottles,' so that it may be always ready for use.

Although, as may be inferred from the text, sulphuric acid is generally used as the standard acid, yet oxalic acid in pure crystals is recommended by M. Mohr, and answers admirably, and is prepared and used exactly in the same manner.

TABLE II.—*Alkalimetric Equivalents.*

Grains.		Grains.

are equivalent to

ALKALOID. *Syn.* VEGETABLE ALKALI, dilute acid, digestion with a little animal charcoal, and subsequent crystallisation, or re-precipitation with an alkali; or the first precipitate is purified by dissolving it once, or oftener, in boiling alcohol, which yields the PURE ALKALOID either on cooling or by evaporation.

2. (When the base is *insoluble in water*, and *non-volatile*, but existing in the plant in a *soluble state*.) The bruised or sliced plant is boiled or macerated in water, and the filtered liquor precipitated and otherwise treated as before.

3. (When the base is *soluble in water*, and *non-volatile*.) An infusion made with very dilute acid (hydrochloric or acetic), is concentrated by a gentle heat; and the residual liquor treated with potassa (or concentrated solution of ammonia) and ether (conjunctly); after repose, the ethereal solution is decanted and evaporated. For those alkaloids which are insoluble in ether (as morphia and cinchonia), the previous process may be adopted.

4. (When the base is both *soluble in water* and *volatile*.) The vegetable, in a bruised or divided state, or its extract, is alkalisied with potassa and distilled; the distillate is neutralised with dilute oxalic or sulphuric acid, and carefully evaporated to dryness; the residuum is next digested in alcohol, and the resulting tincture agitated with potassa and ether, the

Prep. The following general methods of procuring the alkaloids will be found applicable to such as full directions are not given for under their respective heads:—

1. (When the base is *insoluble in water*, *non-volatile*, and existing in the plant in an *insoluble form*.) The bruised plant is boiled or macerated in water acidulated with hydrochloric or acetic acid, and the liquor, after filtration, is neutralised with an alkali (ammonia, potassa, lime, or magnesia); the resulting precipitate is purified by re-solution in

former being in quantity just sufficient to seize on all the acid; lastly, the ethereal solution thus formed, on careful evaporation, leaves the alkaloid nearly pure. It may be further purified by cautious distillation.

As some of the alkaloids are soluble in excess of the alkaline precipitant, over-saturation should be carefully avoided; or the precipitant may be used under the form of carbonate or bicarbonate. When lime and magnesia are employed, they are boiled for a few minutes with the solution.

Props. Alcoholic or aqueous solutions of the alkaloids generally exhibit an alkaline reaction with vegetable colours. Like the alkalis, also, they combine with acids to form salts which, when dissolved in water, are capable of producing the ordinary phenomena of saline double decomposition. Their taste is usually intensely bitter.

The majority of the natural alkaloids contain carbon, hydrogen, nitrogen, and oxygen, and are, at ordinary temperatures, solid, and not volatile without decomposition. Some natural alkaloids contain carbon, hydrogen, and nitrogen only; these are, for the most part, liquid at ordinary temperatures, and can be distilled without decomposition. The greater number of the artificial alkalis are composed of carbon, hydrogen, and nitrogen; some, however, contain oxygen in addition. Alkaloids have also been obtained artificially, in which nitrogen is replaced by phosphorus, arsenic, antimony, or bismuth. Most of the alkaloids, as they are obtained in the free state, correspond in function to ammonia, NH_3 , rather than to the fixed alkalis; that is to say, they form salts by direct union with acids, without elimination of water or any other substance. In order to make them strictly comparable to the fixed alkalis, they require, like ammonia, the addition of water (H_2O) to their formulæ; they may then be considered as hydrates of compound radicles analogous to ammonium.

Physiological action. The alkaloids generally possess great medicinal power; some of them act with terrific energy, and are the most violent poisons with which we are acquainted. Perfectly pure aconitia is about 200 times more poisonous than arsenic, and at least 50 times more poisonous than ordinary medicinal prussic acid. The greater number act on animals in the same way as the plants which produce them, provided they are given in proportionately small doses. Many of them, when judiciously administered, are most valuable medicines.

Pois., Ant., &c. Some of the alkaloids act as narcotic or stupefying poisons; others, are classed with the narcotico-acrid poisons, or those which produce both narcotism and irritation of the parts they touch. The general symptoms produced by opium and its preparations may be taken as an example of the former; those from aconite and strychnia, of the latter. In large doses of the greater

number, narcotism predominates; in smaller ones, irritation; they are rarely coexistent.—

Treatm. No common antidote to the effects of this class of substances has yet been discovered. The only safe treatment, of at all general application, is to immediately clear the stomach by means of a strong and quick-acting emetic (as *sulphate of zinc*), or the stomach-pump, and to administer copious and continued draughts of astringent vegetable solutions (as of *tannin*, *nut-galls*, *oak-bark*, or what is always at hand—*very strong tea* or *coffee*). These may be followed by or combined with a smart purge of *castor oil*, as soon as the stomach is thoroughly cleared of the poison. M. Bouchardat strongly recommends a solution of *iodine*, 3 gr., and *iodide of potassium*, 6 gr., in *pure water*, 16 fl. oz., in cases of poisoning by *OPIMUM*, *ACONITE*, *COLCHICUM*, *DEADLY NIGHTSHADE*, *HEMLOCK*, *NUX VOMICA*, &c., or by the alkaloids obtained from them—*ACONITINE*, *ATROPIA*, *COLCHICINA*, *CONIA*, *MORPHIA*, *STRYCHNIA*, &c., or their salts; but *not* where foxglove or digitaline has been taken. The stomach having been well emptied by an emetic, the solution is to be given by wine-glassfuls for some time; the vomiting being still encouraged during the early part of the administration of the antidote. In the case of narcotics (as *opium*, *morphia*, &c.), this is to be followed by the free use of a strong infusion of *coffee*. According to Dr. Garrod, *purified animal charcoal* is an 'excellent antidote' to many of the alkaloids, including those above enumerated, when taken in poisonous doses; as it not merely absorbs them, but, for the most part, renders them inert. To be serviceable it should be recently prepared and fresh-burnt; and should be given in doses of about an ounce at a time, diffused in warm or tepid water, and frequently repeated. The vomiting which follows its use, owing to the warm water, proves advantageous; but after a sufficient time, may be lessened by employing less water, or cooler or even cold water. Drowsiness, if present, may be combated by the subsequent use of strong coffee or tea, as before. We have seen this plan succeed in several cases.—*Lesions.* Those, like the symptoms, vary. In some cases there are redness and inflammation of the stomach and intestines, and purgescence of the vessels of the lungs and brain; in others, these appearances are either slight or wholly wanting. Where there has been much cerebral disturbance, traces of congestion are usually discernible.

Detect., Tests, &c. The identification of the pure alkaloids is extremely simple; but their detection, when combined with organic and colouring matters, is a task of considerable difficulty. One or other of the following plans may be adopted for this purpose.—

1. (Merck.) The matter under examination is digested, for several hours, with concentrated acetic acid, added in sufficient quantity to produce a strongly acid reaction; the fluid portion

is then strained from the insoluble matter, and the latter being washed with water acidulated with acetic acid, the mixed liquors are gently evaporated to dryness in a water bath; the residuum of the evaporation is boiled first with rectified spirit, and next with rectified spirit acidulated with acetic acid; the mixed liquors are again evaporated, the residuum redissolved or diluted with distilled water, and carbonate of soda or potassa added to feebly alkaline reaction, and the whole, after evaporation to the consistence of a syrup, set aside to repose for 24 hours; it is now again diluted with water, filtered, and the insoluble portion washed with cold distilled water, and digested with concentrated acetic acid; this last solution is diluted with distilled water, and decoloured with pure blood-charcoal (if it be necessary); the fluid, either at once, or after cautious evaporation, may then be tested for the alkaloids, in the usual manner. The charcoal previously used should also be tested in the way described below. This method answers admirably with all the NON-VOLATILE ALKALOIDS, and may be applied to the stomach and viscera, and their contents, and to food, &c., in cases of poisoning.

2. (Stas.) The suspected matter, in a finely divided state, is digested, at 160° to 165° Fahr., with twice or thrice its weight of strong alcohol acidulated (according to the quantity) with $\frac{1}{2}$ dr. to 2 or 3 dr., or more, of pure oxalic or tartaric acid. After a sufficient time, and when the whole has become quite cold, it is thrown on a filter, and the undissolved portion, after being squeezed dry, is washed with strong alcohol. The mixed and filtered alcoholic liquids are then evaporated at a temperature not exceeding 95° Fahr., and, if no insoluble matter separates, the evaporation is continued nearly to dryness;¹ but if fatty or other insoluble matter separates during the process of concentration, the concentrated fluid is passed through a moistened filter, and the filtrate evaporated nearly to dryness, as before. The residuum is next digested with absolute alcohol, in the cold, the insoluble portion, after filtration, washed with alcohol, and the mixed filtrates again evaporated in the air, or in vacuo. The acid residue is now dissolved in a little distilled water, and bicarbonate of soda added as long as effervescence ensues. To this mixture 4 or 5 times its volume of ether is added, and after lengthened agitation (the bottle or tube being held in a cold wet cloth), the whole is allowed to repose for a short time. A little of the supernatant ether is now removed to a small glass capsule or watch-glass, and allowed to evaporate spontaneously.¹ When this leaves oily streaks upon the glass, which gradually collect into a small drop, which emits, when gently heated, a disagreeable, pungent, and stifling

¹ The evaporation according to Stas, should be conducted under a bell-glass over sulphuric acid, with or without rarefaction of the air; or in a tubular retort through which a current of air is made to pass.

odour, the presence of a LIQUID VOLATILE BASE or ALKALOID is inferred; whilst a solid residue or a turbid fluid with small solid particles floating in it, indicates a NON-VOLATILE SOLID BASE.² In either case the blue colour of reddened litmus is permanently restored by the residuum. If no residuum is left on the capsule, some solution of pure soda or potassa is added to the liquid, the whole well agitated for several minutes, and the ether (after repose) decanted; an operation which is repeated with fresh ether a second, third, and even a fourth time. The base, or bases (if any are present), will now be found in the mixed ethereal solution, which is, therefore, tested as before. The presence of an alkaloid being detected, the mixed ethereal solutions are allowed to evaporate spontaneously, care being taken, if a volatile alkaloid be present, to neutralise the liquid with an acid before the final evaporation. The last residuum is then tested for the particular alkaloid present, as before.³

This method, according to Stas, answers well for all the ALKALOIDS which are soluble in ether; including—ACONITIA, ANILINE, ATROPIA, BRUCIA, CODEIA, COLCHICINA, CONIA, DELPHIA, EMETINA, HYOSCYAMINE, MORPHIA (?), NICOTIA, PETTININE, PICOLINE, SOLANINE, STRYCHNIA, VERATRIA, &c. By means of it Stas found nicotia in the heart-blood of a poisoned dog. With such alkaloids as are, however, only very sparingly soluble in ether, (as morphia, for instance,) the result must, necessarily, be doubtful. To detect these, as well as all the alkaloids which are insoluble in ether, it is, therefore, necessary, as directed by Otto, to add to the alkaline fluid left by the decantation of the ether, sufficient solution of soda to dissolve the morphia, &c., (if any has separated,) and after the expulsion of the last traces of the ether by a gentle heat, to add a concentrated solution of hydrochlorate of ammonia, and to allow the mixture to repose for some time in the open air. When MORPHIA is present, it separates under the form of small crystals.⁴ Or the alkaline liquor may be diluted with distilled water, and treated with charcoal, and this with alcohol, in the manner noticed under method 4 (below).

4. (Graham and Hoffmann—slightly modified.) 2 or 3 oz. of purified animal charcoal are digested in about $\frac{1}{2}$ gal. of the (neutral or only slightly acid) aqueous fluid under examination, with frequent agitation, for 10 to 12 hours, or longer. The liquid is then filtered, and the charcoal left on the filter is washed twice with cold distilled water. The charcoal is then boiled for $\frac{1}{2}$ an hour with about $\frac{1}{2}$ a pint of rectified spirit of 80 or 90°; the ebullition being conducted in a flask having a very long tube, open at both ends, fitted air-tight through the cork, to prevent loss of the alcohol

² A merely disagreeable animal odour, without pungency, is here disregarded.

³ "Bulletin de l'Académie de Méd. Belgique," ix, 304;

⁴ "Jahrb. f. prakt. Pharm.," xxiv, 313; &c.

⁵ Otto's "How to detect Poisons."

by evaporation. The spirit, which now contains the alkaloid (if any was present in the original liquor), is next filtered whilst hot, and the filtrate is submitted to distillation until the whole of the alcohol is removed. A small quantity (commonly a few drops) of solution of potassa is then added to the residual aqueous liquor, followed by 1 to 2 fl. oz. of purified ether, after which the whole is well agitated for several minutes, and allowed to repose for a short time. Lastly, the supernatant ether is decanted, and allowed to evaporate spontaneously, when the residuum (if any) left in the capsule may be tested by reagents, as before.

This method was devised for the detection of STRYCHNIA and NUXVOMIA in malt-liquors; but it is equally applicable to the detection of ANY ALKALOID which is soluble in ether. The CHARCOAL TEST may also be employed to detect alkaloids which are insoluble in ether; but then the base must be sought in the aqueous residuum obtained by the evaporation of the alcohol.¹

The presence of the Alkaloids and their Salts, in clear solutions, may be thus determined:—

I. (Fresenius).—1. The solution is rendered very slightly alkaline with dilute solution of potassa or soda, added drop by drop:—

a. No precipitate is formed; total absence of the alkaloids. (See 4, below.)

b. A precipitate is formed:—solution of potassa or soda is added, drop by drop, until the liquid exhibits a strong alkaline reaction:—

a. The precipitate redissolves; absence of *Brucia*, *Cinchonia*, *Narcotina*, *Quina*, *Strychnia*, and *Veratria*; probable presence of *MORPHIA*.

β. Precipitate does not redissolve, or not completely; probable presence of one or more of the first six of the above-named alkaloids:—the fluid is filtered from the precipitate, mixed with either bicarbonate of soda or of potassa, gently boiled nearly to dryness, and treated with water. If it dissolves completely; absence of *Morphia*; an insoluble residue indicates *MORPHIA*.

2. The precipitate 1. b. β. is washed with cold distilled water, dissolved in a slight excess of dilute sulphuric acid, neutralised with a saturated solution of bicarbonate of soda, and allowed to repose a few hours:—

a. No precipitate; absence of *Cinchonia*, *Narcotina*, and *Quina*:—the solution is gently evaporated nearly to dryness, and treated with cold water:—if it dissolves completely, pass on to 4; if there is an insoluble residue, it may contain *Brucia*, *Strychnia*, or *Veratria*. (See 6.)

b. A precipitate:—the filtered fluid is treated as directed at 2. a.; the precipitate is washed with cold distilled water, dissolved in a little hydrochloric acid, ammonia is added in excess, and subsequently a sufficient quantity of ether, agitation being had recourse to:—

α. The precipitate formed by the ammonia redissolves completely in the ether, and the clear fluid separates into two layers; absence of *Cinchonia*; probable presence of *QUINA* or *NARCOTINA*.

β. The precipitate produced by the ammonia does not redissolve in the ether, or not completely; probable presence of *CINCHONIA*, and perhaps also of *Quina* or *Narcotina*. The filtered liquid may be tested for these alkaloids as at a.

3. The insoluble residuum after the evaporation of the solution 2. a., or of the filtrate 2. b., is now dried in a water bath, and digested with absolute alcohol:—

a. It dissolves completely; absence of *Strychnia*; probable presence of *BRUCIA*, *QUINA* (?), or *VERATRIA*:—the alcoholic solution is evaporated to dryness, and, if *quina* has been already detected, the residue is divided into two portions, one of which is tested for *Brucia*, the other for *Veratria*.

b. It does not dissolve, or not completely; probable presence of *STRYCHNIA*, and perhaps also of *Brucia* and *Veratria*:—the filtered fluid is divided into two portions, and tested separately as at a.

4. The original liquid 1. a., may contain *Salicine*, a proximate vegetable principle closely allied to the alkaloids:—a portion is boiled with hydrochloric acid for some time; the formation of a precipitate shows the presence of *SALICINE*. (See 2, below.)²

II. (Larocque and Thibierge). *Terchloride of gold* is recommended, by these writers, as a more decisive test for the alkaloids than the double chloride of gold and sodium commonly employed for this purpose. The following are the colours of the precipitates which it produces with the aqueous solution of their salts:—*BRUCIA*, milk-brown, passing into coffee-brown, and lastly chocolate-brown:—*CINCHONIA*, sulphur-yellow:—*MORPHIA*, yellow, then bluish, and lastly violet; in this last state the gold is reduced, and the precipitate is insoluble in water, alcohol, the caustic alkalis, and sulphuric, nitric, and hydrochloric acid; it forms with aqua regia a solution which is precipitated by protosulphate of iron:—*QUINA*, buff-coloured:—*STRYCHNIA*, canary-yellow:—*VERATRIA*, pale greenish-yellow. All these precipitates, with the exception men-

¹ "Journ. of the Chem. Soc.," 1873.

² Before setting the glass aside the liquor should be well mixed, and the glass stirrer vigorously rubbed against the sides of the vessel.

³ For further information on this subject, see the admirable "System of Qual. Chem. Anal.," by Dr. C. R. Fresenius. Churchill.

tioned, are very soluble in alcohol, insoluble in ether, and only slightly soluble in water. Those with *morphia* and *brucia* are sufficiently marked to prevent these alkalies from being mistaken for each other; and those with *brucia* and *strychnia* are, in like manner, easily distinguishable.

The principal Alkaloids and their Salts, in the state of powder, or with 'conia' and 'nicotia,' in the state of an oily looking liquid, may be thus distinguished:—

1.—*a.* The powder is treated with nitric acid:—It is coloured red; probable presence of *Brucia*, *Delphia*, *Morphia*, or commercial *Strychnia*. If the reddened acid becomes violet on the addition of 'protochloride of tin,' it is *Brucia*; if it becomes black and carbonaceous, it is *DELPHIA*. If the powder is fusible without decomposition, and strongly decomposes iodic acid, it is *MORPHIA*; if it is not fusible without decomposition, and does not decompose iodic acid, it is *STRYCHNIA*.

b. If instead of a red, the powder strikes a green colour with nitric acid, it is *SOLARIA*; if it is insoluble in 'ether,' and not reddened by 'nitric acid,' it is *EMETIA*; if soluble in ether, not reddened by 'nitric acid,' but melts and volatilises when heated, it is *ATROPIA*; if it is thus affected by ether or nitric acid, but does not volatilise, it is *VERATRIA*. (See 2, below.)

2. The powder, or (with 'conia and nicotia') concentrated liquid, is treated with a drop or two of concentrated sulphuric acid:—A red colour is produced; probable presence of *Brucia*, *Nicotina*, *Salicine*, or *Veratria*. If the reddened mixture has at first a roseate hue, turning deep red on the addition of nitric acid, it is *Brucia*; if the original substance moistened with solution of potassa evolves the odour of tobacco, it contains *NICOTINE*; if the red colour produced by the acid is permanent and of an intense blood-hue, and the powder agglutinates into lumps like resin, it is *SALICINE*; if the colour is at first yellowish, changing to blood-red, and ultimately to crimson and violet, it is *VERATRIA*.

b. If instead of the substance being 'reddened' by strong sulphuric acid, no particular action ensues in the cold, it contains either 'conia or *Strychnia*'; if a small fragment of bi-chromate of potassa being now dropped in, assumes a rich violet colour, it is *STRYCHNIA*; if the original matter on being heated, or treated with solution of potassa, evolves a penetrating, disagreeable odour, somewhat analogous to that from 'hemlock,' or to a mixture of those from tobacco and mice, it is *CONIA*.

The presence of one or more of the alkaloids being shown by any of the preceding methods, a portion of the original clear solution or powder, or of the precipitates or filtrates above referred to, must be treated with their 'characteristic tests,' as given under the individual

notices of these articles, so as to set at rest all doubt as to their identity. No single test must ever be relied on, as a positive proof. The presence of *Brucia*, *Morphia* and *Strychnia*, may be determined in substance which after being mixed with the salts of these alkaloids have undergone the acetous vinous, or putrefactive fermentation, as shown by Orfila, M.M. Larocque and Thibierge, and many other eminent chemists and toxicologists, and confirmed, in numerous cases, by our own experiments. *Opium* and *Morphia* may thus be readily detected in beer, wine, soup, and milk.

Concluding remarks. It is a singular fact that none of the organic bases found in plants have yet been formed artificially, although several analogous substances have been thus produced. Closely allied to the alkaloids there also exists an extensive series of neutral proximate principles, which differ from those substances chiefly in the absence of basic properties, and in most of them being destitute of nitrogen. They are usually bitter, and, like the alkaloids, usually represent the active properties of the plants in which they are found; whilst some of them possess considerable medicinal energy. Of this kind are *asparagine*, *elaterine*, *gentiamine*, *picrotozine*, *salicine*, &c. These two classes of bodies, though actually distinct, are frequently confounded. See *ALKALI*, *ORGANIC BASES*, *POISONS*, *PROXIMATE PRINCIPLES*, *VEGETABLE SUBSTANCES*, *NOMENCLATURE*, &c.; also the individual alkaloids under their respective heads.

ALKANET. *Syn.* ANCHUSA, L.; ORCANETTE, Fr.; ORKANET, Ger.; ORCHANET*, DYER'S ALKANET, D. BUGLOSS*. The *anchusa tinctoria* (Willd.; *lithospermum tinctorium* —Linn.), a deciduous herbaceous plant, with a perennial, dark blood-red root. *Hab.*, Asia Minor, Greece, Hungary, &c. It is also largely cultivated in the neighbourhood of Montpellier. The dried root (ALKANET ROOT; RADIX ANCHUSE, B. A. TINCTORIE) is chiefly imported from the Levant. It contains a beautiful blood-red colour, which it freely gives out to oils, fats, wax, spirits, essences, and similar substances, by simply infusing it in them, and is consequently much employed to colour these articles. Wax tinged with it, and applied on warm marble, stains it of a rich flesh-colour, which sinks deep into the stone, and possesses considerable durability. Its spirituous tincture also imparts a deep red to marble.

Prop., &c. The colouring matter of alkanet was regarded by Pelletier as a fatty acid (ANCHUSIC ACID); but it has since been shown to be a species of resin (ANCHUSINE, PSEUDO-ALKANINE, P-ALKANITUM). According to Dr. John, good alkanet root contains 5½ per cent. of this substance. *Anchorine* melts at 140° Fahr.; is scarcely soluble in water, to which it only imparts a dirty red colour, but is very soluble in alcohol, oils, and acetic acid. Alkalies turn it blue. It is found wholly in

the *root-bark*. In selecting this article, the smaller roots should therefore be chosen, as they possess more bark than the larger ones, in proportion to their weight. Exposure to ammoniacal fumes, or even handling it much with the fingers, changes its red to a crimson or purplish hue.

Uses, &c. It is much employed by druggists and perfumers to colour oils, lip-salves, pasters, pomatums, &c.; by varnish-makers, to tinge their varnishes and lacquers; by statuary, to stain marble; by dairy-farmers, to colour cheese; by wine-merchants and bottlers (in the form of tincture), to stain beforehand the corks of their port-wine bottles, in order to imitate the effects of age, and as colouring and flavouring for factitious port-wine; and by dyers, and others. A species of crimson rouge was formerly prepared from it (hence its name).

ALLANTOIC ACID. See ALLANTOIN.

ALLANTOIN (-to-in; -tō — Mayne). *Syn.* ALLANTOIC ACID*, AMNIOTIC A.T. AMNIC A.T.; ALLANTOÏNA, L. A substance discovered by Vanquelin and Buniva in what they imagined to be the liquor amnii of the cow, and hence named by them *amniotic acid*. It was afterwards shown by Dzondi and Lassaigne to exist in the fluid of the allantois, and not of the amnios. It has since been produced artificially by Wöhler and Liebig.

Prep. 1. The *allantoic fluid* of the *fœtal calf* is evaporated to 1-4th or 1-5th of its volume, and then set aside for some time. The crystals thus obtained are purified by re-solution, digestion with animal charcoal, and re-crystallisation.

2. (Wöhler and Liebig.) Uric acid, 1 part; is dissolved in water, 20 parts; and freshly precipitated and well-washed binoxide of lead is added to the solution until the colour ceases to change; the liquid is next filtered while hot, evaporated until a pellicle forms on the surface, and then set aside to crystallise; the crystals being purified as before.

Prop., &c. Small, but very brilliant prismatic, transparent, colourless crystals; tasteless; neutral; soluble in 160 parts of cold water, and in much less at 212°; nitric acid converts it into ALLANTURIC ACID; oil of vitriol resolves it into ammonia, carbonic acid, and carbonic oxide; hot concentrated solutions of the caustic alkalies change it into ammonia and oxalic acid.

ALLANTOXICUM. [L.] *Syn.* ALLANTO-TOXICUM, L. (prim., Gr.). The poison developed, during putrefaction, in sausages made of blood, liver, &c. "It often proves speedily fatal." (Kraus.)

ALLIACEOUS (-sh'us). *Syn.* ALLIACEUS, L.; ALLIACÉ, ALLIACÉ, Fr.; KNOBLAUCH-ARTIG, &c., Ger. Garlic-like; an epithet applied to substances having the odour of properties of garlic or onion.

Alliaceous Plants. Chives, garlic, leeks, onions, romabole, shallots, &c.

ALLIGATION. *Syn.* ALLIGATIO, L. In *commercial arithmetic*, a 'rule' for ascertaining the price or value of mixtures, and for determining the proportions of the ingredients that must be taken to produce mixtures of any given price, value, or strength. The first is called ALLIGATION MEDIAL; the second, ALLIGATION ALTERNATE. Its principles and applications are explained under MIXTURES (Arithmetic of).

ALLOPATHY. *Syn.* ALLOPATHIA, L. (from ἄλλοι, other, different, and παθος, affection or disease, Gr.); ALLOPATHIE, Fr. In *medicine*, the method of curing disease by the use of remedies which tend to produce a condition of the system, either differing from, opposed to, or incompatible with the condition believed to be essential to the disease it is sought to cure. It is commonly employed to distinguish the ordinary system of medical practice from homeopathy (which see). Hence (an) ALLOPATHIST, and the corresponding adjective ALLOPATHIC (allopathicous, L.).

ALLOTROPY. *Syn.* ALLOTROPISM; ALIOTROPÏA, ALLOTROPIS'MUS, L. Literally, a difference in character; another form of the same substance. In *chemistry*, a term invented, by Berzelius, to express the state or condition, or the change of character, assumed by certain substances at different temperatures, or under different treatment, whilst their nature and composition continue the same. It more particularly relates to colour, hardness, solubility, texture, &c. Boron, carbon, silicon, iron, sulphur, and phosphorus, afford striking examples of the changes here referred to.

ALLOXANTIN (-tîn; or -lög-zân'). C₈H₂N₂O₇ · 3H₂O. A crystallisable substance, first obtained by Dr. Prout from uric acid.

Prep. 1. Uric acid, 1 part; is boiled in water, 32 parts; dilute nitric acid being added until solution is complete; the resulting liquid is evaporated to 3rds its volume, and then set aside for 10 or 12 hours; the crystals, which are deposited, are purified by re-solution and crystallisation.

2. Sulphuretted hydrogen gas is passed, in a full stream, through a moderately strong aqueous solution of alloxan, in the cold. The *alloxantin*, which is deposited as a crystalline mass, is purified by draining, cautious washing with cold water, re-solution in boiling water, and re-crystallisation. The impure mother-liquor from which crystals of alloxan have separated, is diluted with water, may be used for this purpose.

Prop., &c. Crystals, small colourless, transparent, four-sided, oblique rhombic prisms; scarcely soluble in cold water; solution reddens litmus; with baryta water it gives a characteristic violet-coloured precipitate, which disappears on heating; and with nitrate of silver a black precipitate of that metal; the crystals are reddened by ammoniacal vapours.

ALLOY. *Syn.* ALLIAGE, Fr.; LEGIRUNG, VERMISCHUNG DURCH SCHMERZEN, Ger. In coinage, a compound of the precious metals with another, or others, of less value; also the least valuable metal, or metals, in such compounds. In chemistry and metallurgy, combinations of the metals with each other usually obtained by fusion. When mercury is one of the component metals, the compound is termed an AMALGAM.

Prep., &c. No general rules can be given for this purpose. Alloys of metals differing greatly in fusibility, are commonly made by adding the more fusible one, either in the melted state, or in small portions at a time, to the other melted, or heated to the lowest

possible temperature at which a perfect union will take place between them. The mixture is usually affected under a *flux*, or some material that will promote liquefaction, and prevent volatilisation and unnecessary exposure to the air. Thus; in melting lead and tin together, for solder, resin or tallow is thrown upon the surface, in tinning copper, the surface is rubbed with *sal ammoniac*; and in combining some metals, powdered charcoal is used for the same purpose. Quicksilver combines with many metals in the cold, forming AMALGAMS.

Comp. The following Table exhibits the composition of the more important compounds of this class;—

Table of the principal Alloys.

NAMES.	COMBINING METALS.
ALBATA	See German silver.
AMALGAMS	Mercury and other metals.
BATH-METAL	Copper and zinc.
BELL-METAL	Copper and tin.
BRASS	Copper and zinc.
BRITANNIA METAL.....	Tin with antimony, copper, and bismuth.
BRONZE	Tin and copper.
CANNON-METAL	Tin and copper.
DUTCH GOLD	Copper and zinc.
FUSIBLE METAL	Bismuth, lead, and tin.
GERMAN SILVER.....	Copper, nickel, and zinc, with, sometimes, a little iron and tin.
GOLD (<i>standard</i>).....	Gold with copper.
„ (<i>old standard</i>)	Gold with copper and silver.
GUN-METAL.....	See Cannon-metal.
MOSAIC GOLD	Copper and zinc.
OR-MOLU	„ „
PEWTER (<i>common</i>)	Tin and lead.
„ (<i>best</i>).....	Tin with antimony, bismuth, and copper.
POT-METAL, COCK-METAL	Copper and lead, with, sometimes, a little zinc.
QUEEN'S METAL	Tin with antimony, bismuth, and copper.
SHOT-METAL	Lead with a little arsenic.
SILVER (<i>standard</i>)	Silver and copper.
SOLDER	Tin and lead.
SPECULUM-METAL	Tin and copper, and arsenic.
STEREOTYPE-METAL	Lead, antimony, and bismuth.
TOMBAC, RED TOMBAC	Copper and zinc.
TUTANIA	See Britannia metal.
TYPE-METAL	Lead and antimony.
WHITE COPPER (<i>Packfong</i> ; <i>White tombac</i>)	Copper and arsenic.

Prop., &c. Alloys generally possess characteristics unshared by their component metals. Thus; copper and zinc form brass, which has a different density, hardness, and colour to either of its constituents. Whether the metals tend to unite in equivalent proportions, or in any definite ratio, is still undetermined. The evidence afforded by the natural alloys of gold and silver, and by the phenomena accompanying the cooling of several alloys from the state of fusion, goes far to prove that such is the case.

(Rudberg.) The subject is, however, one of considerable difficulty, as metals and metallic compounds are generally soluble in each other, and unite by simple fusion and contact. That they do not combine indifferently with each other, but exercise a species of elective affinity not dissimilar to other bodies, is clearly shown by the homogeneity and superior quality of many alloys in which the constituent metals are in atomic proportion. The variation of the specific gravity and melting-points of alloys

from the mean of those of their component metals, also affords strong evidence of a chemical change having taken place. Thus, alloys generally melt at lower temperatures than those required for their separate metals. They also usually possess more tenacity and hardness than the mean of their constituents; but their malleability, ductility, and power of resisting oxygen, is generally diminished. The alloy formed of two brittle metals is always brittle; that of a brittle and a ductile metal, generally so; and even two ductile metals sometimes unite to form a brittle compound. The alloys formed of metals having different fusing-points are usually malleable whilst cold, and brittle whilst hot. The action of the air on alloys is generally less than on their simple

metals, unless the former are heated. A mixture of 1 part of tin and 3 parts of lead is scarcely acted on at common temperatures; but at a red heat it readily takes fire, and continues to burn for some time like a piece of bad turf. In like manner, a mixture of tin and zinc, when strongly heated, decomposes both moist air and steam with almost fearful rapidity.

The *specific gravity* of alloys is never the arithmetical mean of that of their constituents, as commonly taught; and, in many cases, considerable condensation or expansion occurs. When there is a strong affinity between two metals, the density of their alloy is generally greater than the calculated mean; and *vice versa*, as may be seen in the following Table:—

Alloys having a density—

Greater than the mean of their constituents:—

Copper and bismuth,
 " palladium,
 " tin,
 " zinc,
 Gold and antimony,
 " bismuth,
 " cobalt,
 " tin,
 " zinc,
 Lead and antimony,
 Palladium and bismuth,
 Platinum and molybdenum,
 Silver and antimony,
 " bismuth,
 " lead,
 " tin,
 " zinc.

Less than the mean of their constituents:—

Gold and copper,
 " iridium,
 " iron,
 " lead,
 " nickel,
 " silver,
 Iron and antimony,
 " bismuth,
 " lead,
 Nickel and arsenic,
 Silver and copper,
 Tin and antimony,
 " lead,
 " palladium,
 Zinc and antimony.

"Every alloy," says Dr. Ure, "is, in reference to the arts and manufactures, a new metal, on account of its chemical and physical properties. A vast field here remains to be explored. Not above sixty alloys have been studied by chemists, out of many hundreds which may be made, and of these very few have yet been practically employed. Very slight modifications often constitute very valuable improvements upon metallic bodies." See ANALYSIS, ASSAYING, BRASS, BRONZE, ELECTROTYPE, GERMAN SILVER, GOLD, METALS, SPECIFIC GRAVITY, &c.

ALLSPICE. See PIMENTO.

ALLUVIAL. (Πόσις-γῆ). *Syn.* ALLUVIOUS*; ALLUVIUS, L.; D'ALLUVION, Fr. In *geology*, applied to partial deposits of mud, sand, gravel, &c., left by rivers and floods upon land not permanently submerged beneath water; in *agriculture*, applied to soils so formed or deposited.

ALLUVIUM. [L., Eng.] *Syn.* ALLUVION, Fr.; ANFLÖSSUNG, ANSCHWEMMUNG, Ger. In *geol.* and *agr.*, alluvial deposit or soil. See SOILS, &c.

ALLYL (-Η). C_3H_5 . In *chemistry*, the radical of the essential oils containing sulphur, as those of *assafoetida*, *garlic*, *horseradish*, *mustard*, *onions*, &c., which are either *sulphides* or *sulphocyanides* of allyl. Its probable existence was first shown by Captain Reynolds, who succeeded in producing several of its derivatives. It has since been obtained, in a separate state, by the action of sodium upon iodide of allyl. It is a oily substance with a high boiling-point.

Sulphide of Allyl, $(C_3H_5)_2S$; obtained (artificially) by acting on sulphocyanide of allyl with sulphide of potassium. See OIL OF GARLIC.

Sulphocyanide of Allyl, C_3H_5CNS ; obtained by submitting iodide of allyl to the action of sulphocyanide of potassium; or by gently mixing a mixed alcoholic solution of sulphide of allyl and bichloride of mercury, with sulphocyanide of potassium. See OIL OF BLACK MUSTARD.

ALMOND (ah'münd). *Syn.* AMYGDALA (also -US, -UM*), L.; AMANDE, Fr.; MANDEL, Ger., Dut., Dan., Swed. The 'almond-tree' (*amygdalus communis*—Linn.; Ph. L., E., and D.; *Amandier*—Fr.), a tree of the *nat. ord.* Rosaceæ, indigenous to Persia, Syria, and the north of Africa; but also extensively cultivated in southern Europe. The almond-tree is about the size of the peach-tree, which it much resembles in appearance. It is inca-

pable of ripening its fruit in this country, and is, therefore, only grown here for the sake of its beautiful xernal flowers. There are several varieties, of which the most important are the *sweet* and the *bitter*, so named from the flavour of the seed or kernel. These, for the most part, resemble each other in appearance. De Candolle ('Prodromus,' ii, 580) gives five varieties of this species:—A. AMA'RA (*bitter-almond*); A. DUL'CIS (*sweet-a*); A. FRAGILIS (*frāj-i*; *tender-shelled a.*); A. MACROCAR'PA (*large-fruited a.*, *pistachio a.*, *sultana a.*); A. PERSICOIDES (*peach-a.*).

Persian Almond. The peach.

ALMONDS (-mōndz). *Syn.* AMYGDALÆ, L.; AMANDES, Fr.; MANDELN, Ger. The seed or kernels of the almond-tree. They are met with in commerce both in the shell (AMYGDALÆ CUM PUTAMINE, -in-e, L.), and shelled (AMYGDALÆ, L.). In the retail shops, most commonly in the latter form. Those rancid, broken, or worm-eaten, should be rejected.

Bitter Almonds. *Syn.* AMYGDALÆ AMA'RÆ, L.; AMYGDALA AMARA, Ph. E.; AMANDES AMÈRES, Fr.; BITTERE MANDELN, Ger. A variety imported from Mogadore, chiefly characterised by possessing the bitter flavour, and, when rubbed with water, the odour of peach-kernels. They are also smaller and thicker than the sweet almond.

Uses, &c. Bitter almonds are used to relieve the flavour of sweet almonds, to clear muddy water, and to flavour confectionery, liqueurs, &c. By pressure, they yield their bland oil (OIL OF ALMONDS; O'LEUM AMYGDALÆ, L.); the resulting cake (BITTER-A-CAKE; PLACENTA A. AMARÆ, L.) is distilled for the volatile oil (ESSENTIAL OIL OF A.; O. A. A., L.), and is afterwards again pressed into cakes (A-CAKE) and used to fatten pigs, and for other purposes. Bitter almonds are now seldom employed in medicines, although it is said that they have cured 'intermittents' when bark had failed (Bergius), and that their emulsion has been found useful in pulmonary and dyspeptic affections, whooping-cough, and asthma; and externally, as a lotion in acne. (Thomson.) In large quantities they are poisonous, and even in the smallest quantities have been known to produce nettle-rash (*urticaria*), and other unpleasant symptoms. They have long been in repute as an antidote to intoxication. The ancient bacchanals chewed them at their orgies, to lessen the effects of wine, and to enable them to take it in larger quantities with impunity.

Blanched Almonds (blācht'-). *Syn.* AMYGDALÆ DEORBITATE, L. Almonds from which the husk or seed-coat has been removed. This is effected by soaking them for a short time in warm water, until the skin can be easily removed by pressure between the thumb and forefinger. They are then peeled, rinsed in cold water, drained, and dried. When intended for the table, the last is effected by wiping

them with a soft towel; but when they are intended to be powdered, or kept, they are dried by a very gentle heat in a stove, or in the sun.

Burnt Almonds. *Syn.* ROASTED ALMONDS; ALMOND COFFEE. Used to colour and flavour liqueurs and confectionery; and formerly, as a substitute for coffee.

Guiana Almonds (gñe-āh-nā; g hard). Brazil-nuts.

Indian Almonds. The fruit of *terminalia catappa* (Linn.). They are oleaginous, and nutritious; and are used as a substitute for almonds.

Ja'va Almonds (jāh'-). The nuts or kernels of *canarium commune* (Linn.). They are eaten, made into bread, and pressed for their oil.

Sweet Almonds. *Syn.* ALMONDS; AMYGDALÆ, L.; A. DUL'CIS, Ph. D.; AMYGDALA, A. JORDANICA, Ph. L.; A. DUL'CIS, Ph. E., & Ph. L. 1836; AMANDES, AMANDES DOUCES, Fr.; SÜSSE MANDELN, Ger. These are the well-known dessert or table fruit of the name, and are the kind always referred to when 'almonds' (simply) are spoken of or ordered.

Comm. var.—1. JORDAN ALMONDS, which are the finest, and are imported from Malaga. Of these there are two kinds; the one, above an inch in length, flat, and with a clear brown cuticle, sweet, mucilaginous, and rather tough; the other, more plump, and pointed at one end, brittle, but equally sweet with the former.—2. VALENTIA A. (which come next in quality) are about $\frac{3}{4}$ ths of an inch broad, not quite an inch long, round at one end, and obtusely pointed at the other, flat, of a dingy brown colour, with a dusty cuticle.—3. BAE'BAEY and ITALIAN A., which resemble the latter, but are generally smaller and less flattened.—4. A variety, of medium quality, imported in baskets from Spain.

Uses, &c. Sweet almonds are nutritive, emollient, and demulcent; but frequently disagree with weak stomachs. The husk is apt to occasion indigestion and nausea. Owing to a peculiar idiosyncrasy of some habits, dyspepsia, diarrhoea, oedematous swelling of the face, and urticaria (*nettle-rash*), sometimes, though seldom, follow the use of unblanched almonds. Blanched almonds do not produce these inconveniences, and, therefore, should be preferred for the table. In medicine, almonds are employed chiefly under the form of emulsion, confection, &c., and to suspend oily substances in water. Their uses for dietetical purposes are well known. Preparations of them are also employed as cosmetics. The cake left after expressing the oil (ALMOND-CAKE), is used for washing the skin, which it is said to render beautifully soft and clear. See ALMOND PASTE, &c.

ALNIGHT† (awl'-). A cake of wax with a wick in the midst. The forerunner of, and a rude form of the modern dumpy night-lights called MORTARS.

ALOE (āl'-o). *Syn.* AL'OE (-o-ē), L., Fr. (or

ALOES), Ger., Ital., Sp., Belg., Dan., Dut., Swed. The aloe-tree. In *botany*, a genus of plants of the *nat. ord.* Liliaceæ (DC.). The species, of which there are several, are succulent plants or small trees with endogenous stems, and stiff, fleshy, hard, pointed leaves, abounding in a purgative principle (ALOES), which is obtained from them by either evaporating the expressed juice or the decoction. They are all natives of warm climates, and most of them are indigenous to southern Africa.

Hist. אֶהְלֵם, *ahleem*, (aloe-trees,) were known to the sacred historians; and both the plant and the inspissated juice are described by Dioscorides and Pliny.²

Uses, &c. In Africa, the leaves of the Guinea aloe are made into ropes, fishing-lines, bow-strings, stockings, hammocks, &c. The leaves of another species are used to catch and hold rain-water. The expressed juice and decoction are also used by the natives as a distaff. (Vide *infra*.) Recent comparative trials, made in Paris, of the strength of cordage and cables formed of hemp, and of the aloe from Algiers, are said to have shown the great superiority of the latter. Fabroni obtained a fine violet colour from the recent juice of the aloe, which has been proposed as a dye for silk.³

American Aloe. The *agave Americana* (Linn.), is a plant unconnected with the preceding, and belonging to the *nat. ord.* Bromeliaceæ. It is found in all parts of tropical America, and is largely cultivated on the shores of the Mediterranean; and less frequently, as an exotic plant in this country. It grows to the height of about 20 feet, and takes many years to produce its gigantic and magnificent pyramid of flowers; shortly after which it perishes, exhausted, as it were, by its efforts in bestowing its rare beauty on the floral world. The vulgar belief is, that it blossoms only once in a century; but, as stated by the late Mr. Loudon, it flowers sooner or later, according to the culture bestowed on it. Its sap yields a kind of honey (AGA'VE HONEY), and by fermentation, an intoxicating liquor (PULQUE); desiccated juice, mixed with wood ashes, is used as soap, and lathers either with sea or fresh water; leaf-fibre, used as hemp to make thread and twine.

ALOE-RESIN. *Syn.* RESINA ALOËS, L. The resinous matter deposited by a decoction of aloes as its cools.

Prep. (Ph. L. 1746.) Boil aloes, 1 part, in water, 8 parts, and allow the decoction, strained whilst hot, to repose until the next day; then wash the deposited RESIN, and dry it by a gentle heat. It is probably a mixture of aloe and oxidised extractive.

ALOËS (-oze). *Syn.* BITTER ALOËS†; ALOË (-o-ē, L.; ALOËS, SUC D'ALOËS, Fr.; ALOE,

GLAUSINDE ALOE, Ger.⁴ The inspissated juice or extract of several species of aloe.

Comp., Prep., &c. Aloes is a complex resinous substance containing a body called *aloin*, which is its active or purgative principle. It is completely soluble in boiling water, and in alcohol or rectified spirit. The decoction deposits an impure resin or resinoid on cooling.

Phys. eff., Uses, &c. Aloes is a warm stimulating purgative, in doses of 3 to 10 gr.; whilst even 1 or 2 gr. seldom fail to produce one motion without pain or inconvenience. It is considered highly serviceable in hypochondriacal, hysterical, and dyspeptic affections, particularly in phlegmatic habits, and in cases arising from deficiency of bile. As an emmenagogue, and a vermifuge, few medicines are more valuable. It acts on the large intestines, and principally on the rectum; and, therefore, should be administered with caution, or only in small doses, where there is a tendency to prolapsus or piles, and in cases where uterine stimulants (as in pregnancy, &c.) would be improper. "It is remarkable with regard to it, that it operates almost as good a purpose in a small, as in a large dose; and one or two grains will produce one considerable defecation, and twenty grains will do no more, except it be that in the last dose (case), the operation will be attended with griping, &c. It is one of the best cures for habitual costiveness." (Cullen.) Many of the effects complained of arise from its slow solubility in the primæ viæ, and may be obviated by administering it in a liquid form, or in a solid form combined with soap, which renders it freely soluble in the juices of the stomach.

Aloes is more frequently taken than, perhaps, any known purgative. It enters into the composition of a majority of the aperient medicines prescribed by the faculty, and forms the principal ingredient of nearly all the advertised purgative, antibilious, and universal pills of the nostrum-mongers. The fact of *aloetic pills* not acting until about 8 to 10 hours after being swallowed—so that if taken on retiring to rest at night, they do not generally disturb the patient before the usual time of rising in the morning—has contributed more than anything else to make such remedies popular with parties whose habits or business avocations would be otherwise interfered with.

Aloes is also extensively used in *veterinary practice*. It is the most valuable and reliable purgative for the horse of the whole materia medica; but is less to be depended on for cattle, sheep, and hogs. Barbadoes aloes is the best for this purpose. Cape aloes are, however, often employed, when 14th more must be given.—*Dose* (of the former), for a HORSE, 4 to 8 dr. ⁵—CATTLE, 3 to 6 dr. (followed by a purging drench);—HOGS, 5 to 15 gr.;

¹ Lib. iii, c. xxv.

² "Hist. Nat." lib. xxvii, c. v.

³ "Annales de Chimie," xxv, 306.

⁴ Also see ALOË (above).

⁵ Aloes takes from 18 to 30, or even 36 hours, to operate on a horse.

SHEEP, 15 to 30 gr.;¹—DOGS, (small ones) 10 to 30 gr., (middle-sized) 20 to 45, or even 60 gr., (large) $\frac{1}{2}$ to 1 dr., or even 2 dr.

Aloes is also used in dyeing; and as a colouring matter in stains, lacquers, and varnishes. Aloes, and several of its preparations, are likewise extensively employed to adulterate porter.

Var. These, arranged in the order of their reputed medicinal value, are—Socotrine, Hepatic, Barbadoes, Cape, &c.; and alphabetically, as given below:—

Barbadoes Aloes. *Syn.* ALOES IN GOURDS; AL'OE BARBADENSIS, L., Ph. L. & E. Imported from Barbadoes and Jamaica, usually in gourds; sometimes in boxes. The best is the inspissated juice of the cut leaf of *aloë vulgaria*; an inferior quality is prepared from the decoction.—*Char., &c.* Opaque, lustreless, of a liver colour, a little tending to black, with a bitter nauseous taste, and a very disagreeable odour, especially when breathed on; *powder*, a dull olive-yellow. It is the 'hepatic aloes' of most continental writers, and said to be the 'Alôe of Dioscorides.' It is more active than the other varieties of aloes; but is also more apt to occasion hemorrhoids, and to gripe, than any of them.

Caballine Aloes (line). *Syn.* FETID ALOES, HORSE A.; ALOË CABALLINA, A. GUINIE'NIS, L.; ALOËS CABALLIN, Fr. From *aloë Indica* (O'Shaughnessy); or from *aloë spicata* by long and careful boiling (Lindley). Used only by farriers. Scarcely known in English commerce.

Cape Aloes. *Syn.* ALOË CAPENSIS, A. LUCIDA (Geiger), L. Imported from the Cape of Good Hope, and obtained from *aloë spicata*, and other Cape species. Odour, stronger and even more disagreeable than that of Barbadoes aloes; colour, deep greenish-brown; appearance, shining and resinous; fracture, generally glassy; *powder*, a lively greenish-yellow; almost completely soluble in boiling water, decoction paler than that of other kinds. It is weaker than Barbadoes or even hepatic aloes, and is more apt to gripe, &c., than the latter. A finer kind, known as 'Bethelsdorp aloes,' imported from Algoa Bay, is more of a liver colour, and softer than the preceding, and hence often called CAPE-HEPATIC-ALOES.

Hepatic Aloes. *Syn.* BOMBAY ALOES*, EAST-INDIA A*, LIVER-COLOURED SOCOTRINE A*; ALOË HEPATICA, Ph. L. & D.; A. INDICA, Ph. E. Imported from Bombay and Madras. It is usually said to be obtained from "uncertain species of aloes;" but it is almost certain that it is "the juice of the Socotrine aloes plant which has been solidified without the aid of artificial heat."²—*Char., &c.* Opaque, of a liver colour, bitter taste, and an unpleasant odour.³ (Ph. L.) It is less odorous,

darker coloured, and more opaque than Socotrine aloes; its powder has also a duller colour; and weak spirit leaves much undissolved matter. Its decoction on cooling frequently deposits a yellow powder. The finer and brighter varieties of *hepatic aloes* are commonly sold for 'Socotrine,' and their medicinal virtues are nearly similar. (See below)

Indian Aloes (various):—1. Deep brown or black, very opaque, and less soluble than ordinary aloes. Scarcely known in commerce.—2. Several varieties ranging in character from 'Cape aloes' to 'hepatics,' and occasionally to 'Barbadoes,' obtained from several species.

Mo'cha Aloes (-käh). *Syn.* ALOË DE MOCHA, L. Imported from Muscat. An inferior kind of Indian aloes. (Christison.) It is obtained from the same plant as produces genuine hepatic aloes. (Lindley.) It holds an intermediate position between 'Cape' and 'hepatics,' but contains much impurity; the latter often amounting to upwards of 25%. Some specimens are, however, of excellent quality. When melted and 'doctored,' it is sold for Barbadoes, hepatic, and even Socotrine aloes.

Socotrine Aloes (-trin; sük-†). *Syn.* SOCOTRINE ALOES, SMYRNA A., TURKEY A.; ALOË SOCOTRINA, Ph. L.; ALOË, Ph. L. 1836; A. SOCOTRINA, Ph. E. "The juice of the cut leaf of uncertain species hardened by the air." (Ph. L.) Genuine Socotrine aloes is generally supposed to be obtained from *aloë spicata*; but is referred to by De Candolle to a distinct species, *a. Socotrina*; and by Martius, also to *a. purpurascens*. Formerly this variety was brought from the Island of Socotra or Zocotora (hence the name), by way of Smyrna and Malta; but it is now chiefly obtained from Bombay and Madras.—*Char., &c.* Colour, garnet red to golden red; smell, peculiar and aromatic, not unlike a decaying russet apple, especially when fresh-broken, or breathed on, or warmed; taste, permanently and intensely bitter; fracture, conchoidal; softens in the hand, and becomes adhesive, yet retains considerable brittleness; *powder*, bright golden-yellow colour; central portions of the lump often soft, especially when first imported. "It is brittle, bitter, of a reddish-brown colour, and an aromatic odour. Light permeates thin recently broken laminae." (Ph. L.) "In thin pieces, translucent and garnet red; almost entirely soluble in spirit of the strength of sherry. Very rare." (Ph. E.)

Socotrine aloes are always preferred for medicinal purposes, and are the only variety used in perfumery, varnishes, and other nice purposes in the arts.

Strained Aloes. *Syn.* MELTED ALOES; ALOË COCTA, L. *Proc.* 1. The aloes are melted in a copper pan, by the heat of steam or a water bath, and are then pressed through a strong hair or wire sieve, and allowed to cool.

2. As above, but with the addition of about twice its weight of water; the decoction being strained and evaporated.

¹ Aloes, however large the dose, often fails to purge sheep. In very large quantities it is poisonous to them.

² Pereira, "Elem. Mat. Med. and Therap.," vol. ii, 188, 4th Ed.; "Pharm. Journ.," vol. xi.

Obs. Mocha, Indian, and other common aloes, treated in this way and coloured, are frequently sold for melted or strained 'Socotrine' and 'hepatics.' The colouring matter usually employed is the precipitated carbonate of iron (sesquioxide), or Venetian red, in very fine powder, with, sometimes, a little annatto. This fraud is not readily detected by mere inspection, by those unaccustomed to these matters; and hence the impunity with which it is perpetrated.

The object in melting aloes is to deprive it of the foreign matters, as sand, leaves, pieces of wood, &c., which the commoner kinds generally contain in large quantities. The action of the heat drives off much of their nauseous smell, at the same time that it deepens their colour, and renders their appearance more translucent and resinous, to the disguise of their original nature. The operation, on the large scale, is usually carried on at night, in consequence of the horribly nauseous fumes evolved, which may be smelt at a great distance, and contaminate the clothes of those engaged in it for a long time afterwards.

ALOE'S WOOD. *Syn.* AL'OE-WOOD; EAGLE-WOOD; AGAL'LOCHUM (-kūm), LIG'NUM AL'OE'S, L. AGAL'LOCHI, L. A. YE'RI, L. AQ'VILLE, L. ASPAT'ATHI, L.; AGALLOCHE, BOIS D'ALOES, Fr.; ALOEHOLZ, Ger.; CALAM'BAC, CALAM'-BOUC, Ind.; XYLO-AL'OE'S†. A name applied to the wood of *aloea'ylon agal'lochum* (Lam.), a leguminous tree of Cochin China; and, though apparently less correctly, to that of *aquila'ria agallochum* and *a. ova'ta* (Lour.), trees of tropical Asia, belonging to a different *nat. order*. Both are highly fragrant and aromatic; used in fumigations and pastilles, and occasionally, by cabinet makers and in-layers. The essential oil of the wood, dissolved in spirit, was regarded by Hoffman as one of the best cordials and invigorants known. The same has also been said of a tincture of its resin.

The same name and synonyms are popularly applied to the resin of the above woods (ALOE'S-WOOD-RESIN), of which there are two varieties:—the one, light and porous, and filled with a highly fragrant resinous substance; the other, denser and less resinous. It is an oily concretion in the centre of the tree, the result of disease, which gradually hardens, and, in time, kills it. It is highly fragrant, and is said to be nervine, cephalic, cardiac, and stimulant. The powder is regarded as tonic and astringent. Of all perfumes this is said to be the one most esteemed by oriental nations.

ALOE'TIC. *Syn.* ALOE'TIOUS, L.; ALOE'TIQUE, Fr. Of or belonging to aloes. In medicine, pharmacy, &c., applied to any preparation containing aloes as a characteristic ingredient; made or obtained from aloes. *Substantively*, an aloe'tic medicine.

AL'OIN (-o-in). $C_{17}H_{15}O_2$. [Eng., Fr.] *Syn.* AL'ON; ALO'IN, L. The Messrs. T. & H. Smith,

of Edinburgh, have applied this name to a crystalline substance, which they assert to be the pure cathartic principle of aloes. Their process is to evaporate to the consistence of a syrup, in vacuo, a solution, obtained by exhausting a mixture of aloes and sand, with cold water, and then to set it aside for a few days. The resulting dark crystalline mass is purified by pressure between folds of bibulous paper, and repeated crystallisation, from hot water. Barbadoe aloes are commonly used for the purpose; but soft or semi-liquid Socotrine aloes, or the unevaporated Socotrine-aloes juice, is probably its best source.—*Dose*, 1 to 2 gr.

ALOPE'CIA (-sh'ā). [L.] *Syn.* AL'OPECY, FOX'-EVIL; ALOPECIE, Fr.; FUCHSRAUDE, Ger. In *pathology*, baldness from disease, often extending to the beard and eyebrows; as distinguished from 'calvities,' or ordinary baldness arising from attenuation of the scalp or defective nutrition. See BALDNESS.

ALPACA. A species of Llama, popularly known as the PERUVIAN SHEEP, an animal intermediate between the camel and sheep, having long silky hair, nearly as fine as that of the Cashmere goat. It was introduced to the British manufacturers in 1834, when only 5700 *lbs.* of it was imported; but it soon became an important article of commerce, the quantity imported having gradually risen to above 2½ millions of *lbs.* in 1853; whilst the price has risen from about 9d. to 2s. 7d. the *lb.* in the same time. The name is also given to fabrics woven from the wool of this animal; and to others in fine wool, made in imitation of them. The gigantic factory, &c., erected at Saltaire, Yorkshire, in 1852, for this manufacture, covers about 12 acres of land. See LLAMA.

AL'PHA-ORSELL'IC ACID. See ORSELLIC ACID.

AL'QUIFOU (-ke-fōō). *Syn.* BLACK LEAD-ORE, POTTER'S ORE. A native sulphide of lead used by potters to give a green glaze to coarse wares.

ALSTONIA SCHOLARIS. (Ind. Ph.) *Habitat.* Common in forests throughout India.—*Official part.* The bark (*Alstonia cortex*). It occurs in thick, irregular, more or less contorted pieces, easily broken. It consists of a rough greyish epidermis, investing a buff or pale cinnamon-coloured bark; internally, still lighter in colour, and of a spongy texture, having a very bitter taste, but devoid of odour.—*Properties.* Astringent tonic, anthelmintic, antiperiodic.—*Therapeutic uses.* In chronic diarrhoea and the advanced stages of dysentery; also as a tonic in debility after fevers and other exhausting diseases.—*Dose*, 3 to 5 grains, either alone or combined, in bowel affections, with small doses of ipecacuanha and extract of gentian.—*Preparations.* TINCTURE OF ALSTONIA (*Tinctura Alstonia*). Take of alstonia bark, bruised, 2½ ounces; proof spirit, 1 pint. Macerate for seven days in a closed vessel, with occasional agitation; filter, and add sufficient proof spirit to make 1 pint. Or prepare by

percolation, as Tincture of Calumba.—*Dose.* 1 to 2 fluid drachms.

Infusion of Alstonia. (*Infusum Alstonia.*) Take of alstonia bark, bruised, $\frac{1}{2}$ an. ounce; boiling water, 10 fluid ounces. Infuse in a covered vessel for an hour and strain.—*Dose.* From 1 to 2 fluid ounces twice or thrice daily. A good serviceable tonic.

ALTERATIVE (awl'-tér-à-tív). *Syn.* ALTERANT*; ALTERANS (ál'-), L.; ALTERNANT, ALTERNATIF, Fr. In *medicine*, having power to alter; applied to substances and agents which occasion a change in the habit or constitution, and thus re-establish the healthy functions of the body, or any part of it, without producing any sensible evacuation or other obvious effect.

ALTERATIVES (-tívz). *Syn.* ALTERANTIA, L.; ALTERNATIFS, &c., Fr. Alterative medicines or agents. The preparations of mercury and iodine, when properly administered, are the most useful members of this class; and are those which are now the most generally employed.

ALTHEIN (ál-thé'-ín). *Syn.* ALTHE'INA, L. The name given by Braconnot to a substance identical with *asparagin*, which he discovered in the 'marsh-mallow' (*althæa officinalis*, Linn.).

ALUDEL (-û-). In *chemistry*, a pear-shaped glass or earthen pot open at both ends, formerly much used for conducting other vessels in the process of sublimation. A number of them joined together are still employed for the distillation of quicksilver, in Spain.

ALUM. $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24Aq.$ *Syn.* POTASH-ALUM, SULPHATE OF ALUMINUM AND POTASSIUM, COMMON ALUM; ALUMEN, A. POTASSIUM, L.; ALUN, SULFATE D'ALUMINE ET DE POTASSE, Fr.; ALAUN, Ger.; ALUME, Ital.

The principal alum-works in England, until recently, were those of Lord Glasgow, at Hurlitt and Campsie, near Glasgow, and those of Lords Dundas and Mulgrave, at Whitby, Yorkshire (est. 1600); but those of Mr. Spence, at Manchester, and at Goole (Yorkshire), and of Mr. Pochin, at Manchester, are now among the largest, if they be not actually the largest in the world. There are also extensive alum-works at and near Newcastle-on-Tyne; but none of importance, as we know of, in any other part of these realms.

Nat. hist. Alum is found native in some places (NATIVE ALUM), either effloresced on the surface of bituminous alum-schist (Göttwigg, Austria); or united with the soil in the neighbourhood of volcanoes (Solfatara, Naples); when it may be obtained by simple lixiviation and evaporation, a little potash being commonly added to convert the excess of sulphate of alumina present into alum. It is also found in certain mineral waters (East Indies).

Sources. The alum of commerce is usually obtained from schistose pyritic clays, commonly termed alum-ores, aluminous shale, a-

schist, &c.; and from alum-rock, a-stone, or alunite. At La Tolfa, Civita Vecchia, where the best Roman-alum is produced, the source is stratified alum-stone. On the Continent, and in Great Britain, it is generally pyritaceous clays, volcanic aluminous ores, aluminous shale, or alum-slate. These minerals contain sulphide of iron, alumina, bitumen or carbon, and frequently a salt of potassium. Of late years large quantities of alum have been prepared on the banks of the Tyne from aluminous clay.

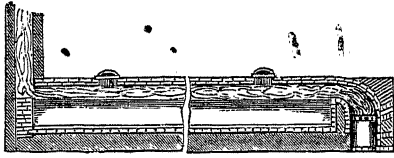

Prep. The manufacture of alum is technically said to be conducted according to the *natural process* when prepared from alum-schist or alum-ore; and according to the *artificial process* when made by acting on clay with sulphuric acid, and adding a potassium salt to the resulting lixivium. The following are the details of these processes:—

a. From ALUM-ORE, ALUMINOUS SCHIST, or SHALE, &c.:—

1. The *mineral* (alum-ore, a-schist, &c.), is placed in heaps, and moistened from time to time with water, when it becomes gradually hot, and falls into a pulverulent state. This decomposition commonly occurs either wholly, or partially, on the floor of the mine. If the ore does not possess this property on mere exposure to air and moisture, it is broken into pieces and laid upon a bed of brushwood and small coal, to the depth of about four feet, when the pile is fired and fresh lumps of the alum-mineral thrown on, until the mass becomes of considerable height and size. The combustion, as soon as established, is conducted with a smothered fire, until the calcination is complete; care being taken to prevent fusion, or the disengagement of either sulphurous or sulphuric acid, from contact between the ignited stones and the carbonaceous fuel.¹ To promote these ends the pile, at the proper time, is 'mantled' (as the workmen call it) or covered with a layer of already calcined and exhausted ore, in order to protect it from high winds and heavy rains; as also to moderate the heat, and let it proceed gradually, so that the sulphur present may not be lost or wasted by volatilisation. The roasting is finally checked by a thicker 'mantling,' and the whole allowed to cool. By this time the pile has usually lost about one half its bulk, and become open and porous in the interior, so that the air can circulate freely through the mass; the latter, in dry weather, as the heap cools, being usually promoted by sprinkling a little water on it, which, by carrying down some of the saline matter, renders the interior still more open to the atmosphere. The whole, when cold, or nearly cold, is, if

¹ The generality of *alum-minerals* require roasting; and their own bituminous matter is, in many cases, sufficient to produce the heat required, which need not necessarily exceed 600 to 650° Fahr., provided it be continued for a sufficient period. It is only when they are less bituminous or carbonaceous that *slack* or *saw-dust*, &c., is employed.

necessary, still further exposed to the action of air and moisture. The time required to calcine the heap properly, including that taken by the burned ore to cool, varies, according to its size

and the state of the weather, from three to nine, or even twelve months. The residuum of the calcination is next placed in large stone or brick cisterns, and edulcorated with water, until all the soluble portion is dissolved out; the solution is then concentrated in another stone cistern, so made that the flame and heated air of its reverberatory furnace sweep the whole surface of the liquor. (See *engr.*) The evaporation is continued until it just barely reaches the point at which crystals are deposited on cooling; when it is run off into coolers. After the sulphate of iron, always present, has been deposited in crystals, the mother-liquor, containing the sulphate of aluminum, is run into other cisterns, and a saturated solution of chloride of potassium, or of sulphate of potassium, or (sometimes) impure sulphate or carbonate of ammonium, or a mixture of them, is added until a cloud or milkiness ceases to be produced on addition of more.¹ It is next allowed to settle and get thoroughly cold, and the supernatant 'mother-liquor' being

drawn off with a pump or syphon, the precipitate, which is alum in the form of minute

¹ For pure POTASH-ALUM a salt of potash only must be employed. When ammonia (usually in the form of gas-liquor or gas-sulphate) is used as the precipitant, the product is AMMONIA-ALUM. The ordinary alums of commerce are now generally mixtures of the two.

² The respective quantities required to produce 100 parts of alum from the sulphate of alumina liquor, are—

Chloride of potassium	15.7
Sulphate of " "	18.4
ammonium	18.9

In practice, the exact quantity required may be found by a previous trial of a little of the aluminous liquor; but the indications mentioned in the text will always show the operator when a sufficient dose is added.

crystals (technically termed 'flour'), is well drained, and subsequently washed by stirring it up with a little very cold water, which is then drained off, and the operation repeated a second time with fresh water. A saturated solution of the pulverulent alum ('flour') is next formed in a leaden boiler, and the clear portion is run or pumped off, while boiling hot, into crystallising vessels, called 'roaching casks' (see *engr.*), the staves of which are lined with lead, and nicely adjusted to each other. After the lapse of a week or ten days, the hoops and staves of these 'casks' are removed, when a thick crust of crystallised alum is found, which exactly corresponds in form and size to the interior of the cask. A few holes are then made in the sides of this mass, near the bottom, to allow the contained mother-liquor to drain off, after which the whole is broken up and packed in casks for sale. Sometimes the alum thus obtained, or the lower portion of it, is washed with a little very cold water, and, if discoloured, or small or slimy, is purified by a second crystallisation.

• 2. As ammoniac-alum (Spence's process; see *below*), but using a potash-salt as the precipitant, either wholly or in part, instead of ammonia; and, in the latter case, supplementing the deficiency of potash with ammonia, as there explained.

5. FROM ALUMINOUS CLAY AND OIL OF VITRIOL:—

1. Clay, free or nearly free from 'carbonate of lime' and 'oxide of iron,' is chosen for this purpose. It is moderately calcined (in lumps) in a reverberatory furnace, until it becomes friable; great care being taken that the heat be not sufficient to indurate it, which would destroy its subsequent solubility. It is next reduced to powder, sifted, and mixed with about 45% of its weight of sulphuric acid (sp. gr. 1.45), the operation being conducted in a large stone or brick basin arched over with brickwork. Heat is then applied, the flame and hot air of a reverberatory furnace being made to sweep over the surface of the liquor. The heat and agitation are continued for 2 or 3 days, when the mass is raked out, and set aside in a warm place for a few weeks (6 to 8), to allow the acid the more perfectly to combine with the clay. At the end of this time the newly formed sulphate of alumina is washed out, the solution evaporated until of a sp. gr. of about 1.38 (1.24 for 'ammonia-alum'), and the salt of potash added. The remaining operations resemble those above described. Good alum may be produced by this process at about two thirds the cost of rock or mine alum.

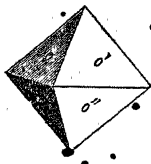

2. (Process of Mr. Pochin.) Fine China clay is heated in a furnace, and mixed with a suitable proportion of sulphuric acid; the latter being considerably diluted with water, in order to moderate its action, which would otherwise be far too violent. The mixture is then passed into cisterns, furnished with

movable sides, where, in a few minutes, it heats violently and boils. The thick liquid gradually becomes thicker, until it is converted into a solid porous mass; the pores being produced by the bubbles of steam which are driven through it, owing to the heat resulting from the reaction of the ingredients on each other. This porous mass (ALUM-CAKE; CONCENTRATED ALUM) appears perfectly dry, although retaining a large amount of combined water. It also contains all the silica of the original clay, but in such a state of fine division, that the whole appears homogeneous; whilst it imparts a dryness to the touch which can scarcely be given to pure sulphate of alumina. From this substance a solution of pure sulphate of alumina is easily obtainable by lixiviation, and allowing the resulting solution to deposit its silica before using it; but for many purposes the presence of the finely-divided silica is not objectionable. The sulphate-of-alumina solution so obtained is adapted to all the purposes in dyeing for which alum is now employed; the sulphate of potash or of ammonia in the latter being an unnecessary constituent, and one merely added to facilitate the purification and subsequent crystallisation of the salt. To obtain ALUM from the porous alum-cake (the proper proportion of acid having been used in its preparation, or subsequently added), it is only necessary to precipitate its concentrated solution with a strong solution of a salt of potash, or of ammonia, or a mixture of them, and to otherwise proceed as before.

Ratio. In the above process the sulphide of iron of the shale or schist is converted by atmospheric oxygen into sulphate of iron and sulphuric acid; the sulphuric acid decomposes the clay, setting silica free, and producing sulphate of aluminum. The sulphate of iron is mostly got rid of by concentrating the solution of the mixed sulphates, and the mother-liquors are converted into alum by the addition of the salt of potassium. When chloride of potassium is used, it yields chloride of iron and sulphate of potassium, the latter combining with the sulphate of aluminum, and the former remaining behind in the mother-liquor. See ALUMS (in Chemistry).

Comp. Potassium alum has the formula $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24Aq$.

Prop. Alum crystallises in regular octahedrons, often with truncated edges and angles; (see engr.) and sometimes in cubes, but only when there is a deficiency of acid in its composition, with the alkali in slight excess of the proper quantity. (Löwel).¹ It is slightly efflorescent in dry air;

¹ The ordinary alum, of commerce, consists of large crystalline masses, which do not present any regular geometrical form; but by immersion in water for a few days, octahedral and rectangular forms are developed on its surface. (Daniell.)

soluble in 18 parts of cold water, and in rather less than its own weight of boiling water; tastes sweet, acidulous, and very astringent; is styptic; and reddens litmus. When heated it melts, loses its water of crystallisation, and becomes white and spongy (DRIED ALUM); a strong heat, short of whiteness, decomposes it, with the evolution of oxygen and a mixture of sulphuric and sulphurous anhydride; calcined with carbonaceous matter it suffers decomposition, and furnishes a pyrophoric residuum (HOMBERG'S PYROPHOROUS). Ignited with alkaline chlorides, hydrochloric acid is liberated; which also occurs when their concentrated solutions are boiled together. Ammonia precipitates pure hydrate of aluminum from potassium alum; but only a subsulphate from the simple sulphate of alumina. Sp. gr. 1.724; but, when containing ammonia, often so low as 1.710.

Tests, &c. It is easily recognised by its crystalline form, its taste, and by its complete solubility in water. Its aqueous solution gives a white gelatinous precipitate soluble in excess; a platinum wire moistened with the solution imparts a violet colour to the blowpipe flame; and chloride of barium gives a white precipitate insoluble in nitric acid.

Pur. When pure, its solution is not affected by tincture of galls, sulphuretted hydrogen, ferrocyanide of potassium, nor solution of nitrate of silver. Heated with caustic potassa, or quick-lime, it does not evolve fumes of ammonia.

Adult., &c. The principal impurity, and one which renders alum unfit for the use of the dyer, is iron. This may be readily detected by the blue precipitate it gives with ferrocyanide of potassium, or the black precipitate with sulphide of ammonium, which are very delicate tests. Lime, another very injurious contamination, may be detected by precipitating the alumina and iron (if any) with ammonia, and then adding oxalate of ammonia to the boiled and filtered liquid. The liquid filtered from the last precipitate (oxalate of lime) may still contain magnesia, which may be detected by the white precipitate caused on the addition of an alkaline phosphate. Common alum frequently contains ammonia, from urine, or the crude sulphate of the gas-works, having been employed in its manufacture. Powdered alum is frequently adulterated with common salt, in which case it gives a white curdy precipitate with nitrate of silver, turning black by exposure to the light.

Phys. eff., &c. In small quantities alum acts as an astringent; in larger doses, as an irritant. It acts chemically on the animal tissues and fluids, is absorbed, and has been discovered in the liver, spleen, and urine (Griffa), the last often becoming acid (Kraus). Externally, it is astringent. The almost

² Good English alum contains less than 0.1% of iron. The best Roman or Italian alums seldom contain more than 0.08% of iron-alum, notwithstanding their exterior colour.

general use of alum, by the English bakers, is one of the most fertile sources of dyspepsia and liver and bowel complaints, in adults; and of debility and rickets in children. Bad teeth and their early decay, is another consequence of the daily use of alum in our food. The bone matter (phosphate of lime) of bread, instead of being assimilated by the system, is either wholly, or in part, converted into a salt of alumina, which is useless and incapable of appropriation. When alum has been taken in poisonous doses an emetic should be given, followed by warm diluents and demulcents containing a little carbonate of soda; and subsequently, by a purgative.

Uses, &c. The applications of alum in the arts and manufactures are numerous and important. It is used to harden tallow and fats; to render wood and paper incombustible; to remove greasiness from printers' blocks and rollers; to prepare a paper for whitening silver and silvering brass in the cold; to help the separation of the butter from milk; to purify turbid water; to dress skins; to fix and brighten the colours in dyeing; to make lake and pyrophorus, &c. &c. It is also extensively used for clarifying liquors, and for many other purposes connected with the arts and everyday life. In *medicine*, alum is used as a tonic and astringent, in doses of 5 to 20 gr.; as a gargle (1 dr. to $\frac{1}{2}$ pint of water); and as a collyrium and injection (10 to 15 gr. to 6 oz. of water). In lead colic, $\frac{1}{2}$ to 1 dr. of alum (dissolved in gum-water), every 3 or 4 hours, is said to be infallible. Powdered alum is frequently applied with the tips of the fingers, in cases of sore throat and ulcerations of the mouth, &c. A teaspoonful of it is said to be one of the very best emetics in croup. (Dr. Meigs.) Alkalies, alkaline carbonates, lime, magnesia, acetate of lead, astringent vegetables, &c., are incompatible with it.

Gen. commentary. In addition to the particulars of its manufacture given above, we may add, that the plan of getting rid of the ferric salts there referred to, has to some considerable extent been successfully replaced by that of precipitating the alum, instead of the sulphate of iron, by adding alkaline matter to the lixivium. The crystalline precipitate is purified by draining, re-solution, and re-crystallisation; whilst the sulphate of iron and Epsom salts contained in the mother-liquor, are obtained by subsequent evaporation and crystallisation; after which a fresh crop of alum may be got from it, by the use of an alkaline precipitant, as before.

In *estimating* the strength of his solution, the alum-maker takes as a standard, a measure or sp. gr. bottle capable of holding exactly 80 pennyweights of distilled water. The excess of the weight of liquor, in pennyweights, over 80, or that of water, is called so many 'pennyweights strong.' Thus one of 90 pennyweights (90 dwt.) is said to be '10 dwt. strong; or

simply, 'one of 90 dwt.' These numbers correspond to $2\frac{1}{2}$ degrees of Twaddle's hydrometer, and may easily be found by dividing Twaddle's degrees by $2\cdot5$ or $2\frac{1}{2}$; or by multiplying them by $\frac{1}{4}$, and pointing off the right-hand figure of the product for a decimal. The result is in alum-makers' pennyweights.

By a patent now expired (Weisman's, 1839), the ferric salts are precipitated by the addition of a solution of ferrocyanide of potassium (prussiate of potash); after which the supernatant clear liquor, which is now a solution of nearly pure sulphate of alumina, is decanted, and evaporated for future operations, until it either forms, on cooling, a concrete mass, which is moulded into bricks or lamps, for the convenience of 'packing,' or until it is sufficiently concentrated to be converted into ALUM by the addition of a salt of potash or of ammonia, in the usual manner. The product, in each case, is perfectly free from iron. By a like addition of the ferrocyanide to a solution of ordinary sulphate of alumina or alum, the dyer may himself easily render them free from iron, or iron-alum; when, as mordants for even the most delicate colours, they are equal to the very best Roman alum.

Another process has been patented (Barlow & Gore, 1851) for the manufacture of alum from the ash or residue of the combustion of Boghead-coal, which, though hitherto regarded as almost valueless, actually contains about 30% of alumina. It has not, however, been found a convenient material for the purpose.

By the latest and most approved processes the least possible quantity of boiling water or liquor is employed for making the solutions, so that they may crystallise without evaporation, and thus economise fuel; and the mother-liquors of previous operations are constantly employed for this purpose, when possible. Nor is anything which is convertible to use, from the drainage of the heaps, to the liquor and slime of the roaching casks, allowed to be wasted.

By whatever process, or from whatever materials alum is obtained, it is absolutely necessary for the successful and economical conduct of its manufacture, that the precise composition of the mineral or minerals employed should be exactly known. This can only be determined by actual analysis, which should be extended to several parts of the same bed, and particularly to the upper and lower strata, which frequently differ in composition from each other, and thus require different treatment, or may be most advantageously employed in combination with each other. The necessity of this will be seen by reference to the composition of the following minerals, of which the top contains a larger proportion of iron-pyrites than the bottom, and the two require to be mixed, to equally diffuse the sulphuric acid generated by the

calcination, &c., to which they are subjected.

The following is the per-centage composition of certain alum shales :—

	Whitby, Yorkshire, (Richardson.)			Campsie, near Glasgow. (Ronalds.)

Alum-rock, or alum-stone, is a species of impure *alunite*, and is not of very common occurrence. That of Tolfa, near Civita-Vecchia, according to Klaproth, consists of—

Silica	56.5
Alumina	19.
Sulphuric acid (SO ₃)	16.5
Potassa	4.
Water	3.
Loss	1.
	100.

which exhibits an excess of about 3% of sulphuric acid, and about 14% of alumina, more than are requisite to form alum with the 4% of potassa; proportions which, therefore, require to be supplemented with a potassium-salt during the process of manufacture. The alum-stone of Mont d'Or contains, according to Cordier, 1.4% of oxide of iron.

The presence of lime in alum-ore is most prejudicial, owing to its affinity for sulphuric acid being greater than that of either alumina or iron. Ores containing it in any quantity are, therefore, unfitted for the manufacture of alum. Magnesia is also prejudicial; but in this case, the sulphate of magnesia left in the mother-liquors is not wholly valueless, as it may be crystallised and sold as 'Epsom-salt,'—a thing which is actually done in some English alum-works.

The potash-salt employed by the alum-makers is either the sulphate or the chloride—chiefly the latter; its sources being the waste liquor of soap-works, saltpetre refineries, and

glass-houses. Wood-ashes, though rich in potash, do not answer well unless freed by lixiviation from the large amount of carbonate of lime which is always present in them.

The ammonia-salt used in making alum is generally the crude sulphate prepared from the waste ammoniacal liquor of gas-works, or that from the manufacture of sal-ammoniac by the destructive distillation of animal matter. Both these liquors may be used without previous conversion into sulphate of ammonia whenever there is an excess of sulphuric acid in the aluminous solution.

Soda-salts are seldom, if ever, used as precipitants in the manufacture of alum, on account of the easy solubility of the resulting SODA-ALUM—a property which unfits them for this purpose. See ALUMINA, AMMONIA, DYEING, MORDANTS, POTASSA, SULPHURIC ACID, &c. (also *below*).

Ammonia Alum. (NH₄)₂SO₄ . Al₂(SO₄)₃. 24Aq. *Syn.* (ALUMEN; ALUM; B. P.), ALUMEN AMMONIATUM, L.; ALUN D'AMMONIAQUE, A. AMMONIACAL, Fr. This is an alum in which the sulphate of potassium is replaced by an equivalent of sulphate of ammonium. It is prepared by adding crude sulphate of ammonium to solution of sulphate of aluminum; or gas-liquor, putrid urine, &c., to the acid-sulphate.

Much of the common alum, especially that prepared on the Continent, contains both potassium and ammonium, and recently, enormous works for its manufacture have been established in England. As an astringent, and as a source

of alumina in dyeing, it resembles potash-alum (*i. e.* ordinary alum). It may, however, be readily distinguished from the latter by the fumes of ammonia which are evolved when it is moistened and triturated, or heated, with caustic potassa or quick-lime; and by the residuum of its exposure to a white heat being pure alumina. See ALUM (*anté*).

Basic Alum. A variety of alum found native at Tolfa. On calcination and subsequent lixiviation, it yields ordinary alum. A like substance falls as a white powder, when newly precipitated alumina is boiled in a solution of alum.

Baumé's Alum. Alum-white. See WHITE PIGMENTS.

Dried Alum; Burnt Alum. *Syn.* ALUMEN USUM, A. EXSICCATUM (B. P.); ALUM SEC, Fr.; GEBRANNTER ALUM, Ger.; ALUME CACINATO, Ital. Alum deprived of its water of crystallisation by heat.

Prep. Take of alum, 4 oz. Heat the alum in a porcelain dish or other suitable vessel, till it liquefies, then raise and continue the heat, not allowing it to exceed 400°, till aqueous vapour ceases to be disengaged, and the salt has lost 47 per cent. of its weight. Reduce the residue to powder, and preserve it in a well-stopped bottle.

Prop., &c. Similar to those of common alum, but it is rather more astringent, and is less soluble. When moistened, or placed in contact with water, it resumes its water of crystallisation with evolution of heat.—**Dose.** 10 to 20 gr.; in colic (especially painters' colic), hæmoptysis, &c. It is chiefly used as an escharotic, to destroy 'proth flesh,' &c.

Chrome Alum. See ALUMS (in Chemistry).

Iron Alum (-um). *Syn.* ALUMEN FERRICUM, SULPHAS FERRI ET POTASSÆ, FERRI PEROXYDI POTASSIO-SULPHAS, &c., L.

Comp. $K_2SO_4 \cdot Fe_2(SO_4)_3 \cdot 24Aq.$

Prep. Take of peroxide of iron, 9 lbs.; sulphuric acid, 14 lbs.; dissolve, dilute the mixture with water, q. s., and add of potassium sulphate, 10 lbs.; evaporate, and crystallise.

Prop., &c. Crystals, beautiful octahedrons of a pinkish or pale violet colour. It is strongly recommended, by Dr. Tyler Smith, as a chalybeate tonic, and has been used by him, at St. Mary's Hospital, with marked success. It has also been used as a mordant, in dyeing black.—**Dose.** $\frac{1}{2}$ gr. to 5 gr.

Roman Alum. *Syn.* RED ALUM*, ROACH A., ROCHE A., ROCK A.*; ALUMEN ROMANUM, A. RUBRUM, A. RUPEUM, &c., L.; ALUM ROMAIN, A. DE ROCHE, Fr.; ALUME DI ROCCO, It. In small fragments, covered with a reddish powder (ALUMEN RUBRUM VULGARE); originally imported from Civita-Vecchia, where it occurs native. It is much esteemed by dyers from being nearly free from iron-alum. That now sold for it in England, is ordinary alum coloured with Venetian red, Armenian bole, or rose-pink (ALUMEN RUBRUM SPURRUM). This is done by shaking the fragments in a

sieve over a vessel of hot water, and then stirring them up with the colour, until the surface is uniformly tinged with it. In genuine roach-alum the colour not only covers the surface, but also partially pervades the substance of the crystals. The name was formerly also applied to a pure white variety of alum, prepared at Tolfa; but it is now, in English commerce, exclusively given to common alum artificially coloured.

Soda Alum. *Syn.* SULPHAS ALUMINÆ ET SODÆ, L. *Comp.* $Na_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24Aq.$ An alum in which the potassium sulphate of common alum is replaced by a like salt of sodium. It does not occur in commerce. (Vide *suprà et infra*.)

ALUM-EARTH. Alumina.

ALUM MORDANTS. In dyeing, mordants having for their basis either common alum or the acetate or sulphate of aluminum. See ALUMINA and MORDANTS.

ALUM-ROOT. *Syn.* AMERICAN SANTOL; HEUCHERA (Ph. U. S.), L. The root of *heuchera Americana* (Linn.), a plant of North America. It is powerfully styptic and astringent; and is used chiefly as an external application in cancer.

ALUM-WHITE. See WHITE-PIGMENTS.

ALUMS. *Syn.* ALUMINA (*pl.* of *alumen*), L. In chemistry, a term applied to a series or group of salts having 'common alum' for their type, which they resemble in crystalline form and constitution.

It is found that the aluminum of common alum may be replaced by any other metallic oxide having a like constitution, without affecting the leading characteristics of the salt; and further, that in the newly formed compound, as in potash-alum, the second sulphate may also be replaced under the like conditions. All the alums crystallise in octahedrons or cubes, and they all contain the same number of molecules of water. The alums of commerce (or alums proper) all contain aluminum and an alkaline sulphate.

Prep. All the alums may be made by mixing together solutions of the respective sulphates in equivalent proportions, when crystals may be obtained by evaporation in the usual manner. The presence of sulphuric acid, in slight excess, assists their crystallisation.

ALUMED (al'umd). Mixed or impregnated with alum. In dyeing, mordanted with alum.

ALUMEN (-'l'ee-). [L.] Alum; the pharmacopœial name of alum. (See *above*.)

ALUMINUM. *Syn.* ALUMINUM (which see).

ALUMINOUS. In mineralogy, of, resembling, or containing aluminum. In town, or is pertaining or obtained from it. By spontaneous **ALUMINUM.** [Eng.] obtained in long, transparent, metallic radical or in alum, in powder, 4 parts; distributed, united with dissolve; acetate of lead, M. Wöhler, who succeeded solution and mixture

gray metallic powder (A.D. 1827); and later (1845), under the form of globules exhibiting the leading characteristics of the metal. In 1854, M.umas announced to the 'Academy of Sciences,' that M. St. Clair Deville had procured pure aluminum from clay, and exhibited several specimens of considerable size and beauty. The result was a general impression that it might be easily obtained in any quantity, and ultimately at a reasonable price; expectations which have been only partly, though to a great extent, fulfilled, owing to the expense and trouble of the process, notwithstanding recent improvements.

Prep. (M. Deville; A.D. 1854-59).—A quantity of chloride of aluminum, varying from 200 to 300 grammes (say from 6 to 10 oz.), is introduced into a wide glass or porcelain tube, between two plugs of asbestos to retain it in position, and a current of hydrogen (thoroughly dried by passing first through concentrated sulphuric acid, and then through a tube containing fused chloride of calcium) passed over it; a gentle heat being at the same time applied to the part of the tube containing the chloride, to drive off any free hydrochloric acid which might have been formed by the action of the air upon it. A small porcelain boat, containing sodium, is now introduced at the other extremity of the glass tube, which is then again closed; and when the sodium is fused, the chloride is sufficiently heated to cause its vapour to come into free contact with it. A powerful reaction ensues, with the evolution of much heat, and this continues as long as any undecomposed sodium remains to act on the passing vapour. The mass in the 'boat,' which is now a mixture of the double chloride of aluminum and sodium, in which small globules of the newly reduced metal are suspended, is allowed to cool in the hydrogen; after which it is treated with water, to remove the soluble double chloride. The residuum, consisting of small globules of aluminum, is lastly, reduced to a solid button or mass, by fusion, at a strong heat, under a layer of the fused double chloride of aluminum and sodium.

On a large scale two cast-iron cylinders are employed, instead of the glass or porcelain tube just referred to; the anterior one of which contains the sesquichloride of aluminum, and the posterior one a tray holding the sodium, of which 10 or 12 lbs. are commonly operated on at once. These cylinders are united by means of a smaller intermediate one, filled with clean scraps of iron, which serve to separate the free hydrochloric acid, and chloride of iron, from the vapour of the chloride of aluminum—a thing which is passed through them. During the reaction the vapour of the chloride this English alum-works.

The potash-salt employed kept heated to from makers is either the sulphate or two other cylinders chiefly the latter; its source, since the chloride liquor of soap-works, comparatively low tempera-

ture, and the reaction between it and the fused sodium, when once commenced, usually generates sufficient heat for the completion of the process.

Occasionally a mixture of the double chloride of aluminum and sodium, 40 parts; chloride of sodium, 20 parts; fluor spar, 20 parts; each separately dried, powdered, and then blended together; sodium, in small pieces, $7\frac{1}{2}$ to 8 parts, are used instead of the last.

It is likewise made from a mixture of kryolite and fused chloride of potassium, of each, in powder, 5 parts; sodium, 2 parts; a cast-iron crucible being employed; the resulting minute globules being collected and fused to a button under a layer of the double chloride of aluminum and sodium.

Prop. &c. Aluminum, when quite pure, closely approaches silver in appearance, except in being rather less white and lustrous than that metal. Ordinary specimens, called pure, have a slight bluish tint or tin-white colour, with a perfect lustre, but far inferior to that of pure silver. Sp. gr. 2.56 (about that of glass), which by hammering may be raised to 2.67. It is both ductile and malleable; fuses at a temperature between the melting-points of zinc and silver; is not affected by either damp or dry air, or by oxygen at ordinary temperatures, or by water whether cold or boiling; even steam, at a red heat, is only slowly decomposed by it. It is not acted on by nitric acid, however concentrated, unless boiling, and then very slowly; nor by dilute sulphuric acid, sulphuretted hydrogen, and the sulphurets, or even the fused hydrates of the alkalis. It is, however, readily dissolved by hydrochloric acid, with the evolution of hydrogen, even in the cold; and by a concentrated mixture of nitric and sulphuric acid. It is feebly magnetic, conducts electricity about 8 times better than iron, and is more electro-negative than even zinc. Commercial specimens, owing to the presence of iron and silicon, and often zinc, usually slowly tarnish in damp air, and possess the other properties described above in a somewhat diminished degree.

In a finely divided state, particularly in the state of powder or minute scales in which it was originally obtained, when heated to redness, it catches fire and burns with great rapidity in the air, and in oxygen gas with intense brilliancy, the product in each case being alumina.

Aluminum unites with the other metals, forming ALLOYS, of which some promise to be of great value in the arts. An alloy of 100 parts of aluminum with 5 parts of silver, may be worked like the pure metal, but is harder and susceptible of a finer polish, whilst its property of not being affected by sulphuretted hydrogen and acids remains unimpaired; even 3% of silver is said to be sufficient to impart to it the full brilliancy and colour of pure silver. An alloy containing 16% of gold is softer and scarcely so malleable as the pure metal. With

8% of iron, or 10% of copper, it still remains tough and malleable; but a larger proportion of either of these metals renders it brittle.

The presence of 2 or 3% of zinc destroys its ductility and malleability, and also impairs its colour and lustre; whilst less than even $\frac{1}{2}$ % of bismuth renders it brittle in a high degree. Small quantities of aluminum added to other metals change their properties in a very remarkable manner. Thus, copper alloyed with 10% of aluminum has the colour and brilliancy of gold, is harder than bronze, very malleable, and may be worked at high temperatures easier than the best varieties of iron; and with 20% is quite white, and closely resembles silver. With more than 12% of aluminum the alloy is harder, but brittle. The alloy formed of 100 parts of silver with 5 parts of aluminum, is as hard as the silver of our coinage, whilst the other properties of the latter metal remain unaltered.

Uses. The valuable properties of aluminum adapt it to numerous applications in the arts and everyday life. Hitherto these have been very limited, owing to its comparatively high price; which, notwithstanding it has fallen considerably, is still sufficient to prevent its general or even extensive application. The 'eagles' of the French army have been made of it, as well as certain articles of jewelry, plate, &c., as brooches, bracelets, chains, spoons, and other ornamental and useful objects. Owing to its low sp. gr., it has been used as a suitable material for the minute decimal weights of chemists, for military helmets, trumpets, &c. A few cornet-a-pistons, for which its lightness and sonorousness admirably adapt it, have actually been made of it. Its power of resisting oxygen, sulphuretted hydrogen, moisture, &c., would render it invaluable as a coating to metals, particularly iron and lead, to protect them from rust or corrosion, did not its price intervene. As an internal coating for water-pipes, cisterns, &c., no other substance, except gold and platinum, is so well adapted. In chemistry, capsules, tubes, &c., either made of or coated with it, may be often advantageously substituted for those of platinum.

In addition to what has been said above, it may be observed that, in preparing aluminum, the chief care should be to avoid accidents or failure by the employment of too high a temperature, and to avoid the product being contaminated with other metals or with carbon. To ensure the purity of the metal is a matter of the greatest difficulty, owing to the facility with which foreign matters are taken up, during the process, from the materials of which the apparatus is composed; and from the substances from which it is prepared being seldom absolutely pure. Indeed, it is not too much to assert that chemically pure aluminum has not yet been obtained; and that even a very close approximation to it is of very rare occurrence. Whenever a copper boat is used to hold the sodium, the product is always contaminated

with copper. Sesquichloride of aluminum always contains some of the chlorides of iron and silicon, both of which are volatile, and probably takes up a further portion from the porcelain or earthenware used to form the apparatus. Sodium also is seldom uncontaminated with carbon or some compound of it; in which case, and likewise when it is not carefully freed from the naphtha in which it has been preserved, the product always contains carbon. The crucible, whether of porcelain or iron, in which the final fusion is made, also contributes to contaminate the metal. Hence the inferior whiteness and brilliancy of commercial specimens of aluminum; a metal which, in its absolutely pure state, may be reasonably inferred to be as superior in the above respects to silver, as silver is to tin. Commercial aluminum contains from 88 to 94 per cent. only of pure aluminum, and from 1 to 4 per cent. of iron, $\frac{1}{2}$ to 3 per cent. of silicon, and from 1 to 6 per cent. of copper.

Aluminum salts are generally colourless, soluble, and crystallise with difficulty, and are distinguished as follows:—

Tests.—1. Ammonia and the alkaline carbonates throw down a bulky white precipitate (hydrate of aluminum) from solutions of its salts, which is insoluble in excess of the precipitant:—2. Pure potassa and soda throw down white gelatinous precipitates, freely soluble in excess of the precipitant, from which the hydrate of aluminum is reprecipitated by chloride of ammonium, even in the cold:—3. Phosphate of ammonium gives a white precipitate:—4. Iodide of potassium produces a white precipitate, passing into a permanent yellow:—5. Sulphuretted hydrogen gives no precipitate:—6. Sulphydrate of ammonium precipitates alumina from these solutions:—7. Bisulphate of potassium, added to concentrated solutions, gives a precipitate of octahedral crystals of alum:—8. At a red heat its salts part with some of their acid; at a white heat, most of it, if not all:—9. Aluminum compounds, ignited on charcoal before the blowpipe, and afterwards moistened with a solution of protonitrate of cobalt and again strongly ignited, give an unfused mass, which, on cooling, appears blue by day, and violet by candlelight; a test, however, which is inapplicable to fusible compounds of aluminum, and such as are not free, or nearly free, from other oxides.

Aluminum, Acetate of. *Syn.* ACETATE OF ALUMINA. *Prep.* Pure hydrate of aluminum is digested, to saturation, in strong acetic acid, in the cold; and the resulting solution, after being filtered or decanted, is either evaporated by a very gentle heat to a gelatinous, semi-solid consistence (its usual form), or is preserved in the liquid state. By spontaneous evaporation it may be obtained in long transparent crystals.

Red liquor. From alum, in powder, 4 parts; warm water, q. s. to dissolve; acetate of lead, in powder, 3 parts; the solution and mixture

being effected by lengthened agitation in a *tub* or other *wooden* vessels, and the *clear liquid*, after repose for a sufficient time, decanted or drawn off from the sediment.

From *alum*, 2 parts; (dissolved in) *warm water*, q. s.; *solution of pyrolignite of lime* (20° Baumé), 3 parts; as before, but allowing a longer time for the subsidence of the precipitate, and taking more care in the decantation, than when acetate of lead is employed.

By decomposing a *solution of crude sulphate of alumina* with *neutral* or *monobasic acetate of lead*.

Prop. Its characteristic property is the feeble affinity existing between its acid and base, which, when it is used as a mordant, is counterbalanced by that of the fibres of the cloth or yarn to which it is applied. In other respects, it resembles the other simple salts of alumina.

Uses, &c. In *dyeing* and *calico-printing*, as a mordant. In *medicine*, properly diluted, in chronic diarrhoea; and, mixed with syrup of poppies, in slight cases of hæmoptysis (*spitting of blood*). It has been employed, by M. Gannal, as an injection to preserve animal bodies, which it will do for years.—*Dose.* $\frac{1}{2}$ to 1 dr. daily, in divided portions, taken in thin mucilage or syrup, or in barley-water; as an *injection*, 10 to 20 gr. to water, 4 to 6 fl. oz., in gonorrhœa, leucorrhœa, &c.

Aluminum, Chloride of. Al_2Cl_6 . *Syn.* SESQUICHLORIDE OF ALUMINUM; ALUMINII CHLORIDI, &c., L. *Prep.* A thick paste made of dry precipitated alumina, lampblack, and oil, is strongly heated in a covered crucible until all the organic matter is carbonised. The residuum is transferred to a porcelain tube fixed across a furnace, one end of which is connected with another tube containing dried chloride of calcium, and the other end with a small tubulated receiver. The porcelain tube is then heated to redness, whilst chlorine, dried by passing through the chloride-of-calcium tube, is transmitted through the apparatus. In one or two hours, or as soon as the tube is choked, the whole is allowed to cool, and the newly formed SESQUICHLORIDE collected and preserved in mineral naphtha for use.

On the large scale:—Chlorine, dried as before, is passed over a mixture of pure clay, lampblack, and coal-tar, contained in an iron retort similar to that used in the manufacture of coal-gas (previously ignited by means of a suitable furnace), and connected with a cool chamber accurately lined with tiles of earthenware. The vapours of the SESQUICHLORIDE condense in this chamber, as a yellowish crystalline mass, which is collected and preserved as before.

Prop., &c. It is volatile at a dull red heat; excessively greedy of moisture; and very soluble, with decomposition, hydrochloric acid and alumina being formed. Once dissolved, it cannot be again recovered. Its chief use is in the preparation of aluminum.

Obs. Although alumina, like magnesia, is freely soluble in hydrochloric acid, the sesquichloride of aluminum contained in this solution cannot be obtained in the anhydrous state, or even the solid form, by its evaporation; the chloride suffering decomposition, with the formation of hydrochloric acid, which is volatilised, and alumina, which is left behind.

Aluminum, Nitrate of. $Al_2(NO_3)_6$. *Syn.* NITRATE OF ALUMINA; ALUMINÆ NITRAS, L. *Prep.* Similar to that of the acetate and citrate. Its concentrated acid solution deposits rhombic crystals, containing 18 equiv. of water.

Aluminum, Oxide of. (Al_2O_3) , and Hydrate of $(Al_2(OH)_6)$. *Syn.* ALUMINA.

Prep. Aluminum is precipitated as a hydrate from solutions of aluminum salts on the addition of an alkali or alkaline carbonate; and this precipitate, after being thoroughly washed and dried, on ignition loses its water and becomes anhydrous. The following are the best formulæ for the purpose:—

Alum is dissolved in about 20 times its weight of distilled water, and the solution is dropped slowly into pure solution of ammonia, until the latter is nearly but not entirely saturated, when the whole is set aside for some time. The clear supernatant liquid is then decanted, and the precipitate is carefully and thoroughly washed three or four times with tepid distilled water; after which it is collected on a filter, again well washed with water, and, lastly, pressed and dried between bibulous paper, either without heat, or at a temperature not higher than 120° Fahr. The product is pure hydrate of aluminum, and is converted into anhydrous alumina by exposure to a white heat in a covered crucible. The residuum, after ignition, is pure ANHYDROUS ALUMINA, or SESQUIOXIDE OF ALUMINUM.

A solution of alum is slowly added to a solution of carbonate of ammonia, avoiding excess; and the resulting precipitate, after being washed and pressed, is dried at a heat of from 120° to 180° Fahr.

Prop., &c. A soft white powder. The hydrate is freely soluble in the acids and in solution of caustic potassa and soda (from which it is precipitable by sal ammoniac); when anhydrous (as after ignition), it is scarcely acted on by acids, and when perfectly indurated, or crystallised, it is wholly insoluble; but on ignition with alkalies, alkaline ALUMINATES are formed, and the alumina is then readily dissolved by acids, forming salts, which are mostly colourless, non-volatile, and soluble; they have a very astringent and somewhat sweetish taste, redden litmus paper, and lose their acids by ignition. Its most remarkable, or rather useful property, is its strong affinity for the fibres of organic bodies, as cotton, flax, silk, wool, &c., which are capable of taking it from its salts; and also for organic colouring matters. Hence its great use in dyeing, and in bleaching liquids and the preparation of lakes.

AMALGAMATION. [Eng., Fr.] *Syn.* AMALGAMA'TIO, L.; VERQUICKEN, Ger. The act or process by which an amalgam is formed; hence loosely, the mixing or blending of different things. In the art of the refiner, the operation of separating gold and silver from their ores by means of mercury.

AMANDINE (-dène). *Prep.* 1. (Transparent).—*a.* Fine new white or pale honey, 4 oz.; white soft-soap (prepared from lard and potassa), 2 oz.; mix thoroughly in a marble mortar, adding 1 or 2 teaspoonfuls (if necessary) of solution of potassa, until a perfectly homogeneous paste or cream is produced; then rub in, by degrees, and very gradually, of oil of almonds, 7 lbs. (or *q. s.*), previously mixed with essential oil of almonds, 1 oz.; essence (oil) of bergamot, $\frac{3}{4}$ oz.; oil of cloves, $\frac{1}{2}$ oz.; and balsam of Peru, 3 dr. The product, which should have a rich, transparent, jelly-like appearance and behaviour, is, lastly, put into pots for use or sale.

b. (G. W. S. Piesse.) Simple syrup, 4 oz.; white soft-soap (see above), 1 oz.; oil of almonds, 7 lbs. (previously scented with—); essential oil of almonds and bergamot, of each, 1 oz.; oil of cloves, $\frac{1}{2}$ oz.; the whole being mixed, &c., as before. Both the above are of very fine quality. Glycerin, in the proportion of about $\frac{1}{2}$ oz. to each lb. of the products, added with the soap, improves their softening quality.

2. (Opaque).—*a.* From white potash-soap and gum-mucilage (thick), of each, 3 oz.; new white honey, 6 oz.; and the yolks of 5 large eggs; well mixed together, and afterwards intimately blended first, with oil of almonds (scented as before, or at will), 2 lbs.; and afterwards, with thick pistachio-milk (made of the fresh-peeled nuts and rose-water), 5 fl. oz.

b. From almond-paste, honey, white potash-soap, and glycerin, of each, 1 oz.; yolk of 1 egg; oil of almonds, $\frac{1}{2}$ pint (holding in solution—); essential oil of almonds, 1 dr.; balsam of Peru, $\frac{1}{2}$ dr.

Uses, &c. To whiten and soften the skin, and to prevent it chapping. A small portion, about half the size of a filbert, with a few drops of warm water, produces a very white and rich lather, with which the hands and face are lightly rubbed, and the skin, in a short time, gently wiped with a small napkin, whilst the water on it is still milky.

The manufacture of AMANDINE is a matter of some difficulty and labour. The details essential to success, are given under EMULSINES. It is sometimes coloured, which is done by infusing or dissolving in the oil, before using it, a little—spinach-leaves, for GREEN; and palm-oil, or annatto, for YELLOW and ORANGE. A beautiful SCARLET or CRIMSON tinge may be given to it by a little liquid rouge or carmine (ammoniacal), added just before removing it from the mortar. See EMULSINES, OLIVINE, PASTES, &c.

AMANTIA MUSCARIA. The fly-agaric or fly-mushroom? See AGARIC.

AMANTINE (-tine). *Syn.* AMANTINA, L. The name given by Letellier to the poisonous principle of *amanita muscaria*, and some other species of fungi. It is brown, uncrystallisable, and soluble.

AMARA (-māre-). [L.] In medicine and pharmacology, the bitter tonics.

AMARANTH. *Syn.* AMARANTHUS, L.; AMARANTE, Fr. The flower love-lies-bleeding ('*amaranthus caudatus*'—Linn.). In poetry, an imaginary flower that never fades. (Milton.) In chromatics, a colour inclining to purple.

AMARYTHRINE (-rith-rin). A bitter principle found, in certain lichens, associated with erythrine (which see).

AMBER. *Syn.* ELECTRON, Gr.; ELBO'TRUM, SUC'CINUM (Ph. D.), L.; AMBRE, SUC'CIN, Fr.; BERNSTEIN, Ger.; LYNX-STONE †, LA'PIS LYN'CIS †, L. A well-known yellowish, semi-transparent, fossil resin, of which trinkets and the mouth-pieces of pipes are commonly made.

• *Nat. hist., &c.* Amber is found in detached pieces on the sea-coast, and is dug up in diluvial soils. That of commerce comes chiefly from the southern coasts of the Baltic, where it is cast ashore between Königsberg and Memel; and from Ducal Prussia, Saxony, Poland, Sicily, and Maryland (U.S.), where it is dug out of beds or mines. It has also been found on the shores of Norfolk, and small pieces are occasionally dug up in the gravel pits round London. It is probably an antediluvian resin; and when found on the coast, is supposed to be disengaged, by the action of the sea, from neighbouring beds of lignite or fossil coal. Much diversity of opinion for a long time prevailed amongst naturalists and chemists as to the origin of amber, some referring it to the vegetable, others to the mineral, and some even to the animal kingdom; its natural history and analysis affording something in favour of each. The vegetable origin of amber has, however, been recently shown by various facts, and is now generally admitted. According to Sir David Brewster, its optical properties are those of an indurated vegetable juice. ('Ed. Phil. Journ.,' ii.) Insects and fragments of vegetables are frequently found imbedded in it; and this in a manner which could only have occurred when the resin was a viscid fluid. Microscopical researches have led to the conclusion that it is the production of some species of pine, closely allied to the *pinus balsamea*. ('Entom. Trans.,' i & ii.)

Manuf. Amber is WORKED in a lathe, POLISHED with whitening and water or rottenstone and oil, and FINISHED OFF by friction with flannel. During the operation the pieces often become hot and electrical, and fly into fragments; to avoid which, they are kept as cool as possible, and only worked for a short period at a time. The workmen are said to often suffer

considerably from electrical excitement. Amber is JOINED and MENDED by smearing the surface of the pieces with *linseed* or *boiled oil*, and then *strongly* pressing them together, at the same time holding them over a *charcoal fire*, or heating them in any other convenient way in which they will not be exposed to injury. The *commoner varieties* are HARDENED and rendered CLEARER, either by boiling them in *rape oil* for about 24 hours, or by surrounding the pieces with *clean sand* in an iron pot, and exposing them to a gradually increasing heat for 30 or 40 hours. During this process small fragments are kept in the sand at the side of the pot, for the purpose of occasional examination, lest the heat be raised too high, or be too long continued.

Prop., &c. Hard; brittle; tasteless; glossy; generally translucent, but sometimes opaque, and occasionally, though rarely, transparent; colour, generally yellow or orange, but sometimes yellowish-white; becomes negatively electric by friction; smells agreeably when rubbed or heated; fracture, conchoidal and vitreous or resinous; soluble in the pure alkalies, and, without decomposition, in oil of vitriol, which then becomes purple; insoluble in the essential and fixed oils without long digestion and heat; soluble in chloroform; melts at about 556° Fahr.; burns with a yellow flame, emitting at the same time a peculiar fragrant odour, and leaving a light and shiny coal. By dry distillation it yields *inflammable gases*, a small quantity of *water*, a little *acetic acid*, a *volatile oil* (OIL OF AMBER; OLEUM SUCCINI, L.) at first pale, afterwards brown, thick, and empyreumatic, and an *acid* (SUCCINIC ACID; ACIDUM SUCCINICUM, L.) with *residual charcoal* 12 to 13%. Sp. gr. 1.065 to 1.09, but usually about 1.070. It cannot be fused without undergoing more or less chemical change.

Ident. Amber may be known from *mellite* and *copal*, both of which articles are occasionally substituted for it, by the following characteristics:—1. MELLITE is *infusible* by heat, and burns *white*:—2. A piece of COPAL, heated on the point of a knife, catches fire, and runs into drops, which flatten as they fall:—3. AMBER burns with *spitting* and *frothing*, and when its liquefied particles drop, they rebound from the plane on which they fall (M. Haüy):—4. Neither *mellite* nor *copal* yield succinic acid by distillation; nor the agreeable odour of amber when burnt; nor do they become so readily electric by friction.

Uses. It is chiefly made into mouth-pieces for pipes, beads for necklaces, and other ornaments and trinkets. It is also used as the basis of several excellent varnishes. In *medicine*, it was formerly given in chronic coughs, hysteria, &c.—*Dose* (of the powder), 10 to 60 gr.

Remarks. The finer sorts of amber fetch very high prices. A piece 1 lb. in weight is said to be worth from 10*l.* to 15*l.* 5000 dollars a few years since were offered in

Prussia for a piece weighing 13 lbs., and which, it was stated by the Armenian merchants, would fetch from 30,000 to 40,000 dollars in Constantinople. It is more valued in the East than in England; and chiefly on account of the Turks and other Orientals believing it to be incapable of transmitting infection. In the royal cabinet, Berlin, there is a piece weighing 18 lbs., supposed to be the largest ever found. The *coarser kinds* alone are employed in medicine, chemistry, &c.

Acid of Amber* (äs'-). Succinic Acid.

Bal'sam of Amber. Syn. BAL'SAMUM SUCCINI, L. The *thick matter* left in the retort after the rectification of oil of amber; and which it resembles in its properties.

Factitious Amber (-tish'-). Syn. SUCCINUM FACTITUM, L. Mellite, copal, and anise, have each been substituted for amber, especially for small fragments of it. Recently an imitation has been produced by acting on gutta percha with sulphur, at a high temperature, which, either alone, or in combination with copal, is said to have been extensively passed off for genuine amber.

Liquid Amber†. See LIQUID-AMBAR.

Oil of Amber. See OILS.

Resin of Amber. See PYRÉTINE.

Salt of Amber. Succinic Acid.

Soluble Amber. *Prep.* Fragments of amber are cautiously heated in an iron pot, and as soon as it becomes semi-liquid, an equal weight of pale boiled linseed-oil, previously made hot, is very gradually stirred in, and the whole thoroughly blended.—Used as a cement for glass and earthenware, and thinned with oil of turpentine to make varnishes. It will keep any length of time if preserved from the air.

AMBER-CAMPHOR. See PYRÉTINE (Crystalline).

AMBER DRINK†. Amber-coloured malt liquor.

AMBER-SEED. Musk-seed (which see).

AMBER-TREE. The popular name of a species of *anthospermum*, an evergreen shrub, of which the leaves, when bruised, emit an agreeable odour.

AMBERGRIS (-gris; -Grise †). Syn. GRAY AMBER*; AMBERGRISSEA (grizh'-e-ä), L.; AMBERGRIS, Fr.; AMBRA, AMBAR, Ger. An odorous, solid substance, found floating on the sea in tropical climates, and in the cæcum of the cachalot or spermaceti-whale (*physeter macrocephalus*). It has been supposed, by some, to be a morbid secretion of the liver or intestines, analogous to biliary calculi; but according to Mr. Beale, it consists of the mere indurated feces of the animal, perhaps (as suggested by Brande, and Pereira), somewhat altered by disease. "Some of the semifluid feces, dried with the proper precautions, had all the properties of ambergris." (Beale.) It is occasionally found in masses weighing from 60 to 225 lbs.

Prop., &c. Solid, opaque, ash-coloured, streaked or variegated, fatty, inflammable;

remarkably light; highly odorous,¹ particularly when warmed, cut, or handled—the odour being peculiar and not easily described or imitated, of a very diffusive and penetrating character, and perceptible in minute quantities; rugged on the surface; does not effervesce with acids; melts at 140° to 150° Fahr. into a yellowish resin-like mass; at 212° flies off as a white vapour; very soluble in alcohol, ether, and the volatile and fixed oils. It appears to be a non-saponifiable fat, analogous to cholesteroline. Sp. gr. 0.780 to 0.926.²

Pur. From the high price of genuine ambergris it is very frequently, if not nearly always, adulterated. When quite pure and of the best quality, it is—1. Nearly wholly soluble in hot alcohol and ether, and yields about 85% of ambreine:—2. It almost wholly volatilises at a moderate heat, and when burnt leaves no notable quantity of ashes; a little of it exposed in a silver spoon, melts without bubble or scum; and on the heated point of a knife it is rapidly and entirely dissipated:—3. It is easily punctured with a heated needle, and on withdrawing it, not only should the odour be immediately evolved, but the needle should come out clean, without anything adhering to it (Normandy):—4. The Chinese are said to try its genuineness by scraping it fine upon the top of boiling tea. "It should dissolve (melt) and diffuse itself generally." Black or white is bad. The smooth and uniform is generally factitious.³

Uses, &c. It is highly prized for its odour, which is found greatly to improve and exalt that of other substances; hence its extensive use in perfumery. In medicine, it was formerly given as an aphrodisiac, in doses of 3 to 10 gr. "A grain or two, when rubbed down with sugar, and added to a *hoghead of claret*, is very perceptible in the wine, and gives it a flavour, by some considered as an improvement." (Brande.)

Factitious Ambergris. An article of this kind, met with in the shops, is thus made:—*Orris-powder*, *spermaceti*, and *gum-benzoin*, of each, 1 lb.; *asphaltum*, 3 or 4 oz.; *ambergris*, 6 oz.; *grain-musk*, 3 dr.; *oil of cloves*, 1 dr.; *oil of rhodium*, $\frac{1}{2}$ dr.; *liquor of ammonia*, 1 fl. oz.; beaten to a smooth hard mass with *mucilage*, and made into lumps whilst soft. This fraud is readily detected.

AM'BREINE (-bre-in). *Syn.* AMBREIN^a, L.; AMBREINE, Fr.; AMBARSTOFF, Ger. The fatty, odorous principle of ambergris.

Prep. Digest *ambergris* in hot alcohol (sp. gr. 0.827), until the latter will dissolve no more, then filter. The AMBREINE will be deposited as the solution cools, in an irregular

crystalline mass, which may be purified by recrystallisation in alcohol.

Prop. &c. Melts at about 99°; volatilises at 212° to 220° Fahr.; nitric acid converts it into AMBREIC ACID. It closely resembles cholesteroline.—*Prod.* 85%.

• **AMBERATE** (-brét'). [Fr.] Musk-seed.

AM'ETHYST (-thist). *Syn.* PURPLE ROCK-CRYSTAL; AMÉTHYSTE, Fr.; AMETHYSTUS, L. A beautiful sub-species of quartz or rock crystal, of violet-blue colour of varying intensity, in great request for cutting into seals, brooches, and other like articles of ornament. It was known and prized in the earliest ages of antiquity. Among the ancients, cups and vases were made out of this mineral; and it was an opinion of the Greeks and Persians, that an amethyst bound on the navel would counteract the effects of wine, and that wine drank out of an amethystine vessel would not intoxicate. See GEMS.

Amethyst. In *chromation*, *dyeing*, &c., a rich variety of deep violet colour. Hence, AMETHYSTINE (-in), &c.

• **Oriental Amethyst.** A rich violet-blue variety of transparent, crystallised corundum.

AM'IANTH (-e-ānth). *Syn.* AMIANTHUS, AMIAN'TUS, L.; AMIANTE, Fr. The whiter and more delicate varieties of *asbestos*, particularly those which possess a satiny lustre.

AM'IDIN (-e-din). [Eng., Fr.] *Syn.* AMYDINE; AM'DI'NA, L. A substance noticed by Saussure in *starch-paste*, when long kept. According to Caventou, it is formed at once by the action of boiling water on starch. It forms the interior substance of the starch-grains, and its properties are intermediate between those of starch and gum. It is, indeed, the soluble part of starch, of which a perfect solution can only be obtained by prolonged ebullition in a large quantity of water.

AMID'OGEN NH₂. *Syn.* AMMID'OGEN (Goodrich). Literally, the generator of amides; in chemistry, the name given by Kane to an hypothetical body, composed of two atoms of hydrogen and one of nitrogen. It forms AMIDES by combining with other bodies.

Amidogen Bases. In chemistry, 'amines' in which only one equiv. of hydrogen is replaced by an organic radical; and hence called PRIMARY MONAMINES.

AMMONIA NH₃. *Syn.* AMMONIA GAS, AMMONIACAL GAS, ANHYDROUS AMMONIA, TER-HYDRIDE OF NITROGEN; AMMONIAQUE, Fr.; AMMONIAK, Ger. At the present day, the ammonia of commerce is chiefly prepared from the ammoniacal liquor of the gas-works and the manufactories of ivory black, animal charcoal, &c. In these places a large quantity of crude ammoniacal liquor is produced; to which either sulphuric or hydrochloric acid is added, by which it is converted into a salt, which may be obtained nearly pure by evaporation, and one or more crystallisations, and, in the case of the hydrochlorate and carbonate, subsequent sublimation. Other sources and processes have

¹ It has a "pleasant musk-like odour, which is supposed to be derived from the squid ('sepia moschata') on which the animal feeds," the "horny beaks" of which "are often found imbedded in the masses." (Pereira.) It has a "small resembling that of dried cow-dung." (Redwood, "Gray's Supplement," 1887, p. 606.)

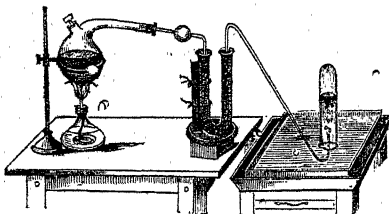

² Sp. gr. 780 to 896—Brande; 908 to 920—Pereira.

³ Ure's "Dict. of A., M., & M." 5th Ed., i, 138.

been sought out and occasionally adopted for the preparation of the principal salts of ammonia (its *sulphate, carbonate, and hydrochlorate*); some of which have been patented, but few of them have got into general use, or have been carried out on the large scale. For many years the manufacture of ammonia and its compounds has incessantly engaged the attention of European chemists.

Ammonia, in a state of combination, is found, in variable quantities, among the saline product of volcanoes, in sea and rain water, in bituminous coal, in urine, in guano, and in the atmosphere, especially that of large towns. The minute stellated crystals sometimes found on dirty windows in London, and other populous cities, consist of sulphate of ammonia. (Brande; Fownes; Letheby.) In the *free state* it exists in the juices of some plants, and in the living blood of animals, and it is freely developed during the decomposition of azotised vegetable substances, and during the putrefaction of animal matter.

Prep. A mixture of *fresh hydrate of lime* with an equal weight of *sal ammoniac* (both dry and in fine powder), is introduced into a glass flask or retort, the beak of which communicates with one end of a U-shaped tube filled with small fragments of *recently burnt quick-lime*, and from which extends another glass tube, about 18 inches long, having its further end bent up ready to be placed under a gas-jar, on the shelf of a *mercurial pneumatic trough*. (See *engr.*) The joints being all

made air-tight by collars of *India rubber*, heat is applied by means of a spirit-lamp, and as soon as the air contained in the apparatus is expelled, the gas is collected for use. It cannot be dried by means of *chloride of calcium*. Powdered *quick-lime* may be substituted for the hydrate in the above process; in which case the *evolved gas* is *anhydrous*, but a much greater heat is then required for its liberation.

Comp. Ammonia is a compound of 3 volumes of hydrogen, and 1 vol. of nitrogen, condensed into two volumes; and by weight of 82.35 parts of nitrogen, 17.65 parts of hydrogen, or, in other words, of one atomic weight of nitrogen and three of hydrogen, having the formula NH_3 .

Prop. Gaseous, colourless, invisible; highly pungent, acrid, irritating and alkaline; irrespirable, unless very largely diluted with air;

extinguishes combustion; burns slowly in oxygen; sp. gr. 0.589; 100 cub. inches weigh 18.26 gr. Under a pressure of 6.5 atmospheres, at 50° Fahr., it forms a transparent, colourless liquid of the sp. gr. 0.731; at 60° Fahr. this liquid expanded into 1009 times its volume of ammoniacal gas; at -40° Fahr., and the ordinary atmospheric pressure, it forms a subtle colourless liquid, which at -103° Fahr. freezes into a white, translucent, crystalline substance. (Faraday.) It is highly basic; all its salts are either volatilised or decomposed at, or under, a red heat—those with a *volatile acid* sublime unchanged—those with a *fixed acid* lose their ammonia. It is decomposed into its elements by transmission through a red-hot tube; and when in contact with metallic oxides or spongy platinum, at the same temperature, the newly evolved hydrogen unites with the oxygen of the oxide or of the atmosphere, forming water. Water at 50° Fahr. absorbs 670 times its volume of this gas, and the solution has the sp. gr. 0.875. Its concentrated aqueous solution boils at 130°, and freezes at -40° Fahr.

Tests, &c. Ammonia is recognised by—1. Its pungent odour.—2. By turning vegetable blues *green*, and vegetable yellows *brown*; but which soon regain their *previous colours*, especially on the application of heat.—3. By producing *dense white fumes* when brought in contact with those of hydrochloric acid.

Phys. eff., &c. Inhaled, *undiluted* with air, it is an irritant poison, producing spasms of the glottis, convulsions, and death; even when *diluted*, it acts as a powerful acrid, and local irritant; applied to the skin it causes vesication. The use of the pungent odour of common 'smelling salts,' in *syncope, headache, &c.*, is well known. Largely *diluted* with air, it has been recently highly extolled in *chronic hoarseness, asthma, &c.*; and as an *antidote* to the fumes of *bromine, chlorine, and hydrocyanic acid*. (Smee.)

Ant., &c. The vapour of *acetic acid* or common *vinegar*, freely inhaled. It may be produced by sprinkling a little on a piece of hot iron, as a heated shovel. If bronchial inflammation follows, it must be treated by purgatives and a low diet; and, if severe, and the patient be plethoric or robust, by venesection or cupping.

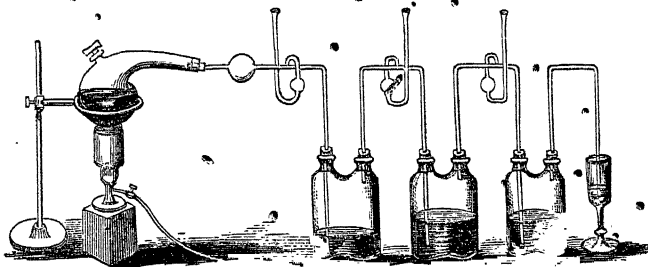

Uses. Ammonia is employed in numerous processes in *chemistry and the arts*; but chiefly in the form of 'liquor of ammonia,' 'spirits of hartshorn,' &c., and in combination, under the form of salts. In its *pure or gaseous state* it possesses little practical interest.

Ammonia, Solution of. Syn. SOLUTION OF AMMONIA, LIQUEUR AMMONIALE, AMMONIUM HYDRATE, AMMONIA, Eng.; AMMONIAQUE LIQUIDE, DISSOLUTION D'AMMONIAQUE, ESPRIT DE SAL AMMONIAC, Fr.; ATZENDER AMMONIUM-LIQUOR, SALMIAC-GEIST, Ger.; LIQUORE DI AMMONIACO, Ital. Ammonia gas readily dissolves in water, one volume of water absorbing

about 670 volumes of ammonia, much heat being liberated, and the solution increases greatly in volume.

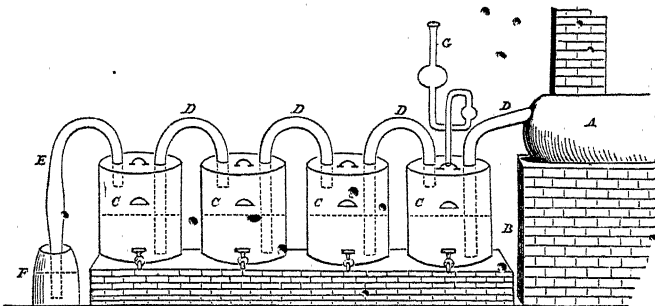

This solution is regarded in two very different lights; firstly and most generally, as simply

a solution of gaseous ammonia, a view rendered most probable by its general physical and by many chemical reactions; by a few, however, it is looked upon as a solution of ammonium hydrate.

Prepared by distilling, in a tubular retort, equal parts of sal ammoniac, hydrated lime, or slaked lime and water, and passing the gas evolved through a set of Wolff's bottles partially filled with water, as in the figure above.

Commercially, this article is prepared, on the large scale, from a mixture of about equal parts of fresh-slaked lime and sal ammoniac or sulphate of ammonia, which is heated in an iron cylinder or retort connected with a set of 'refrigerators,' the latter consisting of a row

A, Cylindrical Iron Retort.
B, Furnace for ditto.
C C C C, Stoneware Receivers.

D D D D, Connecting Pipes.
E F, Waste Pipe and Receiver.
G, Safety Tube.

of stoneware bottles with double necks, containing water, and kept very cold. The general arrangement of the apparatus used in this manufacture is exhibited above, and, with the accompanying references, will be easily understood. The 'condensers,' when in use, are surrounded with cloths (not shown in the engr.) kept wet with very cold water, whilst constant current of cold air is commonly made to pass over them. The pipe (D), leading from the retort, is also several feet long, and is advantageously passed through a wooden screen, in order that the radiated heat of the retort and brickwork of the furnace, may be intercepted as much as possible.

Two different methods of proceeding are adopted in this process. In the one, the dry pulverulent ingredients are mixed together,

and the resulting gas distilled over into the water placed in the receivers. In the other, the lime is made into a 'pap' with water, and the ammonia-salt, in coarse powder, being added, the whole is rapidly blended together, before closing the retort, and applying heat. In either case a proportionate quantity of water is put into the Condensers, and the operation is nearly similar; but the latter method requires the least heat, and so far as the receivers and refrigerators are concerned, is, perhaps, the one most easily managed. It is that which is always, and necessarily followed, when sulphate of ammonia is employed.

Prop., Uses, &c. Highly pungent, caustic, and alkaline; lighter than water, and presenting in a liquid form most of the characteristics of pure ammonia. When strongest, has a sp.

gr. of '875, and contains about 39 per cent. of ammonia, but the usual strong ammonia of commerce has a sp. gr. of but '88. The liquor ammonia fortior, B. P., has a sp. gr. of about '893, and contains 32.5 per cent. of ammonia, while the liquor ammonia B. P. has a sp. gr. of about '940, and contains about 10 per cent. of ammonia. As a *medicine*, it is antacid, diaphoretic, rubefacient, stimulant, and counter-irritant; and is used in various affections in which these remedies are indicated. As a *reagent* it is superior to cantharides, and as a *caustic* it is used with advantage in the bites of rabid animals, especially those of serpents and insects. Its *vapour* is a common nasal stimulant in faintings, epilepsy, &c. In its *concentrated form* it is a *corrosive poison*.—*Dose*. 5 to 25 drops, in cold water, or milk and water. It enters into the composition of several valuable external remedies, and is in constant employment in the *chemical laboratory*, both as a reagent, and for the preparation of other compounds.

Ant., &c. When the *fumes* have been inhaled, the patient should be exposed to a current of fresh air; and when the *liquid* has been swallowed, *vinegar* or *lemon-juice* mixed with water, may be administered; followed by an emetic, or, on its failure, by the stomach-pump.

Estim. The quantity of gaseous ammonia in pure water of ammonia is easily determined from the specific gravity of the liquid, or from its saturating power. When *impure* or mixed with other substances, a *given weight* of the sample is placed in a small retort, the end of which is made to dip into a vessel containing dilute hydrochloric acid. A strong solution of caustic potassa is then poured into the retort, and heat applied by means of a small spirit lamp. When all the ammonia is distilled over, the acid solution is evaporated to dryness, by the heat of a water bath, and the residuum (chloride of ammonium) weighed. Each grain of the chloride thus found represents '31804 gr. of pure AMMONIA; 53.5 parts of the former being equivalent to 17 of the latter. If the article for examination be a solid substance (as a salt), it may be dissolved in water, &c. in dilute acid, before being put into the retort.

In accurate experiments, in the laboratory, ammonia is usually weighed either as chloride of ammonium (see above), or as ammonio-bichloride of platinum (NH_4Cl , PtCl_2); every gr. of the latter representing '07614 gr. of pure AMMONIA. Sometimes, though rarely, the quantity of ammonia is determined from the volume of nitrogen eliminated from it, of which 14 gr. represent 17 gr. of AMMONIA.

Concluding remarks, Patents, &c. Whatever form or process may be adopted for the preparation of liquid ammonia, it is absolutely necessary to keep the receivers as cool as possible, by means of snow, ice, or a current of very cold water, for the purpose of promoting the absorption of the gas, and to prevent its

loss. On the *small scale*, the glass receivers or bottles may be most conveniently surrounded with ice, or a freezing mixture, and two, or more of them, should be furnished with *safety-tubes*, to prevent accidents. On the *large scale*, a capacious oblong retort, usually of iron (but sometimes, though seldom, of lead), with a large opening or tubulature conveniently situated for inserting the 'charges,' and withdrawing the residuum of the distillation, is employed. The tubulature, or opening, is closed by means of a large and accurately ground iron stopper, or with a door secured by screws, as the case may be. The stopper is well greased before insertion, and is removed by means of a powerful lever. Should it become so firmly fixed that it cannot be displaced in the usual manner, a cloth moistened with cold water, and carefully wrapped round it, without touching the neck of the retort, will generally cause it to contract sufficiently to enable the operator to remove it with facility. Sometimes a large iron kettle, with a movable and accurately fitting lid secured in its place like that of a 'Papin's digester,' and having a large and long tubulature in its centre, is employed instead of a retort, over which it has the advantage of exposing a larger opening for the removal of the residuum of the process. In either case the distillatory vessel is imbedded in sand supported by fire-brick, and is not exposed directly to the heat of the furnace. Before commencing the distillation the joints are all well luted, to avoid leakage. An excellent plan is to pass the gas, as it leaves the retort, through a silver or pewter 'worm' or 'refrigerator' set in a tub supplied with a stream of very cold water; by which it will be sufficiently cooled before it reaches the 'receivers' to obviate the necessity of any further attention to them than keeping the cloths wrapped round them constantly moistened with cold water. The lower end of the 'worm' should be connected, by means of a balloon-shaped 'adopter,' with the 'still,' and the upper end with the first 'receiver;' the use of the balloon being to intercept any volatilised ammonia-salt that might be accidentally driven over by the heat being too high, or too suddenly raised.

The heat should be gradually applied, and very gradually raised, to prevent any of the sal ammoniac or sulphate being volatilised undecomposed; and even towards the end of the process it should not even approach redness.

The lime is best 'slaked' and 'papped' with about 4 parts of water; as a lower heat is then required to expel the gas, and it passes over more easily and fully, than when less water is employed. This is absolutely necessary when the sulphate is the ammonia-salt used; as otherwise the residuum of 'sulphate of lime' would become so hard that it could not be easily removed from the retort.

The gas, when expelled from the retort, is distilled in a vessel, it is dis-

connected from the receivers, and (when sal ammoniac has been employed) the heat is raised sufficiently high to fuse the residual chloride of calcium, which is then at once baled or poured out. Glass retorts often suffer fracture at this point; but if they escape now, it generally happens that they are broken when heat is applied for a second operation. Hence, according to Prof. Muspratt, it is rare to find a retort, even when carefully handled, that will stand two operations.

When *crude sulphate of ammonia* is employed it is advisable to have only a *little* water in the first receiver, which is placed there merely to *purify* the gas which passes through it, and to retain any traces of volatile empyretic or oily matter which may be carried over with it.

Pure solution of ammonia is most easily obtained from 'sal ammoniac;' but crystallised *sulphate of ammonia*, often crude, is more commonly employed, on account of its lower price.

The *preparation of pure solution of ammonia* admits of no other improvements, than such as merely affect the form of the apparatus employed to produce it; and hence, unlike the ammonia-salts of commerce, has been little meddled with by inventors and patentees. Among the plans having for their object the production of an *ammoniacal solution*, more or less concentrated, fitted for many of the purposes of the *arts*, and for the preparation of salts, but *not for chemical and medical use*, besides those of Reece, Spence, Crane and Jullien, &c., already noticed, may be mentioned—

1. That of Watson (*Patent*, dated 1838) in which *gas-liquor* mixed with a proper quantity of *fresh-slaked lime*, is distilled from a spacious retort or still into a receiver containing *cold water*, until much steam passes over with the gas, when the strong alkaline liquor forming the *distillate*, and called the *first portion*, is drawn off. The distillation is then continued, when a weaker and impurer solution is obtained, called the *second portion*. The first portion is then reintroduced into a retort or still with a small quantity of *fresh lime*, and the distillation repeated. The *product* the patentee calls the *first portion of the second distillation*. The latter is a strong ammoniacal liquor sufficient for all the purposes of scouring, cleaning, conversion into commercial ammonia-salts, &c. It may be further purified by a *third* distillation; the *second* portion of each operation being transferred again to the still with the next *fresh charge* of *gas-liquor*.

2. A modification of Coffey's still,¹ patented by Mr. W. E. Newton (1841), under the name of the 'AMMONIA STILL,' is now extensively and successfully employed in this manufacture.

¹ An engr. and description of this still, as employed for *spirit*, is given under DISTILLATION (which see).

By its use *ammonia* may be obtained from 'gas-liquor,' 'bone-spirit,' or any other ammoniacal liquor or solution, and even from solutions of the salts of ammonia, of *almost any density*, and of considerable purity; and this by a process which is continuous and inexpensive. The body of the apparatus is formed of *wood*, the chambers are lined with *lead*, and the diaphragms are of perforated *sheet iron*. The *management of the apparatus* varies with the form in which it is desired to obtain the product. When the ammonia is required to leave the upper chamber of the rectifier in the form of gas, either pure or impure, the steam, which *ascends*, and the current of 'ammoniacal liquor' which *descends*, are regulated in such relative proportions that the latter remains at or near the atmospheric temperature during its passage through some of the upper chambers, becoming successively hotter as it descends, until at length it enters into ebullition; in which state it passes through the lower chambers, either to make its escape, or to enter a cistern provided to receive it. If, on the contrary, the ammonia is required to leave the upper chamber in combination with the vapour of water, the supply of steam entering below, must be in such proportion, to that of the ammoniacal liquor supplied from above, that the latter may be at or near the boiling temperature in the upper part of the apparatus. *Crude liquor* and *ammonia-salts*, before being thus submitted to distillation, are, of course, first treated with a proper quantity of *quick-lime*—in the one case, to remove most of the impurities, and in the other, to set the ammonia free by seizing on its acid.*

The water or solution contained in the *first* bottle or the *first* receiver is found to be the *strongest*, provided it has been kept well cooled; and that in the *others*, of progressively *decreasing* strength. By mixing the contents of one bottle with another, a solution of *almost any strength* may be made. It is also *easy* to prepare liquor of ammonia of *any required strength*, or to ascertain the *strength* of that in the receivers, by observing the expansion of the liquid. *Water*, when fully saturated with ammonia, expands from 3 volumes, to 5 vols; and in less, but corresponding proportion, according to the quantity absorbed. All that is necessary in practice is, that each receiver be furnished with a *gauge-pipe* by which the degree of expansion may be noted. On the *small scale*, graduated glass receivers may be used.

Liquor of ammonia is now seldom made by the druggist, or on the small scale, the large manufacturing chemists supplying it at a very low rate, and of very superior quality. In the *shops*, it is kept of two or three strengths.

The estimation of the strength of ammonia

* For a full description of the 'AMMONIA STILL,' see Newton's '*Patent Journ.*,' and '*Pharm. Journ.*,' xiii, 64 &c.

solutions in commerce is known as ammonimetry, and depends on the sp. gr., for although the *per-centage richness of solutions of ammonia*, or of its carbonates, may be determined, with the greatest accuracy, by the methods of ALKALIMETRY, already described; for all the ordinary purposes of commerce, and of the laboratory, the strength of

pure solutions of ammonia may be inferred, with sufficient correctness, from their density; and to this the term AMMONIMETRY is usually restricted.

The sp. gr. of the sample being found either by the hydrometer¹ or sp. gr. bottle, in the usual manner, its *per-centage strength* may be seen by inspection of the following Table:—

TABLE exhibiting the relations between the SPECIFIC GRAVITY of Solution of Ammonia and the PER-CENTAGE STRENGTH, for every variation of '00125 Sp. Gr., from '87500 to 1'00000, at 62° Fahr. Abridged from the larger Table of Mr. J. J. GRIFFIN.

* * The specific gravity of mixtures of pure solution of ammonia and pure water is precisely the mean of the specific gravities of their constituents. (Davy; Dalton; Christison.) In all solutions of ammonia, a quantity of anhydrous ammonia, weighing $212\frac{1}{2}$ gr., displaces exactly 300 gr. of water, and reduces the sp. gr. of the liquid to the extent of '00125. (Griffin.) The strongest solution of ammonia which it is possible to prepare at 62° Fahr., has the sp. gr. '87500, and contains 34'694% of pure ammonia, by weight, or 21,251 gr. per gallon. (Griffin.)²

¹ An hydrometer specially weighted and graduated for this purpose, is called an AMMONIMETER, AMMONIOMETER, or AMMONIA-METER (AMMONIMETRUM, AMMONIOMETRUM, &c., L.).

² Mr. Griffin, in his 'System of Ammonimetry,' calls

every $212\frac{1}{2}$ gr. of anhydrous ammonia a TEST-ATOM; and every 7 water-gr. measure, a SEPTUM. Thus, a gallon of water (= 10 lbs.) contains 10,000 septems. The degrees of his AMMONIA-METER range from 1 to 100, and indicate the number of test-atoms of ammonia in one gal. of the liquid.

Ammonia, Carbonates of. (B. P.) *Syn.* AMMONIÆ CARBONAS. See AMMONIUM, SESQUICARBONATE OF.

AMMONIUM. The name given to a group of atoms, which play the part of a compound basic, radical, or metallic element. This substance, whose formula is NH_4 or $(\text{NH}_4)_2$, has never been isolated, although capable of forming most stable salts with the various acid radicals. Several attempts have been made, however, to obtain this compound radical, or group of elements, in a free state, and with more or less success, but on account of its great instability it invariably decomposes when set free into ammonia and hydrogen.

Ammonium salts are some of the most important chemical agents, and are usually recognised as follows, ammonia solution, however, usually acting in exactly the same manner as a solution of ammonium hydrate:—By imparting a *deep blue tint* to solutions of salts of copper. By *exhalation of ammoniacal gas* (recognised by its odour), when triturated or mixed and heated with caustic potassa, soda, or lime. Added to a solution of bichloride of platinum, they produce a *heavy yellow, crystalline precipitate*, consisting of *minute octahedrons* easily discernible under the microscope. With protonitrate of mercury, a *black precipitate*. With bichloride of mercury, a *heavy, white precipitate*. With a concentrated solution of tartaric acid, a *crystalline, white precipitate*, nearly similar to that given with salts of potassa. They are nearly all *soluble in water, volatile, and crystallisable*.

Except the carbonate, they are almost invariably estimated by conversion into ammonia, and estimation by volumetric analyses, as in alkalimetry. In the laboratory, however, for exact purposes, they are converted into the double chloride of ammonium and platinum.

Ammonium Salts:—

Ammonium, Acetate of. $\text{NH}_4\text{C}_2\text{H}_3\text{O}_2$. *Syn.* AMMONIÆ ACETAS, L.; ACÉTATE D'AMMONIAQUE, Fr.; ESSIGSÄURES AMMONIAK, Ger. *Prep.* 1. Take of *acetate of lime* or of *potassa* and *sal ammoniac*, equal parts; mix and distil at a gentle heat. The oily liquid (BINACETATE OF AMMONIUM, $\text{HNH}_4(\text{C}_2\text{H}_3\text{O}_2)_2$), in the receiver forms a radiated crystalline mass on cooling. Dry *gaseous ammonia* passed into this salt, melted by a gentle heat, transforms it into the solid and inodorous *neutral acetate*, $\text{NH}_4\text{C}_2\text{H}_3\text{O}_2$.

2. *Strong acetic acid* is saturated with *ammonia* or *carbonate of ammonium*, and the solution evaporated over *sulphuric acid* in vacuo; the resulting crystals, after being carefully drained, are dried by pressure between bibulous paper.

Prop., &c. Long, slender crystals, or a crystalline mass, freely soluble in both alcohol and water, and deliquescent in the air; taste, sharp and cooling, and somewhat sweetish. Its solutions cannot be evaporated without loss of the ammonia; even the salt passes off in

large quantities with the vapour of water. Its aqueous solution becomes alkaline on keeping, from decomposition of the acid. Distilled with *anhydrous phosphoric acid*, it is converted into ACETONITRILE. An aqueous solution of this salt was introduced into the Materia Medica by Boerhaave, and has since been extensively used as a *diaphoretic* and *febrifuge*, under the popular name of MINDEERUS SPIRIT, after Minderer or Mindererus, who extensively employed it and extolled its virtues. When *pure*, both the salt and its solutions are *neutral* to test-paper, and are *wholly volatilised* by heat. See LIQUOR AMMONIÆ ACETATIS.

Ammonium, Arseniate of. $(\text{NH}_4)_2\text{AsO}_4$. *Syn.* AMMONIÆ ARSENIAS, L. *Prep.* 1. (NEUTRAL.) Saturate a warm concentrated solution of *arsenic acid* with *carbonate of ammonium* in slight excess; evaporate by a gentle heat, that crystals may form on cooling.

2. **Ammonium, Binaseniate of.** $\text{H}(\text{NH}_4)_2\text{AsO}_4$. As above, but adding an additional equiv. of the acid, as soon as any excess of ammonia has been expelled by the heat employed to evaporate the solution.—*Dose* (of either). 1-24th to 1-12th gr.; in phthisis, certain skin diseases, &c. See SOLUTIONS (and below).

Ammonium, Arsenite of. NH_4AsO_3 . *Syn.* AMMONIÆ ARSENIIS, L. *Prep.* From a hot concentrated solution of *arsenious acid*, and *sesquicarbonate of ammonium*, as the last.—Used (chiefly) to make arsenite of iron. The properties and physiological effects of the above arsenical preparations are for the most part similar to those of arseniate and arsenite of potassa. They are all *poisonous*.

✓ **Ammonium, Benzoate of.** *Prep.* 1. Dissolve benzoic acid in ammonia solution to saturation, then, further add ammonia in slight excess, and crystallise by refrigeration, or in vacuo.

2. (LIQUID; SOLUTIO AMMONIÆ BENZOATIS, L.) As the last, but without evaporating the solution.

Prop., &c. Very soluble and very difficult to crystallise. If the solution is boiled for a short time and then abandoned to spontaneous evaporation, crystals of ACID BENZOATE OF AMMONIUM are deposited. It is used chiefly as a chemical test; but has been recently recommended in chronic bronchitis, old coughs, &c.; and to check the formation of chalk-stones and urinary calculi.—*Dose.* 10 to 15 gr.; (of the solution) 15 drops to 1 fl. dr., or more. See BENZOIC ACID.

Ammonium, Bromide of. NH_4Br . *Syn.* AMMONII BROMIDUM, A. BROMIS, L.; HYDROBROMATE D'AMMONIAQUE, BROMURE D'AMMONIUM, Fr. A salt which is obtained from *hydrobromic acid*, *bromide of iron*, &c., by similar processes to those adopted for the iodide. It forms white prismatic crystals; and, in its general properties, resembles bromide of potassium. It is volatile, and easily decomposed.

Used as a nervine in hysterics; especially useful for sleeplessness where there is no organic disease; given in epilepsy when bro-

mide of potassium fails.—*Dose.* 2 to 20 grains.

Ammonium, Carbonates of:—*c*

Ammonium, Carbonate of. *Syn.* NEUTRAL CARBONATE OF AMMONIUM. Equal parts of dry sal ammoniac and sodium carbonate are heated to form the neutral ammonium carbonate of commerce, which sublimes. Solid crystalline substance, with a strong ammoniacal odour, volatile and soluble.

Uses, &c. In the solid form, it is not now used in medicine; but it is indirectly employed in several liquid preparations in which the sesquicarbonate is ordered. It is superior to any other preparation of ammonia for filling smelling bottles; as it is not only more pungent, but does not lose its pungency by keeping. It volatilises more quickly than the sesquicarbonate, and the residuum, unlike that of the latter salt, continues as odorous as ever. It is the basis of several of the most popular and esteemed advertised *smelling salts* of the shops. *Spirit of hartshorn* is an impure solution of this salt, originally obtained by distilling hartshorn or bones.

Ammonium, Sesquicarbonate of. Probably $2\text{NH}_4\text{HCO}_3 + \text{NH}_3\text{NH}_4\text{CO}_3$, i.e. a mixture or compound of bicarbonate of ammonium and carbonate of ammonium. *Syn.* (CARBONATE OF AMMONIA, AMMONIÆ CARBONAS. B. P.). CARBONATE D'AMMONIAQUE, Fr.; KOHLENSÄURES AMMONIAK, Ger. It is prepared on a very large scale commercially as follows:—*Sal ammoniac* or *sulphate of ammonia*, and *chalk*, equal parts, both dry and in powder, are mixed as before, and sublimed from a series of *iron retorts* or *iron pots*, into a *well-cooled* and *capacious receiver* lined with *lead* or *earthenware*; or, more generally, into such a receiver connected, by *iron* or *lead pipes*, with a second and similar one containing a *stratum of water*, to absorb the *free ammonia* evolved during the process.

Prop. The carbonate of ammonia, of commerce, usually occurs in the form of white, fibrous, translucent, or semi-translucent cakes, generally about two inches thick. It is less volatile and pungent than the neutral carbonate; soluble in 4 parts of water at 55° Fahr., 3·3 parts at 62°, 2·5 parts at 96°, and 2 parts at 120°; boiling water and alcohol decompose it, with the evolution of carbonic acid gas and ammonia; by age or exposure to air, the surface assumes an opaque white colour, from its carbonate flying off, and the remaining bicarbonate being less volatile. Unlike the carbonate, it can neither be resublimed, nor digested or distilled with either alcohol or water, without suffering decomposition. Sp. g. 0·966.

The exact composition of this salt varies, according to its method of preparation.

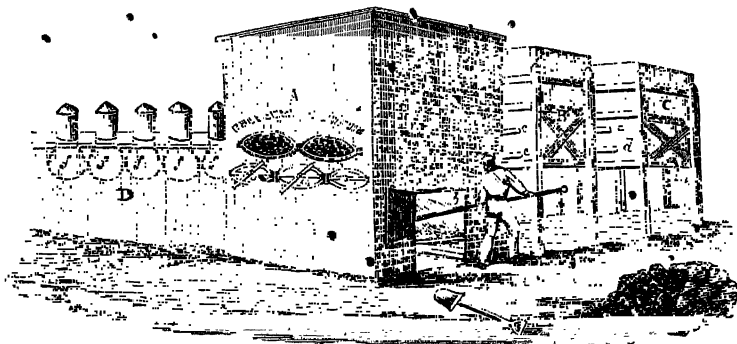

Uses, &c. It is commonly employed by *bakers*, to give lightness to their fancy goods, and to make extemporaneous bread and pastry; by the *chemist* and *pharmacist*, for the

preparation of other salts of ammonia, and in analysis, &c. In *medicine*, it is used as a stimulant, antispasmodic, antacid, and diaphoretic, in *acidity of the stomach*, *dyspeptic affections*, *gout*, *scrofula*, *hysteria*, *lowness of spirits*, *epilepsy*, &c.; and in the *convulsions* attending dentition. It has been recently recommended, by Dr. Bañlow, in *diabetes*. It is also employed to make effervescing draughts; and *externally*, as a counter-irritant and stimulant. Its use as a *nasal stimulant* in headaches, fainting, &c., is well known. In *large doses*, it is emetic; in excessive doses, poisonous. Its long-continued use, in quantity, is often productive of very serious consequences—slow fever, debility, emaciation, scurvy, loss of teeth, hæmorrhage, general cachexy, and even death. The *antidotes* and *restorative treatment* are, the *free use* of lemon-juice, wine or malt-liquors, new milk, and antiscorbutic vegetables, with a generous diet, of which the red meats form a large proportion.—*Dose.* As a *stimulant* or *diaphoretic*, 5 to 15 gr., dissolved in cold water; as an *emetic*, 20 to 30 gr., in tepid water, repeated if necessary; as an *effervescing saline draught*, 15 to 30 gr. A few grains (8 or 10) dissolved in a tumbler of *cold water*, is an excellent 'refresher' in lowness of spirits, or after fatigue; and is highly esteemed by drunkards; being, in each case, preferable to 'spirit of sal volatile.'

Concluding remarks, Patents, &c. In extension of the above, it may be added, that on the *large scale*, the distillation is usually carried on in cast-iron retorts, similar in size, shape, and character, to those employed in the manufacture of coal-gas, and of which five, or more, are commonly set horizontally in the same furnace. (See *engr.*) Each retort has its mouth (*a*), through which the 'charge' is introduced, closed with a movable door, which is securely fastened in its place, in the manner shown in the *engr.*; and is furnished, at the upper part of its further end, with an iron pipe (*c*), to carry off the evolved fumes to the condenser or receiver. The latter consists of two large square wooden chambers (*B, C*), lined with lead, and either fitted with movable covers, secured by water-joints, or with doors in the side, to permit of the easy removal of the sublimed salt. The first receiver communicates with the second by means of a large lead tube (*d*) near its centre, and by another tube (*d'*), somewhat smaller, and nearer the bottom, but above the surface of the stratum of water in the second receiver, before alluded to. These chambers have also a lead pipe (*e, e*), stopped during the process with a plug or cock of lead, to allow of the liquid product of the distillation, &c., to be drawn off, or run into another receiver or cistern, at will. Both chambers are placed on strong wooden supports, or scaffolding, to bring them on a level with the retorts. When the *impure sulphate* or other ammonia-salt is used in the manufacture of the *sesquicarbon-*

nate (which is generally the case), the resulting salt being impure and discoloured, is resublimed in *iron pots* (*f. f. f.*), furnished with movable *lead* heads, which are kept cool by a current of air passing over them; a

little water being introduced into the subliming pots to render the product translucent. The heat is applied either by means of a fire passing from the *retort-furnace* (*A, B*) or by a water bath heated in the same manner; the

latter being the preferable method, as the temperature should *not* be greater than about 200° Fahr., and need not exceed 150° to 155°. These *pots* are arranged in sets, as shown at (*D*) in the engraving.

The charge of a retort usually consists of about 70 to 72 lbs. of *sulphate of ammonia*, or 57 to 58 lbs. of the *hydrochlorate* to 1 cwt. of *chalk*; or in these proportions. The *product* is about 40 lbs. of the *crude salt*, which, by careful resublimation, yields about 39 lbs. of marketable carbonate of ammonia.

Carbonate of ammonia, like the chloride and sulphate, is now scarcely ever prepared on the small scale, that of *commerce* being not only cheaper, but sufficiently pure for *all* the purposes of *medicine* and the *arts*. The *PRICE* ranges from £30 to £35 per *ton*, according to the quality.

Ammonium, Bicarbonate of. HNH_4CO_3 .
Prep. By digesting cold water on *sesquicarbonate of ammonia* in considerable excess, until the whole of the pungent neutral carbonate is dissolved out. If the salt is reduced to powder the operation is facilitated.*

To powdered *sesquicarbonate of ammonia* add *boiling water* just sufficient to dissolve it, and immediately close the vessel; crystals form as the liquid cools, containing $\frac{2}{3}$ equiv. of water.

Prop., &c. For the most part similar to the *sesquicarbonate*, except in having a taste and smell which is only faintly ammoniacal, and hence more palatable. Crystallises in oblique prisms, which, as usually obtained, contain about $23\frac{1}{2}$ of water. It requires 8 parts of cold water to dissolve it. It is *distinguishable* from the *previous carbonates* by the almost entire *absence* of ammoniacal odour, and by its solution giving no immediate precipitate with chloride of barium, but, by standing, or on the addition of a little liquor of ammonia, a white

earthy precipitate, accompanied with the evolution of carbonic acid gas. A *saturated solution* of this salt, evaporated by a *very gentle heat*, or refrigerated, gives small prismatic crystals having neither smell nor taste.

Uses, &c. Similar to those of the other carbonates.—*Dose.* 5 or 7 to 20 or 25 gr.

Ammonium, Chloride of. NH_4Cl . *Syn.* MURIATE OF AMMONIA, SAL AMMONIAC, HYDROCHLORATE OF AMMONIA; CHLORHYDRATE D'AMMONIAQUE, SEL AMMONIAC, &c., Fr.; SALMIAC, Ger. A substance which, as already noticed, appears to have been originally obtained, by sublimation, from the *soot of camel's dung*, in Egypt. In this country, at the present day, it is manufactured chiefly from the *crude ammoniacal liquors* obtained as secondary products in the manufacture of coal-gas and animal charcoal.

Prep. 1. From GAS-LIQUOR:—The *crude ammoniacal liquor* of the gas-works is, either at once, or after distillation,¹ neutralised with *hydrochloric* or *sulphuric acid*, the choice being given to the one which is the cheaper and more accessible at the place where the works are situated. When *hydrochloric acid* is employed, the SATURATION is usually effected by allowing the *acid* to flow from a large wooden vessel or tank lined with lead or gutta percha into a large underground reservoir or tank containing the ammoniacal liquor, and having an exit-tube passing into the chimney or shaft of the steam-engine, to carry off the sulphuretted hydrogen and other offensive gases liberated during the mixture. Sometimes the gas-liquor is accumulated in enormous covered wooden tuns, capable of holding from 10,000 to 20,000 gallons, or

¹ This is now generally conducted in a large wrought-iron boiler, connected with a rude modification of *Coffey's still*; the object being to obtain the liquor free from tar and more concentrated.

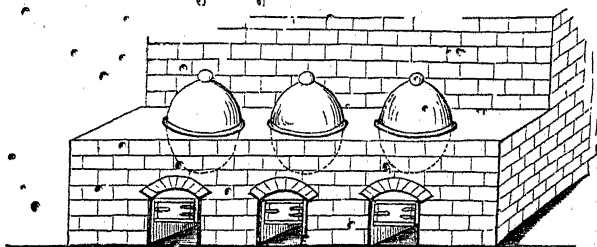

more; and the acid is added by raising the *gutta-percha* carboys containing it by means of cranes, and then thoroughly mixing it with the liquor by means of powerful 'agitators,' whilst the offensive fumes are either passed off as before, or made to traverse the fire of the steam-engine before entering the chimney-shaft. The quantity of acid employed to effect saturation must, of course, depend on the ammoniacal strength of the gas-liquor operated on. The usual proportions are $1\frac{1}{2}$ to 2 lbs. of the former, to each gal. of the latter; but in all cases sufficient should be added to impart a very faint acid reaction to the mixture. This last having been effected, the saline solution, now containing *hydrochlorate of ammonia*, is, after repose, ready to be pumped or run off into the evaporators.

The EVAPORATION of the crude saline solution is usually carried on in large square or rectangular *cast-iron vats*, of very moderate depth, and capable of holding from 1000 to 1500 gallons, or more. These are encased in brickwork, and are heated by a furnace, of which the flues pass in a sinuous course beneath the lining of brickwork on which the vats or pans rest. During the concentration of the liquid, the tar, &c., which separates and floats on the surface, and which thus seriously impedes evaporation, is, from time to time, removed by skimming. As soon as the sp. gr. reaches 1.25, any excess of acid in the solution is exactly neutralised with a little fresh ammoniacal liquor; by which any waste of acid is prevented, at the same time that any ferric salt present, and which would contaminate the ultimate product, is precipitated as sesquioxide. After settling for a short time, the hot liquor is ready to be transferred to the crystallisers.

The vessels employed in the CRYSTALLISATION are *pans* or *tubs*, usually circular, and about 7 or 8 feet wide, by $2\frac{1}{2}$ to 3 feet deep; and are generally set on the ground, or are imbedded either partially or wholly in it. The saline liquor being pumped or run into them at a little below the boiling temperature, crystallises as it cools; the only in-

terference being occasional stirring or agitation, to prevent the formation of large crystals, which would be inconvenient in the subsequent part of the process. The time occupied in the crystallisation varies, according to the size of the 'crystallisers,' and the weather, from 3 or 4 to 8 or even 10 days. The 'mother-liquor' of the 'crystallisers' is pumped back into the evaporating pans for further concentration. The crude blackish salt (*hydrochlorate*) thus obtained is contaminated with tarry and oleaginous matter, free acid, water, &c.; from part of which it is freed by exposing it in a layer about 4 inches deep, on a *cast-iron plate* gently heated by a zigzag flue of a small furnace, until all the water is expelled; care being taken that the heat never rises high enough to volatilise the salt. This operation is generally performed under a dome, or the expanded throat of a large chimney. The salt will now have become of a greyish-white colour, and is ready for the next operation.

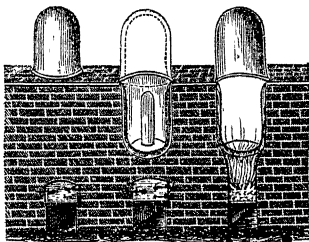

The crude dry salt of the last process is finally purified by SUBLIMATION. For this purpose *cast-iron pots* lined with clay, and heated from below and by flues round their sides, are employed. (See engr.) The crude grey salt is beaten down into these pots until they are about 2-3rds filled, when the heads or capitols are fitted on, and heat applied. The latter are very heavy, being usually made of lead (sometimes of iron), and have the form of a dome, or a hemispherical cup, with a small tube or hole at the apex, in which a plug is loosely placed, to permit the escape of steam. These domes or heads are so made as to fit closely and firmly on the flat rim or flange of the 'sublimers,' and are retained in their places, during use, both by their weight, and by 2 or 3 clamps provided for the purpose. They are also furnished with 3 rings, set at equal distances, to allow of their being lifted off, or moved, by means of a pulley and chains. The due application and regulation of the heat is here of the utmost importance. If the temperature employed be too high, the sublimed salt will be contaminated with empyreumatic matter, whilst some of it

will be carried beyond the dome and lost; and if it be extreme, the head may be altogether blown off, and the contents of the pan scattered about the building; whilst on the other

hand, if the heat employed be too low, the resulting cake of sal-ammonia will be soft, spongy, and either grey or yellowish. The proper temperature is said to be known by two

or three drops of water readily boiling, and being dissipated in vapour, when placed on the head or cover of the sublimer; but it should not 'spit' or 'dance about,' or be raised by the heat out of contact with the metal. The usual practice is to keep the fires "briskly up until the sublimer and their surroundings attain a sufficient degree of heat; they are then slackened, and maintained at a mean temperature." (Muspratt.) The sublimation occupies from 5 to 9 days; but it is customary to raise the heads once, or even twice a week, to ascertain the progress made; the fires having been purposely neglected or checked for some hours previously. The process is finally stopped before the whole of the crude salt in the pots is volatilised; since the heat required for that purpose would lead to the decomposition of the carbonaceous impurities, and cause them to emit volatile hydrocarbons, which would materially lessen the purity and beauty of the product. The unsublimed portion in the pots forms a conical mass, which is technically called the 'yolk.' This is shown in the second engr. (see below), in which the latest improvements in the form of the subliming apparatus are also exhibited.

The sublimation having been carried to a sufficient extent, the fires are allowed to die out. The domes, after cooling, are lifted off, and the attached hemispherical cakes or 'bells' of SAL AMMONIAC OR HYDROCHLORATE OF AMMONIA at once removed. These vary from 2 to 5 inches in thickness, and from 45 or 50 lbs. to 1000 lbs.; and upwards, in weight, according to the size of the sublimer in which they have been produced. They are generally nearly pure, except in the outer part which has been in contact with the metal. From the subliming-house they are taken to the store or packing-house, and after having been scraped, to remove the discoloured portion before alluded to, are either preserved entire, or are broken up into convenient pieces, which are then packed in casks or barrels, and in either state are ready for the market.

When sulphuric acid¹ is used to neutralise the ammoniacal liquor, the process is generally, for the most part, the same as when hydrochloric acid is employed; but here the brown salt obtained by the crystallisation,

¹ Sp. gr. 1.38 to 1.33.

and subsequent desiccation, is crude SULPHATE OF AMMONIA, instead of the hydrochlorate. It is intimately mixed with about an equal weight of chloride of sodium (common salt) before being put into the sublimer.

In some cases particularly where the ammoniacal liquor is rich in carbonate of ammonia, gypsum is employed as a source of sulphuric acid. (See below.)

Another method is to convert the solution of the crude sulphate into a solution of the hydrochlorate, during the process, by the addition of chloride of sodium. Both these last methods are described below.

2. From BONE-LIQUOR, &c.²—The ammoniacal liquor technically called 'bone-liquor' or 'bone-spirit,' and formerly known under the name of 'spirit of hartshorn,' is essentially a solution of carbonate of ammonia more or less contaminated with volatile empyreumatic oil. Its conversion into SAL AMMONIAC may be easily effected by saturating it with hydrochloric acid, evaporating the resulting neutral solution in lead or iron boilers until a pellicle begins to form, then pumping or running off the hot liquors into the crystallisers, and, lastly, draining and drying the crystals. The salt thus obtained may be purified either by sublimation, or by recrystallisation. The whole series of processes closely resemble those already described, except in being less troublesome, owing to the absence of the tarry and other foreign matters which impede and complicate them when gas-liquor is employed.

Another method adopted, particularly on the Continent, and one equally applicable to any crude ammoniacal liquor rich in free ammonia or its carbonates, is to employ sulphate of lime instead of sulphuric acid to neutralise the alkali. For this purpose the ammoniacal liquor is passed through a series of three or four covered wooden filters lined with lead, each containing a layer of crushed gypsum to the depth of 3 or 4 inches. These filters are usually set on 'stages' one above another, and each communicates with a cistern placed beneath it by means of a leaden pipe furnished with a stop-cock. This last is not opened until the liquor has remained some little time in the filter; and a pump throws back once, or oftener, upon each filter, what has already passed through it, before it is allowed to run into the next lower one. The 'liquor' in each filter is not allowed to stand higher

² That employed in England is chiefly obtained, as already mentioned, from the manufacturers of bone-black or animal charcoal; but, on the Continent, the liquor obtained by a like destructive distillation of various animal offals (blood, flesh, horn, hoofs, woollen rags and waste, hair, scrapings of hides, leather cuttings, &c.) is employed for the same purpose. The preparatory process by which this liquor is obtained is essentially the same in each case; except that with animal offal the temperature should not exceed a red-brown heat, in order that the resulting charcoal may afterwards serve to make ferrocyanide of potassium and Prussian blue. These liquors have usually a density ranging between 8° and 9° Baumé (Ure; = sp. gr. 1.056 to 1.063).

than from 2 to 3 inches above the surface of the gypsum; and the lowest or last filter is supplied with fresh gypsum at each separate charge of fresh liquor. A little water is lastly passed through the filters to wash out the portion of ammoniacal liquor absorbed or retained by the filtering media. In this way, the gypsum of the filters is converted into carbonate of lime at the expense of the carbonate of ammonia in the solution; whilst the ammonia of the latter decomposes the gypsum, and becomes converted into sulphate of ammonia, which, with some free ammonia, is found in the filtrate. Sulphuric acid is next added to the filtered liquor, to completely neutralise the free and carbonated alkali still existing in it; after which it is evaporated in a leaden boiler, with frequent skimming to remove floating oil, until of the sp. gr. 1.160. Chloride of sodium (common salt), in sufficient quantity to convert all the sulphate of ammonia in the liquid into hydrochlorate, by double decomposition, is now added, with constant stirring; after which the clear portion is either pumped or syphoned off into a somewhat deep reservoir or tank, where it is allowed to settle. The liquid, after sufficient repose, is pumped from the reservoir to the boilers, and evaporated, with frequent agitation, so long as the sulphate of soda now existing in it falls to the bottom in granular crystals. These crystals are, at intervals, scraped to the cooler portion of the pan or boiler, whence they are removed by copper rakes and shovels, into draining-hoppers, placed near the edges of the pan. The liquor in the boiler is now a strong solution of sal ammoniac, but still containing a little sulphate of soda, from which it has to be freed by crystallisation. With this object, it is further concentrated, and then run or pumped into the crystallisers. In 30 or 40 hours, or longer, the mother-liquor is run or pumped off. The mass of newly formed crystals is then drained, and slightly washed, first with a little weak solution of sal ammoniac, and next with a very little cold water; after which they are again well drained. The crude HYDROCHLORATE OF AMMONIA, thus obtained, is converted into the pure salt, by desiccation and sublimation, as before.

In France, where this method is very generally employed, the sublimation is commonly conducted in stoneware or earthenware balloons or bottles coated with loam, of about 18 to 20 inches in height in the body, and either surmounted with inverted 'cups' or 'heads' 10 or 12 inches high, or simply covered with a tile, when (in the latter case) the sublimate collects in the upper part or neck of the balloon, which is above the action of the fire. A number of these vessels are set on the dome of a furnace, which is perforated with holes or slits, to allow the heat to pass through; whilst their necks or heads are sheltered from the action of the fire by plates of iron or earthenware, having semi-circular indentations on their edges, so that

when placed together they form a level surface, through which the necks of the sublimers protrude, and fit closely. The fire is nicely regulated, so as to cause the salt to condense in the upper and cooler part of the vessels, or in the heads, as the case may be; and great care is taken to occasionally clear the necks with a skewer, to prevent choking, and consequent bursting.

In Scotland, where a similar process is also commonly pursued, the sublimers, according to Dr. Ure, are generally "cast-iron pots, lined with fire-proof tiles; the condensation being effected in globular heads of green glass, with which each of the iron pots are capped."¹

Ratio. Gas-liquor contains carbonate of ammonium (chiefly), with chloride, sulphate, hydrosulphate, cyanide, sulphocyanide, &c., of the same radical. On neutralisation with hydrochloric acid, or sulphuric acid, these are converted into chloride or sulphate of ammonium, according to the acid used. By sublimation with chloride of sodium, the sulphate of ammonium is converted, by double decomposition, into chloride of ammonium, which sublimes; and sulphate of sodium, which remains in the subliming pot. A similar change occurs when the solution of the sulphate, prior to crystallisation, is decomposed by the addition of chloride of sodium, or any other chloride. When the 'gas-liquor' is at once converted into chloride of ammonium by the addition of hydrochloric acid, the sublimation merely purifies the salt. Like changes occur when bone-spirit is employed.

Comp. Chemically considered, this salt consists of equal VOLUMES of gaseous ammonia and hydrochloric acid gas condensed into the solid form; or, by WEIGHT, according to the ammonia-theory, of—

	Atoms.	Equiv. wt.	Per cent.
Ammonia (NH ₃)	1	17	31.78
Hydrochloric acid (HCl)	1	36.5	68.22

Hydrochlorate of Ammonia (NH ₃ HCl)	1	53.5	100
--	---	------	-----

Or, according to the 'ammonium-theory,' of—

	Atoms.	Equiv. wt.	Per cent.
Ammonium (NH ₄)	1	18	33.65
Chlorine (Cl)	1	35.5	66.35

Chloride of Ammonium (NH ₄ Cl)	1	53.5	100
---	---	------	-----

Prop., &c. The sal ammoniac, of commerce, is found under the form of large white hemispherical, cup-like cakes or masses (or in large fragments which are sections of them), possessing a tough, fibrous, semi-crystalline texture, and very difficult to powder. It is odourless, has a saline taste somewhat sharp or acrid, and

¹ Ure's "Dict. of Arts, M., & M.," 5th Edn., i, p. 148.

sublimes without either fusion or decomposition. It slightly reddens litmus; dissolves in rather less than 3 parts of cold water, and in about 1 part of boiling water; is soluble in alcohol; and when crystallised from water, under favorable circumstances, forms distinct octahedra, or cubes, usually small and aggregated together in rays or feathery masses. By slowly evaporating its aqueous solution, it may be sometimes obtained in cakes an inch in thickness. It is anhydrous. Sp. gr. 1.450.

Pur. It should give a colourless solution with water; wholly sublime with heat; and neither chloride of barium, nor sulphuretted hydrogen, should affect its solution. A solution, to which a few drops of nitric acid have been added, should not yield a blue precipitate with ferrocyanide of potassium. It often contains sesquichloride of iron, and sometimes lead; both of which may be readily detected by the above tests. Its complete volatility may be easily determined by heating, in the flame of a candle, a small fragment held on the point of a knife.

Tests.—1. It is known to be a salt of ammonium by its cooling ammoniacal fumes when triturated with lime, or when moistened with caustic potassa or soda.—2. It is shown to be a chloride by its solution yielding, with nitrate of silver, a white curdy precipitate, insoluble in boiling nitric acid, soluble in ammonia.

Uses, &c. In the arts, chiefly in the coating and soldering of metals, and the preparation of alloys; in dyeing; and in the manufacture of ammonia-alum; also, in large quantities, to give a factitious pungency to snuff. In chemistry, as a reagent; and, owing to the cold produced during its solution, to form frigorific mixtures. In medicine, it is chiefly used externally, as a stimulant and resolvent or discutient; and occasionally, internally, as a diuretic, stimulant, resolvent, alterative, tonic, &c., particularly in chronic inflammations of the mucous and serous membranes, in chronic glandular and visceral enlargements and indurations, and in amenorrhœa. In rather large doses, frequently repeated, it is said to prove often highly beneficial in chronic enlargement and induration of the prostate gland (M. René Vanoye); and also in other like cases.—*Dose.* 5 to 20 gr., 3 or 4 times daily, either in powder or solution, mixed with some demulcent; as a discutient or resolvent lotion, 1 to 1½ oz., to ½ pint of water, either with or without 4 or 5 fl. oz. of spirits or strong vinegar (often serviceable in chilblains); as a weak lotion, or a collyrium or injection, 1 to 4 dr., to water, 1 pint. In very large doses it is poisonous; the treatment is emetics and mucilaginous or demulcent drinks.

Concluding remarks, Patents, &c. The methods already described are those by which commercial hydrochlorate of ammonia is usually, if not almost entirely obtained; the various improvements or modifications, from time to time introduced, affecting chiefly the minor details,

and the form or size of the apparatus and machinery employed, and not the general principles on which the processes are based. One of the most important of these has for its object the entire removal of the iron present in the crude salt, some of which, if it be not removed, before sublimation, is volatilised and contaminates the ultimate product. To obviate this evil, Mr. Brewer passes a few bubbles of chlorine through the hot concentrated solution of the salt, previous to its crystallisation; by which the protochloride of iron is converted into the perchloride, which, being acted on by the ammonia always present in the liquor, is precipitated as ferric hydrate, with the formation of a small additional quantity of sal ammoniac. The only precaution necessary is to avoid employing more chlorine gas than is necessary to peroxidise the iron; as beyond this, a portion of the ammonia-salt itself is decomposed, with the evolution of nitrogen. The temperature of the liquor is kept up, after the action of the chlorine, until the whole of the brown flocculent oxide of iron has subsided, when it is at once decanted or filtered into the crystallisers.

Another modification which has been adopted in two or three places, is to effect neutralisation of the crude ammoniacal liquor by distilling it, and passing the fumes in at the lower end of a hollow shaft or column filled with coke, down which the acid trickles; the resulting solution of sulphate or chloride of ammonium being received in proper cisterns, conveniently situated near the base of the column.

In Mr. Spence's method of obtaining ammonia-salts from gas-liquor or bone-spirit, a series of (usually four) cylindrical boilers, or reservoirs, so placed that the contents of each upper one may be drawn off into the one next below it, are employed. Each boiler has an exit-pipe which carries the vapour generated in it, to that next above it, whilst that of the highest boiler passes off to a trunk containing the acid necessary to form the salt. The top boiler is connected with the reservoir of gas-liquor (which is already mixed with milk of lime) by a charging pipe furnished with a stop-cock turned by a floating ball, so as to keep the surface of the liquor constantly at the same height. High-pressure steam enters the lower boiler, by which its ammonia is driven through the connecting pipe into the next boiler, and so on in succession, until it leaves the highest boiler in a concentrated state, and thus enters the acid-tank. When this last contains moderately strong hydrochloric or sulphuric acid, the resulting solution of CHLORIDE or SULPHATE OF AMMONIUM (as the case may be) is sufficiently concentrated to be at once run off into the crystallisers. As soon as the liquor in the lowest boiler is exhausted of its ammonia, its contents are drawn off, and replaced by that of the next boiler, which is followed by a like descent throughout the whole series.

Among *improvements* having for their object the substitution of cheap *chlorides* for the more expensive *commercial acids*, may be mentioned those of—

1. Mr. Laming (*Patent* dated 1843), who employs a strong solution of CHLORIDE OF CALCIUM for converting the *ammonia* of gas-liquor into the *hydrochlorate*.

2. Mr. Hills (*Patent* dated 1846) employs CHLORIDE OF MAGNESIUM² in the same way; and by a subsequent patent, proposes to convert the *ammonia* eliminated in the distillation of coal into the *hydrochlorate*, by mixing CHLORIDE OF MAGNESIUM with the coal in the retorts, or by introducing the chloride into a retort appropriated for the purpose. The heat dispels the chlorine of the chloride, in the form of hydrochloric acid, and this, uniting with the ammoniacal vapour, forms hydrochlorate of ammonia, which is retained in the liquor of the condenser. From this liquor, the salt is obtained by evaporation, &c., in the usual way.

3. Mr. Croll (*Patent* dated 1849) converts the crude ammoniacal vapours that issue with the gas from the common retorts into the *hydrochlorate*, and obtains a solution of it, by passing the gas through a solution of crude CHLORIDE OF MANGANESE³ (1 *cwt.* of the salt to about 40 *galls.* of water) contained in one of the ordinary vessels used for purifying coal-gas. The manganic solution absorbs the ammonia and its salts, converting them into the *hydrochlorate*, whilst a corresponding proportion of oxide of manganese is precipitated. As soon as the liquor in the purifier is fully saturated, it is drawn off, and replaced by a fresh quantity; whilst the saturated liquor containing the *hydrochlorate*, after subsidence, or filtration, is evaporated, &c., as before. Crude CHLORIDE OF IRON may be substituted for the chloride of manganese, in the above process; as may also SULPHATE OF MANGANESE, but then the product, of course, will be *sulphate of ammonia*, instead of the *hydrochlorate*.

4. Mr. Laming (*Patent* dated 1850) also proposes the use of various *salts* and *mixtures* for retaining and condensing the ammoniacal vapour of coal-gas, as it passes from the retorts through the purifiers. Of these the principal are CHLORIDE OF CALCIUM obtained by decomposing *chloride of iron* by *hydrate of lime*; CHLORIDE OF IRON, obtained by decomposing *sulphate of iron* with *chloride of sodium*; CHLORIDE OF MAGNESIUM; a mixture of SULPHATE OF LIME and SULPHATE OF

IRON; or of moist *precipitated oxide of iron* with *carbonate of lime*, *carbonate of magnesia*, or *magnesian limestone*; or one containing *sulphate of magnesia*, or *chloride of magnesium* or *calcium*, or one, or more of them, in combination with *oxide of copper*, either with or without *lime* or *magnesia*, or with both or either of them or their *carbonates*. These salts, or compounds, are mingled with *sawdust*, or some other porous substance not acted on by the gas, before being put into the purifiers; and after they become saturated with the vapour, the newly formed, *hydrochlorate* or *sulphate* (according to the salt or mixture employed), is washed out of the mass with water.

Besides the usual sources of SAL AMMONIAC (and the other ammonia-salts of commerce), it has been proposed to obtain it from *guano*, *peat*, *shale*, &c., as noticed under SESQUICARBONATE OF AMMONIA (*suprà*); the substance employed to effect the *neutralisation* or *decomposition* of the ammoniacal liquor being, in this case, either *hydrochloric acid* or a *chloride*.

In Young's *Patent* (1841) for 'obtaining AMMONIA and its SALTS,' a mixture of 2 parts of *guano*, and 1 part of *hydrate of lime*, is distilled in a retort placed vertically, at a moderate heat, gradually increased until the bottom of the retort becomes red hot. The ammoniacal portion of the fumes evolved are absorbed by the cold water contained in a suitable condenser; whilst the other gases eliminated by the process pass off uncondensed. By subsequently passing *carbonic acid gas* into the liquor of the condenser, a solution of CARBONATE, BICARBONATE, or SESQUICARBONATE OF AMMONIA is formed. By nearly filling the condenser with *diluted hydrochloric* or *sulphuric acid*, instead of with water, a solution of HYDROCHLORATE or of SULPHATE OF AMMONIA is obtained.

Stale urine saturated with *hydrochloric acid*, or with *sulphuric acid* diluted with about twice its weight of water, yields SAL AMMONIAC, or SULPHATE OF AMMONIA (according to the acid used) on evaporation.

Hydrochlorate of ammonia is now wholly prepared on the large scale, and never by the dealer or retailer, by whom it is only occasionally refined or purified, in small quantities, for chemical and medical purposes. The sal ammoniac of commerce is found to be sufficiently pure for all its ordinary applications in the arts; but when wanted of greater purity, it is broken into pieces, and resublimed from an earthenware vessel into a large receiver of earthenware or glass. The product (REFINED SAL AMMONIAC, DOUBLE-REFINED S. A.; AMMONIÆ HYDROCHLO'RAS PURA, SAL AMMONIACUS DEPURATUS, L.) is popularly known as FLOWERS OF SAL AMMONIAC (*flores salis ammoniaci*, L.), from being in a finely divided crystalline state.

The chemically pure chloride of ammonium may be prepared by bringing its gaseous consti-

¹ Particularly such *chlorides* as are the 'waste or bye products' of other manufactures.

² Of the Epsom-salt works, &c.

³ Obtained from the chloride-of-lime works. The portion of the precipitated oxide of manganese saved from the process, may be reconverted into the chloride, by mixing 8 parts of it with 4 parts of common salt, and heating the mixture to low redness, scarcely perceptible in the dark, for 2 to 3 hours. 140 lbs. of the calcined mass, with 40 *galls.* of water, forms a solution that may be again pumped into the purifier.

tuent—ammonia and hydrochloric acid—into contact. During the combination much heat, and even light, is generated, and the anhydrous solid salt is precipitated in a minutely divided state, which, under the microscope, is seen to be crystalline. It may be also more easily and conveniently prepared by saturating pure and moderately dilute hydrochloric acid with ammonia or its carbonates, and evaporating the solution until a pellicle forms, when crystals of the HYDROCHLORATE separate as the liquid cools. A similar but rather more violent reaction occurs when gaseous chlorine is brought in contact with gaseous ammonia, or is passed into a nearly saturated solution of ammonia or its carbonates; but in this case nitrogen is evolved at the expense of the ammonia; moreover, the process is attended with danger.

The manufacture of sal ammoniac is usually a distinct business, and is carried on to a very great extent in the neighbourhood of London. Indeed, the London makers now supply the chief portion of that used in England. A large quantity is now, however, made at Manchester and Liverpool. A small quantity is imported from Germany. That from Brunswick is in the form of sugar-loaves. An inferior quality is also imported, in chests, from the East Indies.

The red bands frequently seen in the sal ammoniac of commerce, are said to arise from the workmen falling asleep, and allowing the fire to go down, and then suddenly raising the heat too high. (Muspratt.) They consist chiefly of ammonio-chloride of iron.

Ammonium, Citrate of. $(\text{NH}_4)_2\text{HC}_6\text{H}_5\text{O}_7$.
Syn. DIAMMONIUM CITRATE, CITRATE OF OXIDE OF AMMONIA; AMMO'NIE CITRAS, L.

Prep. A concentrated solution of pure citric acid, gently heated, is saturated with sesquicarbonate of ammonium, in fine powder, (about 7 parts to 6,) and slightly in excess; and the resulting liquid is crystallised by refrigeration in close vessels, or by evaporation in vacuo. If heat be employed in the evaporation of the solution, an ACID CITRATE will be formed.

Uses, &c. Chiefly as a chemical test. An *extemporaneous citrate*, made with lemon-juice and drank effervescing, is employed as a saline draught, and a mild aperient and diaphoretic, in fevers, &c.

Ammonium, Ferrocyanide of. $(\text{NH}_4)_4\text{FeC}_6\text{N}_6$. 3Aq. *Syn.* FERROCYANATE D'AMMONIAQUE, Fr. *Prep.*—1. Saturate a solution of hydroferrocyanic acid with sesquicarbonate of ammonium, in slight excess; evaporate the solution at a heat below ebullition, and crystallise by refrigeration.

2. Digest ferrocyanide of lead or of iron in a solution of sesquicarbonate of ammonium, at a gentle heat, for some time; then filter, evaporate, and crystallise.

Prop., &c. It is isomorphous with ferrocyanide of potassium; it is easily crystallisable, very soluble in water, and is decomposed by ebullition.

Ammonium, Iodide of. NH_4I . *Syn.* HYDRIODATE OF AMMONIA; AMMO'NII IODIDUM, L.; HYDRIODATE D'AMMONIAQUE, Fr. *Prep.* An aqueous solution of hydriodic acid is neutralised with ammonia, or ammonium sesquicarbonate, in slight excess; and the resulting liquid is either carefully, but rapidly, evaporated to dryness over a water bath, or it is concentrated by the same means, and then caused to deposit crystals by refrigeration; in both cases, care is taken to keep a slight excess of ammonia present during the evaporation. The crystals are dried by pressure between folds of bibulous paper; and the product, in either form, preserved in a stoppered bottle.

Pure iodine is triturated with a little distilled water, and solution of ammonium sulphhydrate added, in small quantities at a time, with continued trituration, until the red colour of the iodine has entirely disappeared. The solution, after being gently boiled for a few seconds, to expel the sulphuretted hydrogen present, is filtered, slightly alkalisied with ammonia, and evaporated or crystallised, as before.

• *Prop., &c.* Colourless; deliquescent; freely soluble in water, and in spirit; air and light turn it yellowish or brownish, with partial decomposition. It closely resembles iodide of potassium, than which it is more active, and thought to be better suited to irritable and relaxed habits.—*Dose.* 1 to 10 or 12 gr.

Ammonium, Lactate of. *Syn.* AMMO'NIE LACTAS, L. An uncrystallisable salt prepared by saturating ammonia, or its carbonate, with lactic acid. It has been found useful in rickets, and in dyspepsia and worms, when occurring in debilitated habits. For this purpose it is best taken fresh-prepared, as a draught, flavoured with syrup of orange-peel, 3 or 4 times daily. See LACTATE and LACTIC ACID.

Ammonium, Nitrate of. NH_4NO_3 . *Syn.* AMMO'NIE NI'TRAS, L.; NITRATE D'AMMONIAQUE, Fr. *Prep.* Saturate nitric acid (diluted with 3 or 4 times its weight of water) with sesquicarbonate of ammonium, evaporate by a gentle heat, and crystallise. When not required in a crystalline form, it is usually evaporated to dryness at about 212° Fahr.; and the heat being carefully raised to about 250° , the fused salt is poured out on a polished slab of iron or stone, and when solidified, broken up and put into bottles.

Prop. When the evaporation of the solution is conducted at a heat under 100° Fahr. the salt is obtained in beautiful hexagonal prisms; when at 212° , in long silky fibres; when by rapid evaporation and fusion, it forms a white, compact, and usually foliated mass. It dissolves in about twice its weight of water; is slightly deliquescent; melts at 230° , and is decomposed into nitrous gas and water at 460° Fahr. It deflagrates, like nitre, on contact with heated combustible matter.

Uses, &c. Chiefly to prepare nitrous oxide or laughing gas (of which nearly 4 cubic feet may be procured from every lb. avoird.); and

with *water*, to form *freezing mixtures*, for which purpose it may be used for any number of times by simply evaporating the solution to dryness, when the salt, obtained unaltered, is ready for another operation. Care, however, should be taken not to expose it to too great heat, as at a certain temperature it deflagrates with violence. It is occasionally employed in the *laboratory* to promote the combustion of organic bodies during incineration; and sometimes, though seldom, in *medicine*, as a diuretic and diaphoretic. It is said to reduce the frequency of the pulse, and the animal heat, without affecting the head, chest, or stomach. (Wibmer).—*Dose*. 10 to 30 gr.

Ammonium, Nitro-sulphate of. *Syn.* AMMO'NIE NITRO-SUL'PHAS, L. Dissolve *sulphite of ammonium*, 1 part; in *solution of ammonia*, 5 parts; and pass *nitric oxide gas* through the solution; rapidly wash the crystals that form with *solution of ammonia*, dry in bibulous paper, without heat, and preserve them in a well-stopped bottle.—*Dose*. 10 to 12 gr.; in typhoid fevers, &c.

Ammonium, Oxalate of. $(\text{NH}_4)_2\text{C}_2\text{O}_4$. *Syn.* AMMO'NIE OX'ALAS, L.; OXALATE D'AMMONIAQUE, Fr. Neutralise a hot *solution of oxalic acid* with *sesquicarbonate of ammonia*; evaporate and crystallise.

Prop. It forms beautiful, colourless, long, rhombic prisms, which effloresce in the air; slightly soluble in *cold water*; freely soluble in *hot water*; heated in a retort, it yields ammonia, carbonate of ammonia, cyanogen, and carbonic acid, together with oxamide, which sublimes.

Uses, &c. In *chemistry*, chiefly as a test for calcium (with which it produces a white precipitate soluble in nitric acid), and to separate lime from magnesium, solutions of the salts of which it does not precipitate. A BINOX'ALATE may also be formed; but it possesses no practical interest.

Ammonium, Phosphate of. $(\text{NH}_4)_3\text{PO}_4$. *Syn.* AMMO'NIE PHOS'PHAS, L. *Prep.* Saturate a *solution of phosphoric acid* with *sesquicarbonate of ammonium*, in slight excess; gently evaporate and crystallise by refrigeration. Diuretic, discutient, and antilithic.—*Dose*. 3 to 10 gr., or 20 to 30 drops of a saturated solution, 3 or 4 times a day in gout, rheumatism, and calculus, accompanied with the lithic acid diathesis; also in rickets and certain forms of dyspepsia.

Ammonium Succinate. *Syn.* AMMO'NIE SUCCINAS, L. *Prep.* 1. *Succinic acid*, 1 part; *water*, 4 parts; dissolve, neutralise with *solution of ammonia*, or of *ammonium carbonate*, in slight excess, and evaporate, and crystallise as directed under the 'benzoate' or 'phosphate'.—*Dose*. 5 to 10 gr.

Ammonium, Sulphate of. $(\text{NH}_4)_2\text{SO}_4$. *Syn.* SULPHATE OF OXIDE OF AMMONIA; AMMO'NIE SUL'PHAS, L.; SULFATE D'AMMONIAQUE, Fr.; SCHWEFELSAURE AMMONIUM SALZ, Ger.; Glauber's SECRET SALT†, G. SECRET SALT—

AMMONILO†, SAL AMMONI'ACUM SECRE'TUM GLAUBE'RI†, &c. Crude sulphate of ammonia exists in considerable quantity in the *soot* from pit-coal; and it is obtained, as a secondary product, from the *ammoniacal liquor* of gas-works and animal charcoal manufactories. These last are its chief sources. It is also found native, associated with sal ammoniac, in the neighbourhood of volcanoes, under the name of 'mascagnine' or 'massagnine.'

Prep. 1. (Medicinal.) Saturate *dilute sulphuric acid* with *sesquicarbonate of ammonia*, in slight excess; filter, gently evaporate, and crystallise.

2. (Commercial.) From *gas-liquor* or *bone-spirit*, saturated with *weak oil of vitriol*, and the clear portion of the liquid, after repose, decanted, concentrated by rapid evaporation, and crystallised, in the manner noticed under AMMONIUM, CHLORIDE OF.

Prop. Crystals, long, flattened, six-sided prisms; soluble in 2 parts of *cold*, and 1 of *boiling water*; fuses, with loss of one atom of water, at about 280° Fahr.; and is volatilised, with entire decomposition, at about 535°. Even its solution, by long boiling, becomes acid from loss of ammonia. The anhydrous salt does not exist.

Uses, &c. Pure sulphate of ammonia is diuretic, aperient, resolvent, and stimulant.—*Dose*, 10 to 30 gr. It is now seldom employed in medicine. The *crude sulphate* is principally used in the preparation of sal ammoniac and sesquicarbonate of ammonia, and for manure. "A mixture of 10% of this sulphate with 20% of *bone-dust*, some *gypsum*, and *farm-yard manure*," forms "a very fertilising compost, applicable to a great variety of soils" (Ure); and we may add—greatly superior to a very large portion of what is now so commonly vended under the name of 'guano.'

Concluding remarks, Patents, &c. The manufacture of *sulphate of ammonia*, on the *large scale*, has been unavoidably explained in treating on the salts of that base already noticed. All that is necessary, is to saturate with *sulphuric acid* the solution of ammonia, crude or otherwise, and obtained in any manner; and then to evaporate the solution until the salt crystallises out. At other times, however, instead of adding the acid to the ammoniacal liquor, the latter, either at once, or after treatment with *lime*, is submitted to distillation, and the evolved alkaline vapour is passed into the acid (previously somewhat diluted), contained in a large receiver or cistern, or a series of them; the salt being obtained from the resulting solution in the usual manner. By *re-solution* and a *second crystallisation*, the sulphate is generally obtained sufficiently pure for all commercial purposes; but when the salt is intended for use as manure, or (unless very rough) for conversion into sal ammoniac, this need not be had recourse to.

Among *modifications and improvements*, not previously noticed, may be mentioned—

1. That of Dr. Richardson (*Patent*, dated Jan., 1850), who mixes SULPHATE OF MAGNESIA with the crude ammoniacal liquor and thus forms a double sulphate of magnesia and ammonia, from which he obtains the SULPHATE OF AMMONIA by sublimation.

2. That of Michiel (*Patent* dated April, 1850), who prepares sulphate of ammonia by means of OXYsulphate of lead obtained by roasting galena (sulphide of lead), by exposing it in a crushed state and thin layers, for 2 or 3 hours, to the heat of a reverberatory furnace. The resulting mixture of sulphate and oxide of lead is reduced to the state of coarse powder, and well worked up with the ammoniacal liquor, when sulphate of ammonia and sulphide and carbonate of lead are produced by the mutual reaction of the elements present. The first is removed by treatment with water; and the residuum serves for the manufacture of lead compounds, or may be reduced to the metallic state by fusion in the usual manner.

3. That of Mr. Laming, (*Patent* dated Aug., 1852), in which a stream of SULPHUROUS ACID GAS is transmitted through the liquor containing the ammonia, either in the free state or as carbonate, by which SULPHITE OF AMMONIA is formed. This salt he oxidises, and thus converts into the SULPHATE OF AMMONIA, by agitation and free exposure to the air.

Sulphate of ammonia, like the hydrochlorate, may also be obtained by saturating stale urine with the acid, and subsequent evaporation and crystallisation. See AMMONIA; AMMONIA, CARBONATES OF; AMMONIUM, CHLORIDE OF, and MANURES, &c.

Ammonium, Sulphide of (Neutral). $(\text{NH}_4)_2\text{S}$. *Prep.* Saturate strong solution of ammonia with pure sulphuretted hydrogen gas; then add a second portion of solution of ammonia, equal to that first used, and preserve it in a well-stoppered bottle.

Ammonium, Sulphydrate of. NH_4HS . *Syn.* SULPHIDE OF AMMONIUM, HYDROSULPHIDE OF AMMONIUM, HYDROSULPHATE OF AMMONIA.

Prep. By passing sulphuretted hydrogen gas, to saturation, through a mixture composed of strong solution of ammonia, 1 part, and distilled water, 4 parts.

Props. Prepared as above, it has a very fetid odour. When pure it is wholly volatilised by heat, and does not disturb a solution of sulphate of magnesium. Mineral acids decompose it, with the evolution of sulphuretted hydrogen. By keeping, it decomposes and acquires a yellow colour. This yellow colouration does not, however, render it unfit for use as a reagent; but it must be borne in mind that it will now deposit sulphur when mixed with acids. In this state it proves valuable as a reagent to detect hydrocyanic acid, and as a solvent to separate metallic sulphides thrown down by sulphuretted hydrogen.

Uses, &c. It is principally employed by chemists, as a reagent to precipitate metals, to separate metallic sulphides, &c.; and by the per-

fumers, as a mordant in dyeing hair. In medicine, it has been used by Cruickshank, Rollo, and others, to check the morbid appetite, and to increase the action of the stomach and general tone of the system in diabetes mellitus. It has also been used by Brauw, Gruithuisen, and others, in old pulmonary and vesical catarrhs. It is a powerful sedative, lessening the action of the circulatory system, causing nausea, vomiting, vertigo, drowsiness, &c.—*Dose*, 3 to 6 drops, three or four times daily, mixed with pure water, and instantly swallowed. In large doses it is poisonous.

Ant. Very dilute solution of chlorine, or of chloride of lime or soda, followed by a powerful emetic, or the stomach-pump. When the vapour has been respired, free exposure to fresh air, with the head a little elevated, and copious affusions of cold water, with moderate draughts of brandy-and-water, and the use of the smelling-bottle (ammoniacal) should be adopted. If need be, artificial respiration should be attempted, and the air around the patient should be slightly impregnated with the fumes of chlorine or chloride of lime.

Ammonium, Persulphide of. *Syn.* BOYLE'S FUMING-LIQUOR, HOFFMAN'S VOLATILE SPIRIT OF SULPHUR, &c.; AMMO'NIE PERHYDROSULPHAS, A. PERHYDROSULPHURETUM, &c. Authorities differ as to the constitution of this liquid, which, since its introduction by Beguin in 1650, has passed under more aliases than perhaps any other preparation. Its precise position amongst the ammonia-compounds is still undecided.

Prep. 1. (Beguin.) Sulphur, 1 lb; quick-lime, $\frac{1}{2}$ lb; sal ammoniac, 4 oz.; mix and distil.

2. (Boyle.) Sulphur and sal ammoniac, of each, 5 oz.; quick-lime, 6 oz.; as last.

3. (Liebig.) Agitate the common hydrosulphate of ammonia with pure sulphur, until the latter ceases to be dissolved; and, after repose, decant the clear liquid.

Prop., &c. An orange-yellow, fuming, fetid liquid, of an oily consistence, having the characteristics of the common sulphydrate in a remarkable degree. It may prove an excellent medicine. "Useful for wounds and ulcers." (Beguin.) Diluted with three parts of spirit of wine, it formed the LIQUOR ANTIPODAGRICUS of F. Hoffman; of which we are told, that about 30 drops acted as a strong sudorific; and applied externally, mixed with camphor, "it relieved pain like a charm." (Hoffman.) The sulphides of ammonium are now scarcely ever employed as remedies.

Ammonium, Sulphite of. $(\text{NH}_4)_2\text{SO}_3 \cdot 7\text{Aq}$. *Syn.* AMMO'NIE SULPHIS, L. Prepared by passing sulphurous acid gas into a solution of ammonia. It is crystallisable and very soluble in water.

Ammonium, Sulphocyanide of. NH_4CNS . *Prep.* 1. Neutralise hydrosulphocyanic acid with ammonia, and gently evaporate the solution to dryness, by the heat of a water bath.

2. Digest *hydrocyanic acid* with *yellow sulphhydrate of ammonium*, and, after a time, evaporate as before.

A deliquescent, white, saline mass, very soluble in water, but seldom employed out of the laboratory in a pure state. Of late it has been obtained in quantity as a crude product of the gas liquors.

Ammonium, Tartrates of. Of these there are two:—

Ammonium, Neutral Tartrate of. $(\text{NH}_4)_2\text{C}_4\text{H}_4\text{O}_6$. *Syn.* AMMO'NIE TAR'TRAS, L. *Prep.* Saturate a solution of *crystallised tartaric acid*, 150 grs.; with *sesquicarbonate of ammonium*, 118 grs.; and either evaporate the solution at a gentle heat, and crystallise; or evaporate to dryness, and powder the residuum.

Prop., &c. Prismatic crystals, or a crystalline mass; soluble and efflorescent. Its medicinal properties and doses resemble those of citrate of ammonium.

Ammonium, Bitartrate of. $\text{NH}_4\text{HC}_4\text{H}_4\text{O}_6$. *Syn.* AMMO'NIE BITAR'TRAS, L. *Prep.* To a strong solution of *tartaric acid*, add another of *sesquicarbonate of ammonium*, or of *tartrate of ammonium*, as long as a precipitate falls; which must be collected and dried.

Prop., &c. A crystalline powder, only slightly soluble in water, closely resembling ordinary cream of tartar. It is diaphoretic, diuretic, and deobstruent, and is frequently, though improperly, sold for the preceding preparation.

Ammonium, Valerianate of. $\text{NH}_4\text{C}_5\text{H}_9\text{O}_2$. *Syn.* AMMO'NIE VALERIA'NAS, L. *Prep.* Saturate *valerianic acid* with *strong solution of ammonia*, and evaporate the resulting liquid to a syrupy consistence at a heat under 175° Fahr.; then add *twice its volume of alcohol*, and, after agitation, allow it to crystallise by spontaneous evaporation.—*Dose.* 2 to 8 or 10 grs.; in neuralgia, epilepsy, hypochondriasis, hysteria, low fevers of an intermittent kind, &c.; also in dyspepsia and debility complicated with these affections.

AMMONIACAL. [Eng., Fr.] *Syn.* AMMONIACALIS, L. Pertaining to, or possessing the odour or properties of, ammonia. See AMMONIA, PERFUMES, &c.

AMMONIACUM. *Syn.* GUM AMMONIACUM, G. AMMO'NIAC†; GOMME AMMONIAQUE, Fr.; AMMONIAK, Ger. A gummy-resinous exudation from the stem of *dorema ammoniacum*, in tears and masses, of a pale cinnamon colour, brittle, and when broken has a white and shining surface. Collected in Persia and the Punjab. (B. P.)

Gum ammoniacum has an unpleasant odour, especially when heated, and a nauseous and slightly bitter taste. It is a mild, stimulating expectorant and emmenagogue; and its effects on the system resemble those of assafoetida, except in being weaker. *Externally*, it is resolvent.—*Dose*, 10 to 30 grs. in pills or emulsion.

'Strained' Ammoniacum. *Syn.* PREPARED

AMMONIACUM; AMMONI'ACUM PRÆPARATUM (Ph. L.), L. *Prep.* (Ph. L. 1851.) Boil *ammoniacum* in water just sufficient to cover it; strain the mixture through a hair sieve, and constantly stirring, evaporate in a water bath, until, on cooling, it becomes hard. The product, owing to a loss of volatile oil, is much weaker than the unprepared gum-resin. The process is only necessary with rough lump-ammoniacum.

Ammoniated. *Syn.* AMMONI'ATUS, L. In pharmacy, perfumery, &c., applied to preparations containing ammonia.

AMMO'NIO-, Ammon'ico-. In chemistry, a common prefix to double salts containing ammonia; as *ammonio-citrate*, *a.-chloride*, or *a.-tartrate of iron*, &c. See the respective metals.

††† The *sp. gr.* of any sample of liquid ammonia, expressed in three integers, deducted from '998, and the remainder divided by 4, gives a number which represents the *per-centage strength*, nearly. (Ure.) This rule may be sometimes conveniently employed for rough calculations, in the absence of Tables.

TABLE II.—Showing the *per-centage of PURE AMMONIA*, and of AMMONIA-WATER of '9000, in Water of Ammonia of the given specific gravities, at 60° Fahr. By Dr. URE.

Sp. Gr. by experiment.	Water of Ammonia of '900, per cent.	Pure Ammonia, per cent.	Water, per cent.
'9000	100	26.500	73.500
'9045	95	25.175	74.825
'9090	90	23.850	76.150
'9135	85	22.525	77.475
'9177	80	21.200	78.800
'9227	75	19.875	80.125
'9275	70	18.550	81.450
'9320	65	17.225	82.775
'9363	60	15.900	84.100
'9410	55	14.575	85.425
'9455	50	13.250	86.750
'9510	45	11.925	88.075
'9564	40	10.600	89.400
'9614	35	9.275	90.725
'9662	30	7.950	92.050
'9716	25	6.625	93.375
'9768	20	5.300	94.700
'9828	15	3.975	96.025
'9887	10	2.650	97.350
'9945	5	1.325	98.675

*** Strengths corresponding to *sp. gr.* which are not in the above Tables, may be found by the 'method of differences' explained under ALCOHOLOMETRY (p. 68-9).

AMONTILLADO. [Sp.] See SHERRY and WINE.

AMORPHOUS (mor'f'us). *Syn.* AMORPH'US, L.; AMORPHE. INFORME. DIFFORME. Fr.:

AMORPHISCH, MISGEBILDET, MISSGESTALTET, Ger. Shapeless. In *chemistry* and *mineralogy*, applied to substances devoid of regular or crystalline form; as a lump of chalk, the majority of precipitates, &c. The corresponding substantives are AMORPHISM, AMORPHOTNESS* (*amorphis'mus*, L.; *amorphisme*, Fr.).

AMPHIB'IA (-fib'-y'ä). [L. pl.; prim. Gr.] *Syn.* AMPHIB'IAN (-yänz), AMPHIB'IALS (-y'älz). Animalst hat possess the faculty of living both in water and on land. In *modern zoology*, it is restricted to those animals which possess both gills and lungs; as the *batrach'ia* or frog tribe. The term is also often applied, *colloquially*, to otters, seals, walruses, crocodiles, &c., none of which can breathe under water, although, from the languid nature of their circulation, they are able to remain a long time in it.

AMPHIB'IOUS (y'üs). *Syn.* AMPHIB'ITUS, L.; AMPHIBIE, Fr.; BEYDLEBIG, Ger. In *botany* and *zoology*, having the faculty of growing or living both on land and in water. See AMPHIBIA.

AMPHITYPE (-fe-). See PHOTOGRAPHY.

AMYGDALIN. $C_{20}H_{27}NO_{11}$. 3Aq. This substance exists in bitter almonds. It crystallises in pearly white plates, which are odourless and almost tasteless. It is nearly insoluble in hot and cold water and in cold alcohol, but soluble in boiling alcohol.

AMYGDALOID (-loyd). *Syn.* AMYGDALOIDAL; AMYGDALOÏDES (-déz), L.; AMYGDALOIDE, Fr. Almond-shaped. In *mineralogy*, amygdaloid is 'toadstone.'

AMYLACEOUS (äm-e-lä'-sh'üs). *Syn.* AMYLACEUS, L.; AMYLACÉ, Fr. Of or like starch; consisting of or abounding in starch; starchy. See FOOD, NUTRITION, STARCH, &c.

AMYL (-il). C_5H_{11} . The radical of the fusel-oil compounds (AMYL-SERIES).

Amyl, Ac'etate of (äc'). $C_5H_{11}C_2H_3O_2$. *Syn.* PEAR-OIL. *Prep.* From *fusel-oil*, 1 part; *acetate of potassa* (dry), 2 parts; *concentrated sulphuric acid*, 1 part; distilled, with the usual precautions, from a glass retort into a cool receiver. The *distillate* is purified by washing it with *very dilute solution of potassa*, and redistilling it from *fused chloride of calcium*. A little *litharge* added to the liquid in the retort, before rectification, will remove any sulphurous odour, should it be present.

Prop., &c. Liquid, limpid, colourless; insoluble in water; soluble in alcohol; boils at 272° Fahr. alcoholic solution of potassa converts it into an acetate of that base, with reproduction of fusel-oil.

Obs. The odour and flavour of this preparation are those of the Jargonelle-pear. It is now extensively manufactured, and, after dilution with alcohol, is sold under the name of ESSENCE OF JARGONELLE-PEAR, for flavouring liquors and confectionery.

Amyl, Valer'ianate of. $C_5H_{11}C_8H_7O_2$. *Syn.* APPLE-OIL, A-ESSENCE, &c. This compound is abundantly formed during the preparation

of *valerianic acid* from *potato oil*, and is recognised by the offensive odour of rotten apples evolved during the process. By treating the *crude product* of the distillation with a *weak solution of pure potassa*, the valerianic acid is removed, and the *volatile oil* obtained nearly pure. Dissolved in *rectified spirit* it forms the 'APPLE-ESSENCE' now so much employed as a flavouring ingredient for confectionery and liqueurs. See FRUIT ESSENCES, VALERIANIC ACID, &c.

AM'YLENE (-e-lène). C_5H_{10} . [Eng., Fr.] *Syn.* AM'YLENE*; AMYLE'NA, AMYLE'NUM, L. A peculiar volatile, liquid hydrocarbon, discovered by Cahours.

Prep. From *fusel-oil* repeatedly distilled along with either *anhydrous phosphoric acid*, or a *concentrated solution of chloride of zinc*; the product being repeatedly rectified, at a low temperature, until the boiling-point sinks to 102° Fahr.

Prop., Uses, &c. An ethereal liquid, lighter than water, having an aromatic odour, slightly alliaceous. Sp. gr. of vapour, 2.68. Its vapour was several times successfully employed, by the late Dr. Snow, as a substitute for ether and chloroform in producing anaesthesia, being, though less agreeable, also less pungent, and consequently easier to breathe, than either of them; but its use has since been given up owing to doubts as to its safety, two or three deaths having followed its inhalation.

ANÆSTHESIA (än-ëz-thé'-zh'ä; -sh'ä; -thêze'-y'är). [L.; prim. Gr.] *Syn.* ANESTHÉSIE, Fr. In *pathology*, diminished or lost sense of feeling.

In *surgery* and *obstetrics*, the *production of temporary anaesthesia*, for the purpose of rendering operations painless, relieving the pangs of childbirth, &c., is effected by the use of—

ANÆSTHETICS. *Syn.* ANESTHÉTICA, L.; ANESTHÉTIQUES, Fr. In *pharmacology* and *surgery*, substances or agents which diminish or destroy sensibility, or which relieve pain. In its full extent this term includes both *anodynes* and *narcotics*; but it is now more generally confined to those substances which greatly diminish common sensibility, or entirely remove susceptibility to pain. Among the most useful, safe, and powerful of this class are chloroform, ether, nitrous oxide, and intense cold. The former are administered by inhaling the vapour or gas; the last, by local application.

ANALÆP'TIC. *Syn.* ANALÆP'TICUS, L.; ANALÆPTIQUE, Fr. Restorative; that recruits the strength lost by sickness.

Analæp'tics. *Syn.* ANALÆP'TICA, L.; ANALÆPTIQUES, Fr. In *pharmacology*, &c., restorative medicines and agents.

ANALYSIS (-e-sis). [Eng. L., Gr.] *Syn.* ANALYSE, Fr.; AUFLÖSUNG, ZERLEGUNG, Ger. In a *gen. sense*, the resolution of anything, whether an object of the senses or of the intellect, into its elementary parts. In *chemistry*, the resolution or separation of a com-

pound body into its constituent parts or elements, for the purpose of either determining their nature, or, when this is known, their relative proportions. It is divided into *QUALITATIVE ANALYSIS* and *QUANTITATIVE ANALYSIS*; and these again into *PROXIMATE ANALYSIS* and *ULTIMATE ANALYSIS*. The first consists in finding the components of a compound, merely as respects their nature or names; the second, in finding not merely the component parts, but also the proportions of each of them; the third gives the results, in the names of the proximate or immediate principles or compounds which, by their union, form the body under examination; whilst the fourth develops the chemical elements of which it is composed.² An analysis may also be made to determine whether a certain body is or is not contained in a compound (as lead in wine); or it may be undertaken to ascertain all the constituents present; the extent of an investigation being merely limited by the object in view.

For success in chemical analysis a thorough acquaintance with the various properties of bodies is required, as well as aptitude in applying this knowledge in discriminating them, and separating them from each other. Judgment and expertness in manipulation are, indeed, essential qualifications. The method pursued must likewise be such as to attain the object in view with unerring certainty, and in the most expeditious manner. "The mere knowledge of the reagents, and of the reactions of other bodies with them, will not suffice for the attainment of this end. This requires the additional knowledge of a systematic and progressive course of analysis, or, in other words, the knowledge of the order, and succession, in which solvents, together with general and special reagents, ought to be applied, both to effect the speedy and safe detection of every individual component of a compound or mixture, and to prove with certainty the absence of all other substances. If we do not possess this systematic knowledge, or if in the hope of attaining an object more rapidly, we adhere to no method in our investigations and experiments, analysing becomes (at least in the hands of a novice), mere guess work, and the results obtained are no longer the fruits of scientific calculation, but mere matters of accident, which sometimes may prove lucky hits, and at others total failures." (Fresenius.)

ANASTATIC PRINTING. See **PRINTING** and **ZINCOGRAPHY**.

ANATOMICAL. *Syn.* **ANATOMICALUS**, L.; **ANATOMIQUE**, Fr.; **ANATOMISCH**, Ger. Belonging to anatomy or dissection.

Anatomical Preparations. Objects of interest in both surgical and pathological anatomy,

^{1, 2} Thus, *suet* consists of olein, palmitin, and stearin. These would form the 'terms' of the *PROXIMATE ANALYSIS* of this substance. But olein, palmitin, and stearin consist of carbon, hydrogen, and oxygen. The *ULTIMATE ANALYSIS* of suet would, therefore, have reference to the elements carbon, hydrogen, and oxygen.

and specimens in natural history, preserved by subjecting them to antiseptic processes, to which is also frequently added injection with coloured fluids (which subsequently harden), amalgams, or fusible metal, in order to display more fully the minute vessels, or the microscopic anatomy of the several parts. See **FUSIBLE METAL**, **INJECTIONS**, **PREPARATIONS**, **PUTREFACTION**, **SKELETONS**, **SOLUTIONS**, &c.

ANCHOVY (-chô'-). *Syn.* **ANCHOIS**, Fr.; **ANCHOVE**, **ANSCHOVE**, Ger.; **ACCUGHE**, **ANCHIOVE**, It.; **ANCHOVA**, Port., Sp. The *clupea encrasicolus* (Linn.), a small fish of the herring tribe, closely resembling the English sprat. It is common in the Mediterranean, and occurs in the greatest abundance, and of the finest quality about the island of Gorgona, near Leghorn. It is taken in the night, during May, June, and July.

Anchovies are prepared for sale or exportation by salting or pickling them—the heads, intestines and pectoral fins having been first removed, but not the scales—and afterwards packing them, along with rock-salt, in the small kegs in which they are imported into this country. The small fish are valued more than the larger ones. For the table they are often fried to a pale amber colour, in oil or butter; having previously been scraped clean, soaked for an hour or two in water, wiped dry, opened (without dividing the fish), and had the back-bones removed. Before being put into the pan they are usually highly seasoned with cayenne; and after being again closed, are dipped into a rich light batter. They are also divided into filets, and served as sandwiches, or in curried toasts. Anchovies are also extensively potted (**POTTED ANCHOVIES**), and made into butter (**A-BUTTER**), and into sauce (**A-SAUCE**),* particularly the last.

The anchovy has a fine and peculiar flavour, and is eaten as a delicacy all over Europe. It was known to the Greeks and Romans, who prepared from it a kind of garum for the table. It is said to be aperitive, stimulant, and stomachic.

The high price of genuine Gorgona anchovies has led the fraudulent dealer to either substitute for them, or mix with them, fish of a less expensive kind. The most frequent **SUBSTITUTIONS** are Dutch, French, and Sicilian fish of allied species or varieties, sardines, and even the common sprat. The genuine Gorgona fish is about the length of one's finger; and may be known by its silvery appearance; by the greater thickness of its head, which is sharp-pointed, with the upper jaw considerably the longest, and the mouth deeply divided; the dusky brown colour of its back,³ and the pink salmon colour of its flesh. When only 3 months old, its flesh is pale; when of 6 months, rather pink; when of 10 to 12 months (or in its prime), a beautiful deep pink colour;

* The colour of the top of the head and back is, in the recent fish, blue, with a tinge of green. (Yarrell.)

and when much older, darker, but less lively. The fin-rays, varying in number with the age of the fish, are—

	Yarrell.	Hassell. ¹
Dorsal	14.	16 (?).
Pectoral	15.	—
Ventral	7.	—
Anal	18.	19 (?).
Caudal	19.	26 (?).

These fins are delicate in structure and greenish-white; and the membranes connecting the rays almost transparent. "The length of the head, compared with the length of the body alone, is as 1 to 3; the depth of the body but 2-3rds of the length of the head, and compared to the length of the whole fish, is as 1 to 7;" "the tail is deeply forked, the gill-covers are elongated, and the scales of the body large and deciduous." "The breadth of the eye is 1-5th of the length of the whole head."² Dutch fish may be generally known by being deprived of the scales, and the French fish by their larger size; and both by the paler or whiter colour of their flesh; and sardines and sprats by the flesh being white. The genuine fish may also be known by the pickle, after repose or filtration, being of a clear pinkish colour, without any red sediment; whilst that from spurious kinds is turbid and red only when agitated, and deposits a heavy red sediment (Armenian bole, Venetian red, or red ochre) on repose. See BUTTER, POTTING, POWDERS, SAUCES, &c.

British Anchovies. See SPRATS.

ANCHUSIC ACID (-kū'-zik. See ANCHUSINE.

ANCHUSINE (-kū'-zīn). [Eng., Fr.] *Syn.* ANCHUSIC ACID*, PSEUDO-ALKANNINE*, PSEUDO-ALKANNIUM*; ANCHUSINA, L. The resinoid constituting the colouring matter of *alkannet-root* (which see).

ANCHYLOSIS (āng'-e-). [L.; prim., Gr.] *Syn.* ANKYLOSIS, ANXYLOSIS (ān-se-), L.; ANKYLOSE, Fr., Ger. In *pathology*, stiffness or immobility of a joint naturally movable. *Anchylōsis* is either *true* or *complete*, as when the extremities of the bones forming a joint are reunited and immovable; or, *false* or *incomplete*, where the affection depends upon a contraction of the tendons and ligaments surrounding the joints, which nevertheless admit of a small degree of motion. For the *first* there is no available remedy; for the *second*, gentle and progressive flexion and extension of the part daily (carefully avoiding violence), friction with oleaginous and stimulating liniments, and the use of the hot bath, vapour bath, or hot-air or Turkish bath, and electricity, have been strongly recommended, and have frequently proved successful.

ANKYLOSIS. See ANCHYLOSIS.

ANDROGRAPHIS PANICULATA. (Ind. Ph.)

¹ Counted, by Dr. A. H. Hassall, in fish in the preserved state.

² Yarrell's "British Fishes."

Syn. KARIYÁT. *Habitat.* Commonly in shady places all over India.—*Official part.* The dried stalks and root (*Andrographis* *Saules* et *Radix*, Kariyat, Creyat). The stem, which is usually met with, with the root attached, occurs in pieces of about a foot or more in length, quadrangular, of a lightish brown colour, and persistent bitter taste.—*Properties.* Bitter tonic and stomachic, very analogous to quassia in its action.—*Therapeutic uses.* In general debility, in convalescence after fevers, and in the advanced stages of dysentery.

Preparations :—

Compound Infusion of Kariyat (Infusum *Andrographis* compositum). Take of kariyat, bruised, $\frac{1}{2}$ an ounce; orange-peel and coriander fruit, bruised, of each, 60 grains; boiling water, 10 fluid ounces. Infuse in a covered vessel for an hour and strain.—*Dose.* From $\frac{1}{2}$ to 2 fluid ounces, twice or thrice daily.

Compound Tincture of Kariyat (Tinctura *Andrographis* composita). Take of kariyat root, cut small, 6 ounces; myrrh and aloes, in coarse powder, of each, 1 ounce; brandy, 2 pints. Macerate for seven days in a closed vessel, with occasional agitation; strain, press, filter, and add sufficient brandy to make two pints.—*Dose.* From 1 to 4 fluid drachms. Said to be tonic, stimulant, and gently aperient, and to prove valuable in several forms of dyspepsia, and in torpidity of the bowels.

ANDROPOGON (CYMBOPOGON) CITRATUM. Lemon Grass. (Ind. Ph.) *Habitat.* Commonly cultivated in gardens in India; also in Ceylon, upon a large scale, for the sake of its volatile oil.—*Official part.* The volatile oil (*Oleum Andropogi Citrati*, *Lemon Grass Oil*, *Oil of Verbena*), obtained by distillation from the fresh plant; of a pale sherry colour, transparent, extremely pungent taste and a peculiar fragrant lemon-like odour.—*Properties.* Stimulant, carminative, antispasmodic, and diaphoretic; locally applied, rubefacient.—*Therapeutic uses.* In flatulent and spasmodic affections of the bowels, and in gastric irritability. In cholera it proves serviceable by aiding the process of reaction. Externally, as an embrocation in chronic rheumatism, neuralgia, sprains, and other painful affections.

Dose. From 3 to 6 drops, on sugar or in emulsion. For external application it should be diluted with twice its bulk of soap liniment or any bland oil.

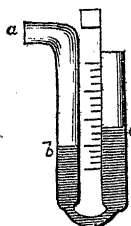

ANDROPOGON (CYMBOPOGON) NARDUS. CITRONELLE. (Ind. Ph.) *Habitat.* Madras Peninsula and Ceylon. The volatile oil of this plant has similar properties to *A. citratum*, and is used for the same purposes.

ANDROPOGON PACHNODES. (Ind. Ph.) The volatile oil of this plant possesses similar properties to that of *A. citratum*, and is used for the same purposes.

ANELECTRIC (ān'-e-). Non-electric; a non-electric.

ANEMOMETER (ān'-e-). *Syn.* ANEMOMETERUM, L.; ANÉMOMÈTRE, Fr.; WINDMESSER,

Ger. *An instrument or apparatus for measuring the force or velocity of the wind, or of a current of air. Various contrivances have been adopted for this purpose. The *anemometer* of Dr. Lind being also applicable to the determination of the draught of a chimney, and the strength of air-currents in ventilation, may be usefully described here:—

Desc. & appl. The open end (a) is kept, by means of a *vane*, presented to the wind, which acting on the surface of the water or other liquid in (b), raises the level of the fluid in the arm (c). The difference of the level of the fluid in the two arms of the instrument is the measure of the force of the wind. To estimate the draught of a *flue*, or chimney, the arm (c) is placed in the chimney, and the orifice (a) in the apartment.¹

ANEMOMETRY. *Syn.* ANEMOMETRIA, L.; ANEMOMETRIE, Fr.; WINDMESSEN, Ger. c In meteorology, physics, &c., the art or act of measuring the velocity or force of the wind, or of ascertaining its direction.

ANEMONE (ā-nēm'-ō-ne). *Syn.* ANEMONY; ANEMONE, L., Gr.; ANÉMONE, Fr. The wind-flower. In botany, a genus of beautiful flowering herbaceous plants, of the nat. ord. Ranunculaceæ. The double flowers of some of the species are among the most elegant ornaments of our gardens. Others are used in medicine. They are all acrid and stimulating.

Sea Anemones (-o-nēz). *Syn.* ANIMAL FLOWERS†, SEA SUN FLOWERS†. Animals of the genus *actinia*, so called, from the resemblance of their claws or tentacles, when expanded, to the petals of a flower. They are of various colours, are generally fixed by one end to rocks or stones in the sand, and are very voracious, being accused of occasionally swallowing a mussel or a crab as large as a hen's egg for a meal. They belong to the highly organised *polypes* of Cuvier.

ANEMONIC ACID. See ANEMONINE.

ANEMOSCOPE (ān'-e--Brande, Mayne). *Syn.* ANEMOSCOPIUM, L.; ANÉMOSCOPE, Fr.; ANEMOSKOP, Ger. An instrument to measure the force and velocity of the wind. See ANEMOMETER.

ANEROID (-royd).² In physics, &c., not fluid; or not depending on water or a fluid for

its action; applied to a certain form of 'barometer' (which see).

ANGELICA (-jél'-). [L., Port., Sp.; Ph. E. & D.] *Syn.* GARDEN ANGELICA; ANGÉLIQUE, Fr.; ANGELIKA, A.-WURZEL, ANGELKBAUT, Ger. The *angelica archangelica* of Linnæus, an aromatic herbaceous plant with a biennial, fleshy root, indigenous to the north of Europe, but frequently found wild in England, and largely cultivated in our gardens. *Dried root* (ANGELICA, Ph. E.), aperient, carminative, diaphoretic, and tonic; much esteemed by the Laplanders, both as food and medicine;—*fruit or seed* (ANGELICA, Ph. D.), resembles the root, but is weaker. The whole plant has been extolled as an aromatic tonic. As a *masticatory*, it leaves an agreeable glowing heat in the mouth. The aromatic properties of this plant depend on a peculiar volatile oil and resin.

Uses, &c. It has been recommended in diarrhœa, dyspepsia, debility, and some fevers; but is now seldom used in medicine.—*Dose.* 30 grs. to 1 dr. The dried root and seeds are used by rectifiers to flavour gin and liqueurs; and the fresh root, tender stems, stalks, &c., are made by the confectioners into an aromatic candy. See CANDY, GIN, LIQUEURS, &c.

Angelica Atropurpurea. [Linn.] *Syn.* AMERICAN ANGELICA; ANGELICA, Ph. U. S. *Hab.* North America. Resembles garden angelica, but placed by some botanists in a separate, though allied genus. It is a popular remedy for flatulent colic, indigestion, and cardialgia, in the United States; and is there regarded as tonic, cordial, and aprodisiac.

ANGELIC ACID. HC₅H₇O₂. A volatile substance, noticed by L. A. Buchner, jun., in *angelica-root*. It has a pungent sour smell, and a biting acid taste; is sometimes fluid and oleaginous, and sometimes crystallised in striated prisms.³

ANGO'LA. *Syn.* ANGO'LA-WOOL, ANGO'RA-W., ANGO'NA-W., &c.; POIL DE CHEVRON D'ANGOEA, Fr.; (Engoor', Engour', or Enguri) TIRIC, Tur. The wool of 'ca'pra Angorensis' or the *Angora-goat*, of which the shawls of Cashmere are made, and others in imitation of them. It is also used to make plush, light cloths for paletôts which are repellent of wet, &c.; and is extensively employed, in France, in the manufacture of lace more brilliant than that of Valenciennes and Chantilly, and at half the price. See ALPACA, SHAWLS, WOOL, &c.

ANGOSTU'RA, Angustu'ra (-tūre'-ā). See CUSPARIA.

False Angostura. See BRUCEA, CUSPARIA, and STRECHNOS.

ANGOSTU'RINE, Angustu'rine (-in). See CUSPARINE.

ANHYDROUS (-drūs; an'hydrous, as marked by Brande, is less usual). *Syn.* ANHYDEUS,

³ Schmidt's "Jahrb." 1842.

¹ The *anemometers* now generally used in meteorological observations are those of Mr. Follet Osler, Dr. Robinson, and Dr. Whewell. For a description of these instruments, see Phillip's "Report on Anemometry," the "Trans. of the Brit. Assoc.," 1846, "Trans. Royal Irish Acad.," &c.

² That is—*without*, *without*, (the) *water*, *fluid*, *form*, as correctly given by Brande. By some strange mistake, Dr. Mayne, in his new "Expository Lexicon," gives "a, priv, *anp*, air, terminal *-ides*," as the derivation of this word; and marks it 'aneroïd.'

L.; ANHYDRÉ, Fr.; WASSERFREI, Ger. } Free from water; dry. In *chemistry* and *mineralogy*, a term frequently applied to substances, as acids, alcohol, gases, salts, minerals, &c., which do not contain either free or combined water. GASES may generally be rendered anhydrous, by passing them through a tube containing fused chloride of calcium, or (e.g. AMMONIA and two or three others) quick-lime, in coarse powder; and some of them, by passing them through concentrated sulphuric acid. SALTS may generally be dried by cautiously submitting them to the action of heat, or by exposure to a very dry atmosphere; and alcohol, and many other volatile fluids, by careful distillation from chloride of calcium, or some other highly hygrometric substance.

AN'IL. [Fr., Sp., L.] The *indigofera anil* of botanists—one of the plants yielding 'indigo'—a native of America, but now largely cultivated in the East Indies. See INDIGO (and below).

AN'LINE¹ (-een). [Eng., Fr.] C_6H_7N . Syn. PHENYL'AMINE; ANIL'NA, ANIL'NUM, &c., L. A peculiar volatile organic base first noticed by Unverdorben in *emphyreumatic bone-oil*, and afterwards obtained by Runge from coal-tar, and by Fritzsche, Zinin, A. W. Hofmann, and others, as a product of various reactions, processes, and decompositions, particularly those attending the destructive distillation of organic bodies.

Prep. Aniline is now almost invariably obtained, on the large scale, either directly or indirectly from coal-tar or indigo; and chiefly from the basic oil or naphtha, or the nitrobenzol, of which the former is the principal source. The following are the leading commercial and experimental processes:

1. From COAL-TAR or COAL-TAR NAPHTHA:—The basic oil or basic portion of coal-tar or coal-tar naphtha, forming the latter, denser, and least volatile products of the distillation or rectification of these substances, is strongly agitated, for some time, along with hydrochloric acid in slight excess, a glass globe, or, on the large scale, a suitable vessel of lead, or of enamelled iron, being employed for the purpose; the clear portion of the liquid (containing the hydrochlorates of the bases present) is then decanted and carefully evaporated over an open fire until acrid fumes begin to be disengaged, when it is again decanted or filtered; the clear liquor, or filtrate, is next treated with potassa or milk of lime in excess, by which the bases—chiefly aniline and chinoline—are liberated under the form of a brownish oil; the whole of the resulting mixture is now submitted to distillation, the portion which passes over at or about 360° Fahr., and which consists chiefly of crude aniline, being collected separately; the product

is purified by rectification and re-collection, once or oftener, at the same temperature, and lastly, by fresh treatment with hydrochloric acid and, careful distillation with excess of potassa or milk of lime, as before.

2. From NITROBENZOL:—a. (Zinin.) An alcoholic solution of nitrobenzol, after saturation with ammonia, is treated with sulphuretted hydrogen, until, after some hours, a precipitation of sulphur takes place; the brown liquid is then repeatedly saturated with fresh sulphuretted hydrogen, until no more sulphur separates, the reaction being aided by occasionally heating or distilling the mixture; an excess of acid is next added, and, after filtering the liquid, and the removal of the alcohol and unaltered nitrobenzol by ebullition or distillation, the residuum is lastly distilled with caustic potassa, in excess. The ANILINE found in the receiver may be rendered quite pure by forming it into oxalate of aniline, repeatedly crystallising the salt from alcohol, and finally distilling it with excess of caustic potassa, as before.

The following is a cheaper and more convenient process; and probably, the best, or one of the best, that has yet been invented for obtaining aniline:—

b. (M. Béchamps.) From nitrobenzol distilled along with basic protacetate of iron: or, what is better—by distilling a mixture of iron filings, 2 parts, and acetic acid, 1 part, with about an equal volume of nitrobenzol, the reaction being assisted, whenever the effervescence flags, by the application of a gentle heat. The liquor found in the receiver consists of aniline and water, from which the first, forming the lower portion, is obtained, after sufficient repose in a separator; or more easily, by adding a very little ether, which by dissolving in the aniline, causes it to rise to the surface, when it is at once decanted. A very spacious glass or earthenware retort must be employed in the process, as the mass swells up violently; and it must be connected with the receiver, on the small scale, by means of a Liebig's condenser, and, on the large scale, by an ordinary worm-pipe and tub, kept in good action by a sufficient flow of cold water.

3. From INDIGO:—Powdered indigo is added to a boiling and highly concentrated solution of caustic potassa, as long as it dissolves and hydrogen gas is extricated; the resulting brownish-red liquid is evaporated to dryness, and the residuum is submitted to destructive distillation in a retort, which, owing to the intumescence of the mass, should be strong and spacious. The ANILINE is found in the receiver under the form of a brownish oil mixed with ammoniacal liquor, and by separation from the latter, and subsequent rectification, is obtained nearly colourless. It may be further purified, as in the preceding processes.—Prod. 18 to 20% of the indigo employed.

4. By fusing, with the proper precautions, a

¹ For a detailed account of the methods of preparing aniline commercially, and of the dyes obtained therefrom, see "Dictionnaire de Chimie," par A. W. Hofmann.

mixture of *isatine* and *hydrate of potassa* (both in powder); a retort connected with a well-cooled receiver, being employed as the apparatus. Said by Profs. A. W. Hofmann and Muspratt, to be "the most eligible process for isolating" aniline.¹

5. From *anthranilic acid* mixed with powdered glass or sand, and rapidly heated in a retort.

6. By treating an *alcoholic solution of benzene* with a little *zinc* and *hydrochloric acid*.

7. By heating *phenyl-alcohol* with *ammonia* in sealed tubes.

Prop., &c. A thin, oily, colourless liquid, with a faintly viscid odour, and a hot and aromatic taste; very volatile in the air; miscible in all proportions with alcohol and ether; very slightly soluble in water; neutral to ordinary test-paper, but exhibiting an alkaline reaction to dahlia-petal infusion and paper; dissolves camphor, sulphur, and phosphorus, and coagulates albumen; possesses a high refractive power; and precipitates the oxides of iron, zinc, and alumina, from solutions of their salts, and neutralises the acids, like ammonia. With the acids it forms numerous crystallisable compounds of great beauty, and which are easily formed, and are precisely analogous to the corresponding salts of ammonia. These, on exposure to the air, acquire a rose-colour, in many cases gradually passing into brown. Its boiling-point is 359° to 360° Fahr.; *sp. gr.* 1.028.

Tests.—1. Chromic acid gives a deep greenish or bluish-black precipitate with aniline and its salts:—2. Hypochlorite of lime strikes an extremely beautiful violet colour, which is soon destroyed:—3. The addition of two or three drops of nitric acid to anhydrous aniline produces a fine blue colour, which, on the application of heat, passes into yellow, and a violent reaction ensues, sometimes followed by explosion:—4. With bichloride of platinum it yields a double salt (PLATINO-CHLORIDE OF ANILINE, analogous to the like salt of ammonia. These reactions distinguish it from all other substances.

Uses, &c. Chiefly in dyeing, for the production of colouring matter of various rich shades of purple and velvet, some approaching pink, by the action of chromic acid; and of a splendid crimson, by the action of various oxidising agents. It forms the basis of the celebrated new dyes for silks lately patented by Mr. W. H. Perkin, and others, and which are not only more delicate and gorgeous in tint, but also more permanent, than any produced by other substances.

Besides numerous salts, various substitution compounds of aniline have been formed, all of which possess vast scientific interest, and several are likely to prove of importance in the arts. See AMINES, DYEING, INDIGO, PHENYLE, &c. (also below).

¹ Muspratt's "Chemistry," i, 599.

Aniline, Chromates of. *Prep.* 1. (NEUTRAL CHROMATE.) From *sulphate* or *oxalate of aniline* and *chromate of potassa*, by double decomposition.

2. (BICHROMATE:—Mr. W. H. Perkin.) *Sulphate of aniline* and *bichromate of potassa*, in equiv. proportions, are separately dissolved in water, and the solutions, after being mixed, allowed to stand for several hours. The whole is then thrown upon a filter, and the black precipitate which has formed is washed and dried. It is next digested in coal-tar naphtha (—? benzol), to extract a brown resinous substance; after which it is digested in alcohol, to dissolve out the colouring matter (BICHROMATE OF ANILINE), which is left behind on distilling off the spirit, as a coppery friable mass. Patented.

Aniline, Cy'anide of. Benzocnitrile.

Aniline, Oxalate of. $(C_6H_7N)_2C_2O_4$. Obtained by saturating an alcoholic solution of oxalic acid with aniline; the salt separating as a crystalline mass. It is very soluble in hot water; much less so in cold water; only slightly soluble in alcohol; and insoluble in ether. It may be crystallised from hot water or boiling alcohol. Used chiefly to form other salts.

Aniline, Sulphate of. $(C_6H_7N)_2SO_4$. Prepared by saturating aniline with dilute sulphuric acid, and gently evaporating the liquid until the salt separates. By re-solution in boiling alcohol, it crystallises out, as the liquor cools, under the form of very beautiful colourless plates, of a silvery lustre. It is freely soluble in water, and in hot alcohol; scarcely soluble in cold alcohol; and insoluble in ether. It is chiefly employed in the preparation of the new aniline dyes.

ANIMALCULE (-küle). [Eng., Fr.; *pl. animalcules*.] *Syn.* ANIMALCULUM (*pl., animalculæ*), L.; THIERCHEN, Ger. In zoology and physiology, a microscopic animal, or one so extremely small, that it is either invisible, or not distinctly discernible, without the aid of a lens or microscope; more especially one that is not perceptible to the naked eye. "A mite was anciently thought the limit of littleness; but there are animals 27,000,000 of times smaller than a mite." A thousand millions of some of the animalcula found in common water are said to be collectively of less bulk than a single grain of sand; yet their numbers are so prodigious as sometimes to give the fluid they inhabit a pale red or yellow tinge. The milt of a single codfish is said to contain more of these minute animals than there are people in the whole earth. Animalcula were first scientifically observed by Leuwenhoek, about the year 1677. Assisted by the microscope he unveiled, as it were, a new

² Animalcule for the plural, sometimes heard and met with, is a barbarism; yet one not wholly confined to the vulgar, for we find it in Vincent's edition of Haydn's admirable "Dict. of Dates," not merely twice, or oftener, in the text, but as a 'title-word'; and also in some other works, where we might least expect it.

world for future naturalists and microscopists to explore.

AN'IME (än'im-e). [Eng., L., Sp.] *Syn.* GUM-AN'IME, A.-RES'IN; ANIMÉ, Fr.; ANIMEHARZ, KOURBARILLHARZ, Ger.; COURBAIL, JUTABA, Nat. A pale brownish-yellow, transparent, brittle resin, which exudes from the *hymenæa courbaril* (Linn.) or locust-tree, the *h. martiana*, and other species of *hymenæa* growing in tropical America. It contains about $\frac{2}{3}$ of volatile oil, which gives it an agreeable odour; melts without decomposition; is (nearly) insoluble in alcohol and in caoutchoucine, but forms a gelatinous mass in a mixture of the two. (Ure.) It burns readily, emitting a very fragrant smell. Sp. gr. 1.054 to 1.057.

Uses, &c. As a fumigation in spasmodic asthma; in *solution*, as an embrocation; and in *powder*, as a substitute for gum guaiacum. In this country, it is chiefly employed to make varnishes and pastilles (which see).

AN'ION (-yün—Br., We.; ä-ni'-ün—Smart). *Literally*, 'upward going'; in *electro-chemistry*, a substance which is evolved from the surface where the electrical current is supposed to enter the electrolyte; an electro-negative body, or one which passes to the positive pole, or *anode*, in electrolysis, as opposed to a **CATION**. See **ANODE**, **IONS**, &c.

ANISATED. *Syn.* ANISA'TUS, L.; ANISÉ, Fr. In *pharmacy*, the art of the *ligoriste*, *confectioner*, &c., applied to articles or preparations impregnated or flavoured with aniseed.

AN'ISE (-is). *Syn.* ANI'SUM, PIMPINEL'IA A. (Linn.), A. OFFICINALE, L.; ANIS, Fr.; ANIS, GEMEINER ANIS, Ger. An annual plant of the *nat. ord.* Umbelliferae (DC.); *Hab.*, Egypt, Scio, and the Levant; but largely cultivated in Malta, Spain, Germany, and various other parts of Asia and Europe. "A considerable quantity is cultivated at Mitcham, in Surrey, chiefly for the use of the rectifiers of British Spirits." (Stevenson.) *Fruit*, aniseed. (See *below*.)

AN'ISEED. *Syn.* AN'ISE, AN'ISE-SEED; SEM'INA ANIS, FRUCTUS A., L.; ANIS, A. VRAI, GRAINES D'ANIS, SEMENCE D'ANIS, Fr.; ANIS, ANISAMEN, Ger.; ANIS, Sp.; ANICE, It. The aromatic fruit or seed of the *pimpinella anisum* just noticed.

Prop., Uses, &c. Its aromatic properties depend on the presence of volatile oil. The seed and oil, and a spirit and a water prepared from them, are officinal in the pharmacopœias. Both the seed and its preparations are reputed stimulant, stomachic, carminative, pectoral, diuretic, and emmenagogue. They are commonly used to relieve flatulence and colicky pains, and to prevent the griping effects of certain cathartics; and they have long been popular remedies for coughs, colds, and other breath ailments. They are esteemed especially useful in warming the stomach and expelling wind, particularly during infancy and child-

hood; the *distilled* or *flavoured water* being usually employed. Nurses also take the latter to promote the secretion of milk, to which it at length imparts its peculiar odour and flavour. In *veterinary practice*, the powdered seed is used as a carminative, pectoral, and corroborant. The *essential oil* is said to be poisonous to pigeons. (Vogel; Hillefeld.) Aniseed is principally used to flavour liqueurs, sweetmeats, and confectionery.—*Dose* (of the powder), 10 grs. to 1 or 2 drs.;—for a horse, $\frac{1}{2}$ to 1 oz.;—cattle, $\frac{3}{4}$ to 2 oz.

Pur., &c. Powdered aniseed is nearly always adulterated, the adulterant being generally linseed meal. Sometimes, as for the horse, the latter is entirely substituted for it, a few drops of oil of aniseed being added to give it smell. The adulteration is not readily detected by the uninitiated, owing to the strong odour of aniseed; but readily by the microscope. The fruit of *myrrhis odorata* (sweet civilly), and of *illicium anisatum* (star-anise), also possess the odour and flavour of common aniseed; indeed, most of the essential oil now sold as 'oil of aniseed,' is star-anise oil. See LIQUEURS, OILS, POWDERS, SPIRITS, WATERS, &c.

Star'-Anise. The fruit or seed of *illicium anisatum* (Linn.), an evergreen tree growing in Japan and China. The odour and properties of both the seed and oil greatly resemble those of common anise. They are both employed by the liqueurists. See **ANISEED** (*above*), &c.

ANISE'ITE' (än-iz-ët). [Fr.] Aniseed cordial. See LIQUEURS.

ANI'SUM. Aniseed.

• **ANNEAL'ING**. *Syn.* NEALING†§; LE REQUIT, Fr.; DAS ANLASSEN, Ger. The art of tempering by heat; appropriately, the process by which glass, porcelain, &c., are rendered less frangible, and metals which have become brittle by fusion, or long-continued hammering, again rendered tough and malleable.

Glass vessels, and other articles of glass, are annealed by being placed in an oven or apartment near the furnaces at which they are formed, called the '*leas*' where they are allowed to cool very slowly, the process being prolonged in proportion to their bulk.

Steel, iron, and other metals are annealed by heating them and allowing them to cool slowly on the hearth of the furnace, or in any other suitable place, unexposed to the cold.

Cast-iron is rendered tough and malleable, without 'puddling,' by embedding it in ground charcoal or hematite, and thus protected, keeping it exposed at a high temperature for several hours, after which the whole is allowed to cool very slowly.

Prince Rupert's drop may be mentioned as an example of unannealed glass; and common cast iron, of unannealed metals; to which heads the reader is referred.

✓ **ANNOT'TA.** *Syn.* ANOT'TO, ANNAT'TO, AN-NAT'TA; ARNAT'TO, ARNOT'TO, &c.; ORLEA'NA, TELLURA O*, &c., L.; ROUCOU, ROCOU, ROUCOU, Fr.; ORLEANS, Ger. A colouring matter forming the outer pellicle of the *seeds* of the *bixa orellana* (Linn.), an exogenous evergreen tree, common in Cayenne, and some other parts of tropical America, and now extensively cultivated in both the E. and W. Indies. It is usually obtained by macerating the crushed seeds or seed-pods in water, for several weeks, ultimately allowing the pulp to subside, which is then boiled in coppers to a stiff paste, and dried in the shade. Sometimes a little oil is added in making it up into cakes or lumps. A better method is that proposed by Leblond, in which the crushed seeds are simply exhausted by washing them in water (—? alkalisied), from which the colouring matter is then precipitated by means of *vinegar* or *lemon-juice*; the precipitate being subsequently collected, and either boiled up in the ordinary manner, or drained in bags, and dried, as is practised with indigo. Annotta so prepared is said to be four times as valuable as made by the old process.

Prop. Goodannotta is of a brilliant red colour; brighter in the middle than on the outside; feels soft and smooth to the touch; has a good consistence, and a strongly characteristic, but not a putrid smell. It is scarcely soluble in water; freely soluble in alcohol, ether, oils, and fats, to each of which it imparts a beautiful orange colour, and in alkaline solutions, which darken it; acids precipitate it of an orange red hue; strong sulphuric acid turns it blue. Its most important property is the affinity of its colouring matter for the fibres of silk, wool, and cotton.

Pur. Annotta is very frequently adulterated; indeed, nearly always so. The adulterants are generally *meal*, *flour*, or *farinâ*, and often *chalk* or *gypsum*, with some *pearlash* and *oil*, or even *soap*, to give it an unctuous character, *turmeric*, *Venetian red*, *red ochre*, or even *orange chrome*, to give it 'colour,' and *common salt* and, sometimes, *even sulphate of copper*, to prevent decomposition—the last two being *poisonous*. Sometimes a little *carbonate of ammonia* is also added to it, to improve the colour. When quite pure, it contains about 28% of resinous colouring matter, and 20% of colouring extractive matter, (Dr. John.) and should leave only a small quantity of insoluble residuum after digestion in alcohol; whilst the *ash*, resulting from its incineration, should not exceed 1½ to 2%. The quantity, colour, &c., of the ash, will give an easy clue to the *inorganic adulterants*, if any are present, which may be then followed up by a chemical examination. The presence of *red lead* may be detected by heating it on a piece of charcoal in the reducing flame of the blowpipe, by which a small bead of metallic lead will be obtained. If it contains *chalk*, *ochre*, *gypsum*, &c., the undissolved residuum of the washed

ash gives the amount of the adulteration (nearly).

Uses, &c. To colour *varnishes* and *lacquers*; as a pigment for painting velvet and transparencies; as a *colouring matter* for *cheese* (1 oz. to 1 *cwt.* of curd), for which purpose it is not injurious, if pure; and as a *dye-stuff* for cotton, silk, and wool, particularly the second, to which it imparts a beautiful orange yellow hue, the shade of which may be varied from 'aurora' to deep orange, by using different proportions of *pearlash* with the water it is dissolved in, and by applying different mordants before putting it into the dye-bath, or different rinsing liquids afterwards. The hues thus imparted are, however, all more or less fugitive.

~ **Annotta Cake.** *Syn.* FLAG ANNOTTA; ORLEA'NA IN FO'LIS, L. From Cayenne; bright yellow, firm and soft to the touch; in square cakes, weighing 2 or 3 lbs. each.

Annotta Egg. *Syn.* LUMP ANNOTTA; ORLEA'NA IN O'VULIS, L. Generally inferior.

Annotta, Eng'lish. *Syn.* TRADEA., REDUCED' A.; ORLEA'NA REDUC'TA, L. A fraudulent mess commonly prepared from egg or flag annotta, gum tragacanth, flour or farina, chalk, soap, train-oil, Venetian red, or bole, common salt, water, mixed by heat in a copper pan, and formed into rolls. Sold for genuine annotta, from which it is readily distinguished by its inferior quality, and its partial solubility in alcohol.

Annotta, Liq'uid. See SOLUTION OF ANNOTTA (below).

Annotta, Pu'rified. See ORELLINE.

Annotta Roll. *Syn.* ORLEA'NA IN ROT'ULIS, O. IN BAC'ULIS, L. From the Brazils; hard, dry, brown outside, yellow within. When pure, this is the variety most esteemed, and the one preferred for colouring cheese.

Annotta, Solution of. *Syn.* ESSENCE OF ANNOTTA, EXTRACT OF A., ANNOTTA-DYE, &c.; SOLUTIO ORLEA'NE, EXTRACTUM O., &c., L. A strong aqueous solution of equal parts of annotta and pearlash, the whole being heated or boiled together until the ingredients are dissolved. Sold in bottles. See ANNOTTA (above), NANKKEEN DYE, &c.

AN'O-. [Gr.] In composition, upwards, &c.; as in *anocathartico* (emetic). See ANA-.

AN'ODE. *Literally*, 'upward way;' in *electro-chemistry*, the 'way in,' or that by which the electric current is supposed to enter substances through which it passes, as opposed to the CATHODE, or that by which it goes out; the positive pole of a voltaic battery.

AN'ODYNE (-dine). *Syn.* ANO'DYNUS (-dinus?), L.; ANQIN, Fr.; SCHMERZSTILLEND, Ger. That allays pain; soothing; atalgic.

Anodynes. *Syn.* ANO'DYNA (sing., *anodynum*), L.; ANODINS, REMÈDES A., Fr. In medicine and pharmacy, substances and agents which allay pain. Some (as the PAREGORICS) act by actually assuaging pain; others (HYP-

NOTICES) by inducing sleep; whilst a third class (NARCOTICS), give ease by stupefying the senses, or by lessening the susceptibility to pain. Among the principal anodynes are opium, morphia, henbane, camphor, ether, chloroform, chloral hydrate, and other medicines of the like kind; to which must be added spirituous liquors, wines, and the stronger varieties of malt liquor. "The frequent use of anodynes begets the necessity of their continuance." (W. Cooley.)

Anodyne, Inf'antile (-ile). *Syn.* ANO'DYNUM INFAN'TILE (-t'il-e), L. *Prep.* Take of *syrup of poppies*, 1 oz.; *aniseed-water*, 3 oz.; *French brandy*, $\frac{1}{2}$ oz. (or *rectified spirit*, $\frac{1}{2}$ oz.); *calcined magnesia*, $\frac{1}{2}$ oz.; mix. An excellent anodyne and antacid for infants.—*Dose.* A small teaspoonful as required.

ANODYNIA (-dîn'y'ă). Freedom from pain; anæsthesia.

ANOREXY. *Syn.* ANOREX'IA, L.; ANOREXIE, Fr., Ger. In *pathology*, want of, or morbidly diminished appetite, without loathing of food. It is usually symptomatic of other affections. See APPETITE, DYSPEPSIA, &c.

ANO ZABAGLIONE (-bäl'y'ô'-nâ). *Prep.* Put 2 eggs, 3 teaspoonfuls of sugar, and 2 small glassfuls of *sherry* or *marsala*, into a chocolate cup, placed in *boiling water*, or over the fire, and keep the mixture rapidly stirred until it begins to rise and thicken a little; then add 1 or 2 teaspoonfuls of *orange-flower water* or *rose water*, and serve it up in wine-glasses. A pleasant Italian domestic remedy for a cold.

ANT (ânt). *Syn.* EMM'ET, PIS'MIRE*† (pîz'-); FORMICA, L.; FOURMI, Fr.; AMEISE, Ger.; EMET, Sax. This well-known little insect belongs to the family *formicidæ*, and the order *hymenoptera*. Like the bee, it is a social animal, lives in communities which may be compared to well-regulated republics, and is of three sexes—male, female, and neuter. Those belonging to the last alone labour and take care of the ova and young. The red ant contains FORMIC ACID (*acid of ants*), and a peculiar RESINOUS OIL. Both of these may be obtained by maceration in *rectified spirit*. A tincture so prepared, and flavoured with aromatics, constitutes Hoffman's EAU DE MAGNANIMITÉ, once greatly esteemed as an aphrodisiac. See FORMICA, FORMIC ACID, FORMYLE, &c.

ANTACID (-täs'id). *Syn.* ANTACIDUS, L.; ANTACIDE, &c., Fr.; SÄURETILGEND, &c., Ger. An agent which neutralises acids or removes acidity. (See *below*.)

ANTACIDS (-täs'idz). *Syn.* ANTACIDA, L.; ANTACIDES, &c., Fr. Antacid substances. In *medicine*, &c., substances which remove or prevent acidity of the stomach, and thus tend to relieve heartburn, dyspepsia, and diarrhoea.

The principal antacids are potassa, soda, ammonia, lime, and magnesia, with their carbonates

and bicarbonates. AMMONIA is one of the most powerful, and when the acidity is conjoined with nausea and faintness, or is accompanied with symptoms of nervous derangement or hysteria, is undoubtedly the best; when great irritability of the coats of the stomach exist, POTASH is to be preferred; when the acidity is accompanied with diarrhoea, carbonate of lime (prepared chalk), lime-water, or Carara-water; and when with costiveness, MAGNESIA. They may all be advantageously combined with some simple aromatic, as ginger, cinnamon, or peppermint. Their preparation, doses, administration, &c., will be found under each in its alphabetical place; and formula containing them, under DRAUGHTS, LOZENGES, MIXTURES, &c.

ANTALGICS (-täl'-). *Syn.* ANTALGICA, L. Medicines which relieve pain; anodynes.

ANTALKALINES (ânt-äl'-kâ-lînz). *Syn.* ANTALKALINA, L. Agents or medicines which correct alkalinity. All the acids, except the carbonic, are antalkaline.

ANTE. In *composition*, before, contrary, opposite; generally in the first sense. See ANTI.

ANTHELMINTICS, Anthelmintics (-thäl-). See VERMIFUGES and WORMS.

ANTHARINE (-in). See ANTIARINE.

ANTHOK'YAN. *Syn.* SUCCUS VIOLE PARAT'US, L. The expressed juice of the sweet or purple violet (Viola odorata—Linn.), defecated, gently heated in glass or earthenware to 192° Fahr., then skimmed, cooled, and filtered; a little rectified spirit is next added, and the following day the whole is again filtered. It must be kept well corked, and in a cool situation.

Uses, &c. Chiefly to make syrup of violets, to colour and flavour liqueurs, and as a chemical test. The London druggists obtain it principally from Lincolnshire.

ANTHONY'S FIRE, Saint (-to-nîz). See ERYSIPELAS.

ANTHOTOPE. See PHOTOGRAPHY.

ANTHRACINE (-sin). Parannaphthalene.

ANTHRACITE (-site). [Eng., Fr.] *Syn.* ANTHRACOLITE, GLANCE-COAL, STONE-COAL, MINERAL CHAR-COAL*, ANTHRACITES, L.; GLANZKOHLE, Ger. A species of coal found in the transition-rock formation, consisting chiefly of dense carbon. It has a conchoidal fracture, a semi-metallic lustre, and a sp. gr. usually varying from 1.4 to 1.6. It burns without either flame or smoke, emits an intense heat, and leaves scarcely any ash; but it is difficult to kindle, and requires a lively draught for its combustion. It is the common fuel in the United States of America, although, until recently, scarcely employed in Europe, and that chiefly in a few iron-works and steam furnaces. Its adoption in this country would not merely at once remove the smoke nuisance, but would produce a vast annual saving to the community. By contracting the throat of the chimney a little, and avoiding the use of the

poker, & may be burnt in a common grate. The Americans use a little charcoal as kindle, and seldom supply fresh coal to the fire oftener than once or twice a day.

The inferior varieties of anthracite are technically and provincially called culm; as is also the small and waste of the better kinds.

For the *analysis, geology, calorific value, &c.*, of anthracite, see COAL, CULM, EVAPORATION, FUEL, HEAT, &c.

ANTHRACOKALI. [Eng., L.] *Syn.* ANTHRACOKALI, ANTHRACALI; ANTHRACOKALI, Hamb. C. 1845. *Prep.* 1. (Polya.) Carbonate of potassa, 6 oz.; quick-lime, $3\frac{1}{2}$ oz.; water, 4 pints; proceed as directed for 'Liquor of potassa,' then evaporate the clear liquid, in an iron capsule, to about 6 fl. oz., add of finely powdered mineral coal, 5 oz., boil, with constant stirring, to dryness, and continue the stirring at a reduced heat, until the whole is converted into a homogeneous black powder, which must be at once placed in small, dry, and well-stoppered phials.

2. (Hamb. C. 1845; Ph. Baden. 1841.) Hydrate of potassa, 7 dr.; melt, add of kenna coal, 5 dr., and then proceed as before.

Prop., &c. A deliquescent black powder, with a caustic taste, and empyreumatic smell; 10 grs. with 1 fl. oz. of water, after filtration, forms a clear, dark brown solution, giving a precipitate with acids, without effervescence. —*Dose.* 1 to 3 grs., twice or thrice daily; and externally, made into a pomade or ointment ($\frac{1}{2}$ to 1 dr., to lard, 1 oz.); in skin diseases (particularly herpetic eruptions), scrofula, chronic rheumatism, &c. It has been highly extolled by Dr. Gibert, and by its inventor, Dr. Polya; but apparently undeservedly.

Anthracokali, Sulphuretted. *Syn.* ANTHRACOKALI SULPHURETUM, L. *Prep.* (Polya.) As formula 1 (*above*), but adding sulphur, 4 dr., immediately after stirring, in the powdered coal.—*Dose, use, &c.*, as the last. See FULIGOKALI.

ANTHRACOMETER. *Syn.* ANTHRACOMETRUM, L.; ANTHRACOMÈTRE, Fr.; KOHLENSÄUREMESSER, Ger. An apparatus used to determine the heating power or commercial value of coal, or other fuel; also an instrument for finding the proportion of carbonic acid in any gaseous mixture.

ANTHYPNOTICS (-thip-). *Syn.* ANTHYPNOTICS (-hip-), &c. See AGRIPNOTICS.

ANTI. [Gr., *avti*, against.] In *composition*, before, against, contrary to, corrective of, &c., more especially representing antagonism or opposition; whilst the Latin *ante*, is generally used in the sense of before, having reference to precedence either of place or time.

Anti- is a common prefix in English words derived from the Greek and Latin, especially those connected with pharmacology and medicine, the final *i* being either dropped or retained (but generally the first) before a, e, and h; as in *antacid* (-tās-), *antibilious*,

antiemetic, *anthelmintic*, *antiscorbutic*, *antiseptic*, &c., whether used as adjectives or substantives. These compounds, which are very numerous, are in general self-explanatory.

ANTIARINE (-in; -ti—Brande). [Eng., Fr.] *Syn.* ANTHIARINE, Eng., Fr.; ANTIARINA, ANTHIARINA, ANTIARIA, UPASIA (-zhā), L. The active principle of the upas-poison of Java. It is extracted from the partially inspissated juice (upas-poison) of the upas-tree by alcohol, and may be obtained under the form of small pearly crystalline scales, by careful evaporation.—*Prod.* About $3\frac{1}{2}\%$ (Mulder).

Prop., &c. Soluble in 27 parts of boiling water; freely soluble in alcohol; scarcely so in ether; heat decomposes it. It is a frightful poison, to which no antidote is known. Even a minute quantity introduced into a wound, rapidly brings on vomiting, convulsions, and death. "It renders the heart insensible to the stimulus of the blood." (Sir B. Brodie.)

ANTI-ATTRITION (-trish-). [Eng., Fr.] *Syn.* AXLE-GREASE, FRICTION COMPO, LUBRICATING COMPOUND, &c. *Prep.* 1. Good plumbago (black lead), finely powdered and sifted, so as to be perfectly free from grit, is gradually added, through a sieve, to 5 times its weight of good lard contained in an iron pan and rendered semi-fluid, but *not* liquid, by a gentle heat; the mass being vigorously stirred with a strong wooden spatula, after each addition, until the mixture is complete, and the composition smooth and uniform. The heat is then gradually raised until the whole liquefies, when the vessel is removed from the fire to a cool situation, and the stirring, which should have been unremitted, continued until the mixture is quite cold. It is applied, in the cold state, with a brush, about once a day, according to the velocity of the parts; and is said to be fully 3-4ths cheaper in use than oil, tallow, tar, or any of the ordinary compo's. When intended for uses in which it will be exposed to warmth, and consequent waste by dripping, a part, or even the whole of the lard is replaced by hard strained grease or tallow, or a little bees' wax is added during its manufacture.

2. *Black lead*, 1 part; *tallow or grease*, 4 parts; ground together until perfectly smooth, either with or without *camphor*, 3 to 5 lbs. per cwt. Expired patent.

3. *Scotch soda*, 60 lbs.; *water*, 30 galls.; dissolve in a capacious boiler, add *palm oil* and *hard tallow*, of each 1½ cwt., and having withdrawn the heat, stir vigorously as before, until the mass is homogeneous and nearly solidified. In hot weather the proportion of tallow is increased, and that of the palm oil diminished; in winter, the reverse. *Used* for the axles of railway carriages and other coarse purposes. For express trains all tallow is usually employed, irrespective of the weather or season.

4. *Bean or rye flour*, 1 cwt.; *water*, $\frac{3}{4}$ cwt.; mix to a smooth paste, raise the heat until the mixture boils, and stir in first of *milk of lime* (of about the consistence of cream), 7 cwt.; *resin-oil*, 10 cwt.; and stir vigorously until cold. Inferior.

5. (Booth's.)—a. From *Scotch soda*, $\frac{1}{2}$ lb.; *boiling water*, 1 gall.; *palm oil* or *tallow*, or any mixture of them, 10 lbs.; as before, observing to continue the stirring until the mixture has cooled down to 60° or 70° Fahr.

b. *Soda*, $\frac{1}{2}$ lb.; *water* and *rape-oil*, of each, 1 gall.; *tallow* or *palm oil*, $\frac{1}{2}$ lb.; as last. Expired patent.

6. (Mankettrick's.) From *caoutchouc* (dissolved in oil of turpentine), 4 lbs.; *Scotch soda*, 10 lbs.; *glue*, 1 lb.; (dissolved in) *water*, 10 galls.; *oil*, 10 galls.; thoroughly incorporated by assiduous stirring, adding the *caoutchouc* last.

7. (LIARD, Fr.) *Finest rape-oil*, 1 gall.; *caoutchouc* (cut small), 3 oz.; dissolve with heat.

Uses &c. To lessen friction in machinery, prevent the bearings rusting, &c. The simplest are perhaps the best. No. 1 & 3 are those most generally employed. Of late years several different liquid hydrocarbons obtained from coal, and particularly paraffin oil, have been extensively employed in this way. See FRICTION, LUBRICATION, &c.

ANTIBILIOUS (-yūs). *Syn.* ANTIBILI'OSUS, L.; ANTIBILIEUX, Fr. An epithet of medicines that are supposed to remove ailments depending on disordered action of the liver. *Aperients, mercurials, and aloeic purgatives* generally, belong to this class. See ABERNETHY MEDICINES, BILE, PILLS, &c.

ANTICARDIUM. See REVIVER (Black).

ANTICHLORIDE (-klōre). Among *bleachers*, any substance, agent, or means, by which the pernicious after-effects of chlorine are prevented. Washing with a weak solution of sulphite of soda (which converts any adhering 'bleaching salt' into sulphate, sulphide, or chloride), is commonly adopted for this purpose. Recently chloride of tin, used in the same way, has been recommended. A cheap sulphite of lime, prepared by agitating milk of lime with the fumes of burning sulphur, and draining and air-drying the product, has been lately patented in England and America, by Prof. Horsford, under the name of 'ANTICHLORIDE OF LIME.' See BLEACHING, &c.

ANTIDOTE (-dōte). [Eng., Fr.] *Syn.* ANTIDOTUM, ANTIDOTUS, L.; ANTIDOT, GEGENGIFT, Ger. In *medicine, toxicology, &c.*, a substance administered to counteract or lessen the effects of poison.

The *principal poisons*, with their *antidotes*, are noticed under their respective heads. Also see POISONS, TOXICOLOGY, &c.

ANTIFERMENT (pop. and more us., in this sense, *ant'ferment'*). [Eng., Fr.] *Syn.* ANTIFERMENTUM, L. Any substance which pre-

vents or arrests fermentation. Several nostrums are sold under this name in the cider-districts. The following are tried and useful formula:—

1. *Sulphite* (not sulphate) of *lime*, in fine powder, 1 part; *marble-dust*, ground *oyster-shells*, or *chalk*, 7 parts; mix, and pack tight, so as to exclude the air.

2. *Sulphite* (not sulphate) of *potassa*, 1 part; new *black-mustard seed* (ground in a pepper-mill), 7 parts; mix, and pack so as to perfectly exclude air and moisture.—*Dose* (of either), $\frac{1}{2}$ oz. to 1 $\frac{1}{2}$ oz. per hhd.

3. *Mustard-seed*, 14 lbs.; *cloves* and *capsicum*, of each, 1 $\frac{1}{2}$ lb.; mix, and grind them to powder in a pepper-mill.—*Dose*. $\frac{1}{4}$ to $\frac{1}{2}$ lb. per hhd.

Uses, &c. The above formulæ are infinitely superior to those commonly met with in trade; and are quite harmless. A portion of any one of them added to cider, or perry, soon allays fermentation, when excessive, or when it has been renewed. The first formula is preferred when there is a tendency to acidity. The second and third may be advantageously used for wine and beer, as well as for cider. That of the third formula greatly improves the flavour and the apparent strength of the liquor, and also improves its keeping qualities. See CELLAR-MANAGEMENT, FERMENTATION, &c.

ANTI-FRICTION METAL. *Prep.* 1. From *tin*, 16 to 20 parts; *antimony*, 2 parts; *lead*, 1 part; fused together, and then blended with *copper*, 80 parts. *Used* when there is much friction or high velocity.

2. *Zinc*, 6 parts; *tin*, 1 part; *copper*, 20 parts. *Used* when the metal is exposed to violent shocks,

3. *Lead*, 1 part; *tin*, 2 parts; *zinc*, 4 parts; *copper*, 68 parts. *Used* when the metal is exposed to heat.

4. (Babbet's.) *Tin*, 48 to 50 parts; *antimony*, 5 parts; *copper*, 1 part.

5. (Fenton's.) *Tin* with some *zinc*, and a little *copper*.

6. (Ordinary.) *Tin*, or *hard pewter*, with or without a small portion of *antimony*, or *copper*. Without the last it is apt to spread out under the weight of heavy machinery. *Used* for the bearings of locomotive engines, &c.

Obs. These alloys are usually supported by bearings of brass, into which it is poured after they have been tinned, and heated and put together with an exact model of the axle, or other working piece, plastic clay being previously applied, in the usual manner, as a late or outer mould. Soft gun-metal is also excellent, and is much used for bearings. They all become less heated in working than the harder metals, and less grease or oil is consequently required when they are used. • See ALLOYS, FRICTION, &c.

ANTIGUGGLER. A small bent tube of glass or metal inserted into casks and carboys, to admit air over the liquor whilst it is being

poured out or drawn off, so that the sediment may not be disturbed.

ANTIMONIAL (-mōne-'yāl). [Eng., Fr.]

Syn. ANTIMONIALIS, L. Pertaining to, composed of, or containing antimony. In *medicine* and *pharmacy*, applied to preparations or remedies (ANTIMONIALS; ANTIMONIALIA, L.) in which antimony, or one of its compounds, is the leading or characteristic ingredient.

ANTIMONIATED. *Syn.* ANTIMONIATUS, L. Mixed or impregnated with antimony; antimonial.

ANTIMONIC ACID. *Syn.* ACIDUM ANTIMONICUM, L.; ACIDE ANTIMONIQUE, Fr.; ANTIMONSÄURE, Ger.

Prep. 1. Pure metallic antimony, in coarse powder, or small fragments, is digested in excess of concentrated nitric acid, until the oxidation and conversion is complete; the excess of nitric acid is then removed by evaporation nearly to dryness, and the residuum thrown into cold distilled water; after which the powder (ANTIMONIC ACID) is collected on a calico filter, washed with distilled water, and dried by a gentle heat. Pure.

2. *Metallic antimony* (in powder), 1 part; powdered nitre, 6 or 8 parts; are mixed and ignited or calcined in a silver crucible; the mass, when cold, is powdered; the excess of alkali washed out with hot water, and the residuum (ANTIMONIATE OF POTASSIUM) decomposed with hydrochloric acid; lastly, the precipitate (ANTIMONIC ACID) is washed and dried as before.

That obtained by the first process is dibasic, and has the formula $H_2Sb_2O_6$, while that produced by the second process is tetrabasic, and has the formula $H_4Sb_2O_7$; the former is called simply *antimonic acid*, the latter *metantimonic acid*.

Prop. Antimonic acid is a soft white powder, sparingly soluble in water, reddens litmus, and is dissolved, even in the cold, by strong hydrochloric acid and by potash. The hydrochloric solution, mixed with a small quantity of water, yields, after a while, a precipitate of antimonic acid; but if diluted with a large quantity of water, it remains clear. Ammonia does not dissolve it in the cold. By heating with a large excess of caustic potash it is converted into metantimonic acid.

Metantimonic acid is more readily dissolved by acids than antimonic acid, and is dissolved by ammonia, after a while, even at ordinary temperatures. It is also perfectly soluble in a large quantity of water, and is precipitated therefrom by acids. It is very unstable, and easily changes into antimonic acid, even in water.

ANTIMONIC ANHYDRIDE (Sb_2O_3). *Syn.* ANTIMONIC OXIDE, ANHYDROUS ANTIMONIC ACID, PENTOXIDE OF ANTIMONY. Antimonic or metantimonic acid, heated to a temperature below redness loses water and yields the anhydride, Sb_2O_3 . Antimonic anhydride is a

Antimonial (—Mayne) is a barbarism.

yellowish-white powder, tasteless and insoluble in water and acids. Boiled with a solution of caustic potash, it is dissolved. If fused with carbonate of potassium, carbonic anhydride is expelled, and a salt is produced from which antimonic acid is precipitated by acids.

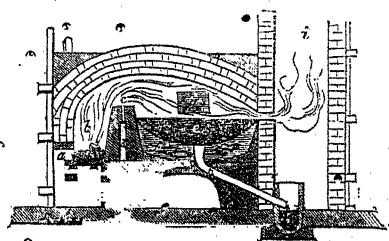

ANTIMONIOUS ACID. See ANTIMONY, TETROXIDE of.

ANTIMONETTED. *Syn.* ANTIMONUITRETTE; ANTIMONIATUS, L. Combined with or containing antimony. See HYDROGEN, &c.

ANTIMONY (-te-mūn-e). *Syn.* METALLIC ANTIMONY*, REGULUS OF A.; ANTIMONIUM, A. METALLICUM, STIBIUM, METALLUM ANTIMONII†, A. REGULUS†, &c., L.; ANTIMOINE, Fr.; ANTIMON, SPIESSGLANZ, SPIESSGLAS, SPIESSGLANZMETALL, Ger.; ANTIMONIO, It., Sp. The term formerly applied to the native sulphide or greyish-black semi-crystalline ore of antimony; but now solely appropriated to the pure metal.

Sources. Metallic antimony, in combination with silver and iron (NATIVE ANTIMONY), with sulphur (GRAY SULPHIDE OF A.), or with nickel (NICKELIFEROUS SULPHIDE OF A.), is found in Bohemia, Hungary, Germany, Sweden, France, England, Borneo, and America; and oxidised, combined with oxide of iron, &c. (ANTIMONIAL OCHRE, RED ANTIMONY, WHITE A.), forming ores, either small in quantity or of little value, in various parts of the world. Of these, the only one in sufficient abundance for smelting, is the common sulphuret, known as 'grey antimony' or 'stibnite.'

Prep. Native antimony is freed from impurities by fusion. The sulphide, after being melted from the gangue, is commonly oxidised by exposure on the concave hearth of a re-

verberatory furnace, and is then reduced to the metallic state by fusion in crucibles with coal-dust, crude tartar, or some other de-oxidising agent. To free the product from iron, it is generally fused, or re-fused, with

* White A. occurs in considerable quantities in Borneo and is used after roasting as a white pigment for iron and other surfaces.

little antimonious oxide; and when the ore contains arsenic, some iron or its oxide, and an alkaline carbonate or sulphate, are used in the same way. It is seldom prepared on the small scale. The following formulæ are in use, or are recommended:—

1. On the SMALL SCALE:—

a. From *tersulphide of antimony*, in coarse powder, 2 parts; *iron filings*, 1 part; fused together in a covered crucible, at a heat gradually raised to dull redness.

b. From the *teroxide* or the *oxychloride of antimony*, fused together, as before, with twice its weight of crude tartar.

c. (Ph. Castr. Ru. 1840.) *Sulphide of antimony*, 16 parts; *cream of tartar*, 6 parts; both in powder; throw the mixture, in small quantities at a time, into a vessel (an earthen crucible) heated to redness; when the reaction is over, (having closely covered the vessel,) fuse the mass, and after a quarter of an hour, pour it out, and separate the metal from the slag.

d. From *sulphide of antimony*, 8 parts; *crude tartar*, 6 parts; *nitre*, 3 parts; as last.

e. (Wöhler.) *Sulphide of antimony*, 10 parts; *nitre*, 12 parts; *dry carbonate of soda*, 15 parts; deflagrate together; powder the resulting mass, and wash it thoroughly with boiling water; lastly, smelt the dried residuum with black flux. All the preceding are nearly pure; the impurity, if any, being traces of copper, lead, or iron.

f. (Berzelius.) From *metallic antimony*, in fine powder, 2 parts; *teroxide of antimony*, 1 part; fused together. The product will be pure provided the antimony employed is free from lead.

g. (Muspratt.) From *antimony*, 9 parts; *peroxide of manganese*, 1 part; fused together; the resulting metal being re-fused with 1-10th of its weight of carbonate of soda.

2. On the LARGE SCALE—commercial:—

a. See above (before 1 a.).

b. From *sulphide of antimony*, 100 parts; iron (in very small scraps), 40 parts; *dry crude sulphate of soda*, 10 parts; *powdered charcoal*, 2½ parts; fused together.—*Prod.* 60 to 65 parts of antimony, besides the scorix or ash, which is also valuable.

c. (Berthier.) *Sulphide of antimony*, 100 parts; *hammerschlag* (rough oxide of iron from the shingling or rolling mills), 60 parts; *crude carbonate or sulphate of soda*, 45 to 50 parts; *charcoal powder*, 10 parts; as last.—*Prod.* 65 to 70 parts.

Prop., &c. Bluish-white, lustrous, with a lamellar texture, and a crystalline or semi-crystalline fracture, with fern-leaf markings on the surface, when pure (*star antimony*); extremely brittle (may be powdered); imparts brittleness to its alloys (even 1-1000th part added to gold renders it unfit for the purposes of coinage and the arts); melts at 809-810° Fahr., or just under redness; fumes, boils, and volatilises at a white heat, and, when suddenly exposed to the air, inflames with conversion

into the teroxide, which is deposited in beautiful flowers of crystals; when perfectly pure and fused without contact with air or foreign matter, it bears an intense heat without subliming (Thénard); allowed to cool slowly from a state of perfect fusion, it crystallises in octahedrons or dodecahedrons; tarnishes, but does not rust by exposure to air or moisture at common temperatures; hot hydrochloric acid dissolves it, with the formation of TRICHLORIDE OF ANTIMONY; nitric acid, when concentrated, converts it into ANTIMONIC ACID; and when dilute, into TRIOXIDE OF ANTIMONY. Sp. gr. 6·7 to 6·8.¹

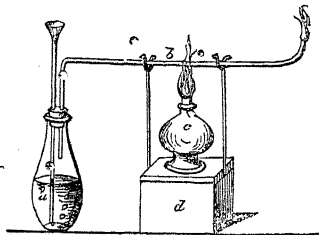

Tests. Metallic antimony may be recognised by the above properties; its oxide, salts, &c., by the following reactions:—1. Sulphuretted hydrogen gives, with acid solutions, an orange-red precipitate, which is sparingly soluble in ammonia,² and insoluble in dilute acids; but readily soluble in pure potassa and alkaline sulphides, and in hot hydrochloric acid with the evolution of sulphuretted hydrogen gas:—2. Sulphydrate of ammonium gives an orange-red precipitate, readily soluble in excess of the precipitant, if this latter contains sulphur in excess; and the liquor containing the re-dissolved precipitate gives a yellow or orange-yellow precipitate on the addition of an acid:—3. Ammonia and potassa, and their carbonates, give (except in solutions of tartar emetic) a bulky white precipitate; that with ammonia and its carbonate being insoluble in excess of the precipitant; that with potassa, readily so; whilst that with carbonate of potassium is only soluble on the application of heat:—4. A rod of zinc throws down metallic antimony, as a black powder, from all its solutions not containing free nitric acid. If the experiment be made with a few drops of a solution of antimony containing a little free hydrochloric acid, and a small platinum dish or capsule be employed, the part covered by the liquid is soon stained brown or blackish, and the stain is irremovable by cold hydrochloric acid, but may be easily removed by warm nitric acid:—5. By ebullition of the acidulated liquid along with copper gauze, foil, or wire, as noticed under 'Reimsch's Test.'³ The peculiar violet-grey of the deposit is characteristic, and may easily be distinguished from that given by arsenical solutions:—6. Mixed with dilute sulphuric acid and poured on some metallic zinc in a gas-generating flask, provided with a small bent tube (see engr.), it yields ANTIMONETTED HYDROGEN (Marsh's test), recognised by burning with a bluish-green flame, and furnishing dense white fumes which adhere readily to any cold substance (as a porcelain plate) held over it; or, if the plate be depressed upon the flame, a deep black, and almost lustreless spot of

¹ When perfectly pure, 6·715—Ure.

² The like precipitate from a solution of antimonious acid in hydrochloric acid, dissolves readily in ammonia, particularly when heated.

³ See ARSENIOUS ACID.

metallic antimony; the fumes and spots in both cases being insoluble in water, and in dilute solution of chloride (crude hypochlorite) of soda. On heating the centre of the tube to redness with a spirit lamp, the bluish-green colour of the flame lessens in intensity, and a mirror of metallic antimony, of silvery lustre, forms inside the tube at the ignited part. On passing dry sulphuretted hydrogen through the tube, still heated by a spirit lamp, this mirror assumes a reddish-yellow colour, approaching black in its thicker parts;

- (a.) Flask containing the suspected fluid, dilute sulphuric acid, and zinc.
 (b.) Small tube, at the one end having an almost capillary orifice, where the gas is ignited.
 (c.) Spirit-lamp.
 (d.) Support.

and by exposure to a feeble stream of hydrochloric acid gas, almost immediately, or in a few seconds, disappears, being carried off by the gas, which, if passed into a little distilled water, yields a solution of chloride of antimony, which may be further submitted to any of the usual tests.¹ If the substance be in the solid state, it must be reduced to powder and dissolved in water; or if insoluble in that menstruum, a solution must be obtained by digestion in either hot hydrochloric or nitrohydrochloric acid, before proceeding to examine it by this method.

Estim. Antimony is generally WEIGHED under the form of *tersulphide*; but sometimes as *antimonious anhydride*, and—though more seldom—as *pure metal*.—

1. A solution being obtained as above, if necessary, it is strongly acidulated with tartaric acid, and the antimony thrown down as a sulphide by a stream of sulphuretted hydrogen. After warming the solution and allowing it to cool, the precipitate (*TERSULPHIDE*) is collected on a filter, dried, and weighed. A small portion digested in strong hydrochloric acid, will completely dissolve if it be the pure sulphide; in which case the quantity of ANTIMONY sought will be equal to $71\frac{1}{2}\%$ (71.5%) of the weight of the sulphide found (very nearly).² Should only part of the precipitate be soluble, a known weight of it may be introduced into a flask, and a con-

¹ See ARSENIOUS ACID.

² *Tersulphide of antimony* dried at 212° Fahr. still retains traces of water, which is not wholly expelled until the heat reaches 390–392°, when it acquires a black colour and a crystalline appearance.

siderable quantity of fuming nitric acid added, drop by drop, and afterwards, a little hydrochloric acid, the mixture being digested, at a gentle heat, until the reaction is complete, and the whole of the sulphur is dissolved. The resulting solution diluted with water, strongly acidulated with tartaric acid, and solution of chloride of barium added as long as it disturbs the liquid, yields a precipitate, of which the weight, after it has been thoroughly washed, dried, and gently ignited, multiplied by 136, gives the quantity of SULPHUR in the sample; and which, deducted from the weight of the *sulphide* first found, gives the quantity of pure ANTIMONY, as before.

2. The quantity of pure ANTIMONY in commercial samples may be determined by treating them (in powder) with nitric acid, which oxidises the antimony and leaves it in an insoluble state, whilst it dissolves the other metals. The resulting oxide is collected on a filter, washed, dried, ignited in an open porcelain crucible, and weighed—its weight multiplied by .7898 gives the quantity of pure metal sought.

3. Dissolve a known weight of the sample in hydrochloric acid, immerse a blade of pure metallic tin in the solution, and keep the liquor acidulous, and in a state of gentle ebullition by the heat of a sand bath, when the whole of the ANTIMONY will be precipitated under the form of a black powder, and may be collected, washed, dried, and weighed. This is particularly adapted to alloys of antimony and tin. See *Tests* (above) and *Pur.* (below).

Pur. The antimony of commerce generally contains a little arsenic, with variable quantities of iron, lead, sulphur, and tin. These impurities may be thus detected:—

1. (Arsenic.) By fusing the sample, in powder, mixed with about an equal weight of tartrate or bitartrate of potassium, in a covered crucible, for 2 or 3 hours, and placing the resulting button, which is an alloy of antimony and potassium, in a '*Marsli's apparatus*' along with a little water, when the disengagement of hydrogen gas will commence, and may be tested in the usual manner. See ARSENIC.

2. (Iron.) Dissolve the powdered sample in nitrohydrochloric acid, dilute the solution with a large quantity of cold water, filter, and pass a current of sulphuretted hydrogen through the filtrate as long as it produces a precipitate; again filter, boil the filtered liquor for a few minutes to drive off the sulphuretted hydrogen, and then test it with ferrocyanide of potassium, which will give a blue precipitate if iron be present; or supersaturate the last filtrate with ammonia, and then add hydrosulphate of ammonium, when, under like conditions, a black precipitate will be formed.

3. (Lead.) Digest the powdered sample in hot nitric acid, which will dissolve out the LEAD but leave the antimony behind. The whitish powdery residuum may be washed, dried, ignited, and weighed, as above; the clear

decanted liquor may be now mixed with the first washings, evaporated to dryness, the residuum re-dissolved in water, and the solution submitted to reagents (*see* LEAD). If lead is found to be present, a solution of sulphate of sodium may be added until it ceases to disturb the liquid, and the resulting precipitate (sulphate of lead) washed, dried, and gently ignited (alone) in a porcelain crucible; the weight of the ignited residuum furnishes a number which, multiplied by '683, gives the weight of the LEAD sought.

4. (Sulphur.) The solution in nitrohydrochloric acid, when tested with either nitrate or chloride of barium, gives a white precipitate of sulphate of barium, insoluble in both water and acids, which when dried, ignited, and weighed, and the weight multiplied by '136, gives the quantity of SULPHUR, as before. In this case, as with the sulphides (*see above*), free sulphur may be removed by digesting and washing the powdered sample in bisulphide of carbon, previous to its solution in the acid, by which the violence of the subsequent reaction will be lessened.

5. (Tin.) Two samples of equal weight are taken; the one is tested for ANTIMONY, as described above; the other is dissolved in a mixture of equal parts of hydrochloric and nitrohydrochloric acid, and a blade of zinc immersed in the solution (*see above*); the mixed precipitate of tin and antimony which forms is collected on a weighed filter, washed, dried, and weighed. The weight of antimony in the first sample subtracted from that now obtained, leaves a remainder which indicates the quantity of TIN in the original sample.

Phys. eff., &c. Nearly all the salts and preparations of antimony are emetic and cathartic, and in large doses *poisonous*—occasioning vomiting, profuse alvine dejections, acute colic, and inflammation of the stomach and bowels, often serious, though rarely resulting in death. TARTAR EMETIC and BUTTER OF ANTIMONY are those from which accidents have principally occurred.—*Ant., &c.* Copious vomiting, if it has not already occurred, should be promoted, and the *recently* prepared hydrated sulphide of iron administered in considerable doses, followed or accompanied by mucilaginous drinks and diuretics. If much prostration follows, wine and stimulants may be had recourse to. In the absence of hydrated sulphide of iron, a solution of tannin, or decoction of galls; cinchona, or oak bark, or even powdered cinchona, mixed with tepid water, may be administered.

Uses. In the arts, antimony enters into the composition of several useful alloys, as TYPE-METAL, PEWTER, BRITANNIA-METAL, MUSIC-PLATE METAL, &c. It is added to the alloy for concave mirrors, to give them a finer texture; to bell metal, to render it more sonorous; and to various other metals to increase their hardness and fusibility; for the latter purpose it is employed in the casting of cannon balls.

Concluding remarks. In 'roasting' or oxidising the native sulphide of antimony on the bed of the reverberatory furnace, as in the common method before referred to, care must be taken to regulate and gradually raise the heat, which, until towards the end of the process, need not be extreme, and then only should it approach dull redness. Without this precaution much of the undecomposed sulphide will be lost by volatilisation. During the whole time the 'charge' should also be well stirred with an iron spatula, to ensure the constant exposure of every part of it to the atmosphere. The process is complete when the whole mass assumes a greyish-white appearance. Earthen crucibles are commonly employed for the subsequent reduction, and after being charged and covered over with ground charcoal, are heated in a reverberatory furnace. The product is the crude metallic antimony of commerce. It is generally REFINED by smelting it with about 1-8th of its weight of the refined sulphide, and about 1-4th of its weight of carbonate or sulphate of soda; but if there be much iron present, more of the sulphide—even 1-4th—may be required; for unless there be sufficient sulphur to combine with the whole of the iron, the arsenic will not be oxidised, but remain as a contamination. When cold, the metal is carefully separated from the slag, and is frequently re-fused with a little fresh carbonate of soda (1 to 1½ part); after which it is cast into pigs, lumps, or ingots. The crude metal, thus treated, commonly yields 94½ of REFINED METAL of tolerable purity.

Should lead have been present in the sulphide or ore, it remains after a second, or even a third fusion, although proportionately reduced in quantity; and it can only be completely separated in the humid way. It is, therefore, always desirable to select an ore free from lead.

Antimony, Ash of. *Syn.* ANTIMONY-ASH, CALCINED ANTIMONY*, CINIS ANTIMONII, ANTIMONIUM CALCINATUM*, L. Prepared by roasting the common grey sulphide of antimony on an iron plate set under a chimney, to carry off the fumes. The product is a mixture of teroxide of antimony, with some unburnt sulphide, and a little antimonious acid.

Prop., &c. Ash-grey; emetic in small doses. Used chiefly as a cheap substitute for teroxide of antimony by the manufacturers of tartar emetic; also to make metallic antimony.

Antimony, Butter of. See ANTIMONOUS, TRICHLORIDE OF.

Antimony, Calx of. *Syn.* CALX ANTIMONII, L. Sometimes applied to *antimony-ash*, but more commonly to crude, unwashed *antiphotetic antimony*.

Antimony, Calx of (Sulphurated). *Syn.* ANTIMONI CALX SULPHURATA, L. *Prep.* (Hufeland.) *Calcined oyster-shells*, 10 parts;

sulphur, 4 parts; crude antimony, 3 parts; powder, mix, and calcine in a luted crucible for an hour. Emetic, resolvent, and alterative.—*Dose.* 1 to 6 grs.; in gout, rheumatism, scrofula, &c.

Antimony, Ceruse of. *Syn.* ANTIMONII CERUSSA, L. *Prep.* (Bate.) As diaphoretic antimony (over which it possesses no advantage), merely using the metal instead of the sulphide.

An old preparation made by igniting antimony in the sun's rays, by means of a lens, was called ANTIMONII CERUSSA SOLARIS.

Antimony, Chlorides of (klôre'idz):—

1. **Antimony, Trichloride of.** SbCl₃. *Syn.* TRICHLORIDE OF ANTIMONY, ANTIMONIOUS CHLORIDE, CHLORIDE OF ANTIMONY, SESQUICHLORIDE OF A., BUTTER OF A., CAUSTIC ANTIMONY†, &c.; ANTIMONII CHLORIDUM, A. TRICHLORIDUM, A. BUTYRUM*, &c., L.; CHLORURE D'ANTIMOINE, BEURRE D'ANTIMOINE, &c., Fr.; ANTIMON-CHLORID, SPIESSGLANZ-BUTTER, Ger. This is the substance of which common chloride, or butter of antimony, of the shops, is an impure concentrated solution containing free acid.

Prep. 1. **SOLID, ANHYDROUS**:—

a. Pure commercial tersulphide of antimony, in coarse powder, 1 part; concentrated hydrochloric acid, 5 parts; are mixed in a capacious stoneware or glass vessel set under a chimney with a quick draught, to convey away the fumes, the whole being constantly stirred, and, as the effervescence slackens, a gradually increasing gentle heat applied until solution is complete; the resulting liquid is put into a retort, and distilled, until each drop of the distillate, as it falls into the aqueous liquid which has previously passed over into the receiver, produces a copious white precipitate; the receiver is then changed, and the distillation continued, when pure TRICHLORIDE OF ANTIMONY passes over, and solidifies on cooling to a white and highly crystalline mass, which must be carefully excluded from the air.

b. From pure metallic antimony, 2 parts; bichloride of mercury, 5 parts; both in fine powder; mixed and distilled in a retort with a large neck, by a gentle sand-heat, into a suitable receiver. Chemically pure.

2. **LIQUID**:—

a. (LIQUOR ANTIMONII CHLORIDI, B. P.) *Syn.* SOLUTION OF CHLORIDE OF ANTIMONY.

Prep. Take of black antimony, 1 lb.; hydrochloric acid, 4 pints; place the black antimony in a porcelain vessel; pour upon it the hydrochloric acid, and, constantly stirring, apply to the mixture, beneath a fume with a good draught, a gentle heat, which must be gradually augmented as the evolution of gas begins to slacken, until the liquid boils. Maintain at this temperature for fifteen minutes; then remove the vessel from the fire, and filter the liquid through calico into another vessel, returning what passes through first, that a perfectly clear solution may be obtained. Boil

this down to the bulk of two pints, and preserve it in a stoppered bottle.

Characters and Tests. A heavy liquid, usually of a yellowish-red colour. A little of it dropped into water gives a white precipitate, and the filtered solution lets fall a copious deposit on the addition of nitrate of silver. If the white precipitate formed by water be treated with sulphuretted hydrogen it becomes orange-coloured. The specific gravity of the solution is 1.47. One fluid drachm of it mixed with a solution of a quarter of an ounce of tartaric acid in four fluid ounces of water, forms a clear solution, which, if treated with sulphuretted hydrogen, gives an orange precipitate, weighing, when washed and dried at 212°, at least 82 grains.

b. (Commercial).—a. Take of ash or calx of antimony, 3½ lbs.; common salt, 2 lbs.; oil of vitriol, 1½ lb.; water, 1 lb.; proceed as before. *Prod.*, 2½ lbs.

c. From roasted sulphide or glass of antimony, 7 lbs.; salt, 28 lbs.; oil of vitriol, 21 lbs.; water 14 lbs.; as before.

d. From crude sulphide of antimony (powdered), 25 lbs.; strongest commercial hydrochloric acid, 1 cwt.; nitric acid, 3½ lbs.; as before; the product being coloured with a little permanganate of iron, and made up to the sp. gr. 1.4. The quality is improved, and the process more easily conducted, if the crude antimony is roasted before dissolving it in the acid. The same applies to the other formulæ.

Prop., &c.—a. **SOLID.** When pure, and nearly free from water, it somewhat resembles butter, melts with a gentle heat, and partially crystallises on cooling; is very deliquescent, and quickly passes into an oily liquid when exposed to damp air; very soluble in strong hydrochloric acid; water, according to its quantity, more or less decomposes it. When perfectly pure and anhydrous, it forms a white and highly crystalline mass, rapidly decomposed by air and moisture.—b. **SOLUTION.** The sp. gr. of the solution of the shops varies from 1.25 to 1.4, in which state it is a transparent fuming yellow liquid (unless when artificially coloured), and extremely acid and caustic. Submitted to distillation, it at first parts with its water and excess of acid, after which the salt itself is volatilised. By changing the receiver as soon as the distillate concretes on cooling, or produces a copious white precipitate on falling into the liquid already passed over, the pure ANHYDROUS TRICHLORIDE may be readily obtained.

Phys. eff. Ant., Lesions, &c. See ANTIMONY. *Uses.* In medicine, only externally, and chiefly as a caustic or escharotic to the wounds caused by rabid and venomous animals, and to repress excessive granulations in ulcers. In pharmacy, as a source of both oxychloride and oxide of antimony. The residuum in the retort when corrosive sublimate is used, is sulphide of mercury, and was formerly called CINNABAR OF ANTIMONY.

2. Antimony, Pentachloride of. Sb_2Cl_5 , *Syn.* PERCHLO'RIDE OF ANTIMONY; ANTIMO'NIU PENTACHLO'RIDUM, L. Prepared by passing a stream of chlorine gas over metallic antimony in fine powder, and gently heated. A mixture of TRICHLORIDE and PENTACHLORIDE OF ANTIMONY is found in the receiver, from which the latter may be separated by careful distillation. It is a colourless volatile liquid, forming a crystalline compound with a small quantity of water, but decomposed by a larger quantity.

Antimony, Crocus of. *Syn.* SAFFRON OF ANTIMONY, LIV'ER OF A.; CRO'CUS ANTIMO'NIU, C. METALLO'RUM, HE'PAR ANTIMONII, L.; CROCUS D'ANTIMOINE, SAFFRAN D'A., Fr. *Prep.* 1. From black sulphide of antimony and saltpetre, equal parts, deflagrated together by small portions at a time, and the fused mass (separated from the scorise) reduced to fine powder.

2. (ANT. CROCUS, Ph. L. 1788.) Sulphide of antimony, 1 lb.; nitre, 1 lb. common salt, 1 oz.; as before.

Prop., &c. Its medicinal properties closely resemble those of diaphoretic antimony. It is a mixture of sulphate of potassium, antimoniate of potassium, teroxide of antimony, oxy-sulphide of antimony, sulphide of potassium, and undecomposed trisulphide of antimony, in variable and undetermined proportions. When repeatedly washed or boiled in water, and dried, it forms the WASHED SAFFRON OF ANTIMONY (C. A. LOTUS, L.) of old pharmacy, and has then lost its sulphate of potassium, caustic potash, and sulphide of potassium. Formerly used to make tartar emetic. See LIVER OF ANTIMONY.

Antimony, Crude. Native sulphide of antimony melted from the gangue.

Antimony, Diaphoretic. *Syn.* CALX OF ANTIMONY, CALCINED A., ANTIMO'NIATE OF POTASH, STIBIATED KA'LI, DIAPHORETIC MINERAL†, &c.; ANTIMO'NIUM DIAPHORETICUM, A. CALCINATUM, CALX ANTIMO'NIU, C. A. ANGLO'RUM†, POTASSÆ ANTIMO'NIAS, KALI STIBIUM†, &c., L. var.; ANTIMOINE DIAPHORÉTIQUE, BLANTIMONIATE DE POTASSE, Fr. An old preparation with numerous synonyms, of which the first two of the above are those which are now chiefly in use.

Prep. 1. Sulphide of antimony, 1 part; nitre, 3 parts; powder, mix, and deflagrate by spoonfuls in a red-hot crucible, then calcine for half an hour, and when cold powder the residuum.

2. WASHED DIAPHORETIC A., W. CALX OF A.; ANTIMONIUM DIAPHORETICUM LOTUM, A. D. ABUTUM (Ph. Bor. 1847), A. CALCINATUM (Ph. L. 1788); ANTIMOINE DIAPHORÉTIQUE LAVÉ, &c., Fr. — (A. Ph. L. 1788.) As the last, but the powder is subsequently deprived of soluble matter by repeated washings with water, after which it is collected and dried.

b. (Ph. Bor. 1847.) Metallic antimony, 1 part; nitre, 2 parts; as above, but drying the

washed powder at a heat not exceeding 104° Fahr.

Prop., &c. A white or greyish-white powder, without either smell or taste; gently diaphoretic and laxative; its activity greatly depending on the quantity of acid in the stomach. — *Dose.* 1 to 3 grs., or even 10 grs.; for horses, 1 to 3 or 4 drs. It was formerly in high repute; but is now almost superseded by the present pharmacopœial preparations.

Antimony, Ethiops of. *Syn.* ÆTHIOPS ANTIMONIALIS, L. *Prep.* 1. From metallic mercury, 1 part; sulphide of antimony, 2 parts; triturated together until the globules of the former entirely disappear. — 2. Sulphide of antimony, 3 parts; black sulphide of mercury, 2 parts; triturated together for some time. An old remedy in certain skin diseases, still highly esteemed by some provincial practitioners. — *Dose.* 3 to 5 grs., gradually increased to 20 or 30 grs.

Antimony, Flowers of. *Syn.* FLO'RES ANTIMO'NIU, L.; FLEURS D'ANTIMOINE, Fr. *Prep.* Throw powdered sulphide of antimony, by spoonfuls at a time, into an ignited tubulated retort with a short and very wide neck, until as many 'flowers' collect in the receiver as are required. An impure oxy-sulphide of antimony, with variable portions of trioxide, and undecomposed tersulphide. Emetic in doses of 1 to 3 grs.

Antimony, Flowers of (Argentine). [*-in.*] *Syn.* WHITE OXIDE OF ANTIMONY, SNOW OF A.; ANTIMO'NIU FLO'RES ARGENTINÆ, A. NIX†, L.; FLEURS ARGENTINES D'ANTIMOINE, OXYDE BLANC D'ANTIMOINE, Fr. *Prep.* Melt metallic antimony in a vessel freely exposed to the air, and furnished with a cool place for the 'flowers' to rest on, and collect them as deposited; or, and what is better, heat the metal to a full red or white heat in a covered crucible, and then suddenly expose it to the air, when it will inflame, and the oxidised vapour condense as 'flowers' on any cool surface (as a partially inverted wide-mouthed flask) held at a little distance over it. The product is TRIOXIDE OF ANTIMONY in a crystalline form, and received the name of *argentine flowers* from its silvery whiteness and beauty.

Antimony, Flowers of (Helmont's). *Syn.* FLO'RES ANTIMO'NIU HELMON'II. An old preparation formed by dissolving sulphide of antimony in *aqua regia*, expelling the free water and acid by heat, and subliming the residuum with an equal weight of sal ammoniac. Violently emetic, even in small doses, and unfit for internal use.

Antimony, Flowers of (Red). *Syn.* FLO'RES ANTIMO'NIU RUBRI, L. From sulphide of antimony, and sal ammoniac, both in fine powder, mixed and sublimed together. Resembles the last.

Antimony, Fulminating. See FULMINATING COMPOUNDS.

Antimony, Glass of. *Syn.* VITRIFIED ANTIMONY, V. OXIDE OF A., GRAY O. OF A.*;

ANTIMO'NII VITRUM, ANTIMO'NIUM VITRIFICATUM, A. VITRIFICATUM (Ph. L. 1788), OXYDUM ANTIMONII VITRIFICATUM, &c., L.; VERRE D'ANTIMOINE, OXYSULFURE D'ANTIMOINE SILICATÉ, Fr. *Prep.* (Ph. L. 1788.) Roast sulphide of antimony in a shallow earthen vessel, over a moderate fire, stirring it constantly with an iron rod, until it turns whitish-grey and ceases to emit fumes at a red heat; put the residuum into a covered crucible which it shall only two thirds fill, and expose it to an intense heat (gradually raised), until it fuses, then pour it out on an iron plate. If calcined too much, a little more crude antimony may be added to make it run well.

Comp., Prop., &c. A mixture of sulphide and oxide of antimony contaminated with a little silica and iron. In fine powder it is emetic, in doses of 1 to 3 grs.; but owing to the uncertainty and violence of its operation, is now seldom employed. It has been used as a cheap source of the TEROXIDE by the manufacturers of tartar emetic.

Antimony, Glass of (Cera'ced). *Syn.* ANTIMO'NII VITRUM CERA'TUM, L. *Prep.* (Dr. Young & Ph. L. 1746.) Glass of antimony, in very fine powder, 1 oz.; yellow wax, 1 dr.; melt together in an iron ladle, and keep it over a gentle fire free from flame, (constantly stirring,) for about half an hour, or until it acquires a snuff colour, then pour it out on a piece of white paper (or a plate), and when cold, powder it.—*Dose.* 2 to 10 grs., in dysentery, &c.

Antimony, Liver of. *Syn.* HEPAR ANTIMO'NII, L.; HEPAR D'ANTIMOINE, OXYSULFURE D'ANTIMOINE SILICATÉ, Fr. *Prep.* From sulphide of antimony, 1 part; and dry carbonate of sodium or potassium, 2 parts; melted together, and heated until it acquires the proper colour, and then cooled, and powdered.

Comp., Uses, &c. A mixture of trioxide of antimony, sulphide of potassium, carbonate of potassium, and undecomposed trisulphide of antimony. It is chiefly used by farriers, in doses of 1 to 2 drs., as an alterative purge for horses, in greasy heels, &c.; and sometimes by chemists, as a source of the crude oxide. Crocus of antimony, before noticed, sometimes passes under the name, and is sold for it.

Antimony, Ore of. *Syn.* ANTIMONY-ORE. Native sulphide of antimony.

Antimony, Oxide of. The B. P. name for Antimony, Trioxide of (which see).

Antimony, Oxides of. Antimony forms with oxygen three definite compounds, viz. the—

Trioxide or antimonious oxide	Sb_2O_3
Tetroxide or antimonoso-antimonic oxide	Sb_2O_4
Pentoxide or antimonio-oxide	Sb_2O_5

Antimony, Trioxide of. Sb_2O_3 . *Syn.* TEROXIDE OF ANTIMONY, ANTIMONIOUS OXIDE (B. P. OXIDE OF ANTIMONY, Eng.; ANTIMONII OXIDUM, L.). *Prep.* (B. P.) Take of solution of chloride of antimony, 16 fluid oz.; carbonate of soda, 6 oz.; water, 2 galls.; distilled water, a sufficiency. Pour the antimonial solution into the water, mix thoroughly, let the precipitate settle, remove the supernatant liquid by a siphon, add one gallon of distilled water, agitate well, let the precipitate subside, again withdraw the fluid, and repeat the processes of affusion of distilled water, agitation, and subsidence. Add now the carbonate of soda previously dissolved in two pints of distilled water, leave them in contact for half an hour, stirring frequently, collect the deposit on a calico filter, and wash with boiling distilled water until the washings cease to give a precipitate with a solution of nitrate of silver acidulated by nitric acid. Lastly, dry the product at a heat not exceeding 212° .

Char. & Tests. A greyish-white powder, fusible at a low red heat, insoluble in water, but readily dissolved by hydrochloric acid. The solution, dropped into distilled water, gives a white deposit, at once changed to orange by sulphuretted hydrogen. It dissolves entirely when boiled with an excess of the acid tartrate of potash.

Uses. Chiefly in making tartar emetic and some other salts of antimony; also in the preparation of *pulvis antimonialis*. Therapeutically, it is a diaphoretic and febrifuge.—*Dose.* 1 to 4 grains.

Antimony, Pentoxide of. See ANTIMONIC ANHYDRIDE.

Antimony, Tetroxide of. Sb_2O_4 or $\text{Sb}_2\text{O}_3 \cdot \text{Sb}_2\text{O}_5$. *Syn.* ANTIMONOSO-ANTIMONIC OXIDE, ANTIMONIOUS ACID. Found natural as *Cervantite* or *Antimony-ochre*. Prepared by heating antimonio anhydride, by roasting the trioxide or trisulphide, or by the action of excess of nitric acid on finely powdered metallic antimony. Thus prepared, it is a white solid, unalterable by heat; slightly soluble in water, more so in hydrochloric acid.

Antimony, Oxychloride of. SbOCl . *Syn.* POWDER OF ALGAROTH. Thrown down as a white precipitate when trichloride of antimony is poured into water. Continued washing with water, deprives it of nearly the whole of its chlorine, and converts it into the trioxide, a change which is more completely effected by aqueous solutions of the alkalis or their carbonates.

Antimony, Oxysulphide of. The compound $\text{Sb}_2\text{O}_3 \cdot 2\text{Sb}_2\text{S}_3$ occurs native as *red antimony*, *Antimony blende*, *Kermesome*, *Rothspiesglanzerz*, *Crocus of antimony*, *Glass of antimony*, and similar preparations, are believed by some authorities to be crude oxysulphides of antimony.

Antimony, Red. See OXYSULPHIDE OF ANTIMONY, before noticed.

Antimony, Regulus of. *Syn.* REGULUS

ANTIMO'NIU, L. Metallic antimony obtained by fusion. Alloys formed by fusing *antimony* with *iron*, *tin*, *lead*, or *copper*, and a little *tartar*, were respectively called *MARTIAL REGULUS OF ANTIMONY* (*r. antimo'ni martialis*, L.), *R. A. JOVIALIS* (L.), *R. A. SATURNINUS* (L.), *R. A. VENERIS* (L.), &c. (See below.)

Antimony, Ru'by of. *Syn. MEDICINAL (dŭs-)* *REGULUS OF ANTIMONY*; *ANTIMO'NI RUBINUS*, *REGULUS MEDICINALIS*, *R. A. M.*, &c., L. From *crude sulphide of antimony*, 5 parts; fused with *carbonate of potassa*, 1 part; and the purified portion separated from the scoriae. See *LIVER OF ANTIMONY*.

Antimony, Saffron of. See *CROCUS OF ANTIMONY*.

Antimony, Smelt'ed. *Syn. ANTIMO'NIUM PURIFICATUM*, L. *Crude antimony* melted and poured into small conical moulds.—*Uses, &c.* Same as the ordinary tersulphide.

Antimony, Snow of. See *FLOWERS OF ANTIMONY*.

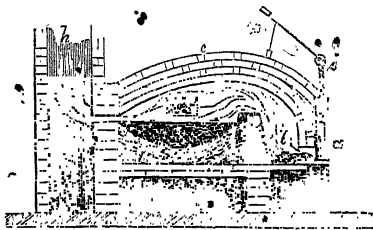

Antimony, Pentasulphide of (Sb_2S_5), is a yellowish red powder, obtained (1) by passing hydrosulphuric acid gas through a mixture of pentachloride of antimony, water, and tartaric acid; or (2) through antimonious anhydride suspended in water. It is insoluble in water; hot hydrochloric acid decomposes it, producing trichloride of antimony, sulphur, and hydrosulphuric acid. With the more basic metallic sulphides it unites to form a class of salts called *sulph-antimonates*.

Antimony, Trisulphide of. *Sb_2S_3*. *Syn. TERSULPHIDE OF ANTIMONY, SULPHIDE OF A., SULPHURET OF A., BLACK S. OF A., SESQUISULPHURET OF A., &c.; L'ANTIMOINE SULFURE, SULFURE D'ANTIMOINE, &c., Fr.; SCHWEFEL-SPIESSGLANZ, ANDERTHALB, &c., Ger.* This is the grey or greyish-black substance commonly known as *crude antimony*, *black antimony*, or *sulphide of antimony*, in commerce, and from which the other compounds of antimony are chiefly obtained.

Nat. hist., Sources, &c. See *ANTIMONY*.

The *crude ore* is freed from earthy impurities in the following manner.—The *crushed ore* is submitted to 'eliquation' in order to separate the *SULPHIDE* from the gangue or earthy matter with which it is contaminated; after which it is remelted and run into 'loaves' or large cakes, in which form it is sent to market. Formerly the operation was performed by introducing the *ore* into large pots or crucibles having a hole in the bottom; and which, after being *closely covered*, were set on a circle around a suitable furnace, by which they were heated. At the present time, the process is commonly conducted in a 'reverberatory furnace,' similar to that figured in the *engraving*.

Native trisulphide of antimony treated in this way and ground to powder constitutes the *BLACK ANTIMONY* (*ANTIMONIUM NIGRUM*), *R. P.*

(a.), (b.) Grate and fire-place.

(c.) Bridge.

(f.) Concave space for ore formed by a solid bed of clay and sand, and having a 'hole' near the bottom extending nearly horizontally through the wall of the furnace, to 'run off' the fused sulphide.

(g.) Door for introducing ore, and removing residuum.

(h.) Chimney.

(i.) Damper, chain, and lever.

Antimony, Trisulphide of (artificially prepared). Saturate an aqueous solution of tartar emetic with hydrosulphuric acid; an orange precipitate will be thrown down. This precipitate, when collected on a filter, washed, and dried, is the pure trisulphide.

Prop, &c. Native, is anhydrous, inodorous, insipid, opaque, brittle, easily pulverisable, and of a dark leaden-grey or steel colour; it has a striated crystalline texture, and breaks with a rough spicular fracture; is insoluble in both water and alcohol; soluble, with decomposition, in hot strong acids and alkaline solutions; melts at a red heat, and is partly dissipated in white fumes, leaving an impure grey-coloured oxide mixed with some undecomposed tersulphide (*ANTIMONY-ASH*). Its powder is black, of peculiar richness, and stains the fingers. Sp. gr. 4.6 to 4.62. The pure precipitated (amorphous) tersulphide is of orange colour; is darkened by a gentle heat, with loss of water; and at a higher temperature passes from the amorphous to the crystalline condition, at the same time that it assumes the colour and appearance of the native sulphide. It dissolves in hot hydrochloric acid, evolving hydrosulphuric acid, and producing a solution of trichloride of antimony.

For. The crude commercial sulphide frequently contains lead, iron, copper, and arsenic, and sometimes manganese. Its goodness is commonly estimated by its compactness and weight, the largeness and distinctness of the striae, and the volatility of its sulphide.

Uses, &c. Chiefly as a source of metallic antimony, and of the oxide in the preparation of other antimonials. Exhibited alone, it possesses little activity unless it meets with acid in the primæ viæ, when it occasionally acts with considerable violence both as an emetic and cathartic.—*Dose.* 10 to 30 grs., in powder; as an alterative and diaphoretic, in rheumatism, gout, scrofula and glandular affections, and in lepra, scabies, and some other skin diseases. It is a favourite alterative in *veterinary medicine*, particularly in skin diseases. Farriers

and grooms frequently mix a little of it with the food of horses to improve their coat and promote their condition. — *Dose*, for a horse, 1 to 4 drs., in fine powder, often combined with nitre and sulphur; for CATTLE, $\frac{1}{2}$ to 1 oz. or even 1½ oz.; DOGS, 5 or 6 to 20 or 30 grs.; HOGS, 20 to 30 grs., twice or thrice daily. According to Dr. Paris, it is one of the ingredients in *Spilsbury's Drops*. It is also an ingredient in *Tisane de Feltz*.

Antimony, Tartarated. $\text{KSbOC}_4\text{H}_4\text{O}_6$. Aq. *Syn.* TARTARIZED ANTIMONY, TARTAR EMETIC, EMETIC TARTAR, POTASSIO-TARTRATE OF ANTIMONY, Eng.; ANTIMONIUM TARTARATUM, B.P. *Prep.* Various methods have been devised for the preparation of this compound, but the following, which is taken from the 'British Pharmacopœia,' is to be preferred:—

Take of oxide of antimony 5 oz., acid tartrate of potash, in fine powder, 6 oz., distilled water, 2 pints. Mix the oxide of antimony and acid tartrate of potash with sufficient distilled water to form a paste, and set aside for 24 hours. Then add the remainder of the water, and boil for a quarter of an hour, stirring frequently. Filter, and set aside the clear filtrate to crystallise. Pour off the mother-liquor, evaporate to one third, and set aside, that more crystals may form. Dry the crystals on filtering paper at the temperature of the air.

Char. and Tests. In colourless transparent crystals exhibiting triangular facets, soluble in water, and less so in proof spirit. It decrepitates and blackens upon the application of heat. Its solution in water gives with hydrochloric acid a white precipitate, soluble in excess, and which is not formed if tartaric acid be previously added. Twenty grains dissolve without residue in a fluid ounce of distilled water at 60°, and the solution gives with sulphuretted hydrogen an orange precipitate which, when washed and dried at 212°, weighs 9·91 grains.

Phys. eff., Doses, &c. Externally, tartar emetic acts as a powerful local irritant, causing a pustular eruption, which permanently marks the skin; for this purpose it is used in the form of solution, ointment, or plaster. Internally, in small doses ($\frac{1}{12}$ to $\frac{1}{8}$, or even $\frac{1}{4}$ gr.), it acts as a diaphoretic and expectorant; in somewhat larger doses ($\frac{1}{2}$ to $\frac{1}{2}$ gr.), it excites nausea, and sometimes vomiting, occasioning depression and relaxation, especially of the muscular fibre; in larger doses (1 to 2 or 3 grs.), it acts as an emetic and sudorific (and often as a purge), depressing the nervous functions, and producing a feeling of feebleness, exhaustion, and relaxation, greater than that caused by other emetics; in certain doses ($\frac{1}{2}$ to 3, or even 4 grs.), it is used as a sedative and anti-phlogistic, to reduce the force of the circulation, &c.; in excessive doses, it acts as an irritant poison, and has in some instances caused death; and even small doses frequently administered, and long continued, have brought

on a state of weakness, prostration, and distaste for food, which has led to a fatal termination. It is usually exhibited dissolved in distilled water, either with or without the addition of a little simple syrup. In acute rheumatism, inflammation of the lungs or pleura, chorea, hydrocephalus, and apoplexy, it is said to have been given in doses of 2 to 4, or even 6 grs., with advantage, by Laennec, Rasori, and others; but these extreme doses are not always safe, and cannot be commendable where smaller ones ($\frac{1}{4}$ to $\frac{1}{2}$ gr., repeated every two hours) appear equally beneficial, and distress the patient less. In doses of $\frac{1}{2}$ gr. to $\frac{1}{2}$ gr. each, combined with calomel, it is a powerful and excellent alternative in acute rheumatism and many skin diseases. Of all our sudorifics it is, perhaps, the most valuable, and the one most generally available. Triturated with 16 to 20 times its weight of sulphate of potassa, it forms an excellent SUBSTITUTE for antimonial powder and James's powder, as a diaphoretic, in doses of 2 to 4 grs.

Whenever much gastric or intestinal irritation is present, tartar emetic should be avoided, or very cautiously administered, and then combined with an opiate, or some other sedative. It should also be given with caution to children; as, according to Messrs. Goodlad and Noble, even in small doses it sometimes acts as a poison on them.

In veterinary medicine, it is employed to promote diaphoresis and expectoration, and to reduce arterial action, particularly in fevers, and catarrhal affections, the dose for HORSES being 20 grs. to 1 dr., or even occasionally, 1½ dr., in gruel, thrice daily; also sometimes as a diuretic and vermifuge, in doses of 1 to 2 drs., combined with tin-filings, for 2 or 3 successive days, followed by a purge of aloes. The usual dose for CATTLE is 20 grs. to 1 dr.; SHEEP, 5 or 6 to 20 grs.; SWINE (chiefly as an emetic), 2 to 5 or 6 grs.; DOGS (chiefly as an emetic), 1 to 3 grs. It is sometimes, though seldom, used externally, as a counter-irritant, in chest affections, &c.; but its employment thus requires caution.

Pois., &c. That from large doses has been already noticed under ANTIMONY (which see). In poisoning, the treatment is the entire disuse of all antimonials, followed by tonics, a light nutritious diet, the use of lemon-juice or ripe fruit, a little wine, warm baths, and mild restoratives generally.

Antimony, Tartarised. See ANTIMONY, TARTARATED.

Antimony, Vitriified. See GLASS OF ANTIMONY.

ANTI-PHLOGISTIC (-flo-jis'-). *Syn.* ANTI-PHLOGISTIOUS, L.; ANTI-PHLOGISTIQUE, Fr.;

¹ "In consequence of the violent vomiting" (and it might be added—prostration), "which (even) 1 gr. has sometimes produced, I have found patients positively refuse to continue the use of the medicine." Pereira, "Th. & M. M.," 4th ed., i, 752.

ANTIPHLOGISTISCH, Ger. In *medicine*, the common epithet of remedies, agents, and treatment, (**ANTIPHLOGISTICS**; **ANTIPHLOGISTICA**, L.) which lessen inflammatory action, or allay the excited state of the system which accompanies it. Of these the principal are bleeding, purging, a low diet, cooling beverages (as water and acidulous drinks), and sedatives generally.

ANTISCORBUTIC (-skor-bū'-). *Syn.* **ANTISCORBUTICUS**, L.; **ANTISCORBUTIQUE**, Fr.; **ANTISCORBUTISCH**, **GUT WIDER DEN SCHARBOCK**, Ger. Good against scurvy. In *medicine*, an epithet of remedies, agents, &c., (**ANTISCORBUTICS**; **ANTISCORBUTICA**, L.) used in scurvy. *Lemon-juice, ripe fruit, milk, the salts of potassa, green vegetables, potatoes, meal-bread, fresh meat, and raw or lightly boiled eggs*, belong to this class.

ANTISEPTIC. *Syn.* **ANTISEPTICUS**, L.; **ANTISEPTIQUE**, Fr.; **ANTISEPTISCH**, **FÄULNISSWIRIG**, Ger. An epithet of substances, agents, &c., (**ANTISEPTICS**; **ANTISEPTICA**, L.) that impede, arrest, or prevent putrefaction. The principal antiseptics in common use are *culinary salt, saltpetre, spices, sugar, vinegar, carbolic acid, creasote, and alcohol*; to which may be added *intense cold, desiccation, and the exclusion of air*. Among **ANTISEPTIC MEDICINES**, *bark, dilute acids, quinine, wine, spirits, camphor, charcoal, and yeast*, take the first rank. See **PUTREFACTION**, **SOLUTIONS** (**Antiseptic**), &c.

ANTISPASMODIC (-spāz-). *Syn.* **ANTISPASTIC**; **ANTISPASMODICUS**, L.; **ANTISPASMODIQUE**, Fr.; **KRAMPFSTILLEND**, Ger. In *medicine*, an epithet of substances and agents (**ANTISPASMODICS**; **ANTISPASMODICA**, L.) which allay spasms and convulsions. It is frequently incorrectly applied to anodynes and narcotics, which soothe pain, but do not repress muscular spasm. *Ammonia, assafoetida, bark, camphor, castor, chalybeates, chloral hydrate, chloroform, ether, Indian hemp and cannabine, musk, opium, saffron, and valerian*, with many other similar substances, are regarded as antispasmodics.

ANTS (ānts). See **ANT**, **FORMIC ACID**, **GARDENING**, **INSECTS**, &c.

AORTA. [L., Ger.] *Syn.* **AORTE**, Fr. In *anatomy*, the main trunk of the arterial system, arising immediately from the left ventricle of the heart, and giving origin to all the other arteries of the body, except the pulmonary artery and its ramifications, which permeate the air-vesicles of the lungs.

APATITE (-tīte). In *mineralogy*, native tricalcium phosphate (phosphate of lime). It is found in Devonshire and Cornwall, and abundantly in Spain, whence it is imported for use as manure, and recently particularly for the manufacture of **ARTIFICIAL GUANO**. Its powder phosphoresces on burning coals. It differs from *phosphorite* in not containing fluorine.

Apatite (phosphate of lime of similar con-

stitution to bone-earth, $\text{Ca}_3(\text{PO}_4)_2$) is found in every fertile soil, and of which it is an essential ingredient.

APERIENT (ā-père'-ē-ēnt; -pēr'-, as marked by Mayne and Smart, though etym. correct, is less usual). *Syn.* **APERITIVE** (-tīv); **APERIENTS**, L.; **APÉRITIF**, Fr.; **ABFÜHREND, ÖFFNEND**, Ger. In *medicine*, opening, laxative, gently purgative; usually applied as an epithet to substances and agents (**APERIENTS**; **APERIENTIA**; **APÉRITIVA**, L.) which, in moderate doses, and under ordinary circumstances, gently, but completely, open the bowels; and in this respect rank between the simple laxatives on the one hand, and the stronger purgatives and cathartics on the other. Among these may be named as examples—*Aloes* (when combined with soap or aromatics), *Castile soap, castor oil, compound extract of colocynth* (in small doses), *compound rhubarb pill, confection of senna, cream of tartar, Epsom salts, Glauber's salt, phosphate of soda* (tasteless purgative salt), *pil. rufi, seidlitz powders, cold-water compress* over the abdomen, &c. Several of these, in larger doses, become active purgatives or cathartics. See **PURGATIVES**, **ISO DRAUGHTS**, **MIXTURES**, **PILLS**, &c.

APIOLE (-pe-ōle; or -ōl). *Prep.* The soft alcoholic extract of *parsley-seed* is either digested or agitated for some time with ether; after sufficient repose in a cool place, the ethereal solution is decanted, and the ether removed by distillation; the residuum is purified by solution in rectified spirit, and agitation first with a little litharge, and next with animal charcoal; after which the spirit is removed by distillation from the filtered solution.

Prop., &c. A yellow, oily, non-volatile liquid, having a peculiar smell, and a highly disagreeable taste; soluble in alcohol, ether, and chloroform; insoluble in water; and coloured red by strong sulphuric acid. Sp. gr. 1.078. In small doses it excites the pulse and nervous system; and in larger ones it causes headache, giddiness, vertigo, &c. It is said to be powerfully febrifuge, and has been highly extolled by MM. Joret and Homolle as a substitute for quinine in intermittents. It has also been found useful in intermittent neuralgias and the nocturnal sweats of phthisis.—*Dose.* 5 to 15 drops in capsules.

APIS. [L.] The bee. In *entomology*, a genus of hymenopterous insects of the family *anthophila* or *mellifera*, section *apid'ria*. (Latreille.) The *mouth* has two jaws, and a proboscis infolded in a double sheath; the wings are four; the two foremost covering the hinder ones when at rest. The sexes are three—*prolific females* or *queens, unprolific females* or *workers* (commonly termed *neuters*), and *males* or *drones*. The females and work-

¹ According to Drs. G. O. Rees and A. S. Taylor, 66 out of 116 cases were cured by it in their practice; but according to the French Commission, the cures are only 43%, and in many of these only temporary.

condition, constitute DEFECTIVE or DISEASED APPETITE.

Deficiency or loss of appetite (ANOREXY; ANOREXIA, L.) generally arises from disordered stomach; but is also frequently symptomatic of other affections, particularly dyspepsia, biliousness, feverishness, and organic diseases of the lungs, stomach, and primæ viæ. It is a common consequence of sedentary life, and of extreme mental anxiety, excitement, or exhaustion. The treatment will necessarily vary with the cause. In simple spontaneous cases, the appetite may generally be improved by out-door exercise, and the occasional use of mild aperients, especially salines and aloetics. When the affection arises from the stomach being loaded with bile and crudities, an emetic in the evening, followed by a stomachic purgative the next morning, with an occasional aperient afterwards, will seldom fail to effect a cure. With heavy drinkers, a gradual reduction of the quantity of the strong liquors usually consumed, is generally followed by a restoration of the appetite and digestive powers. The change thus gradually effected in the course of 8 or 10 days is often almost magical. The excessive use of liquors—especially of spirits, wine, or beer, or even of warm weak ones, as tea, coffee, soup, &c.—is always prejudicial. Hence drunkards are particularly subject to defective appetite; and teetotallers and water-drinkers to a heartiness often almost approaching voracity. See BILIOUSNESS, DYSPERPSIA, &c.

Depraved appetite (PICA, L.), or a desire for unnatural food, as chalk, cinders, dirt, soap, tallow, &c., when an idiopathic affection or depending on vicious tastes or habits (as is often the case in childhood), may be treated by admixing very small doses of tartar emetic or ipecacuanha with the objectionable food or articles. When symptomatic of pregnancy, a plentiful and nutritious diet, including the red meats, with a little good malt liquor or wine, may be adopted with advantage. When symptomatic of chlorosis, to this diet may be added, the use of chalybeate tonics, and sea or tepid bathing; when of dyspepsia, a light diet, bitter tonics, free exercise, fresh air, and cold bathing, will generally effect a cure.

Insatiable appetite (CANINE APPETITE, VORACITY; BULIMIA, L.) is generally symptomatic of pregnancy, or worms, or diseases of the stomach or the viscera immediately connected with it; but sometimes exists as a separate disease, and is even said to be occasionally hereditary. When it occurs in childhood, worms may be suspected, and vermifuges administered. In adults, a common cause is imperfect digestion, arising from stomach complaints or gluttony, when the languor and gnawing pains of disease are mistaken for hunger. In this case, the diet should be regulated and the bowels kept gently relaxed with mild aperients, and tonics (as bark and steel), or bitters (as orange-peel and gentian), may

be administered. When pregnancy or vicious habits are the cause, the treatment indicated under DEPRAVED APPETITE may be adopted. When the affection is occasioned by acidity in the stomach, an emetic, followed by the moderate use of absorbents or antacids, will generally effect a cure. In those cases depending on a highly increased power of the stomach in effecting rapid and complete digestion, its contractile force and morbid activity may be often allayed by the copious use of salad oil, fat meat, &c., by the cautious use of opiates, or by the use or, freer use, of tobacco (either smoked or chewed, or both). A cathartic daily, with a dose of blue-pill, or mercurial powder, every second or third day, is also often advantageous. 25 or 30 drops of solution of potassa, in broth, twice or thrice daily, has also been recommended. See BILIOUSNESS, DYSPERPSIA, WORMS, &c.

APPLE (Æp'l). *Syn.* MA'LUM, PO'MUM, L.; POMME, Fr.; APPEL, Ger.; APPEL, Dut.; APLE, Swed. This well-known fruit is the product of the cultivated varieties of *pyrus malus* (Linn.), or the *crab-apple* of our hedges; a tree of the nat. ord. Rosaceæ. The date of its amelioration from the wild state is probably very remote, as several kinds are noticed by Pliny in a manner that would lead to the inference of a high antiquity. Pippins, or 'seedling improved apples,' are said to have been introduced into this country from the South of Europe towards the end of the 16th century. Don enumerated 1400 varieties of the cultivated apple; there are now probably above 1650. *Renet apples* (PO'MA RENET'TIA) are those ordered in the P. Cod. to be used in pharmacy. In botany and composition, the term *apple* (POMUM) is used to designate any large, round, fleshy fruit, consisting of a 'pericarp,' enclosing a tough 'capsule' containing several seeds; as *love-apple*, *pine-apple*, &c.

The wood of the apple-tree is much used in turnery; that of the crab-tree is generally preferred by mill-wrights for the teeth of mortise-wheels.

The expressed juice of 1 cwt. of ripe apples, after the free acid has been saturated with chalk, yields from 11 to 13 lbs. of a very sweet, but uncrystallisable sugar.

Love-apple. The tomato.

Mad-apple. The larger *Mecca* or *Bus-sorah gail*. They are also called DEAD-SEA APPLES, A. OF SODOM, &c. See GALLS.

Acid of Apples. Malic acid.

APRICOT. *Syn.* A'PRICOCT; ARMENI'ACUM MA'LUM, PRÆCOTIUM, L.; ABRICOT, Fr.; APRIKOSE, Ger. The fruit of *armeni'aca vulg'd'ris* (Lamb.; *prunus armeniaca*, Linn.), a rosaceous tree indigenous in Armenia, Cachmere, &c., and now cultivated in every temperate region of the world. Under the name of *præcor*, it was known in Italy in the time of Dioscorides; but it was not introduced into England until the reign of Henry VIII (A.D. 1540). Its cultivation has since been zealously attended

to by our gardeners, and it is now one of the choicest and most esteemed of our wall-fruits, and is particularly valued for desserts. It is reputed to be nutritious, easy of digestion, laxative, and stomachic. The seeds are bitter and saponaceous.

Apricots are principally eaten as gathered; but are also dried, candied, and made into jam. In confectionery, the Brussels and Breda varieties are preferred to the larger and sweeter kinds. See FRUIT, PRESERVES, &c.

Briançon' Apricots. The fruit of *armeniaca brigantiaea* (Pers.). Acidulous; seeds or kernels, by expression, yield HUILE DE MARMOTE.

A'QUA (-kwä). [L.] Water.—AQUA DESTILLATA or A. DISTILLATA, is distilled water; A. FLUVIALIS or A. EX FLU'MINE (-in-e), river-water; A. FONTANA, spring-water; A. MARI'NA or A. MA'RIS, sea-water; A. MINERALIS, mineral water; A. NIVALIS or D. EX NI'VE, snow-water; A. FLUVIALIS, A. FLU'VIA, or A. IM'BRIUM, rain-water, soft water; A. PUTEANA or A. EX PU'TEO, well, pump, or hard water.

Aqua. In chemistry and pharmacy, this word was formerly applied to numerous preparations and articles now included under other heads. See EAUX, ESPIRITS, HAIR-DYES, LIQUORS, SOLUTIONS, WATERS, &c.

Aquafor'tis. [L.] Literally, 'strong water,' the name given by the alchemists to the acid obtained by distilling a mixture of nitre and sulphate of iron. The word is still commonly employed by mechanics and artists to designate the impure fuming nitric acid of commerce, and is thus also retained in trade. By these parties, concentrated nitric acid is called 'spirit of nitre.' 'Double aquafortis' merely differs from the other in strength. See NITRIC ACID.

Aqua Græ'ca, A. Orienta'lis. See HAIR-DYES and PATENT MEDICINES.

Aqua Mari'na. [L.] The beryl.

Aqua Mirab'ilis†. [L.] Literally, 'wonderful water,' a cordial and carminative spirit distilled from aromatics, and formerly reputed to possess many virtues.

Aqua Re'gia. [L.] Nitrohydrochloric acid, originally so called, by the alchemists, from its power of dissolving gold.

Aqua Toffa'nia. [L.] See AQUETTA.

Aqua Vi'tæ†. [L.] Literally, 'water of life,' a name familiarly applied to the leading native distilled spirit. Thus, it is whiskey in Scotland, usquebaugh in Ireland, geneva in Holland, and eau de vie or brandy in France. When the term is employed in England, French brandy is understood to be referred to. See ALCOHOL, &c.

AQUATINT'A. [L., Fr.] Syn. A'QUATINT, Eng.; ACQUATINTA, It. A species of etching on copper, producing an effect resembling a drawing in Indian ink.

A'QUEOUS (-kwe-). Syn. AQUOSUS*; A'QUEUS, AQUOSUS, L.; AQUEUX, Fr.; WÄSSERIG,

WÄSSERHALTIG, Ger. Watery; made with, containing, or resembling water. In chemistry and pharmacy, applied to solutions, extracts, &c., prepared with water.

AQUETTA. [It., little water.] Syn. A'QUA TOFFANA, A. TOFFANA, L.; AQUETTA DI NAPOLI, ACQUA DELLA TOFFANA, It. A celebrated poison prepared by an Italian woman named Toffano or Tophano, and employed by the Romans about the middle of the 17th century. The composition of this poison has been a matter of frequent controversy. Pope Alexander VII, in his proclamation, described it as "aquafortis distilled into arsenic." This would produce a concentrated solution of arsenic acid. The emperor Charles VI, who was governor of Naples during Toffano's trial, declared to his physician Garelli, that it was arsenic (arsenious acid) dissolved in aqua cymbalaria. According to Gerarde, this cymbalaria was an aquatic species of pennywort, highly poisonous. The only objection to the latter statement is the smallness of the dose, regard being had to the comparative insolubility of arsenious acid; but if the woman Toffano prepared two poisons, as is probable from history—one, a single dose of which was fatal; and another, of which the dose required repetition, and which was more gradual in its action,—the discrepancy will be at once removed.

AR'ABESQUE (-bèsk). [Fr.] In the Arabian manner; more particularly applied to a species of capricious, fantastic, and imaginative ornamentation, consisting of foliage, stalks, plants, &c., to the entire exclusion of the figures of animals. The designs of this class, now so much employed in cloth and leather binding, are produced by the pressure of hot plates or rollers having the pattern engraved on them. See MORESQUE.

AR'ABIN (-bin). C₁₂H₂₂O₁₁. [Eng., Fr.] Syn. SOLUBLE GUM; ARABI'NA, L. The pure soluble principle of gum acacia.

Prép. Dissolve white gum arabic in pure water, filter the solution, and add alcohol as long as it produces cloudiness; collect the precipitated matter, and dry it by a gentle heat.

Prop., &c. Very soluble in water; basic acetate of lead, alcohol, and ether, precipitate it from its solutions. It is isomeric with crystallised cane sugar. It possesses no practical superiority over the best gum arabic, except its paler colour.

AR'ABLE (-äbl). Syn. ARABILIS, L.; ARABILE, LABOURABLE, Fr.; PFLUGBAR, Ger. In agriculture, fit for or under tillage or aration; ploughed.

Arable Land. In agriculture, land which is chiefly or wholly cultivated by the plough, as distinguished from grass-land, wood-land, common pasture, and waste. See LAND, SOILS, &c.

ARACHIS HYPOGÆA. Syn. GROUND NUT PLANT. Hab. Cultivated throughout the tropics of the Old and New World. Official part. The oil of the seeds (*Oleum Arachis, Ground Nut Oil*). Obtained by expression. Limpid, clear,

light yellow, almost inodorous, or with a faint smell, and bland taste. ♀Sp. gr. 0.916.—*Prop. and Uses.* This oil affords a cheap and excellent substitute for olive oil for pharmaceutical and other purposes.

ARATION*. In *agriculture*, ploughing; culture by ploughing; tillage. Lands in a 'state of aration' are those under tillage.

ARBOR. [L.] A tree. The *seventh* family of vegetables in Linnaeus's system. In *anatomy* and *chemistry*, a term formerly applied to membranes and substances having some real or fancied resemblance to a tree or vegetation. An *arborist* is a little tree; an *arborist*, or *arborator*, is one who studies or cultivates trees.

ARCA'NUM. [L.] *Syn.* ARCANUM, Fr.; GEHEIMNIS, Ger. A secret. In *alchemy*, a term applied to various preparations without any precise meaning. "Arcanum is a thing secret, incorporeal, and immortal, which can only be known to man by experience; for it is the *virtue* of each thing, which operates a thousand times more than the thing itself." (Ruland.) in *ancient medicine* and *pharmacy*, a nostrum. The word is still occasionally used in the plural (ARCA'NA, secrets, mysteries,) in the titles of books; as, 'Arcana of Chemistry,' a book professing to contain a full exposition of the mysteries of that art.

Among the *old chemists*, ARCANUM ALBUM was 'pulvis Viennensis albus virgineus' (see POWDERS); A. BECCICUM, a sweetened aqueous solution of liver of sulphur; A. CORALLINUM, *nitric-oxide of mercury* that had been digested in a solution of potash, washed with water, and then had spirit of wine burnt on it (once a favourite mercurial and escharotic); A. DUPLICATUM, sulphate of potash; A. D. CATHARTICUM, roots of *colchicum* and *plantain* (worn as an amulet against fevers and pestilential diseases); A. LUDEMANNI, oxide of zinc; A. TARTARI, acetate of potassa; A. VITÆ, elixir vitæ; &c.

ARCHE'US (-kē'-ūs; ār*—Mayne). [L.] *Syn.* ARCHE'US, L. A term invented by Paracelsus, and employed by the alchemists and other physicians, to imply the occult cause of phenomena, as well as the sub-causes or agents by which the effects were accomplished. Van Helmont and Stahl ascribe certain vital functions to the influence and superintendence of a 'spiritus archæus' or intelligent vital principle. According to others, the powers of 'Archæus' were indefinitely extended. He or it was an occult power of nature, the artificer of all things, physician-general to the universe, &c. &c., to the utmost bounds of absurdity and confusion.

From this word comes the *adj.* ARCHE'AL or ARCHE'AL, hidden, operative.

ARCH'IL (artsh'-il). *Syn.* ARCH'EL*, ORCHIL; ARCHIL'LA, ORCHIL'LA* (ch as k), L.; ORSEILLE, Fr., Ger.; ORICELLO, It. A violet-red, purple, or blue colouring matter or dye-stuff, obtained from several species of lich-

ens, but of the finest quality from *roccella tinctoria* (DC.), and next from *r. fuciformis* (DC.).

The *archil* of commerce is met with as a liquid paste, or as a thin liquid dye or stain of more or less intensity. The ordinary *archil* or *orchil* of the shops (ORCHIL-liquor) is under the last form; and is known as either BLUE OR RED ARCHIL—distinctions which arise as follows:—

Prep. 1. BLUE ARCHIL:—The bruised or coarsely ground lichen is steeped for some time in a mixture of stale urine, or bone-spirit, and lime or milk of lime, or in any similar ammoniacal solution, contained in covered wooden vessels in the cold; the process being repeated until all the colour is extracted.

2. RED or CRIMSON ARCHIL:—The materials are the same as for the last variety, but rather less milk of lime is used, and the 'steep' is generally made in earthen jars placed in a room heated by steam, technically called a stove. The two kinds merely differ in the degree of their red or violet tint—the addition of a small quantity of lime or alkali to the one, or of an acid to the other, immediately bringing them both to the same shade of colour.

Prop. Archil has a disagreeable putrid ammoniacal odour. Its colouring matter is soluble in water, alcohol, urine, ammoniacal and alkaline lyes, and weak acid liquors; alkalies turn it blue, acids red; alum gives with it a brownish-red precipitate, and solution of tin a red one; the alcoholic solution gradually loses its colour when excluded from the air. Its colouring matter consists chiefly of orcein.

Pur. Archil is frequently adulterated with extract of logwood, or of Lima or Sapan-wood. It may be tested as follows:—1. A solution of 50 or 60 drops of pure archil in about 3 fl. oz. of water slightly acidulated with acetic acid, almost entirely loses its colour, or presents only a yellowish tinge, when heated to ebullition in a flask along with 50 drops of a fresh solution of protochloride of tin made with 1 part of the salt to 2 parts of water:—2. A drop of fluid extract of logwood treated in the same way, gives a distinct violet tint, which resists several hours' boiling; but when only 3 or 4 per cent. of logwood is present, the boiled liquid has a permanent grey tint:—3. If the boiled liquid retains its red hue, extract of Sapan-wood is present:—4. The boiled liquor, when the archil is pure, re-acquires its colour by exposure to the air, and the addition of an alkali, particularly ammonia; whilst the colour produced by logwood is destroyed only by an alkaline solution of tin, and is restored by acids.

Uses, &c. It is employed to tinge the spirit used to fill the tubes of thermometers, and to stain paper, wood, &c. The aqueous solution stains MARBLE, in the cold, of a beautiful violet colour, of considerable permanence when not exposed to a vivid light. "Marble thus tinged

preserves its colour unchanged at the end of two years." (Dufay.) Its principal use is, however, in dyeing. By proper management it may be made to produce every shade of pink and crimson to blue and purple. Unfortunately, although the hues it imparts to silk and wool possess an exquisite bloom or lustre, they are far from permanent, and unless well managed, soon decay. It is hence generally employed in combination with other dye-stuffs, or as a finishing bath to impart a bloom to silk or woollens already dyed of permanent colours. In using it as a dye, it is added to hot water in the required quantity, and the bath being raised to nearly the boiling-point, the materials are put in and passed through it, until the desired shade is produced. A mordant of alum and tartar is sometimes used, but does not add to the permanence of the colour. Solution of tin, added to the bath, increases the durability, but turns the colour more on the scarlet. (Hellot.) Milk of lime or salt of tartar is added to darken it; acids or solution of tin to redden it. A beautiful crimson-red is obtained by first passing the stuff through a mordant of tin and tartar, and then through a bath of archil mixed with a very little solution of tin. By the proper management of this dye, lilacs, violets, mallows, rosemary-flower, soupes au vin, agates, and many other shades, may be produced on silk or cloth, either alone or in conjunction with other dyes to modify it. $\frac{1}{2}$ lb. of solid archil, or its equivalent in a liquid form, will dye 1 to 2 lbs. of cloth. HERB-ARCHIL, it is asserted, will bear boiling, and gives a more durable tint than the other lichens, especially with solution of tin. (Hellot.) Recently Mr. Lightfoot has patented a process for dyeing with archil with the aid of oil, after the manner followed for producing Turkey-red on cottons.

Archil, Factitious:—1. From a mixture of onions (in a state of incipient putrefaction) with about 1-10th to 1-12th their weight of carbonate of potash and some ammonia, fermented together; and adding, after some days, 1-7th to 1-8th of the weight of the potash used in a salt of lead. The details of the process essential to success are, however, now unknown, the secret having died with a relative of the writer of this article.

2. Extract of logwood dissolved in juice of elderberries and putrid urine, with the addition

of a little *pearlash* for the BLUE, and a very little *oxalic acid* or oil of vitriol, for the RED variety. Used to stain wood.

Arch'il, Herb. *Roccella tinctoria*. See **ARCHIL** (above), **LICHENS**, & **MOSSSES**.

ARE'CA. [L.] In *botany*, a genus of East Indian trees, of the *nat. ord.* *Palmae* (DC.).

Areca Catechu. [L.; Linn.] *Syn.* **ARE'CA**, **A. INDICA**, **A. FAUFEL**, **BETEL-NUT TREE**. *Hab.* East Indies. *Fruit* (BETEL-NUT), astringent and narcotic; *bark of fruit* (PENANG or PINANG), sialagogue and stomachic; both are used as masticatories; wood and nut yield an inferior or bastard sort of catechu; charcoal of the nut highly esteemed as tooth-powder.

Areca Globulifera. [L.] Properties similar to the last.

Areca Olera'cea. [L.; Willd.] Cabbage-palm.

ARENA'CEOUS (är-e-). *Syn.* **ARENA'CEUS**, L.; **ARÉNAÇÉ**, **SABLONNEUX**, Fr.; **SANDIG**, **SANDARTIG**, Ger. In *agriculture*, *mineralogy*, &c., sandy; resembling sand; friable.

ARENA'RIOUS (-näre'). *Syn.* **ARENA'RIUS**, L.; **ARÉNAIRE**, Fr. Sandy, arenaceous. In *agriculture* and *botany*, applied to soils (ARENARIOUS SOILS) in which sand is the prevailing and characteristic ingredient; also to plants that grow in sandy or arid soils.

ARENATION. *Syn.* **SABUERA'TION**; **ARENAT'IO**, L.; **ARÉNATION**, Fr.; **SANDBAD**, Ger. In *medicine*, sand-bathing; a practice formerly prevalent, in dropsy, of applying hot sand, either by immersion or otherwise, to the feet, legs, or even the whole body.

ARENOSÉ (är-e-nöse'). *Syn.* **ARÉNOUS***; **ARENOSUS**, L.; **ARÉNEUX**, Fr. Sandy; arenaceous (which see).

AREOMETER (ä-re- or är-re-; äre-e—Smart). *Syn.* **AREOMÈTREUM**, L.; **ARÉOMÈTRE**, Fr. Literally, a 'measure of lightness' or 'rarity,' originally applied to any instrument for determining the *specific gravity* of alcoholic and ethereal liquids; but since applied, like the word 'hydrometer,' to instruments adjusted to the densities of all liquids. In this country, the term is principally confined to the *aréomètres* of Baumé, on account of their general use by Continental chemists. The relations and equivalents of Baumé's scales, as now adopted in France, are shown in the first two of the following *Tables*.—

I.—Corresponding DEGREES of BAUMÉ'S AREOMETERS and REAL SPECIFIC GRAVITIES:—

1. *Areometer for liquids LIGHTER than WATER, or Pèse-espéril.*¹

¹ These instruments were originally adjusted at the temperature of 12½° Cent., or 54½° Fahr. Those now made in France are adjusted at 15° C., or 59° F.; and those made in England, at either 59° or (more usually) 60° Fahr. The standard temperature of the instrument must be known for its correct application.

AREOM'ETRY. *Syn.* AREOM'ETRIA, L.; ARÉOMÉTRIE, Fr. The art or operation of ascertaining the *specific gravity* of liquids, and hence also their strength or commercial value; hydrometry. See AREOMETER (*above*), HYDROMETRY, SPECIFIC GRAVITY, &c.

ARE (är; äre—Eng.). [Fr.] See MEASURES.

ARGENTINE (-in). *Syn.* ARGENT'NUS, L.; ARGENTIN, Fr.; SILBERFARBEN, &c., Ger. Silver-like; pertaining to, resembling, or sounding like silver; argental.

Ar'gentine (-tîn). [Eng., Fr.] German silver*. In *mineralogy*, nacreous carbonate of lime, from its whiteness and silvery lustre.

ARGENTUM. [L.] Silver. In *old chemistry and pharmacy*, ARGENTUM FUGIT'VUM†, A. MO'BILE† (-ile), was quicksilver; A. MOR'TUUM†, dead silver, grain-s.; A. MUSI'VUM†, mosaic s., silver-bronze; A. NITRA'TUM†, lunar caustic; A. VI'VUM†, quicksilver; A. ZOÖTIN'ICUM†, cyanide of silver; &c.

ARGIL† (jil). *Syn.* ARGIL'LA, L.; ARGILE, Fr. Clay or potter's earth.

ARGILLA'CEOUS (-jil-). *Syn.* ARGILLA'CEUS, L.; ARGILLEUX, Fr.; THONIG, THONARTIG, Ger. Clayey; pertaining to, containing, or of the nature of clay or argil. In *agriculture*, an epithet of soils (ARGILLACEOUS SOILS) of which clay is the principal or characteristic ingredient.

Argil'lo-arena'ceous (-jil-). In *agr.*, consisting chiefly of clay and sand.

Argil'lo-calca'reous. In *agr.*, consisting chiefly of clay and chalk.

ARGOL. *Syn.* ARGAL*; TAR'TARUS CRU'DUS, L.; TARTRE BRUT, Fr.; WEINSTEIN, Ger. Crude bitartrate of potash, as deposited by wine. That from red wine is RED ARGOL; that from white wine, WHITE ARGOL. See TARTAR.

ARM'ATURE (-ä-türe). *Syn.* ARMATU'R, L. In *magnetism*, a piece of soft iron used to connect the poles of a horseshoe magnet, for the purpose of preventing loss of power.

ARNICA. [L., Fr., Eng.] *Syn.* ARNIQUE, Fr.; ARNIKA, WOLVERLEI, Ger. In *botany*, a genus of plants, of the *nat. ord.* Compositæ (DC.). In the Ph. U. S., *arnica montana* (see *below*).

Arnica Monta'na. [L.; Linn.] *Syn.* ARNICA, MOUNTAIN A., M. TOBAC'CO, GERMAN LEOP'ARD'S BANE; PANACE'A LARSO'RUM*, L. ARNIQUE, A. DES MONTAGNES, TABAC DES SAVOYARDS et DES VOSGES, Fr.; ARNIKA, FALKRAUT, &c., Ger. *Hab.* Meadows of the cooler parts of Europe, North America, and Siberia. It is now cultivated in our gardens. *Flowers* (ARNICA, Ph. U. S., Castr. Ruth., and Bor.) and *leaves*, diaphoretic, diuretic, stimulant, and narcotic; in large doses, emetic and purgative; *root*, discutient; whole *herb*, diaphoretic, stimulant, and nervine.

Prop., &c. Arnica acts as an energetic stimulant on the cerebro-spinal system, and as an irritant on the stomach and bowels.

¹ The standard temperature of the instrument is here 124° Cent., or 544° Fahr.

It is much employed on the Continent, and is given in a great variety of diseases—amaurosis, chlorosis, convulsions, diarrhoea, dysentery, gout, paralysis, rheumatism, &c. It is much used in Germany, instead of bark, in intermittents, putrid fevers, and gangrene. In France it is commonly employed as an excitant in paralysis. It has been greatly extolled as a restorative, and in bruises and injuries from falls. The Savoyards and inhabitants of the Vosges both smoke and 'snuff' the leaves. In England it is little used except by homœopaths. It is said that no animal but the goat will eat this plant. (Thomson.) Its noxious properties chiefly depend on the presence of cytisine.—*Dose.* Flowers, 5 to 10 grs., in powder, with syrup or honey; root, 10 to 20 grs. It is most conveniently administered under the form of infusion or tincture. Severe abdominal pains and vertigo, and even tetanus and death, have followed excessive doses.

Obs. According to Dupuytren, the emetic action of *infusion of arnica* depends on minute particles of the down of the plant which remain suspended in it, and which may be removed by filtration. See INFUSIONS, TINCTURES, &c.

ARNICINE (seen). This name has been applied to two substances—the one discovered by Pfaff; the other, by Bastick:—

Arnicine (of Pfaff). The resinous matter extracted by alcohol from the *roots and flowers* of mountain *arnica*, and in which their acidity appears to reside.

Arnicine (of Bastick). *Syn.* ARNICI'NA, ARNICI'A (-nish'-y'ä), L. *Prep.* 1. (Bastick.) From the *flowers*, by a similar process to that by which he obtains lobelina.—2. From the *flowers* (or *root*), as directed under ARIGNA.

Prop., &c. Bitter; acid; crystallisable; scarcely soluble in water; soluble in alcohol and ether; forms salts with the acids, the hydrochlorate, and one or two others, being crystallisable. Its physiological properties and dose have not as yet been accurately determined.

ARNATT'O, Arnott'o. See ANNOTTA.

ARO'MA. • [L.] *Syn.* AROME, Fr.; AROM, GERTCHSTOFF, Ger. The characteristic odour of substances, particularly the peculiar quality of plants, and of substances derived from them, which constitutes their fragrance.

AROMA'TA. [L.] See AROMATIC.

AROMATIC. *Syn.* AROMAT'ICUS, L.; AROMATIQUE, Fr.; GEWÜRZHAF, Ger. Fragrant; odoriferous; spicy; applied chiefly to plants and their products (AROMATICS, A. PLANTS; AROMAT'A, AROMATICA, L.; AROMATIQUES, ÉPICES, Fr.; GEWURZ, Ger.) characterised by their spicy odour or aroma, and warm pungent flavour, and of which *allspice, cinnamon, cloves, lavender, pepper, rosemary, sage, &c.*, are well-known examples. They are all stimulant, carminative, and antiseptic; and from remote antiquity have been regarded as prophylactic and disinfectant.

Aromatic. In *medicine, pharmacy, perfumery, &c.*, applied to substances, simple or compound, characterised by an agreeable odour or carminative properties, or both; as *aromatic confection, a. pastilles, a. vinegar, a. bark* (CORTEX AROMATICUS, white cannella), &c.

ARQUEBUSADE' (ar-ke-bûs-zâde'). [Fr.] *Primarily*, the shot of an arquebus; but afterwards applied to an aromatic spirit (EAU D'ARQUEBUSADE, Fr.), originally employed as an application to gunshot (arquebuse) wounds.

AR'RAK (arrack'—Brande). [Ind.] *Syn.* ARAC, ABACK, RACK; PALM-SPIRIT; ABAC'CA, SPIRITUS PALMÆ, S. SUC'CI P., S. OBYZE*, L.; ABACK, Fr.; ARAK, Ger. A spirituous liquor imported from the East Indies. The finer qualities are distilled from the fermented juice (*toddy, palm-wine*) of the cocoa-nut tree, palmyra tree, and other palms; and the other kinds, from the infusion of unhusked rice (*rice-beer*), fermented with cocoa-nut or palm-juice, either with or without the addition of coarse sugar or jaggery.

Prop., &c. It is colourless or nearly so, but like other spirit, when long kept in wood gradually acquires a slight tinge, similar to that of ~~the~~ Hollands. The best kinds, when of sufficient age, are pleasant flavoured, and are probably as wholesome as the other spirits of commerce; but common arrack has a strong and somewhat nauseous flavour and odour, depending on the presence of volatile oil derived from the rice, and corresponding to that of corn-spirit. The inferior qualities are hence more heating and apt to disagree with the stomach than the other commercial spirits. In this country it is chiefly used to make punch. When sliced pine-apples are put into good arrack, and the spirit kept for some time, it mellows down and acquires a most delicious flavour, and is thought by many to be then unrivalled for making 'nectarial punch' or 'rack-punch.'

Obs. Batavian arrack is most esteemed; then that of Madras; and next that of China. Others are regarded as inferior. The common *puriah-arrack* is generally narcotic, very intoxicating, and unwholesome; being commonly prepared from coarse jaggery, *spoilt toddy, refuse rice, &c.*, and rendered more intoxicating by the addition of *hemp-leaves, poppy-heads, juice of Aramonim*, and other deleterious substances.

Arrack, Factitious. *Syn.* MOCK AR'RAK, BRIT'ISH A.; VAUXHALL' NECTAR; &c. *Prep.* Good old Jamaica rum (uncoloured), rectified spirit (54 to 56 o. p.; clean flavoured), and water, of each, 1 quart; flowers of benzoin, 1 dr.; sliced pine-apple, $\frac{1}{2}$ oz. (or essence of pine-apple, $\frac{1}{2}$ teaspoonful); digest, with occasional agitation, for a fortnight; then add of skimmed milk, 1 wine-glassful; agitate well for 15 minutes, and in a few days decant the clear portion.

AR'ROW-ROOT. The common name of *maranta arundinacea* (Linn.; *m. Indi-ca*—

Tüss.); a plant of the *nat. ord.* Marantaceæ (Lindl.; Cannaceæ—Endl.). It was originally brought from the island of Dominica to Barbadoes, by Col. James Walker. It has since been extensively cultivated in the West Indies.

Tubers, yield true ARROW-ROOT; when fresh and good they contain about 26% of starch, of which 23% may be obtained as arrow-root, and the rest by boiling.

Arrow-root. *Syn.* MARANT'A, AM'YLU M. MARANTÆ, FÆCULA M., L.; RACINE FLÉCHÈRE, PIVOT, Fr.; PREILWURZ, P.-SATZMEHL, Ger. The starch or fecula obtained from the rhizoma or tubers of *maranta arundinacea* (Linn.; see above), and which forms the true 'arrow-root' of commerce.

Prep. The fecula is extracted from the tubers when they are about 10 or 12 months old, by a process similar to that by which the farina is obtained from potatoes. In Bermuda the tubers, after being washed, are deprived of their paper-like scales and every discoloured and defective part by hand; they are then again washed and drained, and next subjected to the action of a wheel-rasp, the starch being washed from the comminuted tubers with rain-water; the milky liquid is passed through a hair sieve, or a coarse cloth, and allowed to deposit its fecula. This is then allowed to drain, after which it is again carefully washed with clean water, again drained, and after being thoroughly dried in the air or sun, is at once packed for market. (Cogswell.) In St. Vincent (on the Hopewell estate), a cylindrical crushing-mill, tinned-copper washing machines, and German-silver palettes and shovels, are employed; whilst the drying is effected in extensive sheds, under white gauze, to exclude insects. In Jamaica, the washed tubes are generally pulped in deep wooden mortars; machinery being seldom employed in any part of the process.

Prop., &c. A light, dull, dead-white, tasteless, inodorous powder or small pulverulent masses, feeling firm to the fingers, and crackling when pressed or rubbed; viewed by a pocket lens it appears to consist of glistening particles, which are shown by a microscope to be convex, irregular, ovoid or truncated granules, most of them, according to Mr. Jackson, being .0010 of an inch in length, and .0008 of an inch in breadth; mixed with others varying from about double to only half that size. In its action with boiling water, and its general properties, it resembles the other starches; than which, however, it is freer from any peculiar taste and flavour; and thus agrees better with the delicate stomachs of invalids and infants than the ordinary farinas.

Comp. Similar to that of the other starches.

Pur. A large portion of the arrow-root of the shops consists either wholly or in part of the fecula or farina of potatoes, or is more or less mixed with sago-meal or rice-meal: such materials can be readily detected by the microscope. Potato starch is known in commerce as

'FARINA' or 'BRITISH ARROW-ROOT,' or simply 'arrow-root;' whereas, genuine arrow-root is always described as '*Bermuda*,' '*St. Vincent*,' '*St. Kitts*,' or, at least, as '*West Indian arrow-root*.' The substitution of the inferior farinas for genuine arrow-root is not only fraudulent on account of their inferior value, but is reprehensible in a hygienic point of view; as some of them are offensive to a delicate stomach, and exert of themselves, and still more when carelessly manufactured, a laxative action on the bowels; whereas the effect of true arrow-root is that of a slight and soothing tonic.

Uses, &c. As an agreeable, non-irritable article of diet for invalids and children, in the form of cakes, biscuits or puddings, or boiled with milk or water and flavoured with sugar, spices, lemon-juice, or wine, at pleasure. For young children a little caraway or cinnamon water is to be preferred. It is especially useful in irritation or debility of the stomach, bowels, or urinary organs, and in all cases in which a demulcent or emollient is indicated. It must not, however, be employed to the entire exclusion of other food, as, being destitute of the nitrogenous elements of nutrition, it is incapable alone of supporting life. *Arrow-root jelly* is prepared by first rubbing the powder up with a very small quantity of cold water, and then gradually adding the remainder boiling, stirring well all the time. Beef tea, veal broth, or milk, may be used instead of water. Some persons boil it for a few minutes. This jelly, flavoured with a little genuine port wine and nutmeg, is almost a specific in cases of simple diarrhoea arising from habit or debility.

Obs. Arrow-root is imported in tins, barrels, and boxes, from all the West-India Islands; and from Calcutta and Sierra Leone. The best quality was, until recently, solely obtained from Bermuda; but of late equally fine samples have been produced on the Hopewell Estate, St. Vincent, and, according to Dr. Ure, with the advantage of being prepared with the purest spring water, in profusion, instead of rain water.

In commerce, the word 'arrow-root' is now often loosely used as a generic term to indicate any white, tasteless, and edible starch or fecula.

Arrow-root, Brazil'ian. Cassava-starch or tapioca-meal.

Arrow-root, East Indian. *Curcuma starch*; from the tubers of the *curcuma angustifolia*, or narrow-leaved turmeric. The *maranta arundinacea* is now also extensively cultivated in India under the name of *maranta Indica*, and the fecula therefrom extensively exported, which might, with equal propriety, be called East Indian arrow-root; but this is not the case in commerce, the whole passing as W. I. arrow-root irrespective of the place of its production.

Arrow-root, English. Potato-starch.

Arrow-root, Portland. From the underground tubers of *arum maculatum* (Linn.) or *wake-robin*.

Arrow-root, Tahiti. Tacca starch or Ota-hite salep; from the tubers of *tacca oceanica*.

ARSENIATE. *Syn.* AR'SENATE; ARSENIAS, AR'SENAS, L.; ARSÉNIATE, Fr.; ARSENIKSAURE, SALZE, Ger. A salt consisting of AsO₄ and a metal or other basic radical; e.g., ammonio-magnesium arseniate, NH₄MgAsO₄.

ARSENIC (-se-nik). *As.* *Syn.* ARSENITUM; ARSEN'ICUM, ARSENIUM, L.; ARSENIK, A-METALL, Ger. ARSENICO, Sp., It. The brittle, grey-coloured metal, or metalloid, which forms the base of the white arsenic and orpiment of commerce. Discovered by Geber in the eighth century, but first accurately described by Brandt (A.D. 1773). The poisonous properties of arsenious acid were not generally known for some centuries after its discovery. As a medicine it was first employed in intermittents in Hungary.

Sources. Arsenic is peculiar to the mineral kingdom. The metallic arsenic of commerce is obtained by roasting arsenical pyrites (MISPICKEL), in earthen tubes, or in tubular earthen retorts; the arsenic sublimes, and sulphuret of iron remains behind. On the small scale it is prepared by sublimation from a mixture of arsenious acid and charcoal or black flux. Combined with oxygen it frequently exists in mineral waters; and, in a larger quantity, in certain rivulets and streams.

Prep. A mixture of arsenious acid, 1 part; and black flux, 2 or 3 parts; is exposed to a low red heat in a Hessian crucible over which is luted a deep empty crucible, or an earthen tube, to receive the metal; the latter being kept as cool as possible. Charcoal or even oil may be substituted for black flux, and a retort of hard glass may be used, with the same result. Or the following method may be used:—White oxide of arsenic, of commerce, 2 drs.; is placed at the sealed end of a hard German-glass tube ($\frac{1}{2} \times 18$ inches), and covered with about 8 inches of dry and coarsely powdered charcoal; the portion of the tube containing the latter is then raised to a red heat, whilst a few ignited coals are placed beneath the oxide to effect its slow sublimation. The sublimed metal gradually attaches itself to the inside of the tube at its cool extremity. A small charcoal furnace similar to that used for organic analysis should be employed, and the process conducted under a flue to carry off any fumes that may escape. The open end of the tube should be loosely closed with a cork.

Prop. Very brittle, so much so that it may be easily powdered in a mortar; lustre, highly metallic; colour, steel-grey or bluish-white; texture, crystalline; crystals, rhombohedrons; sublimes, without fusion, at 356 to 360° Fahr. (and slowly at lower temperatures), in close vessels unaltered, but when exposed to the air with conversion into arsenious acid; at a higher temperature, in open vessels, it burns with a

pale-blue flame. Its vapour or fumes have a characteristic alliaceous odour; it is slowly oxidised and dissolved by boiling water; but may be preserved unchanged in pure cold water; it rapidly tarnishes in the air, particularly when moist, a black film, consisting of metallic arsenic and arsenious acid forming on its surface; with chlorine, iodine, sulphur, and hydrogen, it unites to form definite compounds. With oxygen it forms acids, but no basic oxide. It combines with the metals in a similar manner to sulphur and phosphorus, the latter of which it resembles in many respects. These compounds are termed ARSENIDES. Sp. gr. 5.7 to 5.9; sp. gr. of vapour, 1.0862.

Uses, &c. With copper it forms a white alloy (PACKFONG); and it is added to some other alloys to increase their whiteness, hardness, and fusibility. In *medicine*, it is only used in combination. In the metallic state it is inert; but, from its great affinity for oxygen, it rapidly becomes oxidised and poisonous; and hence acts as a powerful *poison* when swallowed, or when rubbed on the skin. Its fumes are also highly poisonous. See ARSENIOUS ACID (acid below).

Arsenic, Tribromide of. $AsBr_3$. *Syn.* TRIBROMIDE OF ARSENIC, SESQUIBROMIDE OF A.; ARSENICI BROMIDUM, L. *Prep.* Add metallic arsenic, in powder, cautiously and in a very small quantity at a time, to pure bromine, contained in a vessel set in ice or a freezing mixture, until light ceases to be emitted; then cautiously distil into a well-cooled receiver.

Prop., &c. Solid below 68° Fahr.; above it, a yellowish fuming liquid, which boils at 428° Fahr.

Arsenic, Trichloride of. $AsCl_3$. *Syn.* CHLORIDE OF A., ARSENICI TRICHLORIDUM, &c., L. *Prep.* 1. From a mixture of arsenic, 1 part; and bichloride of mercury, 6 parts; both in powder, carefully distilled into a well-cooled receiver.

2. Gently boil powdered arsenic for some time in hydrochloric acid to which a little nitric acid has been added; then concentrate cautiously by evaporation, and distil as before. It is also produced with the disengagement of heat and light, when powdered metallic arsenic is thrown into gaseous chlorine.

Prop., &c. A colourless, volatile, highly poisonous liquid, decomposed by water into arsenious acid and hydrochloric acid. It has been employed as a caustic in cancer and venereal warts; but its use requires the greatest caution.

Arsenic, Fluoride of. AsF_3 . *Syn.* ARSENIC TRIFLUORIDE, TERFLUORIDE OF ARSENIC. A fuming volatile liquid, prepared as the bromide.

Arsenic, Triiodide of. AsI_3 . *Syn.* TRIIODIDE OF ARSENIC, IODIDE OF ARSENIC; ARSENICI IODIDUM, A. TRIIODIDUM, L.; ARSENIC IODURE, &c., Fr. *Prep.* 1. From finely-pulverised metallic arsenic, 2 parts; iodine, 11

parts; mixed and gently heated in a bent glass tube, or a suitable retort, until combination is complete; the heat being then raised, and the sublimed iodide collected, and at once put into a well-stopped phial.

2. Arsenic, in fine powder, 1 part; iodine, 5 parts; triturate them together, place the mixture in a small flask or retort just large enough to contain it, and apply a gentle heat until liquefaction is complete, avoiding the formation of iodine vapour; when the odour of iodine is no longer perceptible, and the mass assumes a reddish-yellow colour and crystallises on the sides of the vessel, the operation is complete, without having recourse to sublimation. A very easy and excellent process.

Prop., &c. A deep orange-red, crystallisable solid; soluble in water, and highly volatile and poisonous. Its aqueous solution yields the iodine unchanged by rapid evaporation, but when slowly concentrated and set aside, white pearly plates are obtained, consisting of arsenious acid and the triiodide. As a *medicine*, it combines the properties of both arsenious acid and iodine, but its use requires great caution. It has been successfully employed by Dr. A. T. Thomson, Bielt, and others, in obstinate skin diseases (*lepra, impetigo, herpes, lupus, psoriasis, &c.*), and in real or stimulated cancer.—*Dose.* $\frac{1}{16}$ to $\frac{1}{8}$ gr. (in pills or solution), gradually increased to $\frac{1}{4}$ or even $\frac{1}{2}$ gr. (A. T. Thomson.) *Externally*, 2½ grs., to lard 1 oz.; of which 1 dr. may be used at a time. (Bielt.)

Arsenic, Disulphide of. As_2S_2 . *Syn.* ARSENIC BISULPHIDE, BISULPHIDE OF A., RED SULPHIDE OF A., &c., REALGAR; RÉALGAR, ARSENIC ROUGE SULFURE, ORPIN ROUGE, &c., Fr.; ROTHES, SCHWEFELARSENIK, &c., Ger. This substance is found native at Solfaterra, near Naples, and in several other volcanic districts; but that of commerce is often prepared by distilling arsenical pyrites, or a mixture of sulphur and white arsenic, &c., in the proper proportions, as noticed under REALGAR and RED PIGMENTS.

Prop., &c. A fusible, volatile substance; scarlet or ruby-red in mass, but orange-red in powder, by which it is distinguished from cinabar; crystals, oblique rhombic prisms. Sp. gr. 3.3 to 3.6. Its chief use is as a pigment, and in pyrotechny to make white fire. The factitious sulphide has not the rich colour of the native mineral, whilst it is much more poisonous. It is improved by resublimation.

Arsenic, Trisulphide of. As_2S_3 . *Syn.* TRISULPHIDE OF ARSENIC, YELLOW SULPHIDE OF A., SESQUISULPHIDE OF A., ORPIMENT; A. SESQUISULPHURETUM, ORPIMENTUM, L.; ORPIMENT, SULFURE JAUNE D'ARSENIC, &c., Fr.; AURPIGMENT, ORPIMENT, RAUSCHGELB, Ger. This sulphide, like the last, is found ready formed in nature; and is prepared artificially, by sublimation, from a mixture of arsenious acid and sulphur, as noticed under

ORPIMENT and YELLOW PIGMENTS. It also falls as a precipitate when a stream of sulphuretted hydrogen gas is passed through an acid solution of arsenious acid or of an arsenite.

Prop., &c. Golden-yellow crystalline lumps, or a fine golden-yellow powder; crystals, right rhombic prisms; volatile; fusible; very soluble in pure alkalies, by which it is distinguished from sulphide of cadmium; and from trisulphide of antimony by being insoluble in hydrochloric acid. The factitious sulphide (KING'S YELLOW) of the shops often contains 80 to 90% of white arsenic; and is, therefore, much more poisonous than the native trisulphide. Sp. gr. (native) 3.44 to 3.60.

Use, &c. As a dye, as a pigment, and as an ingredient in fireworks, and in some depilatories. Silk, woollen, or cotton goods soaked in a solution of pure orpiment in ammonia, and then suspended in a warm apartment or stove-room, rapidly lose their ammonia, and become permanently dyed of a superb yellow colour. The native sulphides (both red and yellow) are much less soluble, and hence, less poisonous, than those prepared artificially. They also possess the richest colour; and are, therefore, preferred by artists and dyers. In former times, orpiment, like realgar, was employed in medicine. See ARSENIC.

Arsenic, Pentasulphide of. As_2S_5 . *Syn.* SULPHARSENIC ACID, &c.; ARSENICI PENTASULPHURETUM, &c., L. When a stream of sulphuretted hydrogen is transmitted for some time through a solution of arsenic acid, a precipitate of the PENTASULPHIDE is deposited after some hours' repose. Its formation is accelerated by boiling the liquid.

Prop., &c. It greatly resembles the tersulphide in its appearance and general properties.

Arsenic, White. See ARSENIOUS ANHYDRIDE.

Arsenic, Yellow. Trisulphide of arsenic.

ARSENIC ACID. H_3AsO_4 . *Syn.* ACIDUM ARSENICUM, L.; ACIDE ARSENIQUE, Fr.; ARSENIKSÄURE, Ger.

Prep. 1. Arsenious acid, in fine powder, 2 parts; concentrated nitric acid, 6 parts; hydrochloric acid, 1 part; mix in a flask or tubulated retort, and digest, with heat, until solution is complete; after repose, decant the clear portion, and evaporate, to the consistence of a thick syrup.

2. Dissolve arsenious acid in hot hydrochloric acid, and when the solution is cold, add concentrated nitric acid, in small quantities at a time, until red vapours cease to be evolved, then proceed as before.

Prop. Sour, thick syrup, occasionally forming clear transparent crystals, very deliquescent, and converted by heat into the anhydrous acid. Extremely poisonous and soluble.

Arsenates. *Prep.* Most of the metallic arsenates may be formed by adding a solution of a soluble salt of the metal to another of an alkaline arseniate, as long as a precipitate

falls; which must be collected, washed, and dried. The alkaline arseniates may be prepared by adding the base or its carbonate to a solution of the acid, to alkaline reaction, and then evaporating and crystallising the liquid.

Prop., &c. The arseniates of the alkalies are soluble in water; those of the earths and metals insoluble, except in acids. They are isomorphous with the corresponding phosphates.

Tests. Nitrate of silver added to the solution of an arseniate gives a highly characteristic reddish-brown precipitate, which distinguishes it from arsenious acid. Nitrate of lead gives a white precipitate, and the salts of copper greenish-blue ones. Pure lump-sugar dissolved in an aqueous solution of this acid becomes, in a few hours, of a reddish colour, and afterwards of a magnificent purple. Heated with charcoal it evolves a garlic-like odour, and is reduced to the metallic state. The suspected liquid being treated with sulphurous acid and boiled for a short time, the arsenic acid loses oxygen and is converted into arsenious acid, which may be tested for as such. Sulphuretted hydrogen does not precipitate a solution of arsenic acid, or an acidified arseniate, until after the lapse of several hours; and alkaline and neutral solutions, not at all.

ARSENIC ANHYDRIDE. As_2O_5 . *Syn.* ANHYDROUS ARSENIC ACID, ARSENIC ACID; ACIDUM ARSENICUM, L.; ACIDE ARSENIQUE, Fr.; ARSENIKSÄURE, Ger. Best prepared by igniting the arsenic acid, in a platinum crucible, at a low red heat, as long as water is given off.

Prop. White deliquescent substance, and violent poison, readily soluble in water to the acid.

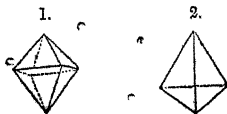

ARSENIOUS ACID. See ARSENIOUS ANHYDRIDE.

ARSENIOUS ANHYDRIDE. As_2O_3 . *Syn.* ARSENIOUS ACID, ARSENIC, WHITE A.; ACIDE ARSENIQUE, ARSENIC BLANC, OXYDE, Fr.; ARSENIKSÄURE, ARSENIKSTE S., Ger.; ARSENIKO BIANCO, It.; A. BIANCO, Sp. The arsenic, or white arsenic, of the shops.

Sources. The white arsenic of commerce is principally imported from Germany, where it is obtained in the process of roasting arseniuretted cobalt ores, in making zaffre. At Altenburgh it is procured from arsenical iron pyrites (mispickel); and at Reichenstein from native arsenide of iron. About 900 to 1000 tons are also annually collected at Cornwall, being principally a secondary product of the process of roasting grey copper ore and white mundic. The British arsenic works in that county, are perhaps the finest in the world. The usual plan is to roast the powdered ore in muffle-furnaces; by which its arsenic is converted into arsenious anhydrid, which escapes as vapour (smelting-house smoke), and passing into the condensing-chambers, is deposited in a pulverulent state, forming the flowers of arsenic, or rough white arsenic, of the smelters,

(the giftmehl or poison-flour of the Germans)! The crude article obtained in this way is purified by re-sublimation in suitable iron pots or other iron vessels, before it is fit for sale. It then forms a semi-transparent vitreous cake, which gradually becomes opaque, and of snowy whiteness, by exposure to the air, and at length acquires a more or less pulverulent state on the surface.

Prop. Crystals (obtained by careful sublimation, or by cooling a boiling aqueous solution), usually transparent, regular octahedrons (see *fig. 1.*), but sometimes, though rarely,

assume the form of tetrahedrons (see *fig. 2.*). When prepared on the large scale, it forms large, glassy, colourless or yellowish-white, transparent or semi-transparent cakes or porcelain-like masses (vitreous arsenious acid, gl'cial a. a.), which soon become opaque on their exterior, and often friable and pulverulent; odourless; volatilises at 380° Fahr.; fumes, odourless, unless carbonaceous organic matter be present, when they smell strongly of garlic; heated under pressure it liquefies and forms a transparent glass; taste, faintly sweetish, with a slight acidity and astringency, not perceived until some minutes after being swallowed. The opaque variety is soluble in 80 parts of water at 59° Fahr., and 7.72 parts of boiling water; but on cooling to 60° , only about $\frac{1}{3}$ rd of this quantity continues in solution. The transparent variety is soluble in 103 parts of water at 59° , and 9.3 parts of boiling water. Both soluble in alcohol, syrups, oils, and spirits, and freely so in alkaline lyes and hydrochloric acid; organic matter generally impedes its solution; solutions redden litmus; heated with organic matter it is reduced to the metallic state. Sp. gr. 3.5 (lowest opaque var.) to 3.8 (highest transp. var.).

Arsenites. True arsenious acid (HAsO_2) has never been obtained in a satisfactory condition, but its salts are readily obtained by dissolving arsenious anhydride in a solution of the base, or by double decomposition. They are generally white, nearly all insoluble, except those of the alkalis, and all soluble in acids.

Tests, Detec., &c. Owing to the importance of the subject, and for convenience and facility of reference, the leading tests for the arsenites and arsenious anhydride are noticed alphabetically below; to which a few general remarks on their application, under the various circumstances that occur to the chemist and toxicologist, are appended. When not otherwise stated, it is to be understood that they are to be applied to pure, or nearly pure and colourless solutions of arsenious acid or the arsenites.

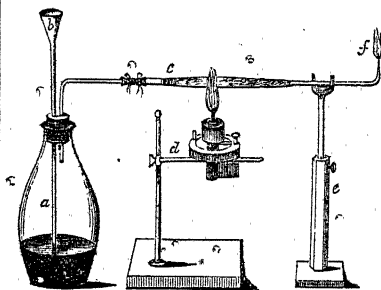

Ammonio-nitrate of silver gives a well-marked yellow precipitate of arsenite of silver in an aqueous of arsenious anhydride solution which is soluble in ammonia and in dilute nitric acid.

Crystallisation Test.—A very minute quantity of arsenious acid placed in a small tube (arsenic-tube), and heated in the flame of a spirit lamp gives a crystalline sublimate, which collects on the cooler portion of the tube, and which, when examined by a pocket lens, is found to consist of sparkling octahedral crystals (see *engr.*).

(Magnified.)

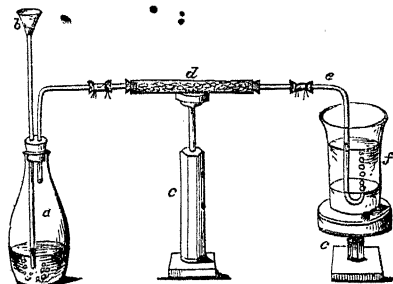

Ellis's Test.—This is a modification of the 'nascent hydrogen test,' in which the suspected gas is passed through a tube containing slips of copper leaf or riband, or still better pure oxide of copper, gently heated; the end of the tube communicating with the atmosphere being drawn to a capillary size, at which the gas may be enflamed and tested, as in 'Marsh's Apparatus.' (See *engr.*) If arsenic be abundant in the gas, the copper will be almost instantly frosted over with a coating of metallic arsenic; and after continuing the heat for a few minutes it will present a beautiful silvery surface, and may then be submitted to further examination.

- (a.) Flask containing the suspected fluid, dilute sulphuric acid, and zinc.
- (b.) Funnel.
- (c.) Tube containing the copper-leaf or c.-riband, and heated by the lamp (d).
- (e.) Support.
- (f.) Capillary end of tube (c), with the gas enflamed.

Lassaig's Test. (Adopted by the French Academy.) This consists in passing the gas generated in the suspected liquid, through a solution of nitrate of silver. (See *engr.*) When arsenic is present black flocculi of metallic silver are deposited, and arsenious acid remains in solution mixed with nitric acid and some arsenide of silver. The filtered liquor, treated with ammonia, will now give a

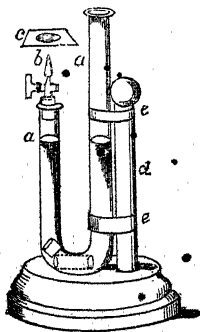

characteristic yellow precipitate of arsenite of silver; or a little dilute hydrochloric acid may be cautiously added to precipitate any remaining nitrate of silver, and the liquid, after filtration, tested for arsenic either in a Marsh's

- (a.) Bottle containing dilute sulphuric acid, zinc, and suspected fluid.
 (b.) Funnel for supplying the bottle with acid.
 (c, c.) Supports.
 (d.) Tube filled with asbestos.
 (e.) Bent tube to convey the liberated gas.
 (f.) Glass vessel containing a solution of nitrate of silver.

apparatus, or with any of the liquid tests; or it may be evaporated to dryness, when its arsenious acid will be converted into arsenic acid by the nitric acid present, and will then be found to give the usual brick-red precipitate of arseniate of silver with a solution of the nitrate of that metal. See MARSH'S TEST.

Marsh's Test. Some of the suspected liquid is mixed with dilute sulphuric acid until strongly acid, and is then poured upon some pure granulated zinc, or clippings or other small pieces of zinc, previously placed in the apparatus; hydrogen gas is immediately evolved, and, if arsenic be present, unites with it, forming arseniuretted hydrogen gas, which escapes by the aperture *b* (see engr.), and may be recognised as follows:—

- (a, a.) Bent glass tube, containing dilute sulphuric acid, zinc, and suspected liquid.
 (b.) Stop-cock and jet.
 (c.) Plate of glass to receive the stain.
 (d.) Support.
 (e, e.) Bands to keep the tube upright.

It possesses a garlic-like odour.

It burns with a bluish-white flame and emits a whitish smoke.

If a piece of window-glass, or a white porcelain plate or saucer, be held a short distance above the flame, a fine pulverulent film of arsenious acid is deposited on it. See (fig.) above.

If the cold plate be held in the flame, so as to slightly impede the combustion of the gas, a blackish-brown deposit of metallic arsenic is obtained, more or less deep, brilliant, and glistening. Both these deposits may be obtained simultaneously by holding nearly vertically over the flame a glass tube about 8 or 10 inches long, and $\frac{3}{8}$ ths of an inch in diameter. See (fig.) above.

A solution of arsenious acid may be obtained by letting the flame play upon 3 or 4 drops of water placed on the under side of the piece of glass or china, to which the 'liquid tests' may be then applied. Another plan is to apply drops of the liquid tests to the plate as above, and to let the flame play on them successively.

The true arsenical spot or film is of a blackish-brown colour, and generally of a very deep hair-brown, usually surrounded at the circumference, with a white film of arsenious acid; whilst that of antimony, which in some points is similar, is of a deep black colour, and but feebly lustrous, and, when viewed by transmitted light, appears smoky-black; whereas an arsenical spot viewed in the same way, appears brown. It is further distinguished from others by—Treated with concentrated nitric acid, it instantly disappears, leaving upon the surface of the liquid traces of the metal, which only dissolve on the application of heat. This solution, gently and carefully heated, leaves a white residuum, which, when cold, gives with a concentrated solution of nitrate of silver, a dull-red precipitate of arseniate of silver.—The nitric solution treated with a few drops of sulphurous acid, and subsequently with sulphuretted hydrogen, gives a canary-yellow precipitate of trisulphide of arsenic, which readily redissolves, forming a colourless solution with ammonia.—The arsenical spot, when heated, is turned bright yellow by sulphuretted hydrogen, and is then readily dissolved, as before, by ammonia, and by its bicarbonate; whereas one of antimony is turned of a deep orange-red, or reddish-brown, by sulphuretted hydrogen, is not readily dissolved by ammonia, and is scarcely or not at all affected by bicarbonate of ammonia.—It is freely soluble in and removed by hypochlorite of soda; a reagent which does not affect antimonial spots. Heated by a flame of pure hydrogen an arsenical stain rapidly disappears. A mixed stain of antimony and arsenic does not disappear by the action of the last two reagents, and is shown to contain arsenic by the two first tests above. When hydrochloric acid is present zinc stains are sometimes formed, but they do not re-

semble those from arsenic. The flame which produces it is very pale blue of bluish-white; whereas antimoniuiretted hydrogen burns with a pale green or greenish-yellow flame, and a white smoke, both of which are characteristic.

Obs. Marsh's test is admirable for its simplicity, delicacy, and trustworthiness, as well as for the ease of its application. It is adapted to all liquids, whether colourless or coloured, which are not so glutinous as to inconveniently froth during the extrication of the hydrogen.¹

Various modifications of the original apparatus have been proposed to obviate this difficulty; among which the one chiefly deserving notice is figured in the margin. It consists of a bent tube having two large bulbs blown in it, and fitted with a stop-cock and jet in the usual manner. In this case the grains or fragments of zinc are put into the lower bulb (a).

It is, however, worthy of remark, that, with ordinary care and skill, a simple wide-mouthed bottle, furnished with a tube and cock, will often be found to answer quite as well as more costly apparatus; as the fluid is less liable to froth than in a narrow tube. Even a common quinine-phial, or a 4-oz. or 6-oz. medicine phial, fitted with a piece of glass tube of very small bore, or even with a piece of a common tobacco-pipe, for a burner (see *engr.*), may be used when no more convenient instrument is at hand.

A film of oil placed on the surface of the liquid tends considerably to lessen the frothing.

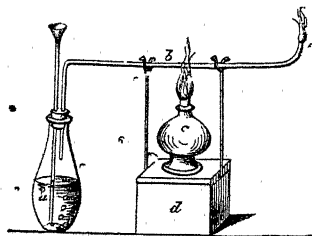

Objec., precav., &c. Objections have been raised to this mode of testing, from the great frothing which often occurs with organic mixtures, and from antimony and imperfectly charred organic

¹ Animal tissues and liquids containing organic matter are best prepared for testing for arsenic by Marsh's test, in the following manner proposed by Odling:—The tissue, or the residue obtained by the evaporation of a liquid over a water-bath, is to be thoroughly dried at a temperature of about 212° F., then ground to powder or cut up into small pieces, next drenched with the strongest hydrochloric acid and allowed to stand twenty-four hours in a warm place, and finally distilled. The distillate will contain arsenic (if it existed in the material under examination) comparatively free from organic matter, and is, therefore, in a fit state to be introduced into Marsh's apparatus, as the organic matter, which is the cause of frothing, has been removed.

matter also forming crusts somewhat resembling, to the inexperienced eye, those produced by arsenic. But these objections are invalid, because there are easy means of purifying the liquid before testing it, and of discriminating between true arsenical spots or deposits, and false ones. Another objection is, that both zinc and sulphuric acid sometimes contain arsenic; but to obviate this difficulty, we have only to use them when perfectly pure; and to test them by means of the apparatus before pouring the suspected liquid into it. Indeed, these objections apply with equal force to all those tests which depend on the production of nascent hydrogen. The precaution necessary to success, and to reliable results, is to set the apparatus with simple zinc, acid, and water, and after it has worked a short time to test the evolved gas for arsenic (as above); when, if no trace of that substance is detected, the suspected fluid, in which the organic matter (if necessary) has been destroyed by any one of the methods hereinafter pointed out, may be added, and the operation continued. Care should also be taken not to light the jet of gas before all the atmospheric air is expelled from the apparatus, as without this precaution an explosion may take place.

Nascent Hydrogen Test. The apparatus used may be similar to that figured in the *engr.* The plan followed in the laboratory of Giessen, is to heat the long tube through which the gas passes to redness in several parts, to produce distinct metallic mirrors; and then to remove the tube from the hydrogen apparatus and transmit a very feeble stream of dry sulphuretted hydrogen through it, the metallic mirrors being at the same time heated by means of a common spirit lamp from the outer towards the inner border or extremity. If arsenic alone is present, yellow trisulphide of arsenic is formed within the tube; if antimony alone is present, an orange-red or black trisulphide of antimony is produced; and if

(a). Flask containing the suspected fluid, dilute sulphuric acid, and zinc.

(b). Small tube, at the one end having an almost capillary orifice, where the gas is inflamed.

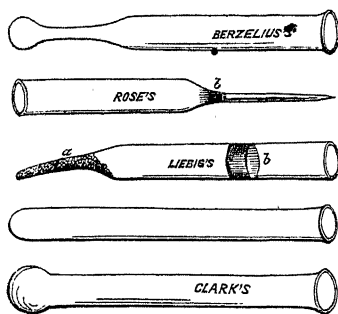

(c). Spirit-lamp.

(d). Support.

the mirror consists of both metals, the two sulphides appear side by side, the sulphide of arsenic, as the more volatile, lying invariably before the sulphide of antimony. If dry

hydrochloric acid gas be now transmitted through the tube, without application of heat, no alteration will take place if sulphide of arsenic alone is present, even though the gas be transmitted through the tube for a considerable time. If sulphide of antimony alone is present, this will entirely disappear; and if both sulphides are present, the sulphide of antimony will immediately volatilise, whilst the yellow sulphide of arsenic will remain. If a small quantity of ammonia be now introduced into the tube, the sulphide of arsenic is dissolved, and may thus be readily distinguished from sulphur which perhaps may have separated.

Reduction Test. A small quantity of the suspected sample, in the state of powder, is mixed with twice its weight, or more, of some reducing agent or flux, and the mixture is placed at the bottom of a very small glass tube,

(a.) The arsenical mixture.
(b.) Arsenical ring.

and heated in the flame of a small spirit lamp for some time, when the arsenic gradually sublimes, and condenses in the cooler portion of the tube, under the form of a metallic crust, mirror, or ring. A common test-tube, if of very small diameter, may be employed; but those known as the reduction tubes of Liebig, Rose, or Berzelius, are undoubtedly the most convenient and efficient. (See engr.)

Liebig's method is by using a mixture of equal parts of dry carbonate of sodium and cyanide of potassium. The suspected substance, perfectly dry and in powder, being first introduced into a Berzelius' tube, is then covered with 6 times the quantity of this mixture, and so that the whole will not more than half fill the bulb. A very gentle heat is next applied, to expel any adhering moisture from the powder and the tube, after which a strong heat is applied to the bulb, and continued for some time, to effect the entire reduction and sublimation of the arsenical compound.

The best fluxes to use are ferrocyanide of potassium dried at 212° F., calcined bitartrate of potassium, cyanide of potassium, and powdered charcoal.

The metallic ring is proved to be arsenical by the properties and tests previously noticed.

Should it be imperfectly formed, or masked by decomposed organic matter, the portion of the tube which contains it may be cut off with a file, next coarsely powdered, then re-introduced into another arsenic-tube, and the exposure to heat repeated.

The characteristics most simple and well-marked are—

The volatility of the deposit when heated, shown by its escaping from the hotter portion of the tube and condensing on the cooler part higher up or further on.

Its conversion into minute octahedral crystals of arsenious anhydride, when repeatedly chased up and down the tube by the cautious application of the flame of a spirit lamp first to one part, and then to another. The character of these crystals with respect to volatility, lustre, transparency, and form, is so exceedingly well marked, that a practised eye may safely identify them, though their weight should not exceed the $\frac{1}{100}$ th, or even the $\frac{1}{1000}$ th part of a grain. A pocket lens is here serviceable. The form of the crystals is very evident with a microscope of 4 powers. Oxide of antimony never forms octahedrons, but only prisms.

In employing this test, particular care must be taken to avoid soiling the sides of the tube in inserting the mixture, and that the substances operated on are perfectly dry; as, unless this is attended to, the experiment does not succeed. The common plan is to introduce the mixture through a small paper funnel or tube extemporised for the purpose. The heat at first should be gentle, and merely sufficient to expel any adhering moisture from the mixture and the inner surface of the tube; after which (except where otherwise ordered) the upper portion of the mixture should be strongly heated, and then the bulb or bottom of the tube exposed to the full flame. After the operation is complete the bulb or lower portion of the tube is usually removed by a file, and the portion containing the deposit hermetically sealed, when it may be preserved, unaltered, for any length of time, ready to be produced as evidence, if required.

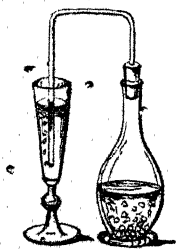

This test is usually regarded as decisive; as we here actually obtain the arsenic in a solid form, recognisable by the most unequivocal characters.

Reinsch's Test; Cupro-arsenical Test. The suspected solution is strongly acidulated with hydrochloric acid (1 to 6 or 8), and after being raised to ebullition in a porcelain or glass vessel, some bright and clean metallic copper in the form of gauze, foil, clippings, or wire, but preferably the first, is added, and the whole boiled together. The time required for the ebullition varies according to the strength of the solution; when weak it should be continued for at least a quarter of an hour. When the quantity of arsenic in the suspected liquid is very small, at least $\frac{1}{2}$ an hour should elapse before the removal of the copper. In solutions containing a notable quantity of arsenic, a few

seconds is often sufficient to obtain a coating; but which, for safety sake, may be extended to 2 or 3 minutes, or even longer. Liquids rich in organic matter also require longer boiling than those nearly free from it. The coated copper, which has now acquired a characteristic iron-grey colour, is then taken from the liquid, carefully washed in distilled water, in alcohol, and (if greasy) in ether, next dried on blotting paper, and then either cut into small pieces or rolled into a small coil or cylinder. It is then heated in a reduction-tube over a spirit lamp, when the metallic arsenic forming the coating is volatilised, and yields a sublimate of minute octahedral crystals of arsenious anhydride; or, if the tube be very small, or any reducing agent be added, a bright metallic ring. When the coating on the copper is sufficiently thick, it may be scraped off with a knife, and heated separately in an arsenic-tube.

This test is invaluable as affording a certain and ready means of abstracting arsenic from its solution, whether pure or mixed with organic matter. The contents of the stomach or other viscera may thus be at once examined, without any tedious preliminary operations. In this way Dr. Christison discovered the presence of arsenic upwards of 4 months after interment; and we have ourselves found it 2 years and 8 months after interment. The coated copper may be preserved unharmed for years. Dr. Taylor found that the 1-8th of an inch of one of these deposits that had been kept in paper nearly fourteen years, gave a well-marked ring of octahedral crystals, when heated.

Sulphuretted Hydrogen Test; Sulphur Test. This produces a bright yellow precipitate of trisulphide of arsenic (orpiment) in solutions containing a free acid; but acts slowly and imperfectly on pure and neutral solutions, and does not disturb those that possess an alkaline reaction. The suspected liquid should there-

fore be slightly acidulated with hydrochloric or acetic acid before applying this test, unless it be already acid, when it is better first to neutralise it with an alkali, and then to add the acid. The transmission of the gas through the liquid (see *engr.*) should be continued for at least half an hour; when the end of the conducting tube, after being well rinsed in the liquid, is removed, and the glass, lightly covered with a piece of porous paper, set aside in a temperature of about 100° Fahr., until the odour of sulphuretted hydrogen is completely lost. The precipitate is now collected on a small filter, washed with pure water, and dried by a gentle heat. It is then placed in a watch-glass or

small capsule, and redissolved in a little liquor of ammonia, which is then again expelled by heat; or it may be at once submitted to confirmatory tests. It is shown to contain arsenic by its ready and perfect solubility in ammonia, and in solutions of the fixed alkalis, their carbonates and bicarbonates, and in alkaline sulphides; by being nearly insoluble in hydrochloric acid, even when concentrated and boiling; and by yielding a metallic mirror when mixed with a flux and submitted to the reduction-test (which see).

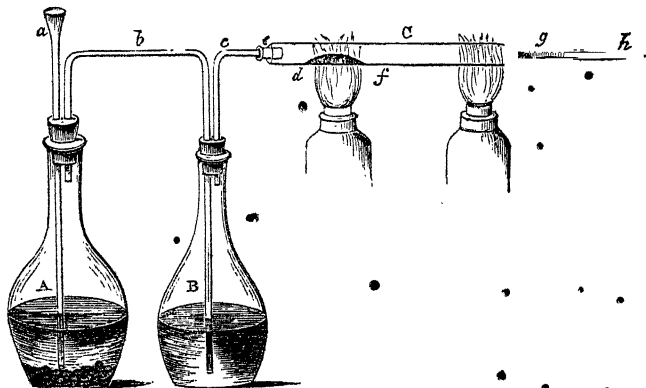

Sulphuretted-hydrogen water and sulphurate of ammonium act in a similar way to gaseous sulphuretted hydrogen; but much less effectively.

For accuracy, the sulphuretted hydrogen should be washed by passing it through a small bottle containing a little pure water, or sulphuric acid, before allowing it to enter the arsenical liquor. The reduction of the newly precipitated sulphide is generally regarded as the most important part of the investigation, and requires great care and attention. An extremely elegant and sensitive method of effecting this, is by heating the mixture in a stream of dry carbonic acid gas. This method has been followed by Drs. Babo and Fresenius with the most satisfactory results, and is thus performed:—(A) is a capacious flask for the evolution of carbonic acid, half filled with rather large pieces of solid limestone or marble (not chalk). To one aperture of the doubly perforated cork, a funnel-tube (a) is adapted, which nearly reaches to the bottom of the vessel; to the other aperture a tube (b), by means of which the gas evolved is conducted into a flask of smaller size (B), in which it is washed and dried by concentrated sulphuric acid. The tube (c) conducts the carbonic acid into the reduction-tube (C), which is shortened in the *engr.*, and must be made of difficultly fusible glass. When the apparatus is prepared, the sulphide of arsenic intended for reduction is rubbed in a small basin, previously heated in a water bath, with about twelve parts of a well-dried mixture consisting of 3 parts of dry carbonate of sodium, and 1 part of cyanide of potassium (prepared by Liebig's method). The mixed powder is then placed on a small strip of card-paper bent into the shape of a gutter, which is next pushed into the reduction-tube up to the point (f), and the tube is turned half round. In this manner the mixture is deposited without soiling any other part of the tube; after which, the strip of card-paper is cautiously withdrawn. The reduction-tube is then, by means of the cork (e), fixed in its place; a moderate stream of carbonic acid gas is evolved by pouring hydrochloric acid into the funnel-tube (a), and the mixture carefully dried, by very moderately heating the tube along its whole length, by means of a small spirit lamp. When the gas-stream has become so slow that the bubbles pass through the sulphuric acid at inter-

vals of about a second, the spot (*k*) is heated to redness by means of a spirit lamp. When this point is attained, another strong spirit-flame is applied to the mixture, progressing from (*d*) to (*f*), until all the arsenic is reduced and volatilised (the first flame at the same time continuing in action at *k*).

The reduced arsenic recondenses at the spot (*g*), forming a mirror, whilst an exceedingly small portion escapes at the capillary orifice (*h*), and fills the air with its garlic-like odour. The

second spirit lamp is at last slowly advanced towards the other lamp, or the spot (*k*), so as to drive towards (*g*) all the arsenic which has adhered to the walls of the wider part of the tube. Both lamps are then removed, the tube closed at the point (*h*) by fusion, and heat applied, progressing from the point (*h*) towards (*g*), to contract the mirror on that side also, which increases its beauty and distinctness. The tube is then cut off at (*f*), and hermetically closed and sealed. In this state

it becomes a permanent evidence which may be referred to in any future proceedings. Neither sulphide of antimony nor any other compound of antimony yields a metallic mirror or ring, when treated in this way. Less than $\frac{1}{100}$ gr. of trisulphide of arsenic thus gives a very distinct and beautiful mirror; and even $\frac{1}{1000}$ gr., a clearly perceptible one.

Voltaic Test. The wires from the opposite poles of a voltaic battery are immersed or brought in contact with a little of the arsenious solution placed in a capsule or on a piece of window-glass. If arsenic be present it is developed at the negative pole; and if this be formed of copper wire, it becomes whitened and assumes the appearance of polished steel or silver, in consequence of the formation of arsenide of copper.

Detection of Arsenic in Organic Mixtures. Of the tests, those which act by producing coloured precipitates are only applicable, with any degree of certainty, to perfectly limpid and colourless liquors. Those depending on the extrication of arseniuretted hydrogen are partially free from this inconvenience; but even here, if the suspected liquid be more than slightly charged with organic matter, so much frothing ensues, as to render the process nearly unmanageable. In this respect *Reimsch's Test* possesses advantages over all others; as it may be applied even to coloured liquids containing a considerable quantity of organic matter, without these being subjected to any preliminary process, and without danger of failure. In some cases also, as with liquids

possessing only a slight degree of consistency or colour, the arsenic may be separated, after simple filtration and acidulation with hydrochloric acid, by a stream of sulphuretted hydrogen, in the usual manner. The reduction-test is only applicable to solid arsenious acid, or to compounds of arsenic obtained by means of other tests or processes. In toxicological examinations the poison is almost always to be sought for in mixtures loaded with organic matter, and under other conditions even more embarrassing. Soon after arsenic is swallowed, it enters the circulation, contaminates the various tissues, localises itself in certain viscera, and is eliminated in the excretions. Hence it becomes necessary not only to examine the solids and liquids in which it is suspected the poison has been administered, the vomited matter, and the contents of the stomach and primæ viæ; but also, in fatal cases, the stomach itself, the liver, muscles, blood, and, more especially, the urine.¹ In such cases the stomach is the part first laid open, and a careful examination is made of its contents and coats in order to detect any undissolved particles of the poison; a pocket lens being employed, if necessary, in the search. If any particles, however minute, are found, they are carefully collected and submitted to the reduction-test. If the reverse be the case, the

¹ Absorbed arsenic more particularly localises itself in the liver, in which it may generally be found in from 12 to 15 hours after administration. The liver also generally retains traces of arsenic long after it has been eliminated from the other viscera and the muscular tissues.

stomach (cut into small pieces), together with its contents, is submitted to some further process, to obtain a solution suitable for the application of the usual tests. The liver, also some muscle, and any other portion of the body that may be selected, are likewise separately treated in the same manner. We have here, both solid and liquid organic matter to operate on, and the problem for solution is, the abstraction of their arsenic in the simplest and most certain manner, and in a form in which its presence may be demonstrated by tests. This subject has long engaged the attention of the most eminent chemists and toxicologists, and various plans have been proposed for the purpose; among which the following appear to be the most valuable, and that usually adopted:—

(Reinsch.) Solids (as the stomach, liver, &c.) are cut into small fragments, and boiled in a glass vessel with water acidulated with about 1-4th of its volume of hydrochloric acid, until the tissues or fragments are entirely broken down into flakes or grains, when the whole, after filtration, is again heated to the boiling-point, and tested as described under Reinsch's test (see ANTIMONY). Liquids do not require this preparation.

Estim. This may be effected in various ways:—

1. **GRAVIMETRICALLY:**—Arsenic is usually weighed under the form of arsenate of lead, arsenate of sesquioxide of iron, tersulphuret of arsenic, (metallic) arsenic, or (directly) as arsenious anhydride. The last three only, as the more simple and convenient, will be noticed here:—

As Trisulphide:—The whole of the arsenic being precipitated by a stream of 'sulphuretted hydrogen, with the necessary precautions, in the manner already noticed, the precipitate, after being carefully collected, washed, and dried, is purified by redissolving it in pure ammonia water, and evaporating the resulting solution in a weighed watch-glass or capsule, by the heat of a water bath. It is then dried at a temperature not above 212° Fahr., and finally weighed. Each grain of the tersulphide so found corresponds to .80487 gr. of arsenious acid, or .61 gr. of metallic arsenic.

As (metallic) Arsenic:—Obtained by one of the processes already given. Each gr. represents 1.32 gr. of arsenious acid.

As Arsenious anhydride:—Obtained in a weighed capsule or tube, either by the crystallisation or sublimation test. The weight is the answer sought for arsenious anhydride. Each gr. of this is equiv. to .75758 gr. of metallic arsenic.

VOLUMETRICALLY. (Method of F. Mohr.) This depends on the fact, that an aqueous solution of arsenious acid, or of an alkaline arsenite, when mixed with an excess of saturated solution of pure carbonate of soda, and a little starch-paste, has its arsenious acid converted into arsenic acid, by a solution of iodine. A standard solution of iodine is, therefore, an

appropriate arsenim'eter for the above mixture. The solution of iodine is added until the blue starch-reaction just begins to appear; the arsenious solution having been previously exactly neutralised with pure carbonate of soda, if acid; or with pure hydrochloric acid, if alkaline. The results are accurate when no substance capable of oxidising or decomposing iodine is present in the liquid tested.

Phys. eff., &c. Arsenious anhydride or white arsenic is alike destructive to vegetable and animal life. Seeds soaked in any but a very weak solution of it, lose their power of germination; and buds plunged in it become incapable of expanding into flowers. When applied to the leaves, roots, or stems, absorption takes place, and the plant soon perishes. On combustion it evolves the characteristic garlic-like odour of arsenic, and arsenic may be discovered in its substance by chemical tests. According to Jäger, Gilgenkrantz, and Pereira, a few of the lower order of the algæ are occasionally developed in solutions of arsenious acid. To all animals, from the infusoria up to man, arsenic proves deleterious, although in different degrees; the highest susceptibility of its effects existing in man, on account of the superiority of his development. In all of them death is preceded by inordinate actions and increased evacuations, especially from the mucous surfaces. Difficult respiration, thirst, vomiting, and convulsions, are the leading symptoms which gradually develop themselves as we approach the higher grades of the system. (Jäger.) In very small or therapeutical doses, properly administered, it is a valuable medicine, and acts as a tonic, alterative, and antispasmodic attenuant; and externally, as an escharotic. In slightly increased medicinal doses, or long-continued small doses, nausea, vomiting, purging, griping, debility, emaciation, and all the effects of slow poisoning, occur in succession—a gradual sinking of the powers of life, without any violent symptom; a nameless feeling of illness, failure of the strength, an aversion to food and drink, and to all the enjoyments of life. Redness of the conjunctiva and eyelids, headache and giddiness, spasms, eczematous eruptions, numbness and paralysis of the limbs, and pytalism, are also frequent and well-marked symptoms of slow poisoning by arsenic. In an excessive or poisonous dose, the symptoms are rapid and violent; usually indicating extreme gastro-intestinal inflammation and disorder of the cerebro-spinal system, and often occasioning death in from 1 to 3 days. The smallest fatal dose found recorded by Christison is $4\frac{1}{2}$ grs., taken in solution. The subject was a child 4 years old, and death occurred in six hours. $2\frac{1}{2}$ grs. destroyed a robust girl in 36 hours. (Letheby.) 2 grs., in solution, are suspected to have caused the death of a full-grown woman. 2 or 3 grs. may be a fatal dose. (Dr. A. Taylor.) Notwithstanding these facts much larger quanti-

tions by weight represented by the numbers attached to them in the following table, or in multiples of these proportions. Dalton accounted for this law by supposing that the constituent particles of matter are indivisible, and believed that, if it were possible to place such particles in the balance, their relative weights would be found to correspond with the numbers given in the table.¹ In other words, the term *atom*, which is derived from the Greek *ἄτομος*, indivisible, is applied in modern chemistry to

the smallest quantity by weight of an element which is capable of existing in a *chemical compound*, hydrogen being taken as unity.

ATOMIC VOLUME. The volume or space occupied by the atomic weights of gases at a temperature of 60° F., and under a pressure of 30 inches of the barometer, compared with that occupied by one part by weight of hydrogen under the same conditions.

In the following table □ represents one volume:—

Name.	Symbol.	Atomic weight.	Atomic volume.	Name.	Symbol.	Atomic weight.	Atomic volume.
ALUMINUM ...	Al	27.5		Molybdenum ...	Mo	92	
ANTIMONY ...	Sb	122		NICKEL	Ni	58.8

In the foregoing table the most important elements are distinguished by the largest type, those next in importance by medium type, and those of rare occurrence, or of which we know but little, by the smallest type.

ATOMIC WEIGHTS. See **ATOM.**

ATON'IC. *Syn.* ATON'ICUS, L.; ATONIQUE, Fr.; ATONISCH, SCHLAFF, Ger. Weak; debilitated: deficient in tone or strength. In *pathology*, applied to diseases or conditions of the body (ATONIC DISEASES; ATONY) in which debility is the leading feature. In *pharma-*

cology, ATONICS are agents which relax or lower the tone of the system.

AT'ONY. *Syn.* ATON'IA, L.; ATONIE, &c., Fr., Ger. In *pathology*, loss of tone, relaxation, morbid diminution of vital energy or power; commonly applied to debility of any kind.

AT'ROPHY (-fe). *Syn.* ATRO'PHIA, L.; ATROPHIE, &c., Fr.; ATROPHIE, Ger. In *pathology*, wasting or emaciation, with loss of strength, and unaccompanied by fever or other sensible cause; defective nutrition; decline.

Classif., Causes, &c. It is either *local*, as in the case of a limb which is small, imperfectly developed, or withered; or *general*, affecting

¹ Strictly speaking, Dalton, the inventor of the Atomic Theory, did not adopt the precise numbers given in the table, but others, which, however, bear a very simple relation to them.

the whole body. GENERAL ATROPHY appears to depend on deficient nutrition, arising from a want of due balance between the functions of assimilation and absorption, or from profuse evacuations draining off the materials necessary for the support of the body. In the former case only may it be regarded as an independent disease. LOCAL ATROPHY commonly arises from some cause which lessens the normal circulation of blood in the part; or from a diminution of the nervous influence, as in paralysis. *General atrophy* is most frequent in infancy, childhood, and old age. In the first two it may be often traced to bad nursing, worms, or a scrofulous taint; and not unfrequently, to continually inhaling impure or damp air. In adults, the causes are impaired digestion and imperfect action of the chyloferous organs, and sometimes diseased action of the liver. In many cases it results from the use of tobacco.

Treatm. This consists in a close attention to diet (which should be liberal and nutritious), exercise, clothing, ventilation, warmth, &c., with gentle stimulants, and chalybeate topics where not contra-indicated, and, in the case of adults, the moderate use of pure generous wine or malt-liquor. Among special remedies, both in this disease and *anæmia*, may be mentioned pure sweet cod-liver-oil, which seldom fails to arrest or greatly retard the progress of the disease, and in very many cases effect an entire cure. When this affection is symptomatic of any other disease, as worms, stomach or liver complaints, &c., the removal of the latter must of course be first attempted. See ANÆMIA, CHLOROSIS, TABES, &c.

ATROPIA (trōpē'ya). $C_{17}H_{23}NO_3$. [L.; B. P.] Syn. ATROPINE (pin; sometimes *atro'pinet*), Eng., Fr.; ATROPINA, ATROPINUM*, L. An alkaloid discovered by Brandes in *atropa belladonna* or deadly nightshade.

Prep. 1. (B. P. Process.) Take of *belladonna root*, recently dried, and in coarse powder, 2 lbs.; rectified spirit, 10 pints; slaked lime, 1 oz.; diluted sulphuric acid, carbonate of potash, of each, a sufficiency; chloroform, 3 ℥. oz.; purified animal charcoal, a sufficiency; distilled water, 10 fl. oz. Macerate the root in 4 pints of the spirit, for 24 hours, with frequent stirring. Transfer to a displacement apparatus, and exhaust the root with the remainder of the spirit by slow percolation. Add the lime to the tincture placed in a bottle, and shake them occasionally several times. Filter, add the diluted sulphuric acid in very feeble excess to the filtrate and filter again. Distil off three fourths of the spirit, add to the residue the distilled water, evaporate at a gentle heat, but as rapidly as possible, until the liquor is reduced to one third of its volume and no longer smells of alcohol; then let it cool. Add very cautiously, with constant stirring, a solution of carbonate of potash so as nearly to neutralise the acid, care, however, being taken that an excess is not used. Set to rest for six

hours, then filter, and add carbonate of potash in such quantity that the liquid shall acquire a decided alkaline reaction. Place in a bottle with the chloroform; mix well by frequently repeated brisk agitation, and pour the mixed liquids into a funnel furnished with a glass stop-cock. When the chloroform has subsided, draw it off by the stop-cock, and distil it on a water bath from a retort connected with a condenser. Dissolve the residue in warm rectified spirit; digest the solution with a little animal charcoal; filter, evaporate, and cool until colourless crystals are obtained.

2. *Expressed juice of belladonna* is evaporated over a water bath to the consistence of an extract, and then triturated in a marble or porcelain mortar with a strong solution of caustic potassa; the resulting mass is digested and well agitated for some time, at the temperature of 75° to 80° Fahr., with benzole, q. s.; and, after repose, the benzole-solution is carefully separated, and its volatile hydrocarbon is distilled off by the heat of a water bath; the residuum in the retort is now exhausted with water acidulated with sulphuric acid, and the resulting 'acid-solution,' after filtration, precipitated with carbonate of soda; the precipitate is crude ATROPIA, which is collected on a filter, pressed between folds of bibulous paper, and dried; after which it is purified by one or more re-solutions in alcohol, and crystallisations, which may or may not be modified in the manner noticed. The proportion of potassa should be about 1 dr. to every quart of the expressed juice. An excellent and economical process. The product is 0.3 to 4% of the weight of the plant from which the juice has been obtained.

3. (Meinard and Liebig.) *Belladonna-root* (fresh-dried and coarsely powdered), is exhausted by alcohol (sp. gr. 0.822); *slaked lime* (1 part for every 24 of the dried root employed) is then added to the tincture, and the whole digested, with agitation, for 24 hours; sulphuric acid is next added, drop by drop, to slight excess, and, after filtration, rather more than one half the spirit is removed by distillation; a little water is now added to the residue, and the remainder of the alcohol evaporated as quickly as possible by a gentle heat; after again filtering, the liquid is reduced by further evaporation to the 1/12th part of the weight of the root employed, and a concentrated solution of potassa dropped into the cold liquid (to throw down a dark greyish-brown matter), carefully avoiding excess or rendering the liquid in the slightest degree alkaline; in a few hours the liquid is again filtered, and carbonate of potassa added as long as a precipitate (ATROPIA) falls after a further interval of from 12 to 24 hours, this precipitate is collected and drained in a filter, and after pressure between folds of blotting paper, dried by a very gentle heat. It is purified by making it into a paste with water, again squeezing it between the folds of blotting paper, drying it, re-dissolv-

ties have been taken, under peculiar circumstances, with comparative impunity; and cases are not wanting in which even enormous quantities have produced very trifling effects. Under all circumstances arsenious anhydride is, undoubtedly, one of the most powerful of the mineral poisons; and in whatever form or way it is introduced into the system, it exerts the same deleterious influence. In all cases, in sufficient doses, its action is to increase the secretions, diminish the contractility of the voluntary muscles, and to produce convulsions, prostration and death.

Arsenic is a non-accumulative, irritant poison, and exerts no decided chemical or corrosive action on the tissues. (Taylor.)

Pois., &c.—Symp. These sometimes begin to appear within half an hour after the poison has been taken, or even sooner; but much more generally, not until after the lapse of some hours. They usually commence with nausea and distress at the stomach, followed by thirst, often intense, and a sense of burning heat in the bowels; then come on constriction of the œsophagus, violent vomiting, severe colic pains, tenesmus, and excessive and painful purging, the stools being occasionally bloody; but pain, vomiting, &c., do not invariably occur. The pulse is generally quick, small, feeble, and irregular—sometimes scarcely perceptible, and the heart's action is irregular and tumultuous. The tongue is dry and furred; the respiration difficult and panting; the urino-genital apparatus is often affected; there is pain and difficult micturition, and sometimes entire suppression of urine; faintings, coldness of the limbs, and cold sweats, with other signs of debility, intervene. Itching and eczematous eruptions of the skin, trembling, painful cramps and contractions of the extremities, and violent convulsions, often follow; and after these, a greater or less prostration of strength, which induces a deceitful calm. At length the heart's action abates, the skin becomes suffused with a cold clammy sweat, and the sufferer dies from exhaustion. The progress, succession, and precise character of the symptoms are modified by the idiosyncrasy of the individual, the quantity of the poison, and the manner in which it has been taken; and are seldom all present in the same person.

Treatm. If vomiting has commenced it should be promoted by tickling the throat, and administering a large quantity of gelatinous hydrated peroxide of iron, or other appropriate antidote, in divided doses, mixed with a large quantity of warm or tepid water, strongly sweetened with sugar. If vomiting has not commenced, which is rare, it must be excited by administering 15 to 20 grs. of sulphate of zinc, or ipecacuanha (or in the absence of these, a teaspoonful of flower of mustard) in a tumbler of tepid water, and tickling the throat as before. If these means fail in rapidly inducing copious vomiting, the dose

must be repeated, or the stomach-pump had recourse to. Altogether as much as 16 to 18 oz. of the hydrated peroxide of iron, may be administered. If the poison has been swallowed several hours previously, and hence may have passed the pylorus, a strong dose of castor oil, or a purgative clyster may be administered, and, after its action, another clyster containing the antidote. As soon as the stomach and bowels are cleared, diuretics and sudorifics should be given in abundance. Lastly, any remaining irritation must be relieved by demulcent and soothing remedies; or if urgent, by slight general or local bleeding, which cannot be earlier practised without danger; and opium, camphor, and ether, followed by tonics, may be had recourse to, to recruit the system.

Lesions. Redness and inflammation of the whole primæ viæ; and sometimes, of the mouth, fauces, and œsophagus, but, more usually, the contrary. Sometimes also, though seldom, there is no marked appearance of inflammation in the stomach and intestines. The stomach is usually highly injected, and frequently marked with extravasations; lungs, gorged with blood; mucous lining of tracheæ reddened; heart generally flabby, and exhibiting deep red or blackish stains, and the right cavities more or less loaded with blood; the conjunctiva is sometimes very vascular; and redness, extravasation of blood, and effusion of serum, is occasionally seen in the brain. The blood is frequently, though not invariably, fluid after death, and dark-coloured. Under certain circumstances, the mucous membrane of the stomach and intestines is lined with a multitude of brilliant points or grains, which have been mistaken for arsenious anhydride; but which, according to Orfila, are composed of fat and albumen. Placed on burning coals, they decrepitate on drying, and produce a species of explosion or defonation. These grains are also met with in the stomach of persons who have not been poisoned. Digested in water, the liquid obtained from them does not show the presence of arsenic when submitted to reagents.

Ant. In the order of their assumed efficiency:—Hydrated or gelatinous sesquioxide or peroxide of iron (for an adult—a table-spoonful, in water, every 8 or 10 minutes, until 12 or 16 oz., or more, have been taken). Hydrated sulphide of iron (as last). Gelatinous hydrate of magnesia (as the last). Calcined magnesia (taken as the first). Salad or olive oil, or almond oil, and oil or fats generally (ad libitum), are all highly effective in lessening, if not destroying the action of arsenious anhydride.¹ Albumen (white of egg),

¹ Dr. Blondlot, in a paper communicated to the Paris Academy of Sciences, has come to the conclusion that the slightest quantity of greasy matter in contact with arsenious anhydride reduces its solubility to about 1-20th of what it was before. This explains at once why, in certain judicial investigations, arsenic has been sought for in vain in the liquid contents of the stomach, when the food consisted

or liquids containing it (in cold water, ad libitum). Milk, wheat-flour, oatmeal gruel, (with water, ad libitum). Lime water, with milk (as the last). Chalk, with milk and water (as the last). Infusion or decoction of bark, or better, of nut-galls (as the last). Sugar or syrup (ad libitum). See *Prescript.* (above); also the above substances under their respective heads.

Uses, &c. Arsenious anhydride and its compounds are extensively employed in the arts and medicine. It is used by the dyer, it furnishes the artist with several of his most beautiful pigments, and the glass-maker and enameller with a flux or material to whiten and decolour their wares. In *agricolture*, it is used (in solution) as an anti-smut for seed-wheat; and as an anti-vermin lotion or dipping for sheep and cattle. In small (therapeutical) doses it is a valuable remedy in intermittent fevers, chronic skin diseases (especially lepra and psoriasis), and in several nervous affections (as neuralgia, epilepsy, chorea, tetanus, &c.). It is the active ingredient of the tasteless ague-drop; and in the Tanjore pills, long celebrated in India for the cure of the bite of the cobra di capello and other venomous serpents, as well as of hydrophobia. It has been given in syphilis, chronic rheumatism, typhus, and several other diseases, with more or less advantage. Cautiously administered in phthisis, it frequently restores the appetite and strength, and greatly retards, and in some cases, arrests the progress of the disease. It has been recently used to relieve toothache arising from caries. *Externally*, it is employed in the form of powder, lotion, and ointment, for the cure of cancer. Plunkett's Ointment, Pâte arsenicale, Davidson's Remedy for Cancer, and several other like preparations, owe their activity to arsenious anhydride. Water in which white arsenic has been steeped has become a favorite cosmetic wash with many ladies, since its assumed property of softening the skin was announced in a certain popular periodical. Its use, whether internal or external, is, however, attended with considerable danger in unskilful hands, and should, therefore, never be adopted but under proper advice.—*Dose.* $\frac{1}{2}$ to $\frac{1}{3}$ gr.; made into pills with crumb of bread and lump sugar; or in solution, 3 to 5 or 6 drops, twice or thrice daily, gradually and cautiously increased to 12, or even 15 drops. As a rule, arsenical preparations should be taken soon after a meal, and by no means partly of fatty substances, such as broth, milk, &c. It likewise explains how arsenious anhydride, taken in powder, may sometimes remain a long time in the stomach before it produces any deleterious effect; since, in such cases, its action is hindered by the presence of fatty matter. Juglers often swallow arsenic with impunity, because, according to Dr. Blondlot, they previously take the precaution to drink milk and eat fat bacon. Hence, in cases of poisoning by arsenic, oils and fatty substances may be administered as real antipotes, capable of suspending the action of the poison for a considerable time, until more radical means of effecting a cure can be applied. The people engaged in some of the arsenic-works regard salt as almost a certain antidote to this poison.

on an empty stomach. (Dr. A. T. Thomson.) The dose should be suspended, or greatly reduced, as soon as the conjunctiva is affected (Hunt); or if dryness of the mouth or throat, or irritation of the stomach or bowels, ensues. Mr. Macculloch found the pills more efficacious than the solution; they act differently, and cannot be substituted for one another.

Arsenic is a favorite tonic and alterative with farriers; who often administer it very carelessly to horses, to the serious injury of these animals. It is also a favorite with grooms, who have imbibed the notion that small doses of it contribute to improve the condition of the skin. The best-informed veterinarians, however, either wholly avoid it, or use it with very great caution.—*Dose* (for a horse), 2 to 5 or 6 grs., twice or thrice daily; in farcy or glanders, 10 to 12 grs. In solution it is often employed as a wash or dipping to destroy vermin in cattle and sheep; but its use is not free from danger, particularly to the shepherd, or dippers.

Gen. commentary. The necessary length of the preceding article, owing to the great importance of the subject in its relations to toxicology and medical jurisprudence, has left us little space for further remark here. In addition to what has been said on arsenical testing, it may be useful to caution the reader, of the absolute necessity of only employing tests and reagents which are themselves absolutely pure; and in which the operator has, by personal examination, failed to detect the slightest trace of arsenic. Commercial sulphuric, nitric, and hydrochloric acids, potash, soda, nitre, iron, and zinc, frequently contain arsenic; from which, however, they may be freed by chemical processes; or they may be purchased in the pure state from respectable dealers in chemicals. But no assurance of the vendor should be regarded as a proof of their purity. In all judicial investigations the absence of arsenic in the several tests and reagents, and the apparatus employed, must be demonstrated and sworn to. We may further add, that the results afforded by no single test can be depended on. In matters of such vast importance, the most ample confirmatory evidence must be sought.

Marsch's, Reinsch's, Lassaigne's, the Sulphur, and the Reduction Tests, and their modifica-

1 "As a therapeutical agent for horses, arsenious acid can be well dispensed with. It is, however, employed by some as a tonic, in doses of from 10 to 20 grs. daily; and by others as a vermifuge. When injudiciously administered death has been the result. By those of the old school it is extolled as a caustic, and a very powerful one doubtlessly it is; but there is this disadvantage attending its use—we cannot control its action, and, oftentimes, a most extensive and painful wound is caused by it. Occasionally it is resorted to for the eradication of warts; although a better plan is to extirpate them at once with the knife. When, however, this is inadmissible, 1 part of arsenious acid, in very fine powder, may be mixed with 4 parts of lard, and a (small) portion of the compound applied, with friction, over and around the excrescence every other day, for three or four times. This will excite such a powerful sloughing action, that in about 10 days the warts will be thrown off." (Prof. Morton.)

tions, are those now generally preferred by toxicological chemists; each of which, with its confirmatory tests, are amply sufficient for the indisputable identification of arsenic.

Modern toxicologists have abandoned most of the old processes for the detection of arsenic, and have adopted one of two, which have been found more expeditious, as well as more certain. These are the *Tests* of Marsh and Reinsch, preferably the latter.

HERAPATH'S METHOD is to obtain deposits by Reinsch's Test on 4 or 5 pieces of No. 13 copper wire; each piece being about 2½ inches long, and previously flattened and planished with a polished hammer for about one half its length. The deposit, with some of the adhering copper, scraped from one of these coated pieces, is sealed up hermetically in a tube for future production. The 'scrapings' from three pieces of wire are separately submitted to the sublimation test in tubes bent in the form of an obtuse V, capillary at one end, and about ⅔ths of an inch in diameter at the other; the capillary leg being about three times as long as the larger one. The 'scrapings' are placed in the bent part of the tube; and the flame of a small spirit lamp is so applied as to slowly drive the sublimate into the narrower portion of the tube, which is held rather higher than the other. If the deposit so obtained be mercury, it condenses in white shining globules;—if lead or bismuth, it does not rise but melts into a yellowish glass, which adheres to the copper;—if tellurium, it falls as a white amorphous powder;—if antimony, it does not rise at that low temperature; but—if it be arsenic, it sublimes as arsenious anhydride, which condenses as minute octahedral crystals, looking, with the microscope, like very transparent grains of sand. One of these tubes containing the sublimed arsenious anhydride is then sealed up, like the first one, for future production. The capillary part of another tube, containing the sublimate, is then cut off, and carefully boiled in a few drops (10 to 15) of distilled water; and, when cold, 3 or 4 drops of the resulting solution is poured on a plate of white porcelain, and to this, by means of a glass rod, one drop of solution of ammoniacal sulphate of copper is added. The mixture is then carefully conducted on to a piece of white filtering-paper set on the surface of a smooth, clean, and dry chalk-stone, by which the moisture is absorbed, and the smallest portion of Scheele's green produced by the test rendered more conspicuous. The ammonio-nitrate of silver test is then applied, in a similar manner, to 3 or 4 drops of the remaining solution; after which, the pieces of paper with the spots are dried, and sealed up in separate tubes, as before, observing to exclude the light from that containing the yellow precipitate of arsenite of silver. A stream of sulphuretted hydrogen is then passed through the remaining tube containing the arsenical sublimate, by which the latter is converted into the yellow

ter-sulphide—this too is sealed up. Here are now five tests—the metal, the acid, arsenite of copper, arsenite of silver, and yellow ter-sulphide of arsenic.

It is now well known that certain soils contain arsenic, either as arsenite of lime or sulphide of arsenic; and which, under favorable circumstances, may permeate or be absorbed by a body, after interment. In judicial investigations following disinterment it is, therefore, necessary to examine portions of the cemetery-earth taken from the grave, as well as from parts more or less distant from it. For this purpose the earth should be *thoroughly* dried in a water bath, drenched with pure and concentrated hydrochloric acid, and allowed to stand for twenty-four hours. The mixture is then distilled, and the distillate tested for arsenic by Reinsch's or Marsh's test. Should the product of one distillation yield no evidence of arsenic, it should be returned to the retort, if necessary, a second or even a third time, and the distillation repeated.

The practice of employing a solution of white arsenic as an anti-smut steep for wheat, has lately *arrested* the attention of chemists. M. Audouard states that he has detected traces of arsenic in the crops raised from seed-wheat thus treated. But that which appears to be likely to prove much more dangerous, is the introduction of arsenic into crops by the employment of crude superphosphate of lime as manure—a substance often rich in this poison. Dr. Edmund Davy positively states that arsenic, as it exists in artificial manures, is taken up by plants growing where those manures have been applied! He found cabbages and turnips taken from fields manured with superphosphate give unmistakable evidence of being 'arseniated.' These facts have some important bearings; for though the quantity of arsenic which occurs in such manures is not large when compared with their other constituents, and the proportion of that substance which is thus added to the soil must be necessarily small, still plants during their growth, as in the case of the alkaline and earthy salts, take up a considerable quantity of this substance. Further, as arsenic is well known to accumulate in soils, though not an accumulative poison in the animal system, the effects, after some time, will probably be, that vegetables raised on those continuously so manured, will ultimately be found to contain such a proportion of arsenic, as will exercise an injurious effect on the health of man and animals. The statement of M. Audouard has been disputed by M. Girardin, because he failed to detect arsenic in corn under the circumstances; and it is also denied by Dr. A. S. Taylor, and others; but our own experiments, very carefully performed, confirm the assertions of both Audouard and Davy. The ultimate consequences of pouring into the Thames such enormous quantities of disinfectants contaminated with ar-

senic, as has been done during the last 3 or 4 years, is another matter deserving consideration, and one which has been ably pointed out by Dr. Letheby, in his reports, as Officer of Health to the City of London.

Dr. Lois has found arsenic, often in large quantities, in ordinary brass, and brass utensils; and we have ourselves repeatedly found arsenic in the Britannia-metal, German-silver, and other cheap white alloys at present in such general use.

The preceding facts are recommended to the careful attention of medical jurists.

By Act of Parliament¹ it is provided—1. That every vender of arsenic shall, before the delivery of the same to the customer, enter in a book or books kept for the purpose, the date of sale, name, and residence of the purchaser, in full, his or her condition or occupation, the quantity so sold, and the purpose or purposes for which it is required, in a form set forth in the schedule to the Act; which form or schedule shall be signed by the vender, and by the said purchaser, unless he be unable to write, when such fact shall be recorded in the said schedule by the vender; and this schedule, when a witness is required to the sale, shall also bear his signature, together with his place of abode:—2. *Arsenic* is, not to be sold to a stranger, unless in the presence of a witness acquainted with both vender and purchaser:—3. No person to sell *arsenic* unless it be previously mixed with at least 1 oz. of soot or $\frac{1}{2}$ oz. of indigo to the pound; unless such admixture would be injurious to the object for which it is intended, when not less than 10 lbs. is to be sold at any one time:—4. Penalty for evading the Act, either as vender, purchaser, or witness, £20:—5. Act not to extend to *arsenic* used in compounding prescriptions, nor to the wholesale trade:—6. The word '*arsenic*' to include 'arsenious anhydride, and the arsenites, arsenic acid, and the arseniates, and all other colourless poisonous preparations of arsenic.' See ARSENIC, ARSENIC ACID, LOTIONS, PILLS, SHEEP-DIPPING, SOAPS, SOLUTIONS, TOOTH-CEMENTS, WHEAT-STEEPS, IRON, POTASSA, SODA, and other Bases, &c. &c. (also below).

Self-detecting Arsenious Anhydride. *Prep.* (Dr. Cattell).—1. Ordinary white arsenic to which is added a small quantity of a mixture of dry calomel and quick-lime; or of dried sulphate of iron and powdered gall-nuts. The product is white, but immediately turns BLACK when mixed with liquids.—2. As the last, but adding a mixture of thoroughly dried sulphate of iron and ferrocyamide of potassium. Strikes a BLUE.—3. As last, but using dried phosphate of sodium and dried sulphate of iron. Strikes a GREEN. Proposed as a method of preventing arsenic being used as a poison.

ARSENIDE. *Syn.* ARSENITURET; ARSENUTRUM (-i-ū), L.; ARSENITURE, Fr. A combination of arsenium with a metal (including hydrogen), in definite proportion.

¹ 14 Vict., c. xlii, 1851.

AR'SENITE (-nīte). *Syn.* AR'SENIS, L.; ARSENITE, Fr.; ARSENGSÄURE SALZ, Ger. A salt of arsenious acid.

ART. [Eng., Fr.] *Syn.* ARS (*gen.*, art'is; *pl.*, ar'tes), L.; τέχνη (*tech'ne*), Gr.; KUNST, Ger. Primarily, strength, power, and hence also mental strength, skill; the application of knowledge or power to effect a desired purpose; the power or ability of doing something not taught by nature or instinct; practical skill guided by rules. SCIENCE is knowledge—ART, practical skill in applying this knowledge. ART is applied science; whilst SCIENCE is knowledge obtained by observation, experience, and ratiocination. This distinction is nowhere more fully seen than within the domain of Chemistry, where knowledge, deduction, great power of generalisation, and great expertness, are necessary elements of success. Art has filled the world with luxuries, conveniences, and comforts; and art—the ARTS—useful or fine—are the safest and surest civilisers of our race. See SCIENCE.

ARTE'SIAN (-tē-zhān; or -tēzē-yān). [From *Artois*, a province of France, in which such wells were first formed.] *Syn.* ARTÉSIEN, Fr. In physics and civil engineering, applied to very deep borings into the ground from which water flows. See FOUNTAINS, WATER, WELLS, &c.

ARTHANI'TINE (-tīn). [Eng., Fr.] *Syn.* ARTANI'TINE; ARTHANIT'NA, L. A peculiar substance first obtained by M. Saladin, by the action of alcohol on the tuberous stems of the herb *arthramita* or *sow-bread*. It is acrid, colourless, and crystalline, and imparts its acidity to the plant.

ARTICHOKE. *Syn.* CIN'ARA, CYN'ARA, SCOT'YMUS, L.; ARTICHAUT, Fr.; ARTISCHOCKE, Ger. The *cyn'ara scol'ymus* (Linn.), a thistle-like perennial plant of the *nat. ord.* Compositæ (DC.). *Hab.* Southern Europe; but now extensively cultivated in our gardens, for its 'bottom,' or the sweet fleshy receptacle of its flowers, which is eaten as a potherb. These are cooked by brisk boiling in water, stalks ends uppermost, until tender; and take $\frac{1}{2}$ to 1 hour, according to their age. Sometimes they are preserved in brine (PICKLED ARTICHOKEs); and also after depriving them of the 'choke' and spiny hairs and blanching them by immersion in boiling water, by drying in the sun (DRIED ARTICHOKEs; CULs D'ARTICHAUT, Fr.), by which they retain their flavour for some time. *Infusion of the flowers*, used with rennet.

As an esculent the artichoke resembles asparagus in its general properties; but it is said to be more nutritious, and even more diuretic. • **Jerusalem Artichoke.** The *helianthus tuberosus* (Linn.), a perennial plant of the sunflower family, and quite distinct from the preceding. *Hab.* The Brazils. It is cultivated in England for culinary purposes. *Roots* (tubers), resemble the artichoke in flavour; but are considered far from wholesome, being apt

to produce flatulence and dyspepsia. They are diuretic, and impart the odour of turpentine to the urine. They are cooked by boiling (15 to 25 minutes, according to size), or frying; in the former case, served with melted butter. They are also served mashed, like turnips. The flowers yield a volatile oil resembling that of turpentine.

ASARABACCA (ās-ā-). *Syn.* AS'ARUM, A. EUROPEUM (Linn.), NARDUS MONTANA*, &c., L.; ASARET, A. D'EUROPE, CABARET, AZAREUM C., NARD SAUVAGE, OREILLE D'HOMME, &c., Fr.; HAZELWURTZEL, Ger. The *ἀσάρον* of Dioscorides, a small, round, hard, stemless, hardy herbaceous plant, bearing chocolate-coloured flowers; and of the *nat. ord.* Aristolochiæ (DC.). It grows freely in central France, and is found in woods and shady places in Lancashire, Westmoreland, and other parts of England. *Hab.* Europe, between 37° and 60° latitude.—*Root & rhizome* (AS'ARI RA'DIX), has a pepper-like odour and an acrid taste:—*Leaves* (A. FO'LIA), less odorous, though bitter-tasted, acrid, and aromatic; formerly official in the pharmacopœias:—*Whole plant* (ASARABACCA, of the shops), nauseant, emetic, and purgative. Before the introduction of ipecacuanha it was the common emetic (6 to 9 of the green leaves in whey); but, owing to the violence of its action, it has long fallen into disuse. Its common name in France (CABARET, or *public-house plant*), is said to have arisen from its frequent employment to relieve the stomach of those who had drunk too hard. It is now almost solely used as a sternutatory or errhine, and is probably one of the best.

According to Gröger,¹ asarabacca contains three volatile, oily principles, which may be obtained by distillation with water:—**VOLATILE OIL** (*o'leum as'aræ*):—AS'ARINE, an odourless, tasteless, and crystalline solid; fusible and volatilisable, yielding white and very irritating fumes:—AS'ARUM-CAM'PHOR, differing chiefly from the last in being precipitated, by water, from its alcoholic solution in cubes or six-sided prisms, instead of delicate flexible needles. Also a brownish, bitter, crystallisable principle (AS'ARINE, AS'ARUM-BIT'TER), which is soluble in alcohol.

Uses, Dose, &c. Dried leaves, 20 to 30 grs., or root, 10 to 12 grs.; as a purge or emetic. As an *errhine*—leaves, 3 to 5 grs.; root, 1 to 3 grs.; in powder, snuffed up the nose every day, or every other day, at bed-time. It excites irritation and a copious watery discharge, more or less muculent, which frequently continues to flow for several days, and occasionally proves highly useful in certain affections of the brain, eyes, mouth, nose, ear, and throat, on the principle of counter-irritation. It has been found "particularly serviceable in *cephalgia* (headache), *obstinate headache*, *chronic ophthalmia* (inflammation of the eyes), and some other lethargic affections." (Dr. A. T. Thomson.) In dimness of sight (especially that arising

from fatigue or congestion), deafness, and slight paralytic affections of the mouth, tongue, lips, or eyelids, not of a serious organic character, and particularly, in chronic earache, it also sometimes affords relief after other remedies have failed. It constitutes the basis of several **CEPHALIC SNUFFS**, ASARABACCA-SNUFF, BARK MCKINSEY'S MEDICINAL POWDER (or SNUFF), and several other like nostrums, which are much extolled by their vendors, and sold at marvellously high prices. See PATENT MEDICINES, POWDERS, SNUFFS, &c. (also *below*).

AS'ARIN (-rîn). C₂₀H₃₀O₅. *Syn.* ASARONE. A species of stearopten, discovered by Görtz, in asarabacca. It has an aromatic taste and an odour resembling camphor, and is said to be emetic. It is probably a mixture of asarum-camphor and some partially oxidised volatile oil. (See *above*.)

As'arine (of Gröger). *Syn.* ASARI'NA, L. The crystallisable bitter principle of asarabacca, noticed above. It is said to greatly resemble *cytisine*.

AS'ARITE (-rite). See ASARABACCA.

ASBESTOS. *Syn.* ASBESTŪS (ἀσβεστός, *incombustible, unconsumable*. Gr.), AMIANTHŪS, LA'PIS A., &c., L.; ASBESTE, AMIANTE, Fr.; ASBEST, STEINFACHS, Ger. In *mineralogy*, a soft, fibrous substance, composed of flexible or elastic filaments which, in their most highly developed form, greatly resemble those of flax or silk, and which bear exposure to a very considerable degree of heat without suffering decomposition. It has been proposed to clothe our firemen in dresses of asbestos; but without freedom of respiration could be insured in a heated and poisonous atmosphere, this envelope would be of little service. Gloves are sometimes made of it, for holding red-hot crucibles. It is also used as a filtering medium for corrosive liquids.

Var. Of these there are several; as AM'IANTH or ELASTIC ASBESTOS, LIG'NIFORM A., MOUNTAIN-CORK, M.-LEATHER, M.-WOOD, &c.; varying from a grey, brown, or green colour, to pure white, and from extreme flexibility and softness, to rigidity and hardness, as indicated by the respective names. In common language, however, the term '*asbestos*' is usually restricted to the softer fibrous varieties.

ASH. *Syn.* FRAXINUS, L.; FRÊNE, Fr.; ESCHÉ, Ger. The popular name of several species of valuable hardy trees bearing apetalous flowers (except in the 'flowering ash'), belonging to the *nat. ord.* Oleaceæ (DC.), and *gen.* Fraxinus; but appropriately, the—

Ash. *Syn.* COMM'ON ASH; FRAXINUS, F. EXCELSIOR (Linn.), F. APET'ALA (Lamb.), F. OE'NUS (Scop.), L.; FRÊNE, F. COMMUN, Fr.; GEMEINE ESCHÉ, Ger. A large tree common to our woods and hedges; *timber* (ASH or ASH-WOOD), used by carpenters, cabinet-makers, and machinists, and much esteemed for its great toughness and elasticity; *bark*, febrifuge, diuretic, resolvent, and tonic; has been success-

¹ Gobel and Kemze, "*Pharm. Waerent*," 1830-1.

fully exhibited in agues; *seeds*, acrid, bitter, and diuretic; *leaves*, purgative, diuretic, and febrifuge; sometimes used instead of senna. In southern Europe it exudes an inferior kind of MANNA, and its medicinal properties are much greater than in our climate.—*Dose*. (Leaves) $\frac{1}{2}$ oz. to $1\frac{1}{2}$ oz. (made into an infusion), as a purge; *seeds*, 1 dr., as a diuretic, &c.

Flowering Ash. *Syn.* MAN'NA-ASH; FRAX'INUS OE'NUS (Linn.), L. A small tree of southern Europe. Yields MANNA. The '*round-leaved flowering-ash*' (CALA'BRIAN-ASH; FRAX'INUS ROTUNDIFOL'IA, Lamarck) is a smaller variety of the preceding, and a native of Calabria and the Levant. Said to yield the best MANNA. The '*small-leaved flowering-ash*' (FRAX'INUS PARVIFOL'IA, Lam.), is another manna-yielding species, indigenous to Asia Minor.

ASH. Ashes (which see).

ASH-BALLS. The ashes of land-plants, especially ferns, damped and made into balls. Used as a substitute for soap in washing, and in cleaning paint.

ASH'ERY. [Amer.] A place where potash or pearlash is made or kept.

ASH'ES. (-iz). [Eng. pl.] *Syn.* ASH; CR'NIS, L.; CENDRES (pl.) Fr.; ASCH, Ger. The remains of anything burned. In *antiquity*, the remains of a body consumed on the funeral pyre; and hence, figuratively, the remains of the dead. The word, in English, has properly no singular; although '*ash*' is very commonly heard; and is now almost exclusively used in composition, as in *pearlash*, *pot-ash*, *soda-ash*, &c.

Ashes. In commerce, the residuum of the combustion of vegetable substances containing either carbonate of potassium ('land-plants'), or carbonate of sodium ('marine plants'), and from which the commercial alkalis are obtained. Their *value* depends upon their richness in 'alkali,' which is determined in the manner explained under ALKALIMETRY. The word is also commonly employed as a general term for the crude carbonates of potash of commerce (which see).

Ashes of Plants. See MANURES, PLANTS, VEGETATION, &c.

ASPARAGIN (ă-jîn). $C_4H_5N_2O_3$. [Eng., Fr.] *Syn.* ALTHE'INE, ASPAR'AMIDE, MAL'AMIDE*; ASPARAGI'NA, ASPARAGI'NUM, L.; AGÉDOLLE, Fr.; SPARGELSTOFF, Ger. A peculiar azotised principle discovered by Vauquelin and Robiquet in asparagus, and since found in the potato, marsh-mallow, liquorice, climbing vetch, and several other plants. Many plants which do not naturally contain it may be made to yield it by growing them in dank damp cellars; whilst many which only normally contain it in very small quantities, are found to yield much more when allowed to vegetate in the same manner.

Prep. 1. From ASPARAGUS-SPROUTS.—The expressed juice, after being heated to the

boiling-point (to coagulate albumen) and carefully skimmed and filtered, is evaporated, at a gentle heat, to a syrupy consistence, and then abandoned to spontaneous evaporation in a warm dry atmosphere for several days; the resulting crystals being purified by cautious washing with very cold water or very strong alcohol, re-solution, and re-crystallisation.

The following are cheaper and more convenient processes:—

2. From MARSHMALLOW-ROOT:—*a.* The root (chopped small, or grated) is macerated for several days in milk of lime, in the cold, the filtered liquid precipitated with carbonate of ammonium, and the clear solution evaporated in a water bath, and otherwise treated as before.

b. From the expressed juice, 2 parts; milk of lime, 1 part; agitated well together; the liquid portion, after some hours, being decanted, filtered, and evaporated, &c., as before.

3. From the ETIOLATED SHOOTS OF VETCHES:—The expressed juice of the young shoots when from 2 or 3 to even 12 or 15 inches long, is gently simmered for 8 or 10 minutes, to coagulate the albumen, and, after straining or clarification, the clear liquid is gently evaporated to the consistence of a thin syrup, and set aside to crystallise, as before. The resulting brown crystals are purified by washing with very cold water, re-solution in boiling water, and re-crystallisation, as in No. 1; or, and what is better, the hot liquid, before evaporation to a syrup, is digested for a short time with a little pure animal charcoal in coarse powder, and then filtered, when large and beautifully white crystals are obtained by the first operation.¹ An excellent and very economical process.

Prop. &c. Crystals brilliant, transparent, colourless, right rhombic prisms; neutral to test-paper; non-basic; having a faint, cooling, and scarcely nauseous taste; scarcely soluble in cold water; freely soluble in hot water; insoluble in strong alcohol and ether; solution unaffected by alkaline sulphurets, oxalate of ammonia, acetate of lead, or infusion of galls; triturated with quick-lime, ammonia is evolved; heated to 212° Fahr. the crystals lose 2 equiv. or 12% of water; heated with water under pressure in a closed vessel, or boiled along with an acid or an alkali, or dissolved in a saccharine liquid and then submitted to fermentation, it is converted into ammonium and ASPAR'IC ACID; aqueous solutions of asparagin and aspartic acid treated with a current of nitrous acid evolve pure NITROGEN, with the formation of MALIC ACID which remains in solution. It was called *asparamide* under the impression that it is *aspartite of ammonia*.

¹ This use of animal charcoal may also be advantageously extended to the other Formule. Mr. C. G. Williams, in Ure's '*Dict. of Arts, M., & M.*' 4th ed., directs the shoots to be used when of "a length of 2 inches," but some authorities recommend them to be of 9, 12, or even 15 inches. The selection must, however, in many cases, depend upon circumstances and convenience.

minus 1 atom of water; and *malamide*, for similar theoretical reasons.

Uses. It is sedative and diuretic.—*Dose.* 1 to 6 grs.; in dropsies, heart-affections, &c.

ASPARAGUS. [L., Eng.] In *botany*, a genus of low, spiny plants, with scale-like leaves, many of which are shrubs and climbers, of the *nat. ord.* Asparagæ (DC.; Liliacæ—Lindl.). The following species, which is that best known in England, is, however, an exception to this description, as it is neither climbing nor spinose.

Asparagus officinalis. [Linn.; L.] *Syn.* ASPARAGUS, COMM'ON A., GARD'EN A.; SPARAGUS, SPAR'ROW-GRASS, SPEER'AGE†; ASPERGE, Fr.; SPARGEL, Ger. A well-known perennial plant, and one of the oldest and most delicate of our culinary vegetables.—Young shoots, from the underground eyes (TUBER'NES ASPAR'AGI, L.); the *asparagus* of our tables; diuretic; communicate a peculiar foetid odour to the urine, and, when eaten in excess, occasion bloody urine and accelerate fits of gout; formerly esteemed emmenagogue and aphrodisiac.—*Root* (RADIX ASPAR'AGI, L.), properties resemble those of the young shoots, but stronger; one of the '*five greater aperient roots*' (RADICES APERIENTES QUINQUE MAJORES, L.) of old pharmacy. The tops and roots, though no longer official in the British Pharmacopœias, are both occasionally employed as popular remedies in dropsy and stone—the first being eaten in the usual way at table; and the second, made into an infusion or decoction ($\frac{1}{2}$ oz. to the pint), taken ad libitum.

As an article of food, asparagus, in moderation, is both wholesome and nutritious. It is cooked by simply boiling it rather quickly until tender, like the other soft green vegetables; and is either served up plain, or on toast with melted butter or *sauce Hollandaise* in a boat. (Soyer; Rundell.) When very small and green, it is frequently dressed and served like green-peas, the tender portion of each shoot being cut into bits of equal size, and about 1-3rd of an inch long. (Miss Acton.)

Choice, &c. "The large grass is generally preferred; although the smaller has the fullest flavour for a dish." (Soyer.) Unlike other plants, the *asparagus officinalis* has not produced a single well-marked permanent variety by cultivation.¹

Asparagus Petras. [L.] *Syn.* ROCK-ASPARAGUS; CORRUDE; ASPARAGUS ACUTIFOLIA, L.; CORRUDE, Fr. Resembles the last in its general qualities; but is said to contain more *asparagin*.

ASPARAMIDE (-mid). See ASPARAGINE.

ASPARTIC ACID. HC₂H₃NO₄. *Syn.* MALAMIC ACID; ACIDUM ASPARTICUM, L.; ACIDE ASPARTIQUE, Fr. An acid first obtained,

by Plisson, from *asparagin*, by boiling it along with hydrate of lead or of magnesia. Its salts are called ASPARTATES (Eng., Fr.; ASPARTAS, L. sing.) • See ASPARAGIN.

ASPEN (-pën). *Syn.* ASP*, TREMBLING POP'LAR†; POPULUS TREM'ULA (Linn.), L.; TREMBLE, Fr.; ABESE (Aspe), &c., Ger. A large tree, of the *nat. ord.* Amentacæ (DC.), not uncommon in the moist woodlands of England, and found native on many of the Scottish mountains. It derives its name from the trembling motion of its leaves, which, owing to the peculiar flattening of the leaf-stalks, are agitated by the slightest impulse of the air. Bark and leaves contain POPULIN associated with SALICIN. Both bark and leaves have been used with advantage in stranguy and intermittents.

ASPHALT' (-fält'). *Asphaltum.

ASPHALTUM. [L., prim. Gr.] *Syn.* ASPHALT', COMPACT BITUMEN, MINERAL PITCH, JEW'S PITCH, FOSS'IL BITUMEN, VITREUS B., &c.; ASPHALTUS, BITUMEN FOSS'ILE (-e-le), B. JUDÆICUM, B. SOLIDUM, B. VITREUM, MUMIA†, M. MINERALIS*, &c., L.; ASPHALTE, BITUME MASSIF, B. SOLIDE, POME JUIVE, &c., Fr.; ASPHALT, ERDEPECH, JUDENPECH, &c., Ger. A black, hard, brittle, and glossy variety of bitumen found on the shores of the Dead Sea (hence called *Lacus Asphaltites*), on and near the shores of the Great Pitch Lake, of Trinidad, and as a mineral product in various other parts of the world.

Prop., &c. Melts without decomposition, and, when pure, burns without residue. It is distinguished from other varieties of bitumen by its more difficult fusibility, and by its fracture being clean, conchoidal, and vitreous. Distilled by itself it yields about 36½ of a peculiar bituminous oil (crude PETROLENE), together with combustible gases, traces of ammonia, and water. To anhydrous alcohol it yields 5½ of a YELLOW RESIN soluble in rectified spirit and ether; by digesting the residuum in ether, a further 70½ of a BROWNISH-BLACK RESIN is obtained, which is freely soluble in the volatile oils and in about 5 times its weight of mineral naphtha. The portion (25½) left undissolved by ether, is very soluble in the oils of turpentine and petroleum. These three resinous principles dissolve altogether, when digested, in the oils of anise, rosemary, and turpentine, and in the fixed oils. (John.) According to others, asphaltum consists almost entirely of *asphaltene*. (Bous-singault.) Parannaphthaline has been found in some varieties. (M. Laurent.) • Average sp. gr. 1 to 1.68. By friction it affords negative electricity. It is soluble in oil of turpentine, benzole, mineral and coal-tar naphtha, the fixed oils, solutions of the caustic alkalis, and several other liquids, by the aid of heat.

Sources. That of commerce is chiefly obtained from the shores of the Dead Sea; but much of that of the shops is a spurious article of the most worthless character. A short time

¹ "The young shoots of *polygonatum* (Solomon's Seal), and others, have been substituted for asparagus." (Lindley's '*Feg. King*,' 3rd ed., 209.)

since some specimens of the purest and most beautiful description, from the great Bitumen Lake of Trinidad, were given us by our respected and venerable friend, the late Earl of Dundonald, who stated, that the supply of both liquid and indurated bitumens, of every grade of quality, was unlimited from that source; but that owing to injudicious importations of inferior kinds, (those most easily shipped,) a prejudice had been created against them in the London market. Our personal investigations have since confirmed the accuracy of these statements.

Uses. The finer varieties are chiefly used as a 'glazing colour' by artists, and in the manufacture of black varnishes and japans. The inferior kinds are applied to the same purposes as ordinary solid bitumen. The Egyptians used it in embalming under the name of *MUTIA*; and the Babylonian builders are said to have employed it, as a cement, in lieu of mortar. It is, however, doubtful whether the hard semi-vitreous variety of bitumen, properly termed 'asphaltum,' was that which was thus employed; its present hardness being probably due to time. As a *medicine*, it is stimulant; and it was formerly used as an ingredient in certain plasters and ointments. See *BITUMEN*, *PITCH*, &c. A mixture of asphalt, chalk, sand, ground sandstone, &c., is used as a pavement for making water-tight tanks and covers, as a coating for gas and water pipes, and for various other similar purposes. Sometimes the pitchy residue obtained by distilling off the more volatile portions of gas tar is employed to replace the asphalt in the foregoing mixture; the product is called *artificial* or *gas-tar asphalt*.

Factitious Asphaltum (-tish-'ūs). *Syn.* *ASPHALTUM FACTITIUM*, L. That of the shops, when not an inferior kind of true asphaltum, is commonly made from the bottoms of *Barbadoes tar*, and other *mineral bitumens*, by heating them until quite hard. Sometimes a little *Scio turpentine*, *balsam of copaiba*, or even *common resin*, is added. Colour, hardness, &c., inferior to those of native asphaltum.

Liquid Asphaltum. *Syn.* *PREPARED ASPHALTUM*; *ASPHALTUM LIQUIDUM*, L. *Prep.* 1. *Scio turpentine*, 2 oz.; melt; add *asphaltum* (in powder), 1 oz.; mix, cool a little, and reduce with hot oil of *turpentine*.

2. (Wilson's.) *Asphaltum*, $\frac{1}{2}$ lb.; melt; add of hot *balsam of copaiba*, 1 lb.; and, when mixed, thin it with hot oil of *turpentine*. Both are used as 'black japan' or 'varnish,' and as a 'glazing colour' by artists.

ASPHYXIA (-fik-'sh'ā; -fiks-'e-ā†). [L., Gr.] *Syn.* *ASPHYXIY* (-e), Eng.; *ASPHYXIE*, Fr.; *PULSLOSIGKEIT*, *SCHWINTOD*, Ger. *Literally*, absence of pulse; hence, a fainting fit; apparent lifelessness. Its use is now generally confined to a suspension of vitality from some cause interrupting respiration, but in which life is not actually extinct, and may, under favourable circumstances, be revived.

Asphyxia is commonly divided into four varieties by nosologists:—

1. **ASPHYXIA ALGIDA**:—*Cause.* Exposure to intense cold.—*Symp.* Countenance pale, livid, and shrivelled; limbs rigid.
2. **ASPHYXIA ELECTRICA**:—*Cause.* Stroke of lightning or electricity.—*Symp.* Countenance pale, limbs flexible, blood incoagulable.
3. **ASPHYXIA MEPHITICA**:—*Cause.* Inhalation of irrespirable gases or fumes.—*Symp.* Countenance pallid, lips wan, &c.
4. **ASPHYXIA SUFFOCATIO'NIS**:—*Cause.* Suffocation or strangulation, as from drowning, hanging, &c.—*Symp.* Countenance turgid and livid.

Treatm., &c. No general rules can be given exactly suitable to each variety. Whenever it is possible to procure medical aid, it should, of course, be immediately sought; as the delay of even a single minute may render it unavailing. In the *treatment* of suspended animation the principal object is to effect a restoration of the respiratory and circulatory functions; the former of which has been arrested by the external condition of the patient; the latter, by the contact of morbidly carbonised blood with the capillary vessels of the lungs. The first thing to be attempted, is the restoration of warmth by active friction with the warm hands, flannels, &c.; the second, the re-establishment of natural respiration by any available means, of which, perhaps, none is simpler or better than alternate pressure and its relaxation, applied to the thorax and abdomen, so as to induce expiration first, and inspiration immediately afterwards, by the natural action and elasticity of the ribs and diaphragm. Cold water may also be suddenly dashed on the face and general surface previously warmed by the frictions, in the hope of inducing a more decided inspiration. If these measures fail, *artificial respiration* should be promptly had recourse to. (Dr. Marshall Hall.) The warm bath, and slight electrical shocks, or continued streaming electricity, may also be applied.

See **CHARCOAL**, **COLD**, **DROWNING**, **HANGING**, **RESPIRATION** (Artificial), **SEWERS-GAS**, **STRANGULATION**, **SUFFOCATION**, &c.

ASPHYXIATED. *Syn.* *ASPHYXIATUS*, L.; *ASPHYXIÉ*, Fr.; *ASPHYKTISCH*, *SCHWINTOD*, &c., Ger. Affected with or labouring under asphyxia. (See *above*.)

ASPIC†. Spike lavender or French lavender; also the *male lavender*, *spica nardi*, or *pseudo-nardus* of old writers. See **ASP**.

Aspic. In cookery, "savory jelly extracted from the succulence of meat." (Soyer.)

Prep. (Miss Acton.) *Calf's feet*, 2 in no.; *veal*, 4 lbs.; *ham*, $\frac{1}{2}$ lb.; *onions*, 2 (large); *carrots*, 3; *water*, 1 gal.; boil 5 or 6 hours, or until reduced to less than one half, strain, and when cold, put the jelly into a stew-pan with the whites of 4 eggs well beaten, a large bunch of savoury herbs, 3 blades of mace (in shreds), a teaspoonful of white peppercorns, and salt,

† s.; keep it well stirred until pretty hot, then let it gently simmer for about 15 minutes, and, after settling, pass it through a *jelly-bag* till quite clear. After cooling a little, it is fit for use; or it may be allowed to cool, and be at any time remelted. French cooks commonly flavour it with *tarragon-vinegar*, added after clarification.

Uses, &c. "Cold poultry, game, fish, plover's eggs, truffles, and various dressed vegetables, with many other things often elaborately prepared, and highly ornamental, are moulded and served in it, especially at large *déjeuners* and similar repasts. It is also much used to decorate raised pies, and hams; and for many other purposes."¹

ASS (äss). *Syn.* AS'INUS, L.; ANE (âne), Fr.; ESEL, Ger. The *equus asinus* (Linn.), a well-known animal found almost everywhere.

ASSAFETIDA. [L. and Eng.] *Syn.* ASSAFETIDA, DEVIL'S DUNG, Eng.; ASSAFETIDA GUMMI, L.; STINKASAND, STINKENDER ASAND, TRUFFELS-DRECK, Ger. A gum resin exuded from the excised root of *norther assafetida* (B. P.); from *ferula assafetida*, and probably from *ferula Persica*. It yields its virtues to alcohol, and forms a clear tincture, which becomes milky on the addition of water. It is imported into Europe from Persia, via Bombay, in cases, mats, and casks.

Comp. Assafetida contains from 4 to 5% of a peculiar volatile oil, and from 50 to 60% of resin of a whitish colour, turning rose-red and reddish-brown by exposure to the air, and giving a greenish solution with concentrated sulphuric acid. Brande resolved this resin into two others—one, soluble in ether; the other, insoluble in that menstruum.

Pur. The assafetida of the shops is generally in masses of a whitish, reddish, or violet hue, formed principally of adhering tears or grains, possesses a peculiar fetid, alliaceous odour, and forms an emulsion with water in all proportions. Hot sulphuric acid blackens it and forms a dark blood-red liquid, sulphurous fumes being evolved. This solution diluted with water, and then saturated with potassa, has a blue colour, which is most visible by reflected light. Digested first in alcohol, and afterwards in weak spirit-and-water, the residuum should not exceed 16%. Sp. gr. 1.325 to 1.330. It is frequently adulterated with inferior gums, and with chalk, clay, sand, &c.* The purest and best is that which is clear, of a more or less pale-red colour, full of white tears, and very fetid.

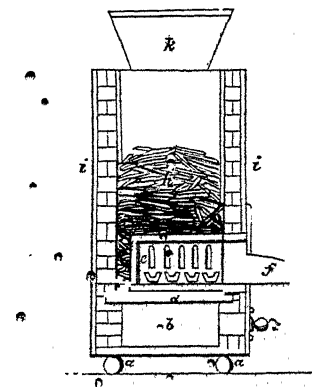

Prop., Uses, &c. Assafetida is stimulant, antispasmodic, emmenagogue, expectorant, aphrodisiac, and anthelmintic, and is the most powerful of all the fetid gum-resins. It is administered with advantage in several uterine diseases, hysteria, chorea, flatulent colic, hooping-cough, infantile convulsions, spasmodic asthma, and some other affections of a spasmodic and convulsive character.—*Dose.* 5

¹ Miss Acton's "*Modern Cookery*," Longmans, 1880, p. 104.

or 6 to 30 grs.; in pills, or preferably made into an emulsion; as an *enema*, 2 drs., with warm water, q. s. Some oriental nations esteem it highly as a condiment. The Brahmins use it against flatulence, and to correct the coldness of their vegetable food. In Persia, the leaves of the plant are eaten as salad; and the root, after being roasted. In *cookery*, it is now frequently employed as a substitute for garlic. "I am assured by an experienced gastronome, that the *finest relish* which a *beef-steak* can possess, may be communicated by" (slightly) "rubbing the gridiron, on which the steak is to be cooked, with assafetida."²

ASSAY ('sä). *Syn.* ESSAI (anc. assaie), Fr.; PRÜFUNG, &c., Ger. Literally, a 'trial' or examination. In *chemistry*, the determination, by any chemical means, of the richness of a substance in its essential material or more valuable ingredient; more particularly applied to quantitative analyses of the commercial alkalis, bleaching-powder, oxide of manganese, ores, and other like articles that are employed on the large scale. In *docimacy* and *metallurgy*, the determination of the quantity of metal in any ore, alloy, or other metallic compound, particularly in the 'dry way,' or by the process of cupellation; and more especially of the quantity of pure gold, or pure silver, contained in coin, bullion, and the commercial alloys and ores of these metals. The substance assayed*. See ASSAYING, &c.

ASSAYING. *Syn.* ASSAY, DO'CIMACY (dös'-), DO'CIMASTIC ART; COUPELLATION, Fr.; AB-

- (a.) Rollers on which the furnace rests.
- (b.) Ash-pit.
- (c.) One of the ash-pit dampers.
- (d.) Grate supporting the muffle-plate.
- (e.) Muffle containing the cupels.
- (f.) The mouth-plate, upon which, during use, is piled ignited pieces of charcoal, by which the mouth of the furnace is closed, and heated air made to pass over the cupels.
- (k.) Interior of furnace containing charcoal.
- (i.) Walls of the furnace.
- (g.) Moveable chimney for regulating the draught.

TEILBEN AUF DER CAPELLLE, Ger. The art of assay, or of determining the quantity of gold

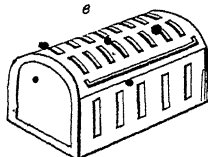

² Pereira, "*Mat. Med. & Therap.*," 4th ed., iii, 177.

and silver in ores and alloys of these metals in the dry way, or by cupellation. It differs from chemical analysis in merely furnishing the quantity of the precious metal contained in the sample examined; instead of the nature and proportions of all, or any, of the ingredients in the compound, at the will of the operator.

Materials, Appar., &c. These are—furnace, muffle, cupels, charcoal, &c., all of which must be provided and properly arranged for use before an assay can be made:—

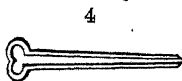

The FURNACE employed at the Royal Mint, and at Goldsmiths' Hall, London, is figured in section in the engr., and has the following dimensions:—Total height, $2\frac{1}{2}$ feet; from the bottom to the grate, 6 inches; grate, muffle-plate, and bed of loam that covers it, 3 inches; space between the grate and the bottom of the funnel or chimney, $21\frac{1}{2}$ inches; funnel, 6 inches. A furnace of any other shape and size may be employed, provided it affords a sufficient heat, and allows of the easy introduction of the muffle.

The MUFFLE (muffl) is a vessel made of clay (see engr.), and furnished with an opening to admit of the introduction of the cupels, and

the complete inspection of the process. It is placed on the muffle-plate (see above), by which it is introduced into the furnace.

The CUPEL (kū-pel) is a small, porous, shallow crucible, usually made of bone ashes or burnt horn. The powder (slightly moistened with water), is placed in a circular steel mould, and after being pressed down tight, is finished off with a rammer having a convex face of polished steel, which is forcibly struck with a mallet, until the mass becomes sufficiently hard and adherent. The newly formed cupel is then carefully removed and exposed in the air for a fortnight, or three weeks, to dry. Fig. 3 represents a cupel in section, and fig. 4, the tongs, used for charging it. The

best weight for cupels ranges between 180 and 200 grs. Those used at the Royal Mint are made of the calcined cores of ox-horns.

Proc. of ass. The muffle, with the cupels properly arranged on the 'muffle-plate,' is placed in the furnace, and the charcoal added and lighted at the top, by means of a few ignited pieces thrown on last. After the cupels have been exposed for about half an

hour, and have become white hot, the lead (see below) is put into them by means of the tongs. As soon as this becomes bright red and 'circulating,' as it is called, the specimen for assay, wrapped in a small piece of paper or lead-foil, is added. The fire is now kept up strongly until the metal enters the lead and circulates well, when the heat, slightly diminished, is so regulated that the assay appears convex and more glowing than the cupel itself, whilst the 'undulations' circulate in all directions, and the middle of the metal appears smooth, with a margin of litharge which is freely absorbed by the cupel. When the metal becomes bright and shining, or, in technical language, begins to 'lighten,' and prismatic hues suddenly flash across the globules, and undulate and cross each other, followed by the metal becoming very brilliant and clear, and at length fixed and solid (called the 'brightening'), the separation is ended and the process complete. The cupels are then drawn to the mouth of the muffle, and allowed to cool slowly. When quite cold, the resulting 'button,' if of SILVER, is removed by the pliers or tongs from the cupel, and after being flattened on a small anvil of polished steel, with a polished steel hammer, to detach adhering oxide of lead, and cleaned with a small hard brush, is very accurately weighed. The WEIGHT is that of the PURE SILVER; and the DIFFERENCE between the weight of the alloy before cupellation, and that of the button of pure metal, represents the proportion of alloy in the sample examined. (See below.) In the case of GOLD, the 'button' has to undergo the subsequent operations of *quartation*, *parting*, and *annealing*, before it is weighed; as described under that metal.

Assayer's weights, &c. The materials used in assaying are accurately weighed in a balance of the most susceptible description; and the weights are given in terms of the 'notation' employed by assayers. The 'fineness,' 'richness,' or 'degree of purity' of GOLD is expressed in carats. Pure gold is spoken of as 24 carats fine; and any other sample containing in 24 parts only 12, 18, 22, &c., parts of pure gold, is said to be of as many carats fine. Every carat is nominally divided into 4 'assay-grains,' each assay-grain into 'quarters,' and each quarter into 'eighths' ($= \frac{1}{8}$ carat), giving 768 "reports" for GOLD. On this system fractional alloys are commonly spoken of as of so many 'carats and thirty-seconds fine.' The real quantity taken for assay, technically termed the 'ASSAY-POUND,' is, however, very small, generally either 12 grs. or 6 grs.; which makes each assayer's eighth-grain, or "report," equal to either the $\frac{1}{48}$ or $\frac{1}{96}$ gr. Troy, as the case may be. The nominal assayer's gold carat is 12 grs. The "journey-weight of gold" is 15 lbs. Troy ($= 701$ sovereigns $= 1402$ half-sovereigns).

The 'fineness,' 'richness,' or 'purity' of SILVER was formerly expressed in penny-

weights; but is now generally reckoned in 1000ths, which admits of greater accuracy. *Pure silver* was said to be "silver of 12 pennyweights." If it contained 1, 2, or 3 parts of alloy, it was termed "silver of 11, 10, or 9 pennyweights," as the case might be. Every *assayer's pennyweight* was nominally divided into 24 grs., and hence gave 288 fine grains, or 'reports,' for SILVER. The fineness of specimens containing odd grains, was given in *pennyweights and fine grains*. The 'ASSAY-POUND' for silver, on this system, may be 24 Troy gr., when 2 real grains are equal to 1 'fine pennyweight,' and $\frac{1}{12}$ real gr. equal to 1 'fine-grain.' In the *decimal method* pure silver is = 1000. The usual weight of silver taken for the 'assay-pound,' when the fineness is reckoned in 1000ths, is 20 Troy grs., every $\frac{1}{20}$ grain of which represents $\frac{1}{1000}$ th of fineness; and so on of smaller divisions. The mint "*journeyweight of silver*," is 60 lbs. Troy (= 3920 shillings, or a like value in other denominations).

Ratio. Cupellation, which is the distinctive and most important operation in assaying gold and silver, is founded upon the feeble affinity which these metals have for oxygen, in comparison with copper, tin, and other cheaper metals; and on the tendency which these latter metals have to oxidise rapidly in contact with lead at a high temperature, and sink with it into any porous earthen vessel, in a thin, glassy or vitriform state. The conditions essential to the success of the process, and which are found in the precious metals, are—that "the metal from which we wish to part the oxides must not be volatile;" and that "it should also melt and form a button at the heat of cupellation; for otherwise it would continue disseminated, attached to the portion of oxide spread over the cupel, and incapable of being collected."¹

Concluding remarks. The art of assaying requires very great care, skill, and experience, for its due exercise; and from the costliness of the precious metals, and their general employment for coin, jewelry, plate, &c., is of the utmost importance both to individuals and governments. Such is the extreme delicacy of the operation of cupellation, that, without the requisites alluded to, it is more likely to fail than to give reliable results. An assay is thought to be good when the 'button' or 'bead' separates readily from the cupel, has a round form, with a brilliant upper surface, and the lower one granular and of a dead metallic lustre. When the upper surface is 'dead' and 'flat,' too much heat has been employed; and in the case of silver, some of the metal may have been lost by fuming or absorption. When the bead adheres to the cupel, or is spongy, variegated, or has scales of litharge still adhering to it, either too little heat has been used, or the process has been stopped before the assay was complete. The remedy is re-exposure to heat

in the cupel, adding a little powdered charcoal or a few small pieces of paper, and continuing the heat until the metal 'brightens' and 'circulates' freely. The lead employed must be absolutely pure, or that technically called '*poor lead*;' and, for this purpose, is commonly prepared by the reduction of refined litharge mixed with some carbonaceous matter, by heat; but, according to the late T. H. Henry, "lead reduced from the litharge of commerce usually contains from 10 to 15 *dwt.* of silver per ton." These remarks apply equally to gold and silver.

The process of assaying by the cupel, however skilfully conducted, gives much less accurate results, especially with silver, than the method of chemical analysis, often termed '*humid*' or '*volumetrical assay*;' whilst it is, in all cases, much more troublesome and expensive, and with compounds containing only small quantities of the precious metals, is not to be depended on. See GOLD, SILVER; also CARAT, CUPELLATION, PARTING, LIQUATION, QUARTATION, REFINING, &c. (and *below*).²

Assay of the Touch. The fineness of JEWELLERY, and of small quantities of GOLD which it is either impossible or inconvenient to assay according to the usual method, is generally determined by means of *touch-needles* and *touch-stones*. The former are made in sets, containing gold of different degrees of fineness, and differently alloyed with copper and silver. The latter are usually of black basalt; but pieces of good black pottery answer the purpose very well. The mode of using them is to mark the stone with the sample under examination, and to compare its appearance, hardness, colour, &c., with that produced by one or more of the needles. When the two are similar, the quality or 'fineness' is considered to be the same. The marks are then further examined by heating the 'touch-stone' to redness, and moistening the strokes with *aqua fortis*, when the appearances resulting from oxidation, &c., differ according to the nature and quantity of the alloy. A nearly similar method is sometimes adopted with SILVER; but the characteristics are scarcely so distinct with that metal. (See *above*.)

Humid Assaying, Humid Assay. Terms applied to the estimation of the quantity of gold and silver in ores and alloys in the moist way, more especially by the method known as volumetrical analysis. See GOLD (Estim.), SILVER (Estim.), VOLUMETRICAL ANALYSIS, &c.

ASSIMILATION. [Eng. Fr.] *Syn.* ASSIMILATION, L.; ANEIGNUNG, VERÄHNLICHUNG, &c., Ger. In *physiology*, the conversion of food into nutriment, and finally into the substances which compose the bodies of animals and plants; the function of nutrition.

² Those desirous of further information on the subject than that contained in this work, are referred to Mitchell's "*Manual of Assaying*;" and to the various memoirs of Gay-Lussac, Chaudet, D'Arcet, Tillet, Brande, Ure, Henry, and others.

¹ Ure's "*Dict. of Arts, &c.*" 5th ed., i, 214.

ASTHEN'IC. *Syn.* ASTHEN'ICUS, L.; AS-THÉNIQUE, DÉBILE, Fr.; SCHWACH, Ger. Weak; debilitated. In *pathology*, an epithet of diseases (ASTHEN'IC DISEASES) accompanied by great and well-marked debility.

ASTHEN'OPY. *Syn.* ASTHENO'PIA, L. In *pathology*, incapacity to keep the eyes fixed on near or small objects for any length of time without confusion of vision. The common causes are over-exertion of the eyes, particularly by artificial light or by a very brilliant one, or during convalescence; congestion of the ocular vessels; debilitating discharges or indulgences; and general nervous debility, however produced. It "appears to consist in weakness of the apparatus, by which the eye is adjusted for the vision of near objects;" and along with this "there is an irritable state of the retina, connected in some manner with a tendency to internal congestion of the eyes."¹ The *treatment* may consist of rest to the eyes, and ablu-tion of them in cold water, with such other efforts to restore their tone and the general health as are noticed under AMAUROSIS. The prospect of complete cure, when the cause is not removable, is unfavorable; but even when confirmed the disease is not likely to end in blindness. The use of *convex spectacles of very low power* will generally be found serviceable. See **EXTRA, SPECTACLES, VISION, &c.**

ASTH'MA (ăst'-mă²). [Eng., Ger., L., Gr.] *Syn.* ASTHMA, Fr.; ENGERÜSTIGKEIT, Ger. In *pathology*, a well-known disease coming on by fits, and characterised by shortness and difficulty of breathing, accompanied by a wheezing sound, cough, stricture and tightness of the chest, with other like symptoms. These gradually increase until the patient can no longer remain in a recumbent position, being, as it were, threatened with immediate suffocation; and they generally terminate, after the lapse of a few hours, in copious expectoration. The attack usually commences towards evening, and the symptoms increase in urgency during the night—often occurring suddenly after the first sleep—until at length, on the approach of morning, a remission takes place, and, in all probability, the patient, worn out and exhausted, falls into a sound sleep. On awaking in the morning he still feels the 'tightness' at the chest, breathes with some difficulty, which is increased by moving, and cannot lie in bed unless his head and shoulders are greatly raised. After a repetition of the fits for some nights, they at length moderate, and after more considerable remissions, pass off at last, leaving the patient in his usual state of health for a time, or until fresh exciting causes produce a return of the disease. For an evening or two previous to the fit, the patient generally feels drowsy, indolent, and low-spirited, and experiences a sensation of fulness about the

stomach, with headache, general uneasiness, and indigestion—these are the premonitory symptoms.

Asthma is principally confined to the later periods of life, and appears in many cases to be hereditary. It is generally severest in the heat of summer, or in the foggy or damp or windy weather of winter. The fits vary in duration from two to several hours. Sometimes copious expectoration commences early, which has led to the division of asthma, by nosologists, into two kinds—*dry, nervous, or spasmodic asthma* (ASTHMA SICCUM, L.) and *humid a.* (A. HUMIDUM, L.).

The *exciting causes* of asthma are exposure to sudden changes of temperature, particularly from heat to cold; unwholesome effluvia, hard drinking, heavy meals, indigestion, violent exercise, and cold, damp, foggy, and sometimes, windy weather.

Treatm. A dry, warm, and airy situation as a residence, should, if possible, be sought. The use of flannel next the skin, and tepid or warm bathing is also advantageous. The bowels should be kept regular by mild aperients, and the stomach preserved in order by the adoption of a light and wholesome diet; particularly avoiding excess in either eating or drinking. The severity of the paroxysm may be generally lessened by adopting the sitting posture, and inhaling the vapour of hot water or of an infusion of chamomile. Small doses of camphor, ether, and opium, frequently repeated, may also be tried. The inhalation of the vapour of a little tar liquefied by heat, is said to often produce considerable relief. The fumes arising from the slow combustion of porous paper dipped in a solution of nitre, and dried, have also been recommended. "The fumes of a piece as big as one's hand being placed on an earthenware plate, and ignited, presently become sensible throughout the room; and within a quarter of an hour their influence, in many cases, is rendered evident, in clearing the passages, and gradually opening the air-tubes." "Of calming vapours that of chloroform is, however, the one likely, in respect of its soothing power, to supersede all others. Inspired in moderate quantity, far less than is requisite to produce general insensibility, it has been found of singular efficacy in allaying, at once, the spasmodic distress of an asthma-fit. But it is a remedy too potent and subtle to be intrusted to the discretion of the patient himself" (Dr. Watson); unless, indeed, he well understands its properties and nature, and has some friend near him to restrain his using it too freely—a thing he is, unfortunately, often tempted, by the urgency of the symptoms, to do. "Bleeding is an imprudent operation in every species of asthma" (Dr. Bree); and has often proved highly injurious, especially in elderly persons. It is only in full plethoric habits, or when the paroxysms are very severe, and attended with signs of congestion of the lungs and

¹ T. W. Jones, "*Defects of Sight*," Lond., 1856; p. 82.

² *Asth'ma* (with *th* fully sounded), as given by Knowles, is difficultly pronounceable, and is now obsolete.

brain, indicated by lividity of the countenance, stupor, extreme dyspnoea, &c., that blood should be taken; and then only by 'cupping' between the shoulders, or by leeches to the chest. Emetics, and active purgatives, must also be avoided during the paroxysm; at which time constiveness may be best removed by an aperient clyster containing assafoetida. At other times, emetics (of ipecacuanha) and diaphoretics, followed by mild purgatives, may be administered with advantage; indeed, an emetic, taken a few hours before an impending fit, will frequently prevent its accession. *Dyspeptic symptoms* must be treated in the usual manner. "*Chalk and opium* will astonish the asthmatic, by the excellence of their effects when the irritation proceeds from dyspepsia of the first passages only." (Dr. Bree.) The same authority also states that 'vinegar,' separately administered, counteracts the flatulence and distension of the stomach.

Various other remedies have been recommended for asthma; among which are the smoking of tobacco and stramonium. In using the latter herb, the root and lower parts of the stem are chopped up and placed in the bowl of a common tobacco-pipe, and a few whiffs are occasionally taken. Drinking at the same time should be avoided. Lately *lobelia inflata* (Indian tobacco) has been highly extolled in asthma, in doses of—*tincture*, 20 or 30 drops, to 2 teaspoonfuls—*powder*, 5 to 15 or 20 grs.; taken at the commencement or shortly before the accession of the fit, and repeated after the interval of an hour, if nausea or expectoration does not intervene. Sir John Floyer is said to have been cured of an asthma of 60 years' standing, at the age of 80, by the constant use of very strong coffee. Sir John Pringle adopted the same remedy with great success. He remarks, "One quality occurred to me which I have observed of that liquor (*coffee*), confirming what you have said of its sedative powers. It is the best abater of periodic asthma which I have seen. The coffee used ought to be the best *Mocha*, newly burnt, and made very strong immediately after grinding it. I commonly order an ounce for one dish, which is to be repeated with fresh coffee after the interval of a quarter or half an hour; and which I direct to be taken without milk or sugar."¹

Very recently cigars and cigarettes of *datura tatula*, Linn.—a peculiar species of stramonium—have been prepared by Messrs. Savory and Moore; and are strongly recommended by Drs. Watson, Latham, Fergusson, and many other physicians of eminence, as the very best remedy yet introduced for asthma.

A change of diet and habits, and particularly a change of residence, will often produce a marked improvement in asthmatic patients, and even effect a cure, when medicines have failed. The use of *bark* and *bitters*, or mild *chalybeate tonics* (when not contra-indicated)

¹ "Letter to Dr. Percival."

tends to improve the tone of the system, and may be adopted, in nearly all cases, with perfect safety. See AIR-BATH (Compressed), CIGARS, DATURA, &c.

Grind'er's Asthma. See MELANOSIS.

ASTRINGENT (-trínjé-). [Eng., Fr.] *Syn.* ASTRIN'GENS, L.; ZUSAMMENZIEHEND, Ger. That straitens or causes wrinkling or constriction. In *pharmacology*, an epithet of substances or agents (ASTRIN'GENTS; ASTRINGEN'TIA, L.) which constrict animal fibre and coagulate albuminous fluids, and thereby obviate relaxation and check excessive secretion or discharges. In modern use, the word, both as an *adj.* and *subst.*, is chiefly applied to internal remedies; those of a like character, employed externally, being usually termed 'styptics,' 'desiccants,' &c.

The principal astringents are—*alcohol*, *alum*, *chalybeates* (generally), *sulphate* of copper, *sulphate* and *perchloride* of iron, *acetate* and *dioacetate* of lead, *lime*, *bichloride* of mercury, *nitrate* of silver, *vegetable astringents* (see below), *acetate*, *carbonate*, *chloride*, *oxide*, and *sulphate* of zinc, &c. See DESICCANTS, STYPTICS, TONICS, &c.

Min'er'al Astringents. See ASTRINGENT- (above).

Vegetable Astringents (vèj'-). Of these the principal are—*alkanet*, *bistort*, *catechu*, the *cinchona barks* and their *alkaloids*, *dragon's blood*, *French or red rose*, *galls*, *kino*, *logwood*, *mastiche*, *oak-bark*, *red sander's wood*, *rhatany*, *tormentil*, *tannic acid*, *gallic acid*, and *areca nut*. (See above.)

Astringent Principle. A term formerly restricted to tannin; but now commonly applied to the astringent matter of any vegetable.

ATMOMETER. *Syn.* ATMIDOMETER; ATMOMETERUM, &c., L.; ATMOMÈTRE, &c., Fr. In *chemistry* and *meteorology*, an instrument for measuring the rate of evaporation from a humid surface.

ATMOSPHERE (-fère). *Syn.* ATMOSPHERA, L.; ATMOSPHERE, Fr.; ATMOSPHÈRE, DUNSTKREIS, Ger. Primarily, a 'vapour-sphere'; *appr.*, the assemblage of respirable gas and aeriform vapours which surround the earth; *fig.*, any surrounding medium or influence.

Comp., *Chem. prop.*, *Pur.*, *Uses*, &c. See AIR (Atmospheric).

Mechanical properties of the atmosphere:—

COLOUR:—The prevailing colour of the atmosphere is blue; at considerable elevations this blue tint is lost, and the sky appears deep black. The prevalence of blue is referred to the greater facility with which the blue and violet rays are reflected; whilst the glowing tints of morning and evening are conceived to arise from the red rays possessing greater momentum than the other rays of the spectrum.

DENSITY:—The density of the atmosphere diminishes with the distance from the earth's surface, and this in the duplicate ratio of the

altitude. Thus, if at a given altitude the density of the air is only one half what it is at the level of the sea, at twice that elevation it possesses only one fourth that density. Or this fact depends the application of the barometer to the determination of the elevation or depression of any point above or below the level of the sea, taken as a standard.

Density of the Atmosphere at Different Elevations. By PROF. GRAHAM.

Height above the level of the Sea in miles	Volume of Air.	Height of the Barometer.
0	1	30
2.705	2	15
5.41	4	7.5
8.115	8	3.75
10.82	16	1.875
13.525	32	.9375
16.23	64	.46875

HEIGHT, &c.:—If the density of the air were uniform throughout its whole extent, the height of the atmosphere, measured by a corresponding column of mercury, would be barely $5\frac{1}{4}$ miles. As, however, its density decreases with the distance from the earth's surface, its real height must be considerably greater. Kepler found that the reflection and refraction of the sun's rays by the atmosphere, producing twilight, ceases when that luminary descends 18 degrees below the horizon; whence it is calculated that the atmosphere cannot have a greater altitude than 45 miles. On the other hand, there is reason to believe that it cannot be much less than this sum. "With a good air-pump air may be rarefied 300 times; supposing this to be the utmost limit to which rarefaction can be carried, the atmosphere would still extend to an altitude of above 40 miles." Whether, in a state of extreme tenacity in which its grosser properties are lost, it extends indefinitely into space, was formerly a subject of controversy. That its boundaries are limited, and that it belongs exclusively to our earth, appears almost certain. "We are warranted in concluding that the atoms of air are not infinitely divisible, and consequently, that the atmosphere has a limit; and the limit must be situated at that height above the earth, where the gravitation of the atoms is just equal to the force of their repulsion."¹ Under ordinary circumstances the mercury of the barometer falls about one inch for every 1000 feet of elevation.

PRESSURE:—The weight or pressure of the atmosphere is shown by the rise of water in the barrel of the common lifting pump, and the suspension of the mercurial column in the tube of the barometer. The fact affords a ready means of determining the actual pressure of the air; the column of mercury, and

¹ Brande's "Dict. of Lit., Sci., & Art."

the column of air by which it is suspended, resembling two weights in equilibrio, at the opposite extremities of the same balance. The mean height of the barometer at the level of the sea, in England, is 29.6 inches (= about 33 $\frac{1}{2}$ feet of water); and as a cubic inch of mercury weighs 3425.92 grs. or 489.56 lb., it follows that the weight of a column of mercury whose base is a square inch, is 14.6 lb. avoirdupois. The pressure of the atmosphere is not merely downwards, but is equally diffused in all directions, and exerts a most powerful effect in the economy of organic beings. On the surface of the body of an adult of ordinary size (say = 15 sq. feet, or 2160 inches), it amounts to the enormous weight of 31,536 lbs., which is not sensible, only because it is balanced by the force of the elastic fluids in the interior of the body. Were this equilibrium to be suddenly destroyed, the consequence would be, either that the body would be instantly torn to pieces with explosive violence, or that it would be crushed under the overwhelming weight that would suddenly fall upon it. Even the comparatively slight variations of atmospheric pressure which occur with changes of wind, weather, and season, exercise a perceptible effect on the functions of life.

Mean pressure of the Atmosphere at the level of the Sea, in different latitudes, at 32° Fahr., expressed in inches of mercury.

Lat.	Height (inches).	Lat.	Height (inches).	Lat.	Height (inches).
0°	29.930	40°	30.019	54 $\frac{1}{2}$ °	29.926
10	29.975	45	30.000	60	29.803
20	30.064	49	29.978	64	29.606
30	30.108	51 $\frac{1}{2}$	29.951	67	29.673

TEMPERATURE:—The temperature of the atmosphere, independently of changes arising from variations of latitude and season, diminishes, like its density, with its elevation. In general, every 100 yards of ascent causes the temperature to fall 1° Fahr. See AIR (Atmospheric), EPIDEMICS, VENTILATION, &c.

Atmosphere. In engineering and pneumatics, the pressure of a column of mercury at 0° Cent. or 32° Fahr., which is 76 centimetres or 29.9218 inches high, at the mean level of the sea in latitude 45°, taken as a standard of that exerted by other elastic fluids. In practice this is assumed to be 15 lbs. to the square inch, under a barometrical pressure of 30 inches. Thus, steam or air condensed so as to exert a pressure of 30 lbs. per sq. inch, is said to be of two atmospheres; at 45 lbs., of three atmospheres, &c.

ATOM (-um). Atomic Weight, Atomic Theory. Syn. ATOMUS, L.; ATOME, Fr.; ATOM, UNTEILBARE THEILCHEN, Ger.

ATOMIC WEIGHT. When the elements unite chemically, they invariably do so in the propor-

ing it in 5 times its weight of alcohol, decolouring it with pure animal charcoal, distilling off greater part of the alcohol, and evaporation and crystallisation by a very gentle heat; or only about one half the spirit is distilled off, and 3 or 4 times its volume of water gradually agitated with it, the resulting milky liquid being then heated to boiling, and allowed to cool very slowly, when nearly the whole of the ATROPIA crystallises out after a few hours. The same may be effected by at once agitating 6 or 8 volumes of water with the alcoholic solution, and setting aside the mixture for 12 to 24 hours, by which time the crystallisation will be completed. This process originated with Soubeiran, was improved by Mein, and subsequently, with slight modifications, adopted by Liebig. The product is about 0.3% of the weight of root operated on.

4. (Bouchardat and Cooper.) The filtered tincture is precipitated with iodine dissolved in an aqueous solution of iodide of potassium, the resulting ioduretted hydriodate of atropia, decomposed by zinc and water, the metallic oxide separated by means of carbonate of potassa, and the alkaloid thus obtained dissolved in alcohol, and crystallised.

5. (Mr. Luxton.) The dry leaves of belladonna are gently boiled, for 2 hours, in distilled water just sufficient to cover them, and the resulting decoction is strained through a coarse cloth into a large precipitating jar; this process is repeated with a second quantity of distilled water, and the two decoctions mixed; concentrated sulphuric acid is now added in the proportion of 2 drs. to every pound of leaves operated on, by which the vegetable albumen of the decoction is precipitated, and the liquid becomes clear and sherry-coloured; the clear liquor is now decanted or syphoned off, and, if necessary, filtered; the filtrate is now decomposed by either passing a stream of gaseous ammonia through it, or by suspending in it a lump of carbonate of ammonia. The effect is that the liquid turns black, and crystals of ATROPIA are slowly formed and deposited. At the expiration of a day or two, the supernatant mother-liquid is removed with a syphon, and the crystals thrown on a filter to drain and dry.¹ It may be purified by re-solution and crystallisation. 1 lb. of leaves yields 40 grs.; or at the rate of fully .57%.

6. (Rabourdin.) To the crystallised juice of the plant (previously heated to coagulate its albumen, filtered, and allowed to cool), 1 quart; is added of caustic potassa, 1 dr.; and afterwards, of chloroform, 1 oz.; the whole is then agitated well, and after $\frac{1}{2}$ an hour's repose, the supernatant liquor is poured from the discoloured chloroform, which, after being washed with distilled water as long as it gives any colour to that liquid, is placed in a small retort, and the chloroform distilled off by the heat of a water bath; the residuum is dis-

solved in a little water acidulated with sulphuric acid, and precipitated with carbonate of potassa, in slight excess; the precipitate is re-solved in alcohol, and the solution, by spontaneous evaporation, yields crystals of ATROPIA.

7. (Ure.) From the expressed juice of the fresh, or the watery extract of the dry plant, by treating it with caustic soda, in slight excess, and then agitating the mixture with 1½ times its volume of ether; the ATROPIA taken up by the ether is again deposited after repose for some time, and is then purified by repeating the treatment with fresh ether as often as necessary.

8. Freshly precipitated hydrate of magnesia is added to the coagulated and filtered expressed juice, and the mixture evaporated to dryness, as quickly as possible, in a water bath; the residuum is pulverised and digested in strong alcohol, and the clear liquid allowed to evaporate spontaneously. The crystals may be purified by repeated re-solutions in alcohol.

Prop., Tests, &c. The crystals obtained from hot concentrated solutions, colourless, transparent, silky prisms; from solutions in dilute spirit, silky needles, like those of disulphate of quinine. It is colourless; has a bitter, acrid, and somewhat metallic taste; dissolves in 200 parts (300 parts—Thomson) of cold and 50 to 54 parts of boiling water, in 1½ parts of cold alcohol, and in 25 parts of cold, and 6 parts of boiling ether; it has an alkaline reaction, fuses at about 194° Fahr., is slightly volatile at common temperatures, and freely rises in vapour at 212° Fahr.; at higher temperatures it volatilises with partial decomposition; with the acids it forms salts, of which several are crystallisable.

Tests.—1. Nitric acid forms with it a yellow solution:—2. With cold sulphuric acid it gives a colourless solution, which becomes red only when heated:—3. Aqueous solutions of atropia and its salts are—*a.*, turned red by tincture of iodine—*b.*, gives a citron-yellow precipitate with terchloride of gold—*c.*, a flocculent whitish precipitate with tincture of galls, and—*d.*, a yellowish-white one with bichloride of platinum:—4. Heated with caustic potassa or soda, it suffers decomposition, and ammonia is evolved:—5. A weak solution cautiously applied to the eyelid or conjunctiva, produces dilation of the pupil lasting for several hours.

Pur., &c. Alkaloid prepared from the root of *atropa belladonna*. Crystals; white, in the form of prisms; soluble in water and rectified spirit. It leaves no ash when burned with free access of air (B. P.).

Phys. eff. It is a very powerful narcotico-acrid poison.¹ Its effects are similar to those of belladonna, but considerably more powerful. "A very minute (imponderable) quantity applied to the eye is sufficient to dilate the pupil." (Pereira.) The $\frac{1}{15}$ to $\frac{1}{10}$ gr. often causes very serious effects in the human subject. The $\frac{1}{4}$ th

¹ "Pharm. Journ.," 1854-5, p. 299.

² A "cerebro-spinal poison."—Taylor.

of a grain accelerates the pulse, affects the brain, causes dryness of the throat, difficulty of deglutition, dilation of the pupil, dimness of sight, giddiness, strangury, numbness of limbs, sense of formication in the arms, rigidity of thighs, depression of pulse, and sometimes feebleness or loss of voice. These symptoms continue for from 12 to 24 hours. In larger doses death ensues.

Ant., &c. These may be similar to those described under *BELLADONNA* and *ALKALOID*.

Uses. Chiefly as an external agent, as a substitute for belladonna, to cause dilation of the pupil; and as a local anæsthetic or anodyne, especially in facial neuralgia. Internally, it has been occasionally given in whooping-cough, chorea, and a few other nervous diseases.—

Dose. $\frac{1}{16}$ gr., gradually increased to $\frac{1}{8}$, or occasionally, even $\frac{1}{4}$ gr. in solution, or made into a pill with liquorice powder and honey, or syrup, or used endermically; for a collyrium, 1 gr. to Water 1 oz., a few drops only being applied to the eye at a time; the greatest caution in each case being observed. It is also employed to make the sulphate. In dispensing it, a single drop of acetic acid, or diluted sulphuric acid, will be found to facilitate and ensure its perfect solution. See *BELLADONNA* and *BELLADONINE*.

Atropia, Sulphate of. *Syn.* *ATROPÏA SULPHAS*, L. *Prep.* (B. P.) Take of *atropia*, 120 grs.; distilled water, 4 fl. drs.; diluted sulphuric acid, a sufficiency.

Mix the atropia with the water and add the acid gradually, stirring them together until the alkaloid is dissolved and the solution is neutral. Evaporate it to dryness at a temperature not exceeding 100°.

Characters and Tests.—A colourless powder, soluble in water, forming a solution which is neutral to test-paper, and when applied to the eye dilates the pupil as the solution of atropia does. It leaves no ash when burned with free access of air.

Intended for external application. It is a powerful poison.

Uses, &c. The same as those of the pure alkaloid.—*Dose.* $\frac{1}{16}$ to $\frac{1}{8}$ gr., either in solution or pills; 1 to 3 gr., to water, 1^{fl} oz., as a collyrium, of which a few drops seldom fail to produce full dilation of the pupil in about a quarter of an hour; 1 to 2 grs., to lard, 1 dr., forms an excellent ointment in neuralgic affections.

Obs. Sulphate of atropia (which is intended for external use only) is rather difficult to crystallise, as it has a tendency to assume an amorphous or gum-like condition. It is more soluble than the pure alkaloid; and like it, is a terrific poison.

ATROPIC ACID. *Syn.* *ACIDUM ATROPICUM*, L. The name given by Richter to a volatile crystallisable substance, possessing acid properties, found in *atropa belladonna* or *deadly nightshade*. In many respects it resembles benzoic acid, from which, however, it is distinguished by not precipitating the salts of iron.

ATROPÏNA, Atropine. See *ATROPIA*.

**AT'TAR.* See *OTTO* and *VOLATILE OILS*.

ATTELETTES (-lèt's). [Fr.] In *cookery*, small skewers, generally of silver, with ornamental heads. The term is also applied to small dishes (*ENTRÉES*, &c.) in which the articles are mounted on attellettes. Small fish, as smelts, are often served in this way. See *AIGUILLETTE*.

ATTENUANT (-n-ànt). *Syn.* *ATTEN'UANS*, L.; *ATTÉNUANT*, Fr.; *VERDÜNNEND*, Ger. That makes thin, or less dense or viscid; diluting. In *medicine*, applied to remedies (*ATTEN'UANTS*, *SPANEM'ICS*) which are supposed to act by thinning, diluting, or impoverishing the blood.

ATTENUATION. *Syn.* *ATTENUA'TIO*, L.; *ATTÉNUATION*, Fr.; *VERDÜNNUNG*, Ger. A thinning or diminishing; a reducing in consistence. In *medicine*, see the *adj.* (above); in *brewing*, the decrease of the density of worts during fermentation, arising from the gradual conversion of their '*saccharine*' (sugar) into alcohol. See *BREWING*, *DISTILLATION*, *WORTS*, &c.

ATTRACTION. [Eng., Fr.] *Syn.* *ATTRAC'TIO*, L.; *ANZIEHUNG*, Ger. The power that draws together matter and resists its separation. That force which attracts bodies towards the centre of the earth, and which keeps on its surface those that are movable, is called *GRAVITY*, or the *attraction of gravitation*. It is exerted at sensible, often at immense, distances, and determines the figure and motions of the planets and comets, and causes the descent of heavy bodies to the ground. This force it is which confers the property of weight upon matter.

That force which unites particles of the same kind of matter, so as to cause them to assume the condition of solid or liquid masses, *e.g.* particles of chalk to form a mass of chalk, particles of water to form a mass of water, is called *COHESION*, or the *ATTRACTION OF COHESION*. That force which binds together different substances without changing their properties, as when paint sticks to wood, ink to paper, &c., is called *ADHESION*, or the *ATTRACTION OF ADHESION*. *CAPILLARY ATTRACTION* is a modification of *adhesion*, and is characterised by being exerted between liquids and the internal surfaces of tubes and pervious bottles. The absorption of water by a sponge, the ascent of oil in the wick of a lamp, are examples of this power. The *CHEMICAL FORCE* or *AFFINITY* differs from all other kinds of attraction in being exerted between definite and constant quantities (*atoms*) of matter, usually of dissimilar natures, and producing combinations possessing properties different from those of their components. (See *AFFINITY*.) This force, as well as cohesion and adhesion, is exerted at distances so small as to be immeasurable.

The terms *ELECTRIC ATTRACTION* and *MAGNETIC ATTRACTION* are employed in *physics* to denote phenomena which we imperfectly understand, and which operate between bodies

at sensible distances, and simulate those of the attraction of gravitation.

ATTRITION (-trish'-ūn). [Eng., Fr.] *Syn.* ATTRITO, L.; ABREIBUNG, AUREIBUNG, Ger. In *mechanics*, the wearing away of parts by friction. In *medicine*, a graze, abrasion, or solution of continuity of the cuticle, or the act which causes it. In *surgery*, the crushing or tearing away of any exterior portion of the body by violence. See ABRASION, ANTI-ATTRITION, FRICTION, &c.

AURANTIA'CEÆ (-she-ē). [Lat.; D.C.] The orange tribe. In *botany*, an extensive and important *natural order* of exogenous trees and shrubs, found exclusively in the temperate and tropical parts of the Old World, and unknown in a wild state in America. The *fruit* is pulpy, succulent, sub-acid, and eatable, and separated into cells by membranous partitions, and is covered with a leathery aromatic skin or rind. Some of the genera embrace plants of great beauty and utility. A few of the Indian species are climbers. The genus CITRUS, which includes the orange, lemon, citron, lime, bergamot, and shaddock, is that best known in Europe.

AURANTIIN (-she-in). *Syn.* HESPERIDIN; AURANTINE* (-tin), Eng., Fr.; AURANTI'NA, &c., L. The bitter principle of the peel of oranges and lemons.

Prep. The exterior or yellow peel of the *Seville orange* (carefully separated from the white matter, and air-dried) is steeped in hot water, and the filtered liquor gently evaporated to dryness.

Prop., &c. It possesses the bitter properties of the peel without any of its glutinosity or fragrance, and is said to agree better with delicate stomachs. It may be taken in water either with or without the addition of a little sugar or capillaire, or dissolved in wine.

AU'RIC (aw'- or 'awr'-). *Syn.* AU'RICUS, L. Of or relating to gold, or containing it, or formed from it.

AURIFEROUS. *Syn.* AU'RIFER, AURIFERUS, L.; AURIFÈRE, Fr.; GOLDHALTIG, Ger. In *mineralogy*, that yields or contains gold; as *auriferous sand*, *a. quartz*, &c.

AURIPIGMENTUM †. [L.] *Literally*, paint of gold; *appr.* native opiment. See ARSENIC.

AURO-CHLO'RIDES (-klōrē-īdz). Compounds of perchloride of gold with chlorides of other bases. They may be prepared by mixing the *terchloride of gold* with the *chloride of the base*, in atomic proportions, and setting aside the solution to crystallise.

Prop., &c. Most of the auro-chlorides crystallise in prisms, dissolve in both alcohol and water, have an orange or yellow colour, and are decomposed at a red heat.

AURO-CYANIDES (-īdz). In *chemistry*, compounds of cyanide of gold with cyanides of other bases. They may be formed in a similar manner to the auro-chlorides. *Auro-cyanide of potassium* is much used in electro-gilding.

AUTOGENOUS (-tōj'-). *Syn.* AUTOGE-

NEAL; AUTOGENUS (-tōj'-), L. Self-generating or effecting; acting without the aid of foreign matter. In *anatomy*, &c., developed from distinct and independent centres; as parts or processes. Among *metallists*, it denotes a method of joining metals by fusing the parts in contact, by means of a flame of hydrogen, or of a mixture of hydrogen and common air, without the intervention of a fusible alloy or solder. Lead, and even ordinary hard solders, are, however, sometimes so employed, and the name, though improperly, retained.

AUTOMAT'IC. *Syn.* AUTOMAT'ICUS, AUTOM'ATUS, L.; AUTOMATIQUE, Fr.; AUTOMATISCHE, Ger. Self-acting or self-moving, or that seems to be so; mechanical; or of or resembling an automaton. In *physiology*, involuntary, applied to functions which are performed without the operation of the will; as the movements in respiration, the contractions and dilations of the heart, the persistent contraction of the sphincters, &c. In *mechanics*, &c., moving and acting from concealed machinery; also, as applied to *machinery*, self-regulating and directing, within the limits prescribed by its author, though moved by external power. To the last class belongs the self-acting machinery of our flax and cotton mills, our engineering establishments, &c.; in which the elementary powers are made to animate, as it were, millions of complex organs, infusing into forms of wood, iron, and brass, an agency resembling that of intelligent beings. The manufactures in which such machinery is employed are termed the **AUTOMATIC ARTS**.

AVENA. [L.] The oat; oats.

AVE'NIN (-nīn). *Syn.* AVENA'INE* (āv-e-); AVENI'NA, &c., L.; AVÉNINE, &c., Fr. A nitrogenous compound, analogous to, and probably identical with, casein, obtained from oats, and on which its nutritiveness chiefly depends.

Prep. The grain, reduced to the state of powder or meal, is washed on a sieve, and the milky liquid, after being allowed to deposit its starch, is heated to about 200° Fahr., to coagulate the albumen; when cold, acetic acid is added as long as a white powder falls, which is AVENIN; this is collected on a filter, drained, and dried by a gentle heat.

AVEN'TURIN, Avanturin (-ū-rīn; -vōng-tōō — Knowles & Smart). [Eng. Fr.] A beautiful iridescent variety of rock crystal, minutely spangled throughout with yellow scales of mica (AVENTURIN, A. QUARTZ). A variety of felspar (A. FEL'SPAR) of somewhat similar appearance is found in the Continent and the Peninsula, of which the finer kinds are called A. ORIENTALE and PIERRE DE SOLEIL by the lapidaries. Both varieties are now imitated by the glass and porcelain manufacturers. See GLASS, GLAZE, PASTE, &c.

AVIARY (-ē-). *Syn.* AVIA'RĪUM, L.; VOGELER, Fr.; VOGELHAUS VOGELBECK, Ger. A place for keeping birds; generally applied to an enclosed space or building in which birds

are kept, or bred, on account of their rarity, plumage, or song; and not for food.

Situa., &c. For exotic birds, a place should be selected where the temperature can be maintained at a proper degree throughout the year, and which is well protected from the weather. This is commonly done by choosing a space attached to the summerhouse or hot-house. When the aviary is only intended for birds of climates similar to our own, any part of the open garden may be chosen, and a portion closed in, either with trellis-work or wire-work, or netting; care being taken to provide, in some easily accessible portion of it, full protection from vicissitudes of weather and season. Nor must cleanliness, and due ventilation and protection from foul air or noxious fumes, be left unattended to.

AVIGNON' BERRIES (äv-veen-yong). French berries.

AVOIRDUPOIS' (äv-ër-du-pois'). The common weight of 16 oz. or 7000 grs. to the lb., used in these realms for all kinds of goods, except jewelry and the precious metals, and medicines in dispensing, or as ordered in the 'British Pharmacopœia' of 1867.

AX'IS. [L., Eng., Fr.] *Syn.* AXE, Fr.; ACHSE, Ger. *Primarily*, that on or around which anything acts or performs; an axle or axle-tree. In *anatomy*, that on or around which any organ or part rests, gravitates, or centres. In *astronomy*, the diameter on or about which a celestial body revolves. In *botany*, part or parts about which particular organs are arranged; an imaginary line passing from the base to the apex of a pericarp, &c. In *crystallography*, imaginary lines passing through the central points of a crystal, and about which the molecules or particles of matter composing it may be conceived to be symmetrically built up. In *geology*, the centre of a mountain-group. In *mechanics*, the straight line, real or imaginary, about which any body oscillates or revolves. See CRYSTAL, &c.

AX'LE, Axle-tree (äks'l). *Syn.* ESSIEU, Fr.; AXE (am rade), &c., Ger. In *mechanics*, the pin, rod, or material line, on which a wheel, &c., turns. See ANTI-ATTRACTION, FRICTION, &c.

AX'UNGE (ünje). *Syn.* AXUN'GIA, L. *Primarily*, 'wheel-grease,' the lard or fat of an animal; restricted in *pharmacy* to hog's lard.—AXUNGIA CURA'TA, A. PREPARATA, is prepared or washed hog's lard (which see).

AZADIRACHTA INDICA. (Ind. Ph.) Nim or Margosa Tree. (Ind. Ph.) *Habitat.* Common throughout India; often cultivated in gardens. *Official parts.*—1. The bark (*Azadirachta cortex*, Nim bark). It varies much in appearance, according to the size and age of the tree producing it. The bark from the trunk of a tree above three or four years of age is covered with a thick scaly epidermis, and varies in thickness from $\frac{1}{4}$ to $\frac{1}{2}$ inch. That from the smaller branches is smooth, of

a dullish purple colour, marked by longitudinal lines of ash-coloured epidermis, from $\frac{1}{16}$ th to $\frac{1}{8}$ th of an inch apart. The inner layer of the bark, of a whitish colour in the fresh state, is powerfully bitter, far more so than the outer dark-coloured layer, which, however, possesses a greater amount of astringency. It contains a crystallisable principle (*margosine*) and an astringent principle (*catechin*).—2. The fresh leaves (*Azadirachta folia*, Nim leaves).—*Properties.* Bark, astringent tonic and antiperiodic; leaves, stimulant.—*Therapeutic uses.* In intermittent and other paroxysmal fevers, in general debility, and convalescence after febrile and other diseases, the bark has been employed with success. The leaves form a useful application to ulcers and skin diseases when a mild stimulant is required.—*Dose.* Of the powdered bark, a drachm three or four times a day.

Preparations. **DECOCTION OF NIM BARK** (Decoctum Azadirachtæ). Take of the inner layer of *nim bark*, bruised, 2 oz.; *water*, a pint and a half. Boil for 15 minutes, and strain whilst hot.—*Dose.* As an antiperiodic, from $1\frac{1}{2}$ to 3 fl. oz., every second hour previous to an expected paroxysm. As a tonic, 1 or 2 fl. oz. twice or thrice daily. As this decoction soon decomposes in hot weather, it should be prepared fresh for use when required.

TINCTURE OF NIM BARK (Tinctura Azadirachtæ). Take of the inner layer of *nim bark*, bruised, 2½ oz.; *proof spirit*, 1 pint. Macerate for seven days in a closed vessel, with occasional agitation; strain, press, filter, and add sufficient proof spirit to make 1 pint. It may also be prepared by percolation in the same manner as Tincture of Calumba, *q. v.*—*Dose.* From $\frac{1}{2}$ to 2 fl. drs. as a tonic.

POULTICE OF NIM LEAVES (Cataplasma Azadirachtæ). Take of fresh *nim leaves*, a sufficiency; bruise and moisten with tepid water. A good stimulant application to indolent and ill-conditioned ulcers. Should it cause pain and irritation, as it sometimes does, equal parts of rice-flour and linseed-meal may be added. The bitter oil of the seeds is held in high repute by the natives as an anthelmintic, and as an external application in rheumatism. It is also said to be an insecticide.

AZOERTHY'RYN (rit'h-rin). A substance obtained, by Kane, from *archil*. It is insoluble in alcohol, ether, and water; but is very soluble in alkaline lyes, to which it imparts a port-wine colour.

AZO'IC. *Syn.* AZOÖT'IC; AZO'ICUS, AZOÖT'ICUS, &c., L. Lifeless; wholly destitute of organic life. In *geology*, &c., applied to strata which do not contain organic remains.

AZOLIT'MIN (äz-o-lit'-min). A dark-red substance obtained, by Kane, from *litmus*, of which it forms a large portion of the colouring matter. It is insoluble in alcohol, and in water unless alkalisied.

AZ'OTE* (äz'ôte; a'-zôte). [Eng., Fr.] *Syn.* AZO'TUM*, L.; AZOT*, Ger. Nitrogen

(because it is unfit for respiration, *i.e.* destroys life).

AZOTIC. *Syn.* AZOT'ICUM, L.; AZOTIQUE, Fr.; AZOTISCH, Ger. Of or like azote, or containing it or formed from it; irrespirable; destructive to life.—AZOTIC ACID† is nitric acid; A. GAS†, nitrogen.—AZO'TOUS ACID† was nitrous acid.

AZ'OTISED (-tizd). *Syn.* NITROGENISED. Containing azote or nitrogen; a common epithet of nitrogenous substances used as food.

AZ'URE (ázh'-üre; á'-zhure — Knowles, Smart, Walker). *Syn.* CÆRU'LEUM, L.; AZUR, Fr; HELLBLAU, HIMMELBLAU, Ger. In dyeing and painting, sky-blue; also the name of one or more pigments which possess this colour. See BLUE DYES, BLUE PIGMENTS, SMALTS, ULTRAMARINE, &c.

AZ'URE-STONE. Lapis lazuli.

AZ'URITE (-ite). In mineralogy, lazulite; blue malachite; sometimes, lapis lazuli (the name being, unfortunately, very loosely applied by different writers).

AZ'YMOUS† (-e-müs). *Syn.* AZ'YMUS, L. Unleavened; unfermented; as, sea-biscuit. Unleavened bread was formerly termed AZ'YME† (-e-me) and AZ'YMUS†, by theologians.

BAB'LAH. The rind or shell of the fruit of *mimosa cineraria*. According to Dr. Ure, it contains a considerable quantity of gallic acid, some tannin, a red colouring principle, and an azotised substance, and is the article imported from the East Indies and Senegal under the name of NEB-NEB.—Used as a cheap dye-stuff for various shades of drab and grey.

BAC'CA (bák'-ä). [L.; *pl.* bac'cæ, bák'-sê.] A berry.

BACK. [D., *bak*, a bowl or cistern.] *Syn.* BAC. In brewing, a large, open, flat reservoir or cistern; commonly that in which wort is cooled. In distillation, the vessel into which the wort is pumped from the coolers, in order to be 'worked' with yeast. The LIQUOR-BACK, in a brewery, distillery, or rectifying house, is the water reservoir or cistern.

BACKS. In the leather trade, the thickest and stoutest portion of the hide, used for sole-leather.

BACON (bä'-kn). [W., *baccun*, prob. from Ger., *bache*, a wild sow; "old Fr., for dried flesh or pork"—Craig.] The flesh of swine salted and dried, and subsequently either smoked or not. The term is usually restricted to the sides and belly so prepared; the other parts of the animal having distinctive names. Sometimes, though rarely, the term is extended to the flesh of bears, and of other like animals, cured in a similar manner.

Qual., &c. When bacon has been properly prepared from young and well-fed animals, and is neither 'stale' nor 'rusty,' it forms a very wholesome and excellent article of food, especially adapted for a light or hasty meal, or as a relish for bread or vegetables. For persons

with a weak stomach, and for invalids, great care should be taken to cook it without injuring its flavour, or rendering it indigestible. This is best effected by cutting it into slices of moderate thickness, and carefully broiling or roasting it; avoiding dressing it too hastily, too slowly, or too much. The common practice of cooking it in almost wafer-like slices, until it becomes brown and crisp, renders it not merely indigestible, but, also a most fertile source of heartburn and dyspepsia. Fried bacon is remarkably strong, and is hence more likely to offend the stomach than when it is broiled, or preferably roasted before the fire; the last being, of all others, the best way of dressing it so as to preserve its delicacy and flavour. Gourmands, however, often esteem, as 'une bonne bouche,' bacon dressed in the flame arising from the dropping of its own fat.

Choice. Good bacon has a thin rind, and an agreeable odour; the fat has a firm consistence and a slightly reddish tinge; the lean is of a pleasing red colour, is tender, and adheres, whilst raw, strongly to the bone. When the fat is yellow, it is either 'rusty' or becoming so, and should be avoided. The streaky parts are not only those which are most esteemed, but are the most wholesome.

BAD'GER (bäj'-ër). *Syn.* ME'LES, L.; BATAREAT, Fr.; DACHS, Ger. The *ursus me'les* (Linn.), one of the plantigrade carnivora, a burrowing nocturnal animal, common in Europe, Asia, and North America. Since the extirpation of the bear, the badger is the sole representative of the ursine family in our indigenous zoology. Its habits are "nocturnal, inoffensive, and slothful; its food consists of roots, earth-nuts, fruits, the eggs of birds, insects, reptiles, and the smaller quadrupeds; its noxious qualities are consequently few and of slight moment, and by no means justify the exterminating war unintermittently waged against it." (Brande.) Its "muscular strength is great, its bite proverbially powerful; and a dog must be trained and encouraged to enter willingly into combat" with it. (Id.)

Uses, &c. The flesh of the badger is prized as food; the skin, used for pistol furniture; the hair, made into brushes. The American badger is commonly called the GROUND-HOG. The Cape badger produces HYRACEUM (which see).

BAD'TANE (-e-ähn). [Fr.] *Syn.* BAD'TAN, B.-SEED. Star-anise seed.

BADI'GEON (bä-dizh'-ōne; bäd'-e-zhünt, or bā-dij'-ünt—Smart). Among operatives and artists, any cement used to fill up holes and to cover defects in their work. Among statuary, a mixture of plaster and free-stone is commonly used for this purpose; among joiners and carpenters, a mixture of saw-dust and glue, or of whiting and glue; and among coopers, one of tallow and chalk. The name is also given to a stone-coloured mixture used for the fronts of houses, and said to be com-

posed of wood-dust and lime, slaked together, stone powder, and a little ochre, umber, or sienna; the whole being mixed up with weak alum water to the consistence of paint, and laid on in dry weather.

BAEL. [Nat.] *Syn.* INDIAN BÆL, BEL*; BA'EL, B. IN'DICUS, BE'LA, B. IN'DICA, L. The *agile marmelos* (Correa; *crataegum*, Linn.) one of the Aurantiaceæ (DC.). Dried half-ripe fruit imported from the E. I., under the name of INDIAN BÆL. Astringent and refrigerant; highly extolled in chronic dysentery, diarrhoea, English cholera, and relaxations generally. It is also used in bilious fevers, hypochondriasis, melancholia, &c. *Root-bark, stem-bark, and expressed juice of the leaves*, particularly the first, also used in the same cases in India. *Pipe fruit*, fragrant and delicious; used, in the E. I., as a warm cathartic, and regarded as a certain cure for habitual costiveness. *Mucus of the seeds* used by painters as size; also as a cement. *Unripe fruit* used to dye yellow. It is generally administered under the form of DECOCTION or EXTRACT (which see).

BAGASSE' (-gäs'). [Fr.] The dry refuse stalks of the sugar cane as they leave the crushing-mill.—Used as fuel in the colonial sugar-houses.

BAGGING. The cloth or materials of which bags or sacks are made. In *agriculture*, applied to a method of reaping corn by a chopping, instead of a drawing cut. See RATS, &c.

BAIN-MARIE. [Fr.] In *old chemistry*, a water bath; also, sometimes, a sand bath. In *cooking*, a shallow vessel containing heated water, in which saucepans, &c., are placed, when it is necessary either to make them hot, or to keep them so, without allowing them to boil. It is extremely useful in making sauces, warming soups and small dishes, and when dinners are delayed after they are ready to serve.

BA'KING (bake'). *Syn.* ACTION DE CUIRE AU FOUR, Fr. The process of cooking, or of heating, drying, and hardening any substance in an oven or kiln, or by the rays of the sun; the art or trade of a baker †; also technically, a batch or ovenful, or the quantity baked at once (= FOURNÉE, Fr.).

In *cooking*, baking is, perhaps, of all others, the cheapest, most convenient, and best way of dressing dinners for small families, where a good domestic oven is at hand. Though the flavour of baked meat is generally considered barely equal to that of the same parts roasted, there are some joints and dishes to which it appears particularly suitable. Among these may be mentioned *legs and loins of pork, legs and shoulders of mutton, fillets of veal, &c.* A *baked pig*, if it has been occasionally basted, and the heat has not been too great, eats equal to a roast one. *Geese and ducks* treated in the same way are also excellent. A *baked hare* which has been basted with raw milk and butter, also eats well; and so do various pieces of beef, especially the *buttock*. Cooks tell us

that this last should be sprinkled with a little salt for a day or two before dressing it, and after being washed, is preferably baked, along with about a pint of water, in a glazed earthen pan tied over with writing paper 'three or four times thick.' A *baked ham* is said to be preferable to a boiled one; to be tenderer, fuller of gravy, and finer flavoured. It should be soaked in water for about an hour, wiped dry, and covered with a coarse thin paste or batter. *Ordinary dishes* require similar treatment in baking to that given them when roasted.

For *domestic use*, where the kitchen-range does not include a really good oven, the portable articles known as a 'DUTCH-OVEN,' and an 'AMERICAN-OVEN,' form an excellent substitute, admirably adapted for small joints, poultry, &c., all of which, when these utensils are skillfully employed, possess a delicacy and flavour fully equal to the same when roasted; whilst not more than one half the fire is required for the purpose. According to Miss Acton, they also "answer excellently for delicate sweet puddings, and for cakes." See BREAD, CAKES, ROASTING, &c.

Baking Powder. See POWDERS.

BAL'ANCE. [Eng., Fr.] *Syn.* BALANX, BY'LANX, L.; BILANZ, WAGEN, &c., Ger. BALANZA, Sp. Any weighing machine which acts by equipoise; a pair of scales. See SCALES, WEIGHING, &c.

Hydrostatic Balance. See SPECIFIC GRAVITY.

Torsion Balance. A delicate instrument, invented by Coulomb, for measuring the intensities of the electrical and magnetic forces.

BALD'NESS (bawld'). *Syn.* CAL'VITAS, CALVI'TIES (-vish'-e-ē), L.; CALVITIE, CHAUVETÉ, Fr.; KAHLHEIT, KAHLKOPF, KAHLKÖPF, KAHLKEIT, Ger. Primarily, absence or loss of any natural covering; *appr.*, destitution or loss of hair, more especially of that of the top and fore-part of the head. In *botany*, absence of beard or awn.

Grey hair and baldness dependent on old age are natural consequences of man's infirmity, and must be regarded as evidence of failing vigour, rather than in the light of a disease. *Premature loss of hair* may be induced by various causes. It is common after severe fevers, and is frequently caused by external pressure, friction, or violence, and by such other local actions and conditions which, when long continued, interrupt the normal functions of the skin. Persons with a consumptive, scorbutic, scrofulous, or syphilitic taint, or of a general bad habit of body, frequently lose their hair early. In these cases it probably arises from debility or paralysis of the cutaneous vessels, and the consequent insufficient nutrition of the hair-bulbs. When it occurs in persons under the middle age, and apparently enjoying good health, it may be often traced to the pernicious practice of constantly wearing a hard non-ventilating hat, or to disordered stomach, habitual smoking or

hard drinking, irregular habits, or late hours. Excessive anxiety or grief, and intense study and thoughtfulness, also tend to promote the early decay of the hair. The natural baldness of the aged, and frequently the premature baldness of earlier years, arises from the gradual attenuation of the scalp, which ultimately becomes too thin to afford room for the performance of the functions of the hair-producing organs, and too scantily supplied with blood for their due nutrition and support.¹

Treatment. The baldness of senility and that arising from the permanent injury or destruction of the hair-bulbs admit of no cure, notwithstanding the daily assurances of advertising impostors to the contrary. In other cases, when a disposition to baldness exists, shown by the hair falling off in large quantities, or ceasing to grow with its usual vigour and rapidity, the frequent, but gentle use of the hair-brush, and of any bland stimulating oil, pommade, or wash, if adopted in time, will generally prove sufficient to arrest the progress of decay, and very frequently, to restore the hair to its pristine condition. The head may be advantageously washed in cold water, at least once a day; or what is better, a shower bath may be taken on rising in the morning. Should this plan not succeed, the head, or the upper part of it, may be shaved, and a wig, or a scalp, adopted for a time. The effect of keeping the hair closely cropped or shaved is to make it grow thicker, stiffer, and stronger, and this often when all other means fail.

Among more active and less common remedies for baldness may be mentioned—mild streaming electricity, stimulant fomentations, cantharidised, ioduretted, phosphuretted, &c., oils and lotions, a night-cap that, without pressing injuriously on the head, lifts, as it were, the scalp into its natural position, &c. &c., all of which are noticed elsewhere.

The celebrated John Wesley recommends rubbing the part morning and evening with a raw onion until it becomes red, and then applying a little honey. The vendors of Rowland's 'Macassar oil' recommend the head to be rubbed with a towel (or hair-brush), until somewhat red, each time before applying their nostrum; and the advice is certainly good, as independent of the stimulus thus given to the skin, and the increased flow of blood through the minute vessels of the scalp, it is rendered more absorbent and sensitive to the action of medicaments. At the same time the reader must be cautioned against placing any reliance

on external applications, unless he assists their action by due attention to diet, exercise, ventilation, and such other matters as tend to promote the general health and vigour of the body.

The substances usually employed to mediate hair-cosmetics, the general management of the hair, and the formulae for various applications to promote its growth, preservation, and beauty; are noticed in the articles *HAIR*, *HAIR-COSMETICS*, *POMMADES*, *OILS*, *WASHES*, &c., to which the reader is referred.

BALEEN' (-lēne'). [Fr. *baleine*.] The fisher's name for whalebone.

BALL (bawī). [Eng., Ger., Swed.] *Syn.* *BALLE*, *BOULE*, Fr.; *BAL*, *BOI*, Dan.; *GLOBULUS*, *PIŦA*, L. In *commerce*, *veterinary medicine*, *perfumery*, &c., applied to various substances made up into a globular, spheroidal, or even a cylindrical form; as *ash-balls*, *horse-balls*, *soap-balls*, &c.

BALLOON' (-lōōn'). *Syn.* *BALLON*, Fr., Ger. Any hollow spherical body of which the sides are extremely thin or attenuated in comparison with its diameter or bulk. In *aërostatics*, a machine or apparatus for elevating and sustaining bodies in the air. In *chemistry*, a globular glass-receiver, with either one or two necks (= *GROS RÉCIPIENT*, Fr.; *GROSSE B.*, Ger.). In *pyrotechny*, a hollow case or ball of pasteboard filled with fire-works or combustibles, which explodes in the air on being fired from a mortar.

Balloon. In *aërostation*, a bag or hollow pear-shaped vessel, made of varnished silk or other light material, and inflated with some gas or vapour lighter than the air, as hydrogen, carburetted hydrogen, heated air, &c., so as to rise and float in the atmosphere. When filled with gas it is called by way of distinction an *AIR-BALLOON* (*aërostat*, &c., Fr.; *luftball*, *luft-schiff*, &c., Ger.); when with heated air, a *FIRE-BALLOON* or *MONTGOLFIER* B. (*ballon à feu*, &c., Fr.).

In the early days of aërostation, and indeed for some years afterwards, balloons were inflated with hydrogen gas, obtained by the action of sulphuric acid and water on iron filings or small fragments of iron; but this method of filling them ultimately gave place to the cheaper and more convenient supply afforded by the gas-light companies. Of late years, the coal-gas furnished by the gas-works has been generally, if not solely, used for the inflation of balloons.

The principles of ballooning may be referred to the well-known difference in the specific gravity of bodies, and to the physical properties of the atmosphere. Pure hydrogen, weighed at the level of the sea, is about 16 times lighter than common air; but when prepared on the large scale, and containing water, and other impurities, it is only from 7 to 11 times lighter than the atmosphere. A globe of atmospheric air of 1 foot in diameter, under like circumstances, weighs $\frac{1}{16}$ lb.; a similar globe of hydrogen (reckoning it only as 6 times

¹ In such cases it will be found that, owing to this attenuation, the scalp covers a larger portion of the skull than previously; and that its sides have somewhat receded from the top of the head, so that the roots of the remaining hair descend lower towards the forehead, temples, and back of the neck, than when the parts were in vigorous health. This may be perceived by applying the open hand to the part, and then gently closing the fingers, when the scalp may be drawn into its original position, and will then appear loose and wrinkled over the occiput, &c.; and this in a manner very different to what occurs when the top of the head is covered, or well-covered, with hair.

lighter than common air), will, therefore, have an ascensional force of $\frac{1}{14}$ lb. Now the weight of the body of air which a balloon displaces must exceed the gross weight of the balloon and all its appendages, in order for the latter to ascend in the atmosphere. The difference of the two weights expresses the ascensional force. The ærostatic power of balloons is proportional to their dimensions, in the ratio of the cubes of their diameters. Thus, it appears that a balloon of 60 feet diameter filled with common hydrogen will ascend with a weight of nearly 7000 lbs., besides the gas case; whilst one of only $1\frac{1}{2}$ foot in diameter, will barely float, owing to the less proportionate volume of gas to the weight of the case containing it. In round numbers the buoyancy of a balloon may be reckoned as equal to 1 oz. for every cubic foot of hydrogen it contains, less the weight of the case and appendages. The carburetted hydrogen supplied by the gas-works is much heavier than hydrogen gas, and consequently much less buoyant, for which due allowance must be made. That which possesses the least illuminating power is the lightest, and consequently the best adapted for ærostation.

The fabric of which the cases of air-balloons are made is strong thin silk, covered with an elastic varnish of drying oil or india-rubber, or what is better, a solution of india-rubber in either chloroform or bisulphide of carbon; the netting is of strong light silk or flaxen cord; and the car, of basket-work. Fire-balloons, on the small scale, are generally made of silver-paper, and are inflated with the fumes of burning spirit of wine, by means of a sponge dipped in that liquid, and suspended just within the mouth of the apparatus.

Owing to the increasing rarity of the atmosphere as we ascend from the earth's surface, balloon cases are made very much larger than is required to contain the necessary quantity of gas, to allow for its expansion as it rises into a rarer medium. A cubical foot of gas measured at the level of the sea, occupies a space of two feet at an elevation of $3\frac{1}{2}$ miles.

The following Table will prove useful to the amateur aeronaut or balloonist:—

TABLE showing the relations between the diameters, surfaces, and capacities of spheres.

Diameters.	Surfaces.	Cubical contents.
1	3.141	.523
2	12.567	4.188
3	28.274	14.137
4	50.265	33.51
5	78.54	65.45
10	314.159	523.6
15	706.9	1767.1
20	1256.6	4189.
25	1963.5	8181.
30	2827.	14137.
40	5026.	33510.

See ATMOSPHERE, GAS, HYDROGEN, PARACHUTE, VARNISH, &c.

BALLOON'ING†. *Syn.* BALLOON'RY†*. The act, art, or practice of ascending or travelling in balloons; ærostation. A BALLOON'IST† is an aeronaut (particularly an amateur or enthusiastic one).

BALLS. The application of this term in commerce, perfumery, veterinary medicine, &c., has been already noticed. (See BALL.) The following may be inserted here:—

Balls, Al'mond (ah'-münd). *Syn.* BOULES D'AMANDE, Fr. *Prep.* 1. *Spermaceti*, 4 oz.; *white wax* (pure), 8 oz.; *oil of almonds*, 1 pint; melt them together in a glazed earthenware-vessel, by the heat of a water bath, and when the mixture has cooled a little, add *essential oil of almonds*, and *expressed oil of mace*, of each, 2 drs.; stir assiduously until it begins to cool, and then pour it into the moulds, which may be ounce-gallipots with smooth bottoms (very slightly warmed), when it will form beautiful hemispherical cakes. Very fine.

2. *Hard clarified suet*, $1\frac{1}{2}$ lb.; *white wax*, $\frac{1}{2}$ lb.; *ess. oil of almonds*, $1\frac{1}{2}$ dr.; *oil of cloves* (or of *pimento*), $\frac{1}{2}$ dr.; as before.

Uses, &c. To soften the skin, and in winter, to prevent chaps and chilblains. Sometimes these balls are coloured, which is done whilst the mixture is in the liquid state. A rich PINK or RED may be given by a little *alkanet-root* or *dragon's blood*; a YELLOW, by *palm oil* or *annotta*; a BLUE, by a little *finely powdered indigo*; and a GREEN, with *spinage* (steeped in the oil before use), or a few grains of *verdigris*. The most appropriate tint for them is a pale yellow or amber.

Balls, Barèges (razhe'). *Syn.* BOULES DE BARÈGES, Fr. *Prep.* 1. *Extract of soap-wort*, 3 oz.; *good glue* or *gelatin* $1\frac{1}{2}$ oz.; *water*, 4 oz.; dissolve with heat, and add of *sulphide of calcium*, 6 oz.; *common salt*, 1 oz. (both in powder); mix thoroughly, and form the mass into balls weighing $2\frac{1}{2}$ oz. each, adding a little *powdered gum*, if required, to thicken it, and using *powdered starch* to roll them in.

2. *Gelatin*, 8 oz.; *sulphide of calcium*, 12 oz.; *common salt*, 2 oz.; *water*, q. s.; after solution and admixture, add *carbonate of soda* and *Castile soap*, of each (in powder), $2\frac{1}{2}$ oz. One ball is added to the water of a bath for an adult, to be used as a substitute for that of Barèges.

Balls, Bitter. *Prep.* 1. *Powdered gentian*, 2 lbs.; *extract of gentian*, 1 lb.; *grains of paradise* (gründ), $\frac{1}{2}$ lb.; *syrup*, q. s.; mix with heat, and divide into half-pound rolls. For ALE.

2. To the above add of *Spanish-juice*, $1\frac{1}{2}$ lb.; previously softened with a little *boiling water*. For PORTEE and STOUT. Both are used by fraudulent brewers; and by publicans in reducing their beer.

Balls, Black'ing. *Prep.* 1. (Bailey's.) *Gum-tragacanth*, 1 oz.; *water*, 4 oz.; dissolve, add

of *sugar candy*, 4 oz.; and afterwards, *ivory-black* and *Prussian blue* (in very fine powder), of each, 2 oz.; *neat's foot oil*, 2 fl. oz.; thoroughly incorporate, and evaporate by a gentle heat, constantly stirring, until of a proper consistence, then pour it into oiled moulds.

2. *Gum-arabic*, moist sugar, and *ivory-black*, of each, $\frac{1}{2}$ lb.; *lamp-black*, $\frac{1}{2}$ lb.; *glue* (melted with a little water), 2 oz.; *water*, 1 quart, or q. s.; *neat's foot oil*, $\frac{1}{2}$ pint; as before.—Used by the shoemakers, harness-makers, &c., to blacken and polish leather. See **HEEL BALLS**.

Balls, Breech'es. See **SCOURING BALLS**.

Balls, Bronze. See **COPYING BALLS**.

Balls, Cam'phor. *Syn.* CAM'PHOR-CAKES, CHAP'-BALLS†, CHIL'BLAIN B.†, &c.; GLOB'ULI CAMPHORATI, PLACENTÆ CAMPHORATÆ, &c., L. *Prep.* 1. *Spermaceti* and *white wax*, of each, 2 oz.; *almond* or *olive oil*, $\frac{1}{2}$ pint; melt together by a gentle heat, add of *camphor* (in small pieces), 1 oz.; when dissolved, stir until partly cold, and then pour it into moulds, as directed under **ALMOND-CAKES** (above).

2. *Clarified suet*, 1 lb.; *spermaceti* and *white wax*, of each, 3 oz.; *camphor*, 2 oz.; as before.

3. *Spermaceti cerate* (Ph. L.), 1 lb.; *spermaceti*, 2 oz.; *camphor*, $1\frac{1}{2}$ oz.; as before.

4. To either of the above add of *balsam of Peru*, $\frac{1}{4}$ to $\frac{1}{2}$ oz.; and, after solution, either strain the mixture through muslin, or allow it to settle, and decant the clear portion from the dregs.

Use, &c. A popular preventive of chapping and chilblains. A little is well rubbed into the skin, previously washed clean and wiped dry. Some persons add colour and scent; but they are generally sold without either. The only suitable colours are amber, pink, or yellow. The best perfumes are *allspice*, *ambergris*, *cassia*, *cloves*, *musk*, *nutmeg*, *rondoletia*, *vanilla*, and *violets*. See **ALMOND CAKES** (antè).

Balls, Clothes. See **SCOURING BALLS**.

Balls, Contray'va. *Syn.* LA'TIS CONTRAY'VÆ, GLOB'ULI C., L. *Compound contrayerva-powder* made into balls with *gum-water*. An obsolete preparation, once in great repute as a stimulant, tonic, diaphoretic, and absorbent.

Balls, Copy'ing. These have a similar composition to 'heel-balls' (see below). For **BLACK**, the best colouring matter is *lamp-black* or *plumbago* with about half its weight of *indigo*; for a **BRONZE-COLOUR**, *bronze-powder* is substituted; and for a mellow **BROWN**, burnt *terra di Sienna*. These should be all in very fine powder. The semi-fluid mass is poured into small flat cylindrical moulds—paper pill-boxes answer the purpose well.—Used by artists and amateurs to copy inscriptions, monumental brasses, and other slightly raised or sunken patterns; the ball being rubbed over the paper previously laid flat on the design, and held securely in its place. They are sometimes

rendered more permanent by damping the wrong side with a sponge dipped in *water*, *strong spirit*, or *oil of turpentine*; or by passing the wrong side over a hot iron held with the face upwards.

Balls, Cosmetic. See **SAVONETTES, &c.** (also above).

Balls, Cream. See **SAVONETTES, SOAP BALLS, &c.**

Balls, Dog. See **DOGS**.

Balls, Gas'coign's. *Syn.* GLOB'ULI GASCOIGNI, L. *Gascoign's powder* made up into small balls with thin mucilage. See **POWDERS**.

Balls, Heel. *Prep.* 1. (Willthorne's.) *Bees' wax*, 1 lb.; *suet*, 4 oz.; melt together, and stir in of *ivory-black* (very finely powdered), 4 oz.; *lamp-black* (sifted), 3 oz.; *gum arabic* and *sugar-candy*, of each (in very fine powder), 2 oz.; and, when thoroughly mixed and partly cold, pour the composition into tin or leaden moulds.

2. To the last add of *resin*, 3 oz.; *oil of turpentine*, 2 oz.

3. *Hard suet* and *bees' wax*, of each, 4 oz.; *powdered gum*, *sugar candy*, and *Venice turpentine*, of each, 1 oz.; *ivory-black* and *lamp-black*, of each, 2 oz.; as before.

4. *Suet* and *bees' wax*, of each, 4 oz.; *lamp-black* and *brown sugar*, of each, 8 oz.; *common size*, 5 oz.; melt together and stir until incorporated.

Uses, &c. Employed to black leather, and more especially by shoemakers for the edges of the soles; the ball being first rubbed on, and the part afterwards smoothed over with a burnisher or polished iron tool gently heated. Also-used by artists to copy inscriptions, basso-reliefs, &c. To produce a good article, the gum, colouring matter, and sugar, must be in the state of extremely fine powder, and the mixture very carefully made; no lumps being left. Some persons dissolve the gum in a little water, and then stir the mixture over the fire until it acquires the proper consistence for moulding (as in No. 4, above); but the first is accounted the best method.

Balls, Horse. See **VETERINARY MEDICINE, &c.**

Balls, Martial. *Syn.* GLOB'ULI MARTIALES, L. *Prep.* 1. Those of the P. Cod. consist of *tartarised iron* mixed with *aromatics*, and made up into small globular masses.

2. (BOULES DE NANCY.) Equal parts of *iron filings* and *red tartar*, in fine powder, made into balls with *proof spirit* or *brandy*. Both are used as chalybeate tonics, either in the form of pills or dissolved in hot water. Seldom employed in England.

Balls, Physic. (Vet. Med.) See **MASSSES**.

Balls, Poultry. See **POULTRY**.

Balls, Scent. See **PASTILS (Toilet)**, **PERFUMERY**, **POMAMBRA**, **SCENTS, &c.**

Balls, Scouring. *Syn.* BREECHES' BALLS, CLOTHES B., CARPET B., &c. *Prep.* 1. *Curd soap* (sliced), 1 lb.; *water*, 2 oz.; melt in a water

bath, or a glue-pot, and when cooled a little, add *ox-gall* and *oil of turpentine*, of each, $2\frac{1}{2}$ oz.; mix well and roll or mould the mass into balls or cakes.

2. *Fuller's earth*, 2 lbs.; *curd-soap*, 1 lb.; beat to a stiff paste with *ox-gall*, q. s.

3. *Soft soap* and *fuller's earth*, equal parts, beat up with a little *oil of turpentine*, and either with or without a little *essence of lemons*.—*Obs.* The above are used to remove paint, grease, and dirt from cloth, carpets, &c. The spot, first moistened with hot water, is rubbed with the cake, and allowed to soak a few minutes, or to become nearly dry, when it is well rubbed with a little warm water and a brush or piece of woollen cloth, and afterwards rinsed in clean water, and finally rubbed dry and smoothed off with a piece of dry cloth or a dry brush. The last formula produces the composition so commonly vended about the streets of London in penny cakes.

4. *Whiting* and *pipe-clay*, equal parts; *water*, q. s. Used for soldiers' belts, trousers, &c.

5. *Pipe-clay*, 2 lbs.; *fuller's earth*, 1 lb.; *whiting*, $\frac{1}{2}$ lb.; *water*, q. s.

6. *Bath brick*, 1 lb.; *pipe-clay*, 2 lbs.; *soft soap*, $\frac{1}{2}$ lb.; *ox-gall*, $\frac{1}{2}$ pint.

7. To the last add of *pumice-stone*, in very fine powder, 6 oz.—*Obs.* The last four are used for cloth and leather, especially for drab and light-coloured coats, trousers, leather breeches, belts, and gloves. *Rose pink*, *yellow ochre*, *umber*, *Irish slate*, or other like colouring matter, may be added to produce any desired tint. *White pepper*, *cloves*, &c., are also occasionally added to drive away moths and insects; and *orris root*, or *essence of bergamot* or of *lemon grass*, as perfume.

Balls, Sweet. See SCENT BALLS (*anté*).

Balls, Tan. The muddy sediment of *tannins* made into balls or lumps.—Used by the poor for summer fuel.

Balls, Wash. See SAVONNETTES, SOAP, &c.

BALM (bahm). *Syn.* BAL'SAMUM, L.; BAUME, Fr.; BALSAM, Gef. Primarily, balsam (of which it is a contraction); formerly and still popularly applied to anything assumed to be soothing, healing, or genial in its action, particularly if also aromatic or fragrant; but chiefly to medicines and liqueurs, supposed to possess these properties. See BALSAMS, LIQUEURS, QUACK MEDICINES, &c.

Balm. *Syn.* COMMON BALM, GARDEN B.; MELISSA, L.; BAUME, MÉLISSE, Fr. The *melissa officinalis* (Linn.), an aromatic perennial herb, a native of the south of Europe, but commonly cultivated in our gardens. It is reputed to be diaphoretic, diuretic, emmenagogue, exhilarating, nervine, and stomachic; and under the form of infusion (BALM-TEA) has long been a popular remedy in hypochondriacal, hysterical, and nervous affections, and in amenorrhœa and chlorosis. It is still sometimes ordered as a drink in fevers and in hypochondriasis.

BAL'SAM (bawl'-săm; -süm'ſ—Knowles, Walker). [Eng., Ger.] *Syn.* BAL'SAMUM (băl'-), L.; BAUME, Fr. Originally, any strong-scented oleo-resinous vegetable juice or exudation, of about the fluidity of treacle, and supposed to possess medicinal virtues. In modern chemistry and pharmacy, any vegetable production which is either semi-liquid, or which naturally becomes concrete, and which contains either benzoic acid, or cinnamic acid, combined with resin and aromatic essential oil. Several of the substances popularly termed balsams contain no benzoic acid, and are consequently now classed with the *turpentine*s. This distinction, however, is far from being universally adopted, and a late high authority defines balsams to be "Exudations from plants, which are liquid or soft solid, and consist of a substance resembling a resin, either combined with benzoic acid, or with an essential oil, or both." (Brande.)

The leading properties of the true natural balsams are—Insolubility in water, almost entire solubility in alcohol, and partial solubility in ether and in the volatile and fixed oils; the possession of a powerful, and generally, an agreeable odour, a hot, resinous or terebinthinate taste, and the usual stimulant and tonic properties of the milder turpentine. Distilled with water, ethereal oil and some acid pass over, and the residuum consists chiefly or entirely of acid-resin.

The TRUE BALSAMS, as those of *benzoin*, *Peru*, *styrax*, and *tolu*, and the celebrated *Chinese varnish-balsam*, contain either benzoic or cinnamic acid. Among those falsely termed balsams, are *copaiba*, *opobalsam*, *Japan lac-varnish*, and some of the turpentine.

The following list includes most of the substances, natural and artificial, which pass, or have passed, under the name of balsams:—

Balsam, Aconitic. See DROPS.

Balsam, American†. Balsam of Peru.

Balsam, Anodyne. *Syn.* SOOTHING BAL-SAM; BAL'SAMUM ANODYNUM (-din-), B. TRANQUILLANS, L.; BAUME ANODIN, B. TRANQUILLE, B. TRANQUILLISANT, &c., Fr. *Prep.* 1. (Bate's.) See PATENT MEDICINES.

2. (Guy's.) A vulnerary balsam invented by Guy, of Caliac, once in great repute, but now obsolete. It consisted of *aloes*, *amber*, *ammoniacum*, *balsam of Peru*, *bellium*, *carranna*, *castor*, *galbanum*, *labdanum*, *myrrh*, *olibanum*, *storax*, *tacamahaca*, and *Venice turpentine*, digested in alcohol.

3. (B. TRANQUILLANS, P. Cod.) Fresh leaves of *belladonna*, *henbane*, *black nightshade*, *lobacco*, *poppies*, and *stramonium*, of each (bruised), 4 oz.; *olive oil*, 6 pints; heat them together until all the moisture is evaporated, leave them to digest for 2 hours, and then strain with pressure; next pour the 'hot oil' on dried 'tops' of *wormwood*, *hyssop*, *lavender*,

† For articles and preparations often called 'balsams,' and not found under this head, see ELIXIRS, OILS, PATENT MEDICINES, PERFUMERY, TINCTURES, &c. &c.

*marjoram, costmary, round-leaved mint, rue, sage, and St. John's wort, and the dried 'flowers' of elder and rosemary, of each, 1 oz.; macerate for a month, press, strain, and preserve the oil in a cool dark place.*¹

4. (BAUME TRANQUILLE DE CHOMEL.) *Henbane, hound's tongue, and tobacco, of each, 1 lb.; white wine, 3 pints; boil down to a quart; press, strain, and add to the hot 'strained liquor' of olive oil, 1 quart, and again boil.*

Balsam, Ap'oplexy. *Syn.* BAL'SAMUM APOPLECTICUM, B. AD APOPLECTICOS (Ph. E. 1744), L. *Prep.* 1. *Amber, civet, musk, Peruvian balsam, and some volatile oils, made into a balsam.*

2. (Ph. E. 1744.) *Expressed oil of nutmeg, 1 oz.; liquefy by a gentle heat, and stir in of the oils of cloves, lavender, and rosemary, of each, $\frac{1}{2}$ dr.; oil of amber, 10 drops; balsam of Peru, 1 dr. Both were formerly used to anoint the head and nostrils of apoplectic patients, and were believed to be of great efficacy.*

Balsam, Asiat'ic†. Balm of Gilead.

Balsam, Bate's. See BALSAM, ANODYNE.

Balsam, Brazil'ian. Balsam of copaiba.

Balsam, Calaba'. *Syn.* TACAMAHACA. A fragrant resinous substance produced by *calophyllum calaba*, or Santa Maria tree.

Balsam, Cam'phor. *Syn.* CAMPHORATED BALSAM; BAL'SAMUM CAMPHORATUM, &c., L. *Prep.* 1. *As camphor-liniment, Ph. L.*

2. (B. ACETICUM C., Sanchez's GOUT-B.—Pelletier.) *Curd-soap and camphor, of each, 5 drs.; oil of thyme, 2 scr.; acetic ether, 5 oz.; digest together in a stoppered bottle until the solids are dissolved. Recommended as an efficacious anodyne-liniment in certain forms of rheumatism and gout.*

Balsam, Can'ada. See TURPENTINES.

Balsam, Cana'ry. A volatile oleaginous substance obtained by distillation from *dracocephalum Moldavicum*.

Balsam, Carpa'thian. Riga Balsam.

Balsam, Cephal'ic (Saxon). *Syn.* BAL'SAMUM CEPHALICUM SAXONICUM, L. A liquid preparation obtained from the essential oils of *amber, lavender, marjoram, nutmeg, pennyroyal, rue, sage, &c.*, distilled together. Once in high repute; but long disused in England.

Balsam, Chil'blain. See LINIMENTS.

Balsam, Chi'na Varnish. The aromatic varnish-like exudation of *aul'gia sinen'sis*, used by the Chinese as a varnish or lacquer, for which purpose it is, perhaps, unequalled. It is highly fragrant, and abounds in benzoic acid.

Balsam, Command'er's†. Compound tincture of benzoin.

Balsam, Copalm'. Liquid-ambar.

Balsam, Egypt'ian†. Balm of Mecca.

Balsam, Fe'male. *Syn.* BAL'SAMUM EMBRYONUM, A'QUA E., L. An obsolete preparation

¹ A specimen of the absurd complexity of French formulae.

made by digesting *mistletoe, civet, musk*, and several other aromatics, in a mixture of wine and various medicated waters, and submitting the whole to distillation. Formerly taken both internally and externally, as a tonic for both fetus and mother; and particularly to prevent abortion, &c.

Balsam, Friar's. Compound tincture of benzoin.

Balsam, Gen'oa. Locatelle's balsam.

Balsam, Glyc'er'in (gl's-). *Syn.* BAL'SAMUM GLYCERINÆ, L. *Prep.* To white wax and spermaceti, of each, 1 oz.; almond oil, $\frac{1}{2}$ lb.; melted together, add of glycerin, 2 oz.; balsam of Peru, $\frac{1}{2}$ oz.; and stir or agitate until nearly cold. 12 or 15 drops of otto of roses may be substituted for the balsam. Used to soften and whiten the skin, and to prevent chaps and chilblains.

Balsam, God'bold's Vegetable. See PATENT MEDICINES.

Balsam, Goulard's'. *Syn.* BAL'SAMUM GOULARDII, B. SATURNI, L.; BAUME DE GOULARD, Fr. *Prep.* (Van Mons.) *Acetate of lead* (in fine powder, and quite dry) is triturated, for some time, with hot oil of turpentine, in a heated mortar, or until no more will dissolve; after repose, and whilst still hot, the clear portion is decanted. Recommended as a useful application to foul and painful ulcers, and to scalds and burns.

Balsam, Green. *Syn.* BAL'SAMUM VERIDE, &c., L.; BAUME VERT, Fr. *Prep.* 1. *Linseed-oil, 6 lbs.; gum-elemi, 1 lb.; heat them together; add of powdered verdigris, 3 oz., or q. s. to impart a rich green colour, and, after repose, decant the clear portion.*

2. *Linseed oil strongly coloured with verdigris. Both were formerly much used by surgeons as detergents. 'Green-oil' or 'oil of elder-leaves' is now commonly sold for it.*

A natural balsam, brought from Peru, and produced by *chloroxylon verticillatum*, is also popularly called GREEN BALSAM (of Peru).

Balsam, Gurgun' (gūōn'). *Syn.* GURGINA BALSAM, WOOD-OIL (of India). From *dipterocarpus triner'vis*, and other species, by applying a slow fire to a notch or wound made in the trunk. Has a mixed smell of copaiba and naphtha. Properties and dose similar to those of balsam of copaiba. Sp. gr. .962 to .964. See COPAIBA and WOOD-OIL.

Balsam, Hill's, of Honey. See PATENT MEDICINES.

Balsam, Hunga'rian. *Syn.* BAL'SAMUM HUNGARICUM, L. A terebinthinate exudation from the extremities of the branches of *pinus pumilio* (Willd.) or mountain-pine. It is also obtained by pressure from the 'cones' of the same tree.

Balsam, Io'duretted. See LINIMENTS.

Balsam, Japa'n Varnish. *Syn.* JAPAN LACQUER. Exudes from incisions made in the trunk of *melanorrhoea usitatisima*, according to Wallich; or *stigma'ria verniciflua*,

according to Lindley. It constitutes the celebrated lac-varnish of the Japanese. It differs from that of China, and from the true balsams, in not containing benzoic acid. It is extremely acrid and irritant; and even its fumes affect the eyes and respiration.

Balsam†, Jews'. Balm of Gilead.

Balsam, Locatelle's. *Syn.* LOCATEL'LI'S BALSAM; BAL'SAMUM LOCATEL'LI, B. LUCA-TEL'LI, B. ITAL'ICUM, B. GENOFF'HE, &c., L. var. *Prep.* 1. (Original Formula.) *Olive oil*, 6 oz.; *yellow wax*, 4 oz.; *sherry wine*, 5 fl. oz.; *red sanders* (in very fine powder), 4 dr.; simmer them together until the moisture is nearly evaporated, then add of *Strasburgh turpentine*, 6 oz.; *balsam of Peru*, 2 drs.; strain through linen, and stir until nearly cold.

2. (Ph. E. 1744.) *Olive oil*, 24 fl. oz.; *yellow wax*, 1 lb.; melt, and add of *Venice turpentine*, 1½ lb.; and, when cooled a little, further add, *powdered dragon's blood*, 1 oz.; *balsam of Peru*, 2 oz.; and stir until cold.

3. (Ph. L. 1746.) *Olive oil*, 16 fl. oz.; *Venice turpentine* and *yellow wax*, of each, ½ lb.; *red sanders*, 6 drs.

Uses, &c. A once highly esteemed pectoral, and still occasionally used, by the lower classes, in phthisis and chronic coughs (mixed with an equal weight of *conserve of roses*), and as a mild stimulating ointment.—*Dose.* ½ dr., or more.

Balsam, Mereu'rial†. Ointment of nitrate of mercury.

Balsam, Metz's. *Syn.* BAL'SAMUM VIE'IDE METEN'SIUM, L.; BAUME VERT DE METZ, Fr. *Prep.* (Guibourt.) *Linsed oil* and *olive oil*, of each, 6 oz.; *oil of laurel-berries*, 1 oz.; *common turpentine*, 2 oz.; melt by a gentle heat, and add of *verdigris*, 3 drs.; *aloes*, 2 drs.; *sulphate of zinc*, 1½ dr.; (all in powder); mix well, strain or pour the liquid into a bottle, and add *oil of juniper*, 4 drs.; *oil of cloves*, 1 dr.—*Used* on the Continent as a common detergent dressing to wounds and ulcers.

Balsam, Mexican†. Balsam of Peru.

Balsam, Natural†. That which exudes from plants, as opposed to those formed by art.

Balsam, New'vine. See OINTMENTS.

Balsam, Odontalgic. See DROPS.

Balsam, Opodeldoc. See OPODELDOC (French).

Balsam, Pectoral. *Syn.* BAL'SAMUM PECTORALE, L.; BAUME PECTORAL, Fr. *Prep.* 1. *Tincture of tolu* and *compound tincture of benzoin*, of each, 2 oz.; *rectified spirit*, 4 oz.; mix.—*Dose.* ½ to 1-teaspoonful, night and morning; in chronic coughs, hoarseness, &c.

2, 3. See BALSAM OF HONEY, B. OF HORE-BOUND, &c.

Balsam, Persian†. Friar's Balsam.

Balsam, Peru'vian†. See BALSAM OF PERU (below).

Balsam, Polychrest. See DROPS & ELIXIRS.

Balsam, Riga (ré'). *Syn.* CARPA'THIAN

BALSAM; BAL'SAMUM CARPATH'ICUM, B. LIB'ANI, &c., L.; BAUME DE CARPATHES, Fr. A pellucid white fluid obtained by careful distillation from the young shoots of *pinus cem'bra* (Linn.) or *Siberian stone-pine*. It much resembles oil of juniper; and, like that article, is powerfully diuretic. It is regarded as vulnerary, and is highly esteemed by some in sprains and bruises. The bottoms of *oil of juniper* are commonly sold for it in the shops. The spirit distilled from *pine-tops* (*spiritus turionum pini*) is also frequently, although incorrectly, called RIGA BALSAM.

Balsam, Sanchez's Gout. See CAMPHORATED BALSAM (above).

Balsam, Sooth'ing. See ANODYNE BALSAM.

Balsam, Stomach'ic. (măk'). *Syn.* BAL'SAMUM STOMACH'ICUM, L.; BAUME STOMACHIQUE, Fr. *Prep.* (Ph. Slesv.-Hols. 1831.) *Oils of cloves, mace, wormwood, and peppermint*, of each, 1 dr.; *balsam of Peru*, 2 drs.; *oil of nutmeg*, 2 oz.; mix. 1 to 5 or 6 drops, on sugar, or dissolved in spirit.

Balsam, Syr'ian. Balsam of Mecca.

Balsam, Thibaut's. See PATENT MEDICINES.

Balsam, Tooth'ache. See DROPS, &c.

Balsam, Traumatic. Compound tincture of benzoin.

Balsam, Turkey. *Syn.* TURKEY BALM. The distilled oil of the *dracocephalum moldavicum*.

Balsam, Tur'lington's. See PATENT MEDICINES.

Balsam Univer'sal. *Syn.* BAL'SAMUM UNIVERSALE, L. *Prep.* (Ph. Slesv.-Hols. 1831.) *Rape oil* (recent), 1½ lb.; *yellow wax*, ½ lb.; *acetate of lead* (in fine powder), 3 oz.; *powdered camphor*, ½ oz.; melted together; observing to triturate the 'acetate' with a small portion of the 'oil' before adding it to the mixture, and not to add the 'camphor' until the heat is reduced a little.—*Obs.* This name has also been given to 'compound cerate of lead,' and even to 'cerate of acetate of lead.'

Balsam, Ver'vain's†. Compound tincture of benzoin.

Balsam, Wound. Several vulnerary preparations have been so called; but FRIAR'S BALSAM ('comp. tinct. of benzoin') is that usually intended.

Balsam of Acon'iti. A yellowish aromatic liquid, of a terebinthinous nature and consistence, obtained from the wounded branches and shoots of the *iwica heterophylla* (DC.). It is highly esteemed as vulnerary by the Caribs of Guiana. (Lindley.)

Balsam of Alpinus. Balm of Gilead; because Prosper Alpinus wrote a learned (?) treatise on it.

Balsam of Am'ber. *Syn.* BAL'SAMUM SUCINI, L.; BAUME D'AMBER, Fr. The article to which this term is usually applied has been already noticed. *Oil of amber* was also formerly so called; and the same name has

been given to the following and other like preparations by their inventors:—

1. (Radius.) *Oil of amber*, 4 fl. oz.; *oil of myrrh*, 2 fl. oz.; *oil of turpentine*, 1 fl. oz.; mix with a gentle heat.

2. (Bate.) See PATENT MEDICINES. They are all stimulant and antispasmodic, and are used either internally or as a friction, like oil of amber.

Balsam of Arcæus. *Syn.* BAL'SAMUM ARCÆI, L.; BAUME D'ARCÆUS, Fr. A digestive ointment formerly in great repute, and still much employed on the Continent. It is now superseded in England by the *comp. elemi ointment* of the Pharmacopœias. In the original formula, *boiling water*, 4 parts, were ordered to be stirred in.

Balsam of Can'ada. See TURPENTINES.

Balsam of Cloves. *Syn.* AROMATICUS BAL'SAM OF CLOVES; BAL'SAMUM CARYOPHYLLI, L. *Prep.* (Bories.) *Oil of cloves* and *oil of nutmeg*, of each, $\frac{1}{2}$ dr.; *spirit of juniper berries*, 3 oz.; mix. Rubefacient and diuretic.—Used chiefly as a stimulating friction. Internally, $\frac{1}{2}$ to 1 teaspoonful.

Balsam of Copai'ba. See COPAIBA.

Balsam of Fern. Oil of male fern.

Balsam of Fioventi. *Syn.* BAL'SAMUM FIOVENTI, L. *Prep.* (P. Cod.) *Venice turpentine*, 16 oz.; *amber*, *elemi*, *galbanum*, *myrrh*, *styrax*, and *tacamahaca*, of each, 3 oz.; *aloes*, 1 oz.; *bay-berries*, 4 oz.; *cinnamon*, *cloves*, *galangal*, *ginger*, *nutmegs*, and *zedoary*, of each, $\frac{1}{2}$ oz.; *dattany of Crete*, 1 oz.; *rectified spirit*, 8 lbs.; macerate a week and distil off 7 lbs. The distilled spirit constitutes this notable preparation of, professedly, many virtues. It is reputed aromatic, diuretic, antispasmodic, and stimulant. One of its applications is as a collyrium—a drop or two being rubbed on the palm of the hands, which are then held to the eyes, so as to cover, without touching them—in chronic ophthalmia, conjunctivitis, &c.¹

Balsam of Gil'ead. See BALSAM OF MECCA.

Balsam of Gua'iacum (gwā'yā-). *Syn.* BAL'SAMUM GUAIACI, B. GUAIACINUM, L. *Prep.* (Ph. L. 1745.) *Gum-guaiacum*, 1 lb.; *balsam of Peru*, 3 drs.; *rectified spirit*, 1 quart; digest 10 days and filter. Diaphoretic, arthrodynic, and anodyne.—*Dose.* 30 to 60 drops, in milk or water; in agues, rheumatism, &c. Externally, reputed also antiseptic.

Balsam of Hon'ey. (hūn'e). *Syn.* PECTORAL BAL'SAM, P. B. OF HONEY; BAL'SAMUM MEL'LE, B. PECTORALE, B. P. MELLIS, L.; BAUME DE MIEL, &c., Fr. *Prep.* 1. *Balsam of tolu*, 1 lb.; *honey* (finest), $\frac{1}{2}$ lbs.; *rectified spirit*, 1 gal.; *turmeric*, 1 oz.; make a tincture.

2. To the last, before maceration, add of *powdered opium*, 2 oz.

3. (Hill's.) See PATENT MEDICINES.

Uses, &c. A good pectoral in colds, tickling chronic coughs, hoarseness, &c., when unac-

¹ See Note 2, p. 171.

panied with fever.—*Dose.* For an adult, $\frac{1}{2}$ to 1 teaspoonful, twice or thrice a day; an occasional dose of some mild aperient being also taken. Tincture of balsam of tolu, or a mixture of the tinctures of tolu and benzoin, is frequently sold in the shops under the name of '*balsam of honey*.' See PECTORAL BALSAM, &c.

Balsam of Hore'hound. *Syn.* BAL'SAMUM MARRUBII, L. *Prep.* 1. *Extracts of horehound* and *liquorice*, of each, 2 oz.; *hot water*, $\frac{1}{2}$ pint; dissolve, and when cold, add of *paregoric*, $\frac{1}{2}$ pint; *oxymel of squills*, 6 oz.; *tincture of benzoin*, 2 oz.; *honey*, 10 oz.; and, after thorough admixture, strain through flannel.

2. (Ford's.) See PATENT MEDICINES.

Uses, &c. A popular pectoral.—*Dose, &c.*, same as of BALSAM OF HONEY (above).

Balsam of Houmi'ri. [Nat.] From *humir'ia balsamifera*, or the *houmiri-tree* of Guiana. It resembles '*balsam of uimiri*' produced by another tree of the same genus. (See below.)

Balsam of Lead. See GOULARD'S BALSAM.

Balsam of Life. *Syn.* BALM OF LIFE; BAL'SAMUM VITÆ, L.; BAUME DE VIE, ELIXIR DE VIE, &c., Fr. Several compound medicines have been called by this name. Those of Gabius, Hoffman, and Turlington, are noticed under PATENT MEDICINES (which see). The following are distinct preparations:—

1. BAUME DE VIE EXTERNE:—*Soap-ointment*, 2 parts; *oil of turpentine*, 1 part; mix. Stimulant and rubefacient. Used as a friction.

2. BAUME DE VIE PURGATIF; Elixir de vie:—a. (Briett.) *Socotrine aloes* and *saffron*, of each, 2 drs.; *rhubarb*, 6 drs.; *liquorice-root*, 1 oz.; *proof spirit* or *brandy*, $\frac{1}{2}$ pint; digest a week, and filter.

b. (Original Swedish formula.) *Aloes*, 9 drs.; *agaric*, *gentian*, *rhubarb*, *saffron*, *theriaca*, and *zedoary*, of each, 1 dr.; *proof spirit* or *brandy*, 1 quart. A mild stomachic purge.—*Dose.* 1 to 6 drs. *Tincture of rhubarb-and-aloes* (Ph. E.) is commonly substituted for it. See ELIXIRS.

Balsam of Liq'orice. See PATENT MEDICINES.

Balsam of Mec'ca. *Syn.* BALM OF GIL' EAD, B. OF MEC'CA, OPOBAL'SAM (-baw'l-), JEWS' BALSAM†, OIL OF B.†, &c., Eng.; BAL'SAMUM (bāl'-) GILEADEN'SIS, B. DE MEC'CA, OPOBAL'SAMUM (-bāl'-), &c., L.; BAUME DE LA MECCQUE, B. DE MECCA*, B. DE JUDEE, OPOBALSAMUM, &c., Fr.; BAL'SAMUM ÆGYPTIACUM†, B. ALPI'NI†, B. ANTIQUO'RUM GENUINUM†, B. ASIATICUM†, B. SYRIACUM†, O'LEUM BAL'SAMI†, &c., L. A fragrant oleo-resinous substance, obtained from *balsamoden'dron gileaden'se* (Kuntz.; *am'yris gileaden'sis*, Linn.; *a. opobal'samum*, Forsk.), a middle-sized tree of the nat. ord. Terebinthaceæ (DC.), growing in Arabia Felix, Asia Minor, and Egypt. It is the BALM of the Old Testament, and the βάλαμον of Theophrastus and Dioscorides.

It is chemically classed with the turpentine.

Prop., &c. When fresh it is turbid and whitish, but becomes by degrees transparent, of a rich golden colour, and slightly thicker; and by exposure, eventually solid. It possesses a penetrating and delicate fragrance; tastes sharp, bitter, spicy, and somewhat astringent; is not entirely soluble in rectified spirit, but dissolves more or less completely in both the fixed and volatile oils, which then assume the fragrance of the balsam. A drop let fall on hot water, spreads itself over the whole surface, like a film of oil, and again contracts on the water cooling. This, with its fragrance, is the common test of its genuineness in Turkey. The inferior qualities, or those of commerce, are generally opaque and thick, rapidly resinifying and turning of a dull yellow by age. When applied to the skin it causes redness and swelling. It was formerly regarded as possessing the most varied and exalted virtues, particularly as an antiseptic, stimulant, vulnerary, and nervine; and its fumes were supposed to prevent barrenness. It is still highly prized in the East as a cosmetic and perfume; and is said to be unequalled for giving a healthy glow to the complexion and promoting the growth of the hair. Its medicinal qualities are intermediate to those of the aromatic turpentine and balsam of tolu.—*Dose.* From 3 to 6, or even 10 or 12 drops.

Obs. According to Bruce, and others, the best balm of Gilead is a spontaneous exudation from the tree; a second quality is obtained by cutting the bark with an axe, and receiving the juice which exudes in a small earthen bottle. A large branch is said to produce not more than 3 or 4 drops a day; and even the most resinous trees seldom yield more than 60 drops daily. Hence its scarcity and costliness. Both varieties are held in such high estimation by the Turks and Egyptians, that none of them are exported as an article of commerce. That which is sent to England is obtained by boiling the leaves and young twigs of the balsam tree in water, and is rejected by the Orientals as worthless. Most of that sold in the shops of England is entirely spurious (see below).

The cosmetics recently so much advertised as 'BALM OF MECCA,' do not contain even a trace of this article; nor do we believe that there is a single drop of the genuine balm to be purchased in London.

The following formulæ are current in the trade for Fac'titious Balm of Mecca:—

1. *Gum-benzoin* (bright, coarsely powdered), 4 oz.; *liquid styrax* (finest), 3 oz.; *balsam of tolu*, 2 oz.; *Canadian balsam*, 1½ pint; are mixed together in a flask, and exposed (closed) to the heat of a water bath, with frequent agitation, until the liquid is saturated; when cold, the clear portion is decanted, and a sufficient quantity of the oils of lemon, cassia,

rosemary, nutmeg, and vanilla, added to give it a strong aromatic odour.

2. From *gum-benzoin* and *balsam of Peru*, of each, 1 oz.; *vanilla* and *nutmeg*, of each (cut small), 1 dr.; *Canadian balsam*, ½ pint; digested as before, and some essential oils added to the decanted liquid.

Balsam of Nutmeg. *Syn.* BAL'SAMUM MYRTICÆ, B. NUCIS TÆ, L. *Prep.* (Ph. B. R. 1847.) *Expressed oil of nutmeg* (—? mace), 3 oz.; *olive oil*, 1 oz.; *yellow wax*, ½ oz.; melt them together by a gentle heat, pour the mixture into paper moulds, and, when cold, cut the mass up into cakes.

Balsam of Peru (—röö'). *Syn.* PERUVIAN BALSAM; BAL'SAMUM PERUVIANUM (Ph. L., E.; and D.), L.; BAUME DU PÉROU, B. PERUVIEN, Fr.; PERUVIANISCHER BALSAM, Ger. A balsam obtained from *Myroxylon Pereire* (*Myrospermum* of Sonsonate). It exudes from the trunk of the tree after it has been scorched and removed. From Salvador, in Central America. B. P.

Prop., &c. A chocolate-coloured or a reddish-brown liquid, of the consistence of treacle, possessing a bitterish, rather pungent taste, and an agreeable aromatic odour somewhat similar to that of a mixture of vanilla and benzoin. It is reputed stimulant, tonic, and expectorant, and has long been a popular remedy in chronic asthma, catarrh, and other pulmonary affections, debility, &c. It is now, however, principally used as an ingredient in pomades, hair-oils, lip-salves, and other cosmetics, in which it is only inferior to 'balm of Mecca,' and in compound perfumery. It is also used to scent lozenges, pastils, and chocolate and liqueurs; for these last, chiefly as a substitute for 'vanilla' when it is scarce and dear.—*Dose.* 10 or 12 to 30 grs. (even 1 dr. is sometimes given), either on sugar, or made into a bolus with liquorice powder, or into an emulsion with honey, mucilage, or yolk of egg.

Pur., Tests, &c.—1. The sp. gr. should not be lower than 1.15; nor higher than 1.16:—2. Ether dissolves it readily and completely:—3. Soluble in 5 parts of rectified spirit:—4. It should undergo no diminution in volume when agitated with water:—5. 100 grs., by its benzoic or cinnamic acid, should saturate not less than 7½ grs. of pure crystallised carbonate of soda:—6. Sulphuric acid converts it into resin, artificial tannin, or charcoal, according to the quantity employed; if, on adding water, a brittle resin is not formed, some fixed oil (probably castor oil) is present:—7. Treated with nitric acid, some hydrocyanic acid is formed, benzoic acid sublimes, and the residual matter is artificial tannin:—8. The alkalies and their carbonates form with it a thickish semi-crystalline mass, which, on being treated with sulphuric acid, deposits a peculiar resinous matter, with crystals of benzoic and cinnamic acid:—9. If a few drops are distilled, and, when iodine is added to the

distillate, an *explosion* results, it has been adulterated with 'copaiba':—10. The genuine balsam contains about $6\frac{1}{2}\%$ of *benzoic* (cinnamic) acid.

Obs. Balsam of Peru was formerly very generally adulterated, and often entirely factitious, but, owing to its present reduced price, this is now only confined to a few of the most unprincipled venders. The following formulæ for this purpose are still extant in the trade:—

Balsam of Peru, Factitious:—From *gum-benzoin* (in coarse powder), 3 lbs.; dissolved in the least possible quantity of *rectified spirit*, and then mixed with *balsam of tolu*, 1 lb.; and *liquid styrax*, 2 oz.; subsequently adding of *rectified spirit*, q. s.

Balsam, Reduced Peruvian:—1. *Balsam of Peru*, 3 lbs.; *balsam of tolu*, 2 lbs.; *rectified spirit*, q. s. to reduce it to a proper consistence:—2. *Balsam of Peru*, 3 lbs.; *gum-benzoin* (dissolved in a little *rectified spirit*), 1 lb.; as before.

Balsam of Rackasiri. *Syn.* BALSAM OF RAKASIRA; BALSAMUM RAKASIRI, B. RACAZIRÆ, B. RHADASIRI. A species of balsamic turpentine, said to be obtained from the *bursera balsamifera* (Pers.), an Indian tree of the natural order Terebinthaceæ. It has a slightly bitter taste, adheres to the teeth when chewed, and, when heated, smells like balsam of tolu. It has been extolled as possessing the virtues of copaiba in an exalted degree. The nostrum vended under the name of BALM OF RAKASIRI by certain quacks, simply consists of *English gin*, coloured, sweetened, and aromatised.

Balsam of Saffron. See ELIXIRS.

Balsam of Soap. Soap-liniment.

Balsam of Soap (The'real). *Syn.* BALSAMUM SAPO'NIS ÆTHE'REUM, L. *Prep.* (Cottelreau.) *Castile soap* (powdered) and *camphor*, of each, 1 dr.; *oil of thyme*, 10 drops; *acetic ether*, 1 oz.; dissolve in a close vessel with the aid of a gentle heat, and decant the clear portion. *Used* as an embrocation or liniment, in gout, rheumatism, &c.

Balsam of St. John's Wort. See OILS.

Balsam of Sto'rax. *Liquid-ambar* or styrax.

Balsam of Sulphur. See OILS.

Balsam of Syriacum. See BALSAM OF MEOCCA AND PATENT MEDICINES.

Balsam of Tolu' (-l'ôô'). *Syn.* TOLU' BALSAM*; BALSAMUM TOLUTANUM (Ph. L., E., & D.), B. DE TOLU, L.; BAUME DE TOLU, Fr.; TOLUTANISCHER BALSAM, B. VON TOLU, &c., Ger. Balsam flowing from the incised trunk of "*myrospermum toluiferum*." (B. P.) The tree which produces it is a native of the mountains of Tolu, Turbaco, &c., in South America.

Prop., Uses, &c. When first brought over it is soft and tenacious, but by age and careless keeping becomes hard, and even brittle, somewhat similar to resin. It is perfectly soluble in alcohol and in ether, and gives out its acid

(benzoic or cinnamic) to water. Its odour is fragrant, though less powerful than that of either styrax or balsam of Peru; and it has a pleasant sweetish taste. It softens under the teeth, melts readily, and burns with an agreeable odour. As a *medicine*, it is a stimulating expectorant, and, as such, is employed in chronic bronchial affections unaccompanied with inflammatory action. It has long been a popular pectoral. *Syrup of Tolu* is an agreeable and common adjunct to pectoral mixtures, and, with *Tolu lozenges*, is often serviceable in tickling coughs. It is also used by confectioners, perfumers, &c., and in fumigating pastils.—*Dose*, 5 to 20, or even 30 grs., dissolved in spirit, or made into an emulsion.

Pur. This is shown by its perfect solubility in rectified spirit, forming a transparent tincture, and by its odour. When adulterated it has a weaker smell, is only partially soluble in alcohol, and the *tincture* formed with that fluid is opaque. The presence of colophony (or lac), according to Ulex, may be detected by the balsam, instead of dissolving in sulphuric acid, swelling up, blackening, and disengaging sulphurous fumes.¹ Castor oil may be detected in the way noticed under BALSAM OF PERU.

Balsam of Tolu, a Factitious, was formerly met with in trade, made of equal parts of *orange-lac* and *white sugar*, reduced to a proper consistence with *rectified spirit*, and 'brought up' with some *tincture of benzoin*, and a few drops of the *oils of cassia and nutmeg* dissolved in a little *essence of vanilla*.

Balsam of Turpentine (-tine). *Syn.* BALSAMUM TEREBINTHINÆ, L. A name formerly given to Strasburgh, Venice, and other like turpentine.

Balsam of Turpentine (Emollient). *Syn.* B. TEREBINTHINATUM, L. *Prep.* *Oliver oil*, 6 oz.; *oil of turpentine*, 2 oz.; *yellow wax*, 1 oz.; *balsam of Peru*, *oil of nutmeg*, and *camphor*, of each, 2 drs. A stimulant emollient; in contusions, ulcerations, engorgements, nephritic pains, &c.

Balsam of Umi'ri. [Nat.] By incision, from the *humiria floribundum* (Mart.), or the *umiriplant* of Para. It is fragrant, limpid, of a palish-yellow colour, and in its medicinal properties is said to combine those of the balsams of copaiba and Peru.

BALSAMIC (bäl-). *Syn.* BALSAMICUS, BALSAMBUS, BALSAMINUS, L.; BALSAMIQUE, Fr.; BALSAMISCH, Ger. Of the nature of balsam, or containing or resembling it; bland, soothing, healing; balmy.

BAMBOO' (-bôô'). [Nat.] *Syn.* BAMBUS, L.; BAMBO, Fr.; BAMBUS, BAMBUSROHR, INDIANISCHER ROHR, Ger. The name of several species of the genus 'bambusa,' but appr. of *b. arundinacea* or 'common bamboo.' See BAMBUSA (below).

Bamboo'-habit (-hâb-). A species of 'life-preserver,' or 'float,' used in China and the

¹ "Archiv der Pharm." 1855.

Indian Archipelago, consisting of four pieces of bamboo tied together so as to form a square.

BAMBU'SA. [Endl.] The bamboo. In *botany*, a genus of magnificent arborescent grasses, of the *nat. ord.* Gramineæ (DC.), having hollow jointed stems, of a hard woody texture, externally coated with siliceous matter, and sometimes secreting a similar siliceous substance (TABASHEER) in their internal cavities. They are all of rapid growth, and vary in height from 6 to 150 feet.

There is, perhaps, scarcely any other plant, besides the palm, which serves for so many purposes useful to man, as the various species of bamboo. Its grain is used for bread; the young shoots are eaten like asparagus, and are also pickled; the smaller stalks are made into walking canes, umbrella and parasol sticks, flutes, &c.; whilst its fibres are manufactured into cloth, and even paper. It is employed extensively in the construction of houses, bridges, masts for boats, domestic furniture, boxes, mats, baskets, utensils of various kinds, fences, water pipes and vessels, quicksilver bottles, &c., and for numerous other purposes connected with everyday life. The genus is confined to the East and West Indies and tropical America. See CANE, PICKLES, TABASHEER, &c.

BANA'NA (-nā' or -nāl'). [Nat.] The *musa sapientum* (Linn.), a species of plantain; also its fruit. See PLANTAIN.

BAND'AGE (-āje). *Syn.* DELIGATIO, FAS'CIA, LIGAMEN, LIGATU'RA, VINCU'RA, L.; BANDAGE, BANDE, Fr.; BINDE, VERBAND, Ger. In *surgery*, the fillet, roller, or cloths, used to support parts, to exert pressure on them, or to retain dressings in their proper places.

Bandages are usually formed of long narrow slips, of calico or linen, and, occasionally, of flannel, which are generally made into a roll (ROLLER) of moderate size, so as to be the more conveniently handled and applied. They are either SIMPLE, as the *circular*, the *spiral*, or the *uniting bandage*; or COMPOUND, as the *T-bandage*, *suspensory b.* &c.

The application of bandages, as in the dressing of wounds, ulcers, &c., though of such frequent occurrence, is often very carelessly and badly done. The form and nature of the part, and the object in view, should always receive consideration; as should also the condition of the patient after their application—whether of repose, exercise, or labour. Ordinary ingenuity will supply the rest. The safest, simplest, and most effective means of fastening them, is, in most cases, furnished by a common needle and thread or cotton.

Bandage, Mustard. A woollen roller soaked in a mixture of the best flower of mustard and warm water, of the consistence of fresh cream, the excess of moisture being expelled by gentle pressure.—Used to envelope the body, or a limb, by repeatedly folding it round the part; in the cold stages of cholera, and in other cases requiring an energetic stimulant. Other

medicaments, particularly those of a stimulating and anodyne character, are sometimes applied in the same manner. See EMBROCATIONS, LOTIONS, POULTICES, &c.

BANDAN'A. [Ind.] *Syn.* BANDAN'NA. A handkerchief, originally from the East Indies, having white spots on a red, blue, or other dark ground. In *calico-printing*, a 'discharge style' in imitation of the Indian bandanas. The fabric, many folds thick, is placed between leaden plates having the pattern cut out of them; hydraulic pressure is then applied, and a clear solution of chloride of lime forced through, followed by a stream of pure water.

BAND'OLINE (-lîn; -lênē). See FIXATURE.

BANE. Poison; anything deleterious or destructive; a word often found joined to another, in the popular and vulgar names of plants and diseases, to denote their character; as BANE-BERRY, the herb *Christopher*; BANE-WORT, *deadly-nightshade*; SHEEP'S BANE, the rot; &c.

BANG, Bangue (bāng'). [Nat.] See INDIAN HEMP.

BAN'IAN (bān'-yān). The *ficus Indicus* (Linn.), or *Indian fig*. The fruit and young branches yield one species of gum-lac; and both the juice and bark are used medicinally.

Among sailors, BANTAN' DAYS are those on which butcher's meat is not served up at dinner.

BANN'OCK (-ūk). In *Scotland* and the northern counties of England, a flat round cake made of oat, rye, or barley meal, baked on an iron plate over the fire, or on the hot hearth.

BAR (Management). See COUNTER, RETAIL, &c.

BAR'BERRY. *Syn.* PEP'PERIDGE-BUSH†, THORNY BOX-TREE*; BER'BERIS, B. VULGARIS (Linn.), L.; EPINE-VINETTE, VINETTIER, Fr.; BERBERITZE, Ger. A perennial bush or shrub common in woods and hedges. *Berries* (BAR'BERRIES, PEP'PERIDGES), gratefully acid, cooling, and astringent; used in pastry, but require, according to their degree of ripeness, from one half their weight to an equal weight of sugar. Both *bark* and *berries* were formerly esteemed in jaundice, biliary fluxes, &c. The *crushed berries* with *water* form a refreshing fever-drink. The *root* dyes a fugitive yellow. See BERBERINE, JAMS, PRESERVES, &c.

BAREGE (*barège*, bār-rāzhe'). [Fr.] A light woollen fabric so named from having been first made in the valley of Barèges. Of late years Paris has become celebrated for its barèges; but these are generally woven with the 'warp' of silk, and the 'woof' of wool. In the common imitations of the shops, the 'warp' is generally of cotton.

BAREGINE (barégine). See GLAIBINE.

BARIL'LA. [Eng., Ger., L., Sp.] *Syn.* SO'DE CARBONAS YENA'LE, L.; BARIG'ILLA, BARIL'LO, Sp., Lev.; BARILLE, SOUDE, Fr.

The alkaline residuum of the combustion of *salsola*, *salicornia*, *chenopodium*, and other species of the order *chenopodiaceae*. These plants, which are cultivated on the sea-coast for the purpose, are cut down when ripe, dried, and burned in heaps, on iron bars laid across pits dug in the earth. The alkali and saline matter contained in them is thus fused, and flows into the cavity below, forming, when cold, a hard grey or bluish porous mass which is *BARILLA*.

Comp. Carbonate, sulphate, chloride, and sulphide of sodium, carbonate and sulphate of calcium, alumina, silica, oxide of iron, and imperfectly consumed carbonaceous matter, with a little iodine and bromine. The proportion of soda varies in different varieties:—

ALICANT BARILLA; obtained chiefly from several species of *salsola* and from *chenopodium setigerum* (-tj'-), &c.; contains from 25% to 40% of carbonate of soda. (Guibourt.)

CANA'RY B.; from *salsola ka'li*. (London.)

French barillas:—

a. *NARBONNE B.*, *SALICOR*; from *salicornia annua* or *herba'cea*; contains 14% to 15% of carbonate of soda.

b. *B. OF AIGUEMORTES, BLANQUETTE*; from mixed plants; contains 3% to 8% of carbonate of soda. (Guibourt.)

c. *NORMANDY B.*, *N. SODA*; from *fuci*.

SICILY BARILLA (sis'-). Principally from *salsola sativa*; furnishes 55% of carbonate of soda. (Fée.)

Good barilla, on the average, contains about 20% of real or available alkali, chiefly under the form of carbonate, besides sulphates, muriates, &c.

Assay. See *ALKALIMETRY*.

Uses, &c. Barilla is chiefly used in the manufacture of soap and glass; but the gross quantity imported, though annually increasing, only reached 54,608 *cwt.* in 1856; whilst the exports of soda in the same year reached to about 1,500,000 *cwt.*, and in 1859 to above 2,000,000 *cwt.* This enormous quantity was chiefly furnished by our home manufactories.

Barilla is chiefly imported from Spain, Sicily, Teneriffe, and the Levant; but since the introduction of Le Blanc's process for obtaining soda from common salt, its importance and value has considerably lessened. See *KELP, SODA*, &c.

BARIUM. Ba. A metallic radical or element, of which baryta is the chief oxide, and somewhat extensively distributed. First obtained in 1808 by Sir H. Davy. Prepared from baryta by strongly heating it in an iron tube, through which the vapour of potassium is conveyed; the reduced BARIUM being subsequently extracted from the mixed residuum by quicksilver, which is afterwards driven off in a small en-glass retort, in a vapour of mineral naphtha.

Prop., &c. Greyish-white, approaching silver in colour and lustre; decomposes water, and gradually oxidises in the air, with the forma-

tion of the ordinary oxide (*BARYTA*). It is malleable, fusible under a red heat; burns in contact with air with a deep red light, and has the sp. gr. 4.70.

Salts. Barium forms numerous salts, which are all either colourless or white, except a few, whose acids are coloured, as the chromate, manganate, &c. Some of them are soluble in water; one or two only are soluble in alcohol, and that very sparingly; and (with the exception of the sulphate) they are all extremely poisonous. They may be prepared by saturating solutions of the acids with either baryta-water, or carbonate of barium; and some of them may be prepared by double decomposition.

The various soluble barium salts are known by the following reactions, and they are all (except the sulphate) soluble either in water or in dilute hydrochloric acid, except the nitrate and chloride, which are not soluble in aqueous solutions of their respective acids. Their solutions give an immediate heavy white precipitate with dilute sulphuric acid, and with solutions of the sulphates, which is insoluble in dilute acids and solutions of the alkalies and of the salts of ammonia, that with a solution of sulphate of lime being very sensitive and characteristic:—Hydrofluosilicic acid gives a very characteristic colourless crystalline and quickly subsiding precipitate, only slightly soluble in hydrochloric acid and nitric acid; alcohol, in equal volume, being added, so hastens and completes the reaction, that the filtrate is unaffected by sulphuric acid:—Chromate of potassium gives a bright yellow precipitate in neutral solutions, soluble in hydrochloric acid and in nitric acid, but insoluble in acetic acid:—Caustic potassa or soda (when quite free from carbonate), and caustic ammonia, cause no precipitate, except in highly concentrated solutions:—Alkaline carbonates give a heavy white precipitate with baryta-water or a solution of baryta, and which is all but insoluble in water, and freely soluble in dilute hydrochloric acid:—Heated with proof spirit, or pyroxilic spirit, the barium salts give a greenish-yellow tinge to the flame:—The barium salts, and particularly the chloride, when exposed on a platinum wire to the inner flame of the blowpipe, colour the outer flame yellowish-green:—Insoluble sulphate of barium may be mixed with powdered charcoal, and exposed for a short time to a full red heat, when sulphide of barium will be formed, which is freely soluble in water, and which, after being neutralized with hydrochloric acid, or acetic acid, will yield a solution suitable to the application of the usual tests. The carbonate, and the salts of barium with the organic acids, are all convertible into pure baryta by exposure to a bright red heat.

Baryta is distinguished from lime and from magnesia by its great solubility in hot water, and by the entire insolubility of its sulphate; from strontia, by being precipitated by hydro-

fluosilicic acid, and by not giving a red colour to the flame of alcohol; from alumina, by its causticity and alkaline reaction, and by not being precipitated from its solution in water by ammonium sulphhydrate.

Pois., &c. The sulphate, owing to its insolubility, is the only salt of barium which is not poisonous.—*Symp.* Nausea, vomiting, pains in the head, ringing in the ears, vertigo, and intermitting cramps and convulsions; the respiration is frequently suspended for several moments, and the pupil is generally dilated. The symptoms, however, often vary, and are not very distinctive.—*Treatm., Ant., &c.* Vomiting, followed by copious draughts of water soured with sulphuric acid, or sulphate of soda (*Glauber-salt*) or sulphate of magnesia (*Epsom-salt*), dissolved in a large quantity of water. When carbonate of barium has been swallowed, a mixture of one of the above sulphates and weak vinegar should be taken after the vomiting, in order that a soluble barium salt may be first formed, on which the alkaline sulphate will act more readily. Subsequent irritation may be soothed by opium or morphia, and antiphlogistics.

Barium, Acetate of. $\text{Ba}(\text{C}_2\text{H}_3\text{O}_2)_2$. *Syn.* BARYTE ACETAS, L. *Prep.* From dilute sulphuric acid, neutralised with carbonate of barium, and the solution evaporated and crystallised. Very soluble in water; insoluble, or nearly so, in rectified spirit.—*Uses, Dose, &c.* Same as the chloride. It is seldom employed.

Barium, Arseniate of. $\text{Ba}_3(\text{PO}_4)_2$. *Syn.* BARYTE ARSENIAS, L. *Prep.* A solution of chloride of barium is added to another of arseniate of potassium or sodium, and the precipitate collected, washed, and dried. By dissolving this salt in a solution of arsenic acid, and crystallising, BINARY ARSENIATE OF BARIUM is obtained. Has been recommended in certain skin diseases, and in phthisis complicated with scrofula.—*Dose.* $\frac{1}{15}$ to $\frac{1}{4}$ gr.

Barium, Arsenite of. $\text{Ba}(\text{AsO}_2)_2$. *Syn.* BARYTE ARSENIS, L. Very slightly soluble.—*Use, &c.* As the last.

Barium, Bromide of. BaBr_2 . *Syn.* BARIUM BROMIDUM, L.; BROMURE DE BARYUM, &c., Fr. *Prep.* Boil a solution of protobromide of iron with moist carbonate of barium, in slight excess; filter, evaporate to dryness, and heat the residuum to redness. By careful evaporation of its aqueous solution it may be obtained in crystals. It is soluble in both alcohol and water, and its physiological properties resemble those of iodide of barium.

Barium, Carbonate of. BaCO_3 . *Syn.* CARBONATE OF BARYTE; BARYTE CARBONAS, L.; CARBONATE DE BARYTE, &c., Fr.; KOHLENSÄUREN BARYT, &c., Ger. A heavy white mass or powder, very nearly insoluble in water, and decomposed by nearly all the acids. It is found in the crude state abundantly in nature, but can only be obtained absolutely pure by adding an alkaline carbonate to a solution of chloride of barium, or by saturating the

hydrate with carbonic anhydride, and in either case washing and drying the precipitate. Native carbonate of barium (*witherrite*) is ordered in the pharmacopœias, and is sufficiently pure for making the barium salts, the only purpose to which it is therein applied.

Uses. In *pharmacy*, &c., chiefly to prepare barium salts. In *chemistry*, to separate certain metallic oxides when occurring together in solutions. In the *arts*, as a base for certain delicate colours, as an ingredient in plate-glass, in the manufacture of beet-sugar, &c. It is not used in medicine. It is extremely poisonous.

Barium, Chloride of. $\text{BaCl}_2 \cdot 2\text{Aq.}$ *Syn.* CHLORIDE OF BARIUM; BARIUM CHLORIDUM, L.; CHLORURE DE BARYUM, CHLORHYDRATE DE BARYTE, &c., Fr.; SALZSÄURE SCHWERERDE, CHLORBARIUM, Ger. Neutralise a hot dilute solution of hydrochloric acid with carbonate of barium, evaporate down, and crystallise. Sulphide of barium can be substituted for the carbonate. If required chemically pure, gaseous hydrochloric acid is transmitted through a concentrated solution of common or impure chloride of barium, as long as a precipitate forms; the resulting crystalline powder, which is nearly the whole of the chloride of barium present, is collected on a filter, and, after draining, is washed repeatedly with small quantities of pure hydrochloric acid, until the washings, diluted with water, and precipitated with sulphuric acid, give a filtrate which, upon evaporation in a platinum-capsule or a watch-glass, leaves no residue; the last traces of acid having been removed by a little alcohol, applied in a like manner, the powder is at once dried, and then carefully preserved from the air.—*Used* in analysis.

Prop., &c. Crystals, flat four-sided tables, colourless and transparent; sometimes double eight-sided pyramids; slightly efflorescent in dry warm air, but otherwise permanent; decrepitate when heated, and lose their water of crystallisation; fuse at a red heat; volatilise at a white heat; insoluble in hydrochloric acid and in alcohol, slightly soluble in rectified spirit, and very soluble in water; water, at 60°, dissolves 43 $\frac{3}{4}$ of the crystals, and nearly 37 $\frac{1}{2}$ of the dry salt; and when boiling, 75 $\frac{1}{2}$ of the former, and about 66 $\frac{1}{2}$ of the latter; a saturated boiling solution (223° Fahr.) contains 100 parts of water, and 78 parts of the crystallised salt.

The crystals contain 2 atoms of water; and a formula of $\text{BaCl}_2 + 2\text{Aq.}$

Uses, Phys. eff., &c. In *chemistry*, it is employed as a test for sulphuric acid and the soluble sulphates. In *medicine*, it has been employed, both internally and externally, as an alterative, resolvent, and deobstruent, in scrofula, glandular swellings, and enlargements, scirrhus cancer, skin diseases, &c.; and more particularly in the first with marked benefit. In large doses it is poisonous. According to Sir B. Brodie, its action on animals is analo-

gous to that of arsenic. Locally, it acts as an irritant. A very weak solution, used as a lotion, often proves serviceable in herpetic eruptions, and as a collyrium in scrofulous ophthalmia.—*Dose.* $\frac{1}{2}$ gr. thrice a day, in water, gradually increased to 2 or 3 grs.

Barium, Chlorate of. $\text{Ba}(\text{ClO}_3)_2$. *Syn.* CHLORATE OF BARYTA; BARYTE CHLORATE, L. *Prep.* From a solution of chloric acid neutralised with freshly precipitated carbonate of barium; the resulting solution, after filtration, being crystallised by evaporation.

By passing chlorine through strong milk of hydrate or of carbonate of barium, in the same way as in making chlorate of potassium.

Prop., &c. Soluble in 4 parts of cold water.—Used in *pyrotechny*, and to make chloric acid.

Barium, Ferrocyanide of. $\text{Ba}_2\text{FeC}_6\text{N}_6$. *Syn.* BA"RII FERROCYANIDUM, L. From pure ferrocyanide of iron digested in baryta-water. By careful evaporation, efflorescent prismatic crystals may be obtained, soluble in $4\frac{1}{2}$ parts of water.

Barium, Fluoride of. BaF_2 . *Syn.* BA"RII FLUORIDUM, &c., L. A white powder, formed by digesting freshly precipitated carbonate of barium in hydrofluoric acid, in excess.

Barium, Hydrate of. $\text{Ba}(\text{HO})_2$. *Syn.* HYDRATE OF BARYTA; BARYTE HYDRAS, L. *Prep.* By digesting caustic baryta, or barium oxide, with a little water, or igniting gently the crystallised hydrate. It can be obtained crystallised as follows:—

1. From a concentrated solution of either nitrate or chloride of barium, precipitated with a rather strong solution of pure potassa, or of pure soda, perfectly free from carbonic acid.

2. A strong solution of sulphide of barium is boiled with successive portions of black oxide of copper, until it ceases to give a black precipitate with a salt of lead; the liquid, after filtration, yields crystals of the hydrate on cooling.

Prop., Uses, &c. Forms a bulky white powder, containing $10\frac{1}{2}\%$ of water of hydration, which it retains even after ignition. In this state it is soluble in 20 parts of cold water, and in 2 parts of boiling water. The hot saturated solution, as it cools, deposits abundantly columnar crystals (CRYSTALLISED HYDRATE OF B.), which contain $51\frac{1}{2}\%$ of water, of which they lose, by drying and ignition, $88\frac{3}{4}\%$ ($=45\frac{1}{2}\%$ of their weight), being reduced to the state of the common or amorphous hydrate. Of all the bases it has the strongest affinity for both sulphuric and carbonic acid; and hence its solution (BARYTA-WATER) and those of its neutral salts (nitrate or chloride) form our most sensitive tests for these substances. Sp. gr. 4.3 to 4.7. The crystallised hydrate is converted into the ordinary hydrate at a gentle heat, and this last fuses at a low

red heat without losing its water of hydration, which it only slowly and with difficulty begins to part with at higher temperatures. In *chemistry*, its uses are, for the most part, similar to those of BARIUM, OXIDE OF.

Barium, Iodide of. Ba_2I_2 . *Syn.* BA"RII IODIDUM, L.; IODURE DE BARYUM, &c., Fr. *Prep.* 1. Dissolve sulphide of barium in water, and add iodine (gradually) in excess; after the reaction is complete, filter, and either evaporate to dryness, or crystallise.

2. Digest freshly precipitated carbonate of barium, in excess, in a hot solution of protiodide of iron; filter and evaporate to dryness; then re-dissolve and crystallise.

3. By saturating hydriodic acid with oxide or carbonate of barium.

Prop., &c. A white or greyish-white mass, or acicular crystals (according to the mode of its preparation); very soluble in water and in alcohol; and decomposed by exposure to the air. It has been highly recommended as an alterative, solvent, and liquefacient, particularly in scrofula, glandular swellings, chronic inflammations, and the other affections in which chloride of barium and iodine are given.—

Dose. $\frac{1}{15}$ to $\frac{1}{8}$ gr. (gradually and cautiously increased to 1 gr.), in distilled water, 2 or 3 times a day. *Externally*, as an ointment (3 or 4 gr., to lard, 1 oz.), as an application to scrofulous swellings. (Biett.) It possesses all the irritant, corrosive, and poisonous properties of the chloride, but in a much more violent degree.

Barium, Nitrate of. $\text{Ba}(\text{NO}_3)_2$. *Syn.* NITRATE OF BARYTA; BARYTE NITRAS, L. *Prep.* As the acetate or chloride of barium, substituting pure nitric acid for acetic or hydrochloric acid.

Prop., &c. Transparent, colourless octahedrons, which are anhydrous, insoluble in alcohol, and require about 8 parts of cold water, and about 3 parts of boiling water, for solution.

Uses. In *chemistry*, to prepare baryta, and as a test for sulphuric acid and the soluble sulphates; and in *pyrotechny*, to give a green tinge to flame.

Barium, Oxalate of. BaC_2O_4 . *Syn.* OXALATE OF BARYTA; BARYTE OXALAS, L. *Prep.* By precipitating a barium salt with oxalate of ammonium. Very nearly insoluble.

Barium, Oxide of. BaO . *Syn.* BARYTA, BARYTES, CAUSTIC BARYTA*, OXIDE OF BA"RIUM, PROTOXIDE OF B., HEAVY BARTH; BARYTE, OXIDE DE BARIUM, TERRE PESANTE, &c., Fr.; BARYT, BARYTERDE, SCHWERERDE, &c., Ger. One of the earths discovered by Scheele in 1774.

Sources. Sulphate and carbonate of barium are abundant minerals, forming the 'vein-stone' of many lead-mines. It is from the latter that baryta and the barium salts are almost exclusively obtained.

Prep. 1. A mixture of carbonate of barium

and charcoal (both in fine powder and moistened) is strongly ignited, for some time, in a porcelain, Hessian, or black-lead crucible, and then allowed to cool out of contact with the air, from which it must also be subsequently carefully preserved.

2. (Pure.) Crystallised Nitrate of barium is calcined in a capacious covered porcelain or Hessian crucible, at a bright red heat, until red (nitrous) vapours are no longer disengaged, even on raising the temperature; and the residuum, as soon as the temperature has fallen sufficiently, but whilst still warm, is at once transferred to a bottle, as before.

Prop. A greyish-white, spongy, earthy-looking mass, fusible only before the oxy-hydrogen blowpipe; highly caustic, corrosive, and alkaline, and slaking, like quick-lime, on the addition of water; but with the evolution of more heat.

Barium, Peroxide of. BaO_2 . *Syn.* DEUTOXYDE OF BARIUM; BARYBINOXIDUM, &c. L.; BINOXIDE DE BARYUM, &c. Fr. *Prep.* Pure baryta is heated to full redness in a porcelain tube, and a stream of pure dry oxygen passed over it as long as the gas is absorbed.

Baryta, 4 parts, is heated as above in a platinum crucible, and chlorate of potassium, 1 part, gradually added to it; the chloride of potassium formed along with the binoxide being afterwards washed away with cold water.

Prop., &c. Grey or greyish-white; with water it forms a hydrate, which is slightly soluble in water, and undecomposed by it in the cold. It is interesting chiefly in its relations with peroxide of hydrogen and the oxygenised acids of M. Thénard.

Barium, Phosphate of. $\text{Ba}_3(\text{PO}_4)_2$. *Prep.* In a similar manner to the oxalate, which it resembles in being an almost insoluble white powder.

Barium, Sulphate of. BaSO_4 . *Syn.* SULPHATE OF BARYTA, HEAVY SPAR, BOLDIGNIAN S., CAWE (mi); BARYTE SULPHAS (Ph. E. & D.), SPATHIUM PENDEROSUM, &c., L.; SULFATE DE BARYTE, SPATH PESANT, &c., Fr.; SCHWEFELSAURES BARYT, SCHWERSPATH, &c., Ger. This salt is found native, often in beautiful tabular crystals, but more frequently in white or reddish-white masses. It is also occasionally prepared artificially, as a pigment and chemical, by decomposing a solution of chloride of barium with dilute sulphuric acid, or with a solution of sulphate of sodium; the resulting precipitate being collected, well washed, and dried.

Prop., &c. When pure, or free from iron, its powder is white. It is insoluble in water, and nearly insoluble in all other menstrua. Before the blowpipe it decrepitates, fuses with great difficulty (by which it is distinguished from the sulphates of strontium and calcium), and ultimately melts into a hard, white enamel. Mixed with charcoal, and heated to redness in a covered crucible, it is reduced to

sulphide of barium. It is readily decomposed by fusion with alkaline carbonates; also very slightly so by their cold solutions; but ultimately completely, though slowly, by their boiling solutions. Sp. gr. 4.3 to 4.75.

Uses. Chiefly as a pigment (PERMANENT WHITE), and to adulterate white-lead; for which purposes the native sulphate is commonly well washed, first in very dilute sulphuric acid, and afterwards in pure water, to remove any iron which may contaminate it, and impair its whiteness. It is also used to form sulphide of barium; and, in pyrotechny, instead of the more expensive nitrate.

Barium, Sulphide of. BaS . *Syn.* SULPHIDE OF BARIUM, SULPHURET OF BARYTA; KA'RI SULPHURETUM, &c., L.; SULFURE DE BARYUM, &c., Fr. *Prep.* Sulphate of barium, well dried and in fine powder, 3 parts; powdered charcoal or powdered coal, 1 part; the mixture is pressed tightly into an earthen crucible, and the cover being fitted on, it is exposed for $1\frac{1}{2}$ to 2 hours, to a bright red heat; after it has cooled, the black mass thus obtained is powdered, and boiled in water, and the resulting solution allowed to crystallise. Some authorities recommend forming the mixed powders into a stiff paste with oil, or oil of turpentine, before calcination; but this is not at all necessary.

Prop., Uses, &c. Crystals, thin and nearly colourless plates, containing combined water; very soluble in hot water, less so in cold water; and rapidly decomposed by exposure to the air. It is principally used to form the BARIUM SALTS, and in organic analysis. Care should be taken in its preparation to expose the solution to the air as little as possible. SULPHIDES of a higher grade may be formed by boiling this compound with sulphur; but they possess little practical interest.

Barium, Sulphite of. BaSO_3 . *Syn.* SULPHITE OF BARYTA. *Prep.* By testing a soluble barium salt with sodium sulphite, and washing the precipitate. Insoluble.

Barium, Tartrate of. $\text{BaC}_4\text{H}_4\text{O}_6$. *Syn.* TARTRATE OF BARYTA. *Prep.* Like that of oxalate of barium. White powder. Slightly soluble.

BARK. [Eng. & Daa.] *Syn.* CORTEX, L.; ÉCORCE, Fr.; BAUMEINDE, RINDE, Ger. The rind or exterior covering of vegetables, corresponding to the skin of animals. It consists of the *cuticle* or *epidermis*—cellular substance, containing colouring matter, &c., and *liber*, the inner or true bark. The last is formed of woody fibre in great quantity, intermixed with cellular tissue. At the commencement of the annual growth of a tree, the bark separates spontaneously from the wood, in order to make room for the new matter forming beneath. It thus increases by yearly layers, and gradually perishes on the outside, owing to distension, from the growth of the interior portion. Its physiological uses are numerous and important. It is the depository of many of the secretions of plants,

and it acts as a living filter, separating secretions from each other, and allowing a part of them to pass off horizontally through the medullary processes on their way to the centre of the tree. But its principal offices appear to be to act as a protection to the tender wood, and as a channel for the sap in its descent from the leaves. "True bark only exists in *exogens* and *gymnosperms*; in *endogens* its place is supplied by cortical integuments, which cannot be separated from the adjacent wood, without violence." (Lindley.)

According to Liebig, the characteristic ingredients found in bark are excrementitious—"substances evidently expelled by the living organism." True wood yields only 25% to 2% of ash; whilst the bark of some trees give 6, 10, to 15 times more; and these, like the organic constituents, differ materially in their composition and characters.

The uses of different species of bark in medicine and the arts are well known. CINCCHONA-BARK is invaluable in fevers; OAK-BARK furnishes the tanner with one of the most important materials of his trade; and the tenacious fibres of other varieties are manufactured into cordage and textile fabrics.

Barks should be collected at that season in which they can be most easily separated from the wood, which, with a few exceptions, is late in the spring; because at this time the active principles deposited in their cells are most abundant. OAK-BARK, collected in spring, contains four times as much astringent matter as that collected in winter.

Bark. (In medicine.) See CINCCHONA.

Bark. (In tanning.) See OAK-BARK.

Bark, Jes'uit's. Cinchona-bark.

Bark, Salt of (Essential). See EXTRACTS and SALTS.

BARLEY. *Syn.* HOR'DEUM, L.; ORGE, F.; GEBSTE, Ger., Anglo-S. A well-known grain, the produce of several species of the genus *hordeum*.

Var., Cult., &c. Those principally cultivated in England are—TWO'-BOWED, LONG'-EARED, or COMMON BARLEY (*hor'deum distichon*, Linn.); SPRING'-BARLEY, SQUARE'-B., or BERE (*h. vulgare*, Linn.); and SIX'-BOWED BARLEY, WINTER B., Scotch BERE or BIGG (*h. hexastichon*, Linn.). PUT'NEY, SPRAIT, or BATTLEDORE B. (*h. zeocriton*, Linn.), is another species less frequently met with. Of each of the above there are several varieties. In Spain and Sicily, two crops of barley are obtained in a year; but, in countries so far north as Britain, it produces only one, and is a delicate species of grain. In England it is generally adopted as a succession crop on light lands, following turnips or green crops. (London.) The yield per acre varies from 28 to 64 bushels, and is usually from 28 to 40 bushels. The average weight per bushel is 50 to 51 lbs.; but the best Norfolk and Essex samples weigh 53 to 54 lbs. per bushel.

Comp. The leading constituents of barley are

nearly similar to those of wheat, but it is scarcely so rich in nitrogenised matter. According to Einhof, the ripe SEEDS or GRAINS are composed of—

Meal	70.05
Husk	18.75
Moisture	11.20
	<hr/>
	100.

According to Johnston, average fine BARLEY-MEAL contains—

Starch	68.
Albumen, gluten, &c.	14.
Fatty matter	2.
Ash or saline matter	2.
Water	14.
	<hr/>
	100.

According to Dr. Ure, the sp. gr. of ENGLISH BARLEY is 1.25 to 1.33 (average, 1.235), and the weight of the husk is about 1-6th; that of BIGG, 1.227 to 1.265, and weight of husk, 2-9ths.

Qual., Uses, &c. Its employment and value as food, and in the manufacture of malt, are well known. It forms good wholesome bread well adapted for persons who live luxuriously; but which, for the abstemious and the delicate, is inferior to that made of wheat, as it is rather less nutritious, and less easy of digestion, and commonly proves laxative to those unaccustomed to its use. Barley-flour and b.-meal are also more perishable than wheat-flour; being very apt to acquire a hot nauseous taste, which even the heat of the oven does not remove. In a medical point of view, barley is regarded as the mildest and least irritating of the cereals. It has always been in high estimation as a demulcent and emollient. The decoction (BARLEY-WATER), made with pearl barley, is a common and useful drink in inflammatory diseases, particularly in those of the chest and urinary organs. Among the Ancients, decoctions of barley (*κριθή*) were the principal aliments and medicines employed in acute diseases.

Barley, Can'tic. Sabadilla.

Barley, Pat. *Syn.* FARINA HOR'DEI, L. Pearl barley reduced to fine powder by grinding in a mill.

Barley, Pearl. *Syn.* PEARLED BARLEY*; HOR'DEUM DECORTICATUM (B.P.), L.; ORGE PERLÉ, Fr.; PERLENGRAUFEN, Ger. The seeds of *hordeum distichon* deprived of the husks. That of commerce is usually made by steaming spring-barley, to soften the skin, then drying it, and grinding it in a mill with the stones set wide apart, so as to round and polish the grains, and to separate the whole of the husk except that left in the furrow of the seed. SCOTCH PEARL-BARLEY and FRENCH BARLEY resemble the last, but are smaller, being generally made from winter-barley or bigg. FARO

DE ORZO is another variety made from *spratt-barley*. See BARLEY (above).

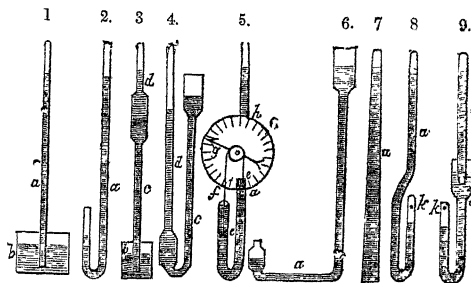

Barley, Scotch. *Syn.* HULLED BARLEY†, POT-B.†; HOR'DEUM MUNDA'TUM, L.; ORGE MONDE, Fr.; GERSTENGRAUPEN, GRAUPEN, Ger. The grains deprived of the husk by a mill, as noticed above, but less completely, and without rounding them.

BARLEY SUGAR. See CONFECTIONERY, and SUGAR.

BARM. See YEAST.

BAROMETER (rōm'-). *Syn.* WEATHER-GLASS†; BAROMETEUM, L.; BAROMÈTRE, Fr.; BAROMETER, WETTERGLAS, Ger. An instrument for measuring the weight or pressure of the atmosphere. It was invented by Torricelli, of Florence, A.D. 1643.

The barometer is made of several forms, but the principle of its construction, with the exception of the aneroid barometer, is the same

1. Torricelli's cistern barometer.

2. ——— syphon ditto

3. Huygen's barometer.

4. ——— modified.

5. Wheel barometer

6. Bernoulli's syphon ditto

7. Amont's conical ditto

8. Gay Lussac's ditto.

9. ——— modified by M. Bunten.

(a) Tube containing a column of mercury.

(b) Mercurial cistern

(c) A column of mercury supporting another of water

(d).

(e, e'). Weights, one of which floats on the surface of the mercury, and by means of the cord (f) moves the index (g).

(h) Graduated dial.

(k) Capillary hole drilled laterally to admit air.

in each, and essentially consists of a column of fluid (usually mercury) supported in vacuo, in a glass tube, by the pressure of the atmosphere on its surface. The annexed engr. exhibits the principal varieties at present known; several of which have been proposed with the view of improving the original instrument, either by increasing its range, or its portability. None, however, equal in simplicity, cheapness, and usefulness, the old forms proposed by Torricelli, and repr. by the figs. 1 & 2. To avoid confusion, the graduated scales and cases of the instruments are not shown.

The construction of a barometer requires the utmost skill and care of a practised artist, and will therefore be seldom undertaken by the amateur or experimentalist—a fact which renders it unnecessary for us to enter into the details here. In the choice of his instrument, the purchaser must greatly depend on the known experience and integrity of the manufacturer; as nothing but lengthened use, and frequent comparisons with other instruments, can possibly prove its excellence. An ordinary barometer, however carefully made, is found to suffer gradual deterioration, from the external air insinuating itself between the mercury and the glass tube, by which the perfection of the vacuum is destroyed. Various plans have been proposed to remedy this inconvenience and source of error. Prof. Daniell forms the bottom part of the tube, to the extent of about 1/3rd of an inch, of solid platinum, welded to the glass. This plan has proved completely

satisfactory. Dr. Ure proposes the use of platinum-foil for the same purpose. Before purchasing an instrument it is as well to ascertain that this has been done. In those called 'STANDARD BAROMETERS' the scale is movable and adjustable by a delicate screw, so as to enable the observer to bring the lower point or zero (0) of the scale coincident with the surface of the mercury in the cistern. Exact contact is readily effected by making the point, and its image as seen by reflection from the surface of the mercury, to coincide. In this case the cistern is made of glass. Provided the ivory scale be connected with the zero-point with a strip of brass, correction as to temperature is very nearly effected by this simple adjustment. The WHEEL-BAROMETER is chiefly serviceable as a domestic or land weather-glass.

Uses, &c. The barometer is employed for ascertaining the amount of atmospherical refraction in astronomical calculations, and in measuring altitudes, and in prognosticating the weather. For the last purpose, on land, it sometimes proves a false prophet; but at sea, its predictions are highly trustworthy. As a mere weather-glass, the indications, as read off from the scale of the instrument, are generally sufficiently accurate; but in all observations connected with meteorology, altitudes, astronomy, &c., certain corrections must be made; the height of the mercury being influenced both by the size of the tube and by the temperature of the air by which it is sur-

rounded, as well as by variations in the weight or pressure of the atmosphere. (See *below*.)

Barometrical Corrections:—

1. As to **CAPILLARITY**:—This applies to all *cistern-barometers* formed of tubes of very small diameters, owing to the mercury assuming a convex surface in the tube. As the tube increases in diameter, so the depression of the mercury lessens. Hence, "the interior diameter" of a barometer "should, in every case, exceed one fourth of an inch." (Brande.) Syphon barometers that have each of their legs of equal size, require no correction, as the depression is equal at both ends.

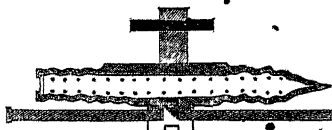

TABLE of *Barometrical Corrections for CAPILLARITY, from the 'Encycl. Brit.'*

Diam. of Tube.	Depression.
·10 inch.	·1403 inch. +
·15 "	·0863 "
·20 "	·0581 "
·25 "	·0407 "
·30 "	·0292 "
·35 "	·0211 "
·40 "	·0153 "
·45 "	·0112 "
·50 "	·0083 "
·60 "	·0044 "
·70 "	·0023 "
·80 "	·0012 "

2. As to **TEMPERATURE**:—These depend on the expansion of the mercury, and of the scale on which the divisions are marked. The *Rule* for reducing an observed height to the corresponding height at the freezing-point, or 32° Fahr., the usual standard temperature, is—Subtract 1-10000th part of the observed height of the barometer for every degree of Fahr. above 32° at the time of the observation. Or—

$$(obs. t. - 32) \times obs. h. \times \cdot 0001 = corr. req.$$

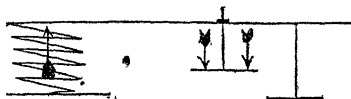

Barometer, An'roid. An instrument invented, or at least perfected, by M. Vidi, of Paris, in which the pressure of the atmosphere is measured without the employment of a fluid, as in the ordinary barometer.¹ Externally, it

somewhat resembles in appearance a carriage clock or a ship's chronometer; internally, it consists of a small air-tight cylindrical box, formed of thin corrugated copper-plates, and partially exhausted of air, the sides of which

¹ An instrument founded on the same principle, and of nearly similar construction, was described by M. Centé, in 1798, in the "*Bull. des Sci. Nat.*," t. i, No. xiii, p. 108.

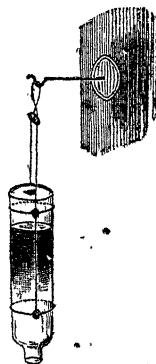

yield to the pressure of the atmosphere; the effect being regulated by a spring, multiplied by a system of levers, and ultimately retorded

by the index on a graduated dial. Compensation for changes of temperature are self-effected, with almost perfect accuracy, by the elastic force of the spring being so adjusted to that of the air in the cylinder, that the loss of force in the one, and the increased expansive force of the other, shall, independently of changes of atmospheric pressure, preserve the lever in equilibrio.

The indications of the aneroid barometer closely correspond to those of the mercurial barometer, at ordinary ranges; the differences never exceeding the ·01 of an inch. It is so extremely sensitive that an ascent or descent of only a few feet is distinctly indicated by it; whilst its portability adapts it for service in situations for which an ordinary barometer is unfitted. On the other hand, it is liable to move by jerks, and the elasticity of the spring, and consequently the zero-point of the scale, has been found to be sometimes affected by time and a rough journey. On this account it is necessary to compare it occasionally with some standard mercurial barometer, to determine its amount or rate of variation, if any.

Barometer, Phial. This amusing philosophic toy is made by cutting off the rim and part of the neck of a common glass-phial with a file. The phial is then nearly filled with water, either pure or tinged blue or red; and the finger being placed on its mouth, it is inverted, and suspended in a vertical position by means of a piece of twine or wire, when the finger is withdrawn. (See engr.) In dry weather the under surface of the water remains level with the neck of the bottle, or even concave; in damp weather, on the contrary, a drop appears at the mouth and continues enlarging until it falls, and is then followed by another in the same way.

Barometer, Port'able. The most accurate are those of Gay-Lussac and Bunten, and after them the *aneroid*. They should be set on universal joints, and well balanced. The common instrument made with a box and leather cistern, seldom continues long correct.

Barometer, Wheel. The common form of the instrument having a dial-face and hands.

[For further information in connection with

the *above subject* the reader is referred to the 'articles' ANEROID, ATMOSPHERE, GAS, HEIGHTS, STEAM, STORM-GLASS, VAPOUR, WEATHER, &c.]

BAROSCOPE† (-skōpe). [Eng., Fr.] *Syn.* BAROSCOPIUM, L. A barometer; sometimes applied to the wheel-barometer, of Hooke.

BAR/RAS. The concrete resinous exudation from the bark of fir-trees. † That from *pinus maritima* is called GALIOPOT.

BARSE. [Provincial.] The common perch.

BAR/WOOD. A red dye-wood imported from Angola and other parts of Africa. It closely resembles cam-wood and sanders-wood in its colouring matter being of a resinous nature, and scarcely soluble in water. In *dyeing*, this difficulty is obviated by taking advantage of the strong affinity existing between it and the proto-salts of tin and iron. Thus, by strongly impregnating the goods with protochloride of tin, either with or without the addition of sumach, according to the shade of RED desired, and then putting them into a boiling bath containing the *rasped wood*, the colour is rapidly given out and taken up, until the whole of the tin in the fibres of the cloth is saturated, and the goods become of a rich bright hue. In like manner the DARK RED of bandana handkerchiefs is commonly given by a mordant of acetate of iron followed by a boiling bath of this dye-stuff. See DYEING, MORDANTS, &c.

BASALT† (bā-sōlt).¹ [Eng., Ger.] *Syn.* BASALTES (-sāl-tēz), L.; BASALTE, Fr. In *geology*, &c., a species of trap-rock, essentially composed of the minerals felspar and augite. It is of a fine compact texture, of a dark-green, gray, or black colour, and usually occurs in regular columns, of which the Giants' Causeway and the Island of Staffa furnish magnificent examples. It is fusible; and when rapidly cooled forms a dark brittle glass; but when slowly cooled retains its original beauty and hardness almost unimpaired. Messrs. Chance, Brothers, of Birmingham, have availed themselves of this property to apply it to decorative and ornamental purposes. Their process is to melt the material² in a reverberatory furnace, and, when sufficiently fluid, to pour it into red-hot moulds of sand enclosed in iron boxes. The corresponding *adj.* is BASALTIC (-sōlt-; -BASALTICUS, -sāl-, L.; BASALTIQUE, Fr.).

BASE. [Eng., Fr.] *Syn.* BA/SIS (*pl.*, ba'ses), L., Gr.; GRUND, GRUNDLÄCHE, Ger. In *chemistry*, it was formerly, and is now occasionally, applied to metallic oxides which possess the property of forming salts with acids. The *alkaloids* are also designated *organic bases*. In *pharmacy*, the characteristic or principal ingredient in any medicine or com-

pound preparation; or that on which its qualities or efficacy depends.

BAS'IL (bāz'-). *Syn.* SWEET BAS'IL, CIT'RON B.; BASILICUM, L.; BASILIC, Fr.; BASILIKUM, Ger. The *ocymum* (ōs'-) *basilicum* (Linn.), an annual aromatic herbaceous plant, of the *nat. ord.* Labiatae (DC.). It is a native of India, but is largely cultivated in every part of Europe as a pot-herb. Leaves, strong-scented; popularly reputed emmenagogue; much used to flavour salads, soups, &c., especially in French cookery. *Mock-turtle soup* derives its peculiar flavour from this herb; as also did the original Fetter-lane sausages, once so highly esteemed by Cockney gourmands. In India it is commonly employed as an anodyne, in childbirth.

BAS'IL (bāz'-). *Syn.* BAS'AN; BASANE, Fr. A sheep-skin, tanned; particularly one dressed on the grain-side, for book-binding.

BASILICON. See CERATES and OINTMENTS.

BAS'KET (bās'-). *Syn.* CAPH'INUS (kōf'-), L.; PANIER, CORBEILLE, &c., Fr.; KORB, Ger. BASKETS are generally STAINED or COLOURED with the simple liquid dyes used for straw or wood; and that, for variegated work, the twigs, after being carefully peeled, washed, and wiped dry or slightly air-dried, are stained before being woven. See OSIERES, &c.

BASS†. [Provin.] The linden-tree; also a hassock or mat made of its inner bark. See BAST.

BAS'SORIN (-rīn). *Syn.* BASSORI'NA, L. A substance first noticed, by Vauquelin, in *Bas'sora-gum*. See INSOLUBLE GUM, TRAGACANTHINE, &c.

BAST (bāst). *Syn.* BASS (which see). The inner bark of the *linden-tree* or *tiel-tree*; also matting, &c., made of it.

BAS'TARDS (-tārdz). *Syn.* BAS'TARD SUG'AR (shōōg'-), PIECES, &c. In *sugar-refining*, impure or damaged sugar resulting from the heat and chemicals used in the process of manufacture, and which will not pay for purifying.

BA'SYL (bāse-yl). In *chemistry*, any simple or compound body, acting as a basic radical.

BATH (baht). *Syn.* BAL'NEUM, L.; BAIN, Fr.; BAD, Ger., Sax. ° A place for bathing; a vessel or receptacle, natural or artificial, containing or adapted to contain water, and used to bathe in. In *architecture* and *hygiene*, a building fitted up for, and appropriated to bathing.

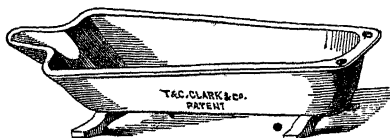

Constr., &c. Here one of the first subjects which must engage our attention is the selection of the material of which the bath is to be formed. For FIXED BATHS polished white marble has always been in favour, owing to its cleanliness and beauty. For this purpose, slabs of sufficient thickness and free from flaws or cracks should be chosen; and they should be securely and properly bedded in good water-tight cement, in a well-seasoned wooden case. The objections to marble, independent of its costliness, are, that it is apt to get yellow

¹ *Basalt*—Mayne; a 'notation' contrary to that of all our leading orthoepists and lexicographers.

² Rowley-rag is used by the Messrs. C.; as beside ordinary basalt, greenstone, whinstone, and other similar minerals, possess the same property.

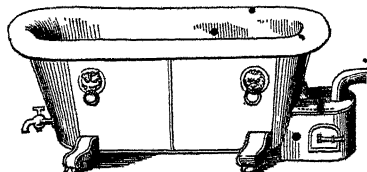

or discoloured, and to lose its polish, by frequent and careless use; and that the restoration of its surface to its original purity, is a matter of considerable expense and difficulty. It is also only fitted to contain water with, at the most, soap, weak alkalies or alkaline carbonates, aromatics, or neutral organic principles; and cannot be employed with water medicated, however slightly, with acids, sulphurets, iodine, chlorine, salines (others than those just named), or colorific substances. As a cheaper material thick slabs of *Welsh slate* are often substituted for marble; but even this substance is attacked by chemicals, though much more slowly. A lining of large *Dutch tiles* is sometimes used; but here the joints are very apt to leak. For baths adapted to all the requirements of health and disease, and which are at the same time durable and comparatively inexpensive, we must, therefore, seek further. *Porcelain, glass, and hard-glazed stone-ware* have been proposed, and are even sometimes used for baths; but they possess the disadvantages of being fragile, and very liable to crack when filled with hot water in cold weather. *Wedge-wood-ware* is very beautiful and durable; but it is expensive, and baths formed of it can only be obtained on special order. *Stourbridge-ware*, as produced of late years, is the only product of the potter's art, that appears entirely to meet the case; but even this yields in durability to *enamelled*

1.

iron as a material for baths adapted to all liquids and temperatures, and to rough or careless usage. (See engr. 1.) The better qualities of *PORTABLE BATHS* (see engr. 2) are generally made of *copper*. Stout *tinned* or *galvanised iron*, and even stout *black-tin* thickly covered with waterproof paint or *japan*, are also employed; but though less ex-

2.

pensive than copper, they have the disadvantage of being much less durable. All these substances are, however, readily acted on by chemicals. A durable and cheap portable bath, adapted to all purposes, must, therefore, like a fixed one, be made of one or other of the

materials already noticed. For *MEDICATED BATHS* large wooden troughs are frequently employed, particularly for acidulated, ioduretted, and sulphuretted baths.

The arrangements for supplying cold and hot water must necessarily greatly depend on circumstances, and the quantity required. For a single *FIXED BATH*, or even for 2 or 3 of them, the common circulating water-heater or boiler, placed in some apartment on a rather lower level than the bath, is, perhaps, the most convenient; but where this is not attainable the water may be run, by means of a pipe, from a boiler situated on a somewhat higher level. In either case a supply of cold water must also be at hand, and conveyed in a like manner, to enable the bath to be reduced to any required temperature. On the large scale, as in our public baths, where numerous baths are in constant use during the day, the hot water is best supplied from a large cistern somewhere above the level of the bath-rooms, and which is heated by a coil of pipe supplied with high-pressure steam from a boiler situated on a lower level, as the ground-floor or basement. The hot and the cold water, conveyed by separate pipes of about 1½ inch diameter, unite in a two-way cock close to the bath, so as to enter it together, by which only one aperture in the end of the bath is required for the purpose. The bath is emptied, and excess of water removed, by a grated aperture in the bottom, also stopped by a cock which, like the former, has handles or keys so placed as to be accessible to the attendant outside the bath-room, as well as to the bather; whilst the danger of overflowing is obviated by a two-inch waste-pipe, opening into the bath at about two inches from the top.

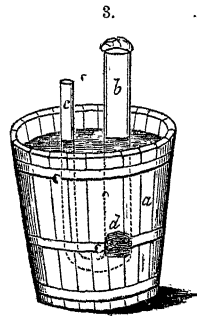

For heating portable baths so many plans are in use, and have been suggested, and even patented, that the reader cannot possibly be at a loss for one to suit his particular case. A small grate for burning charcoal is the one most commonly adopted; but where attainable, a ring or cross of small inflamed gas-jets, is more cleanly and manageable.

When the bath consists of a wooden tub, or any other deep vessel, a simple and inexpensive apparatus brought out in America, under the title of the '*ITALIAN BATH-WARMER*' (see engr. 3), and made of thin sheet-iron, will occasionally be found useful.¹

The situation and the minor details connected with the comfort and convenience of the bath, must greatly depend on the character of the building, and the sum to be devoted to the purpose. When possible, the bath-room should always be on the same floor as the bedrooms, of easy access to them, and so situated and arranged, that a plentiful and constant supply of pure water can be ensured, and the

¹ A small cast-iron 'horse' with three legs (not shown in the engr.) to support the 'warmer' about 2 inches above the bottom of the bath-tub, and to keep it steady and upright, is usually sold with it.

waste water removed without trouble or inconvenience. The basement story should always be avoided; for, as observed by Dr. Ure, there is a coldness and dampness belonging to it, in almost all weathers, which is neither agreeable nor salubrious.

- (a.) Bath-tub.
 (b.) The larger arm of the warming-tube by which the charcoal is introduced, and by which the fumes fly off.
 (c.) The smaller arm to admit air to support the combustion.
 (d.) The fire grate, to support the burning charcoal.

The ranges of the temperature of water appropriate to the respective baths, according to the common nomenclature, are shown in the following Table:—

Name.	Temperature. Fahr.
Cold bath	33° to 75°
Temperate bath	75 „ 82
Tepid bath	82 „ 90
Warm bath	90 „ 98
Hot bath	98 „ 112

Concluding remarks. The importance, and indeed, the absolute necessity of frequent personal ablution, has been already insisted on and explained. But however important and beneficial the use of water in this way may be, the effects arising from the immersion of the body in that liquid, as in the practice of bathing, are far more extensive and complete. What the one does usefully but not completely, the other accomplishes readily, satisfactorily, and perfectly. There is no absolute succedaneum for the entire bath. Its physiological effects are peculiar to itself, and of the utmost importance in pathology and hygiene. The practice of wearing flannel, the daily use of clean linen, the mere washing of the more exposed parts of the body, are but poor attempts at cleanliness, without the occasional, if not frequent, entire submersion of the body in water. Nor should the action of judicious bathing in the promotion of personal comfort and personal beauty be forgotten. Intellectual and moral vigour are also gradually, but materi-

ally, influenced and promoted by the beneficial action of bathing on the system; for mind and conscience being linked to matter in the 'house we live in,' become perturbed, or lethargic, in almost exact accordance with the fluctuations of our physical health. The neglect of bathing in this country is, to us, an absolute enigma. We are always talking about health, and continually professing to be seeking it; but the practical applications of the principles which we advocate, and the doctrines which we teach, are, unfortunately, the exceptions and not the rule.

Our recommendation of bathing applies chiefly to the warm bath and the tepid bath, which are alike adapted to the delicate and the robust, and to every condition of climate and season. Cold bathing, in this climate, is only suited to the most healthy and vigorous, and can only be safely practised during the warmer months of the year, and in a mass of water sufficient to permit of the heat of the body being maintained by swimming or other active exercise. The plunge and shower baths are partial exceptions to these remarks; whilst sea-bathing, for the reasons given elsewhere, comes under another category. This last, "on account of its stimulative and penetrating power, may be placed at the head of those means which regard the care of the skin; and it certainly supplies one of the first wants of the present generation, by opening the pores, and thereby re-invigorating the whole nervous system." "Besides its great power in cases of disease, it may be employed by those who are perfectly well, as the means most agreeable to nature for strengthening the body and preserving the health." Another important advantage which sea-bathing has over bathing in fresh water is, that persons seldom take cold from indulging in it.

We may add, that for bathing to produce its best effects, the water should be soft and pure, and good soap sparingly, but regularly, employed whenever the skin requires it.

The medical and hygienic properties of baths are noticed below, under their respective names:—

Bath. In *chemistry*, &c., a vessel or apparatus containing some medium in which the vessel holding the substance to be heated is immersed, instead of being exposed to the direct action of the fire; by which means a limited and uniform temperature may be ensured.

The highest temperature that can be given to any substance contained in a vessel placed in another of boiling water, is about 205 or 206° Fahr.; but by adding $\frac{1}{4}$ th part of common salt to the bath, a heat of fully 212° may be obtained. Baths of fusible metal, saturated solutions of salt, sand, and (on the large scale) steam, are also used for the same purpose. A bath of oil may be safely heated to about 500° Fahr. without suffering decomposition, and will be found an exceedingly appropriate and convenient source of heat in many

processes. For a Table of Boiling-points, see **EBULLITION**.

Bath. In *medicine*, the medium in which the body, or a part of it, is bathed or immersed, for some object beyond that of mere personal cleanliness or enjoyment; the composition, use, or temperature of the medium, being generally indicated by some epithet, as in the instances below. When only the last is pointed out, pure water is, of course, intended to be used.

Baths are divided by medical writers into classes, and even minor subdivisions, in a manner which is more ingenious than useful. They are said to be **SIMPLE**, when water or its vapour forms the bath; and **COMPOUND**, when the water or vapour is medicated by the addition of other substances (**COMPOUND BATHS**; **BAL'NEA COMPOSITA**, L.). The latter class is also subdivided into **THERAPEUTIC BATHS** (**MEDICATED BATHS**; **BAL'NEA MEDICATA**, B. **THERAPEUTICA**, L.); and **NUTRITIVE BATHS** (B. **NUTRIENTIA**, B. **NUTRITIVA***, B. **NUTRITIVA***, L.). Thus, besides the ordinary water and vapour baths, the medical uses of which are hereafter noticed, we have **WINE-BATHS**, **MILK-BATHS**, **SOUP-BATHS**, &c. (used to convey nourishment, or to sustain the body, as in occlusion of the cesophagus, certain diseases of the stomach, &c.); **CHLORINE BATHS**, **SULPHUROUS B.**, **MERCURIAL B.**, &c. (used in skin diseases, syphilis, &c.); **AROMATIC** and **CHALYBEATE BATHS** (employed as tonics); and **ACID BATHS** (sometimes used to remove the effects of mercury).

On the Continent a variety of substances are employed to medicate baths, which are seldom or never so used in this country.

The quantity of any medicinal substance used to medicate a bath, for an adult, may be, in general, for each gallon of water employed, about the same as that which is used to form a half-pint lotion of medium or rather weak strength. Thus; taking the quantity of bichloride of mercury to form the lotion at 5 grs., and that of sulphurated potash at $\frac{1}{2}$ dr., the quantity required for a bath of 30 to 40 *galls.* will be about 2½ drs. of the first, and about 1½ oz. of the second of these substances. Much, however, depends on the nature of the case, the length of the immersion, the periods of recurrence, and the intended number of repetitions. In the case of very active remedies it will be safest and best to begin with less than (say $\frac{1}{2}$ to $\frac{3}{4}$) the quantity thus indicated.

Medicated baths are, in nearly all cases, taken warm or fully tepid.

*** In the following notices, which are given as examples, the quantity of the ingredients ordered, when not otherwise indicated, is that proper for an ordinary full-sized bath for an adult; *viz.*, from 40 to 60 *galls.* Those which do not contain volatile substances may be used more than once; and many of them several times by adding a small quantity

of fresh ingredients to keep up their strength.

Bath, Acid (äs'-). *Syn.* **BAL'NEUM ACIDUM** (äs'-), L. See **HYDROCHLORIC**, **NITRIC**, **NITRO-HYDROCHLORIC**, and **SULPHURIC ACID BATHS** (*below*). Enamelled, hard-glazed, or wooden vessels must be used with all of them.

Bath, Air. *Syn.* **BAL'NEUM PNEUMATICUM**, L.:—*a.* (Cockl.) Simple exposure of the body, in a state of nudity, for a short time to the atmosphere. Tonic, anodyne, and sedative; in febrile excitement, nervous irritability and restlessness accompanied by a quick or full pulse, &c. Safe and often very effective. It will frequently induce sleep when all other means fail.

b. (Hot:—**ASSA**, A. **SUDATIO**, L.) An apartment to which dry heated air is admitted. Sometimes the arrangement is such that the air is not inhaled. Stimulant; sudorific; more so than even the vapour bath; produces copious perspiration, being, indeed, the most powerful and certain diaphoretic known. It has been advantageously employed in cholera (for which its advocates state that it is almost a specific), congestive fevers, chronic rheumatism, contractions, stiff joints, paralysis, scaly skin-diseases, dropsical swellings, and most of the cases in which the vapour bath is usually employed. The temperatures are—as a sudorific, 85° to 105° Fahr.; as a stimulant, 100° to 130°. When not inhaled it may be often raised, with advantage, 15° to 25° higher. See **TURKISH BATH**.

c. (Compressed.) Recommended, by M. Tarberie, in aphonia, &c. It has recently been employed in asthma, phthisis, and some other like diseases, with extraordinary success, at Ben Rhydding.

d. (Rarefied.) Applied locally. Revulsive; resembles **DRY CUPPING** (which *see*).

Bath, Alkaline. *Syn.* **AL'KALISED BATH**; **BAL'NEUM ALKALINUM**, B. **ALKALIZATUM**, L. *Carbonate of potash* (salt of tartar), $\frac{1}{2}$ lb. In itch, prurigo and chronic skin diseases accompanied with dryness and irritation, acute gout, lithic gravel, scurvy, diarrhoea, &c. *Scotch soda*, 1 lb., is sometimes substituted for the 'potash;' but is less effective, and is theoretically objectionable.

Bath, Alum. *Syn.* **BAL'NEUM ALUMINIS**, L. *Alum* (in powder, or previously dissolved in hot water), $\frac{1}{2}$ lb. to 1½ lb., or even 2 lbs. In troublesome excoriations, extensive burns, obstinate vesicular eruptions, diarrhoea, &c.; also in obstinate piles and prolapsus ani. See **ASTRINGENT BATH**.

Bath, Ammoniacal. See **HYDROCHLORATE OF AMMONIA BATH** (*below*).

Bath, Animal. *Syn.* **BAL'NEUM ANIMALLE**, L. The skin or any part of an animal just killed, wrapped round the body or a limb. Once much esteemed; now, happily, disused in this country.

Bath, Antimonial. *Syn.* **BAL'NEUM ANTIMONIALE**, L. *Tartar-emetic*, 1 to 2 oz. (Sou-

beiran.) In lumbago and certain skin diseases, also as a counter-irritant.

Bath, Antipso'ric. *Syn.* BAL'NEUM ANTI-PSO'RICUM, L. See SULPHURETTED BATH (also others both above and below).

Bath, Aromatic. *Syn.* BAL'NEUM AROMAT'ICUM, L. *Balm, chamomile, lavender, mint, rosemary, sage, thyme*, with any other like aromatic herbs (at will), of each, a handful, mixed together and steeped in a (covered) pail of boiling or very hot water, for an hour, and then strained, with pressure, into the bath. Sometimes 2 or 3 oz. of *sal-ammonia*, a $\frac{1}{2}$ lb. of *alum*, or 1 lb. of *common salt*, is also added. Occasionally used in cutaneous affections, chronic rheumatism, diarrhoea, dyspepsia, stiff-joints, &c.; also in debility arising from loss of blood, spermatorrhoea, suppressions, hysteria, hypochondriasis, &c.

The AROMATIC VAPOUR BATH is made by causing the vapour to pass through the herbs.

Bath, Astringent. *Syn.* BAL'NEUM ASTRINGENS, L. *Prep.* (Most.) *Alum*, (2 to) 4 lbs.; dissolve in *boiling water*; and add, *whey*, 6 or 8 pailfuls, or q. s. In extensive burns, piles, prolapsus ani, &c. See ALUM BATH, OAK-BARK BATH, &c.

Bath, Balsamic. *Syn.* BAL'NEUM BALSAM'ICUM, L. *Bordeaux turpentine and tar*, of each, 2 lbs. (or of *tar* alone, 3 to 4 lbs.); *hot water*, 6 or 7 galls.; stir continuously until nearly cold, then add the clear portion to *water*, q. s. to form a bath. In mumps, pruriginous diseases of the skin, eczema, impetigo, &c.

Bath, Barèges (Factitious). *Syn.* BAL'NEUM BARÈGENSE (Factitium), L. *Prep.* 1. *Crystallised sulphuret of sodium*, 3½ oz.; *chloride of sodium*, 1½ oz.; *gelatine* (dissolved), 4 oz.

2. (Trousseau & Revell.) *Dry sulphuret of potassium*, 4 oz.; *water*, 16 oz.; dissolve, and add the solution to the bath; then further add, of *sulphuric or hydrochloric acid*, $\frac{1}{2}$ oz., previously diluted with *water*, 8 oz. In itch, moist skin diseases, chronic diarrhoea, chronic rheumatism, lead colic, &c. See BATHS, WATERS, &c.

Bath, Benzo'ic. *Syn.* BAL'NEUM BENZO'ICUM, L. 1. *Benzoin* (in powder), $\frac{1}{2}$ lb.; *water* (at 90°) q. s. In irritations, hysteria, hypochondriasis, &c. It is also reputed to be feebly aphrodisiac.—2. A common warm bath, with a little powdered benzoin laid on a heated plate near the bather, so that the fumes may be inhaled. Slightly soothing or anodyne; in chronic laryngitis, relaxed uvula, &c.

Bath, Bichlo'ride of Mercury. See MERCURIAL BATH.

Bath, Bran. *Syn.* BAL'NEUM FUFURIS, L. *Bran*, 5 to 7 lbs.; *boiling waters*, 2 or 3 galls.; *digested* together for an hour, or boiled for 15 minutes; the strained liquid being added to the bath. Emollient; in dry and scaly skin disease, and to allay itching and surfacial irritation; also to promote suppuration, &c.

Bath, Cam'phor. *Syn.* BAL'NEUM CAMPHORÆ, B. CAMPHORATUM, L. *Camphor*, 3

or 4 drs., coarsely powdered, and placed on a plate heated by boiling water, in the bath-room. Anodyne, anaphrodisiac, and diaphoretic; in spasmodic asthma, chronic cough, relaxation of the uvula, ardor urinae, nervous irritability, &c.

Bath, Carbon'ic. *Syn.* CARBON'IC ACID BATH; BAL'NEUM CARBON'ICUM, B. ACIDUM CARBONICUM, L.

1. *Carbonic acid gas* applied, by means of a suitable apparatus, to prevent its being respired. Antiseptic, diaphoretic, and excitant to the vascular system; in amenorrhoea, chlorosis, hysteria, scrofula, cancerous and other ulcers (particularly foul ones), &c.

2. *Water*, at 50° Fahr., charged with the gas. Powerfully antiseptic and sedative; in foul ulcers, gangrene, &c.

Bath, Chlo'ride of Ammo'nium. *Syn.* BAL'NEUM AMMO'NI CHLORIDI, B. AMMO'NIÆ HYDROCHLORATIS, L. *Sal-ammoniac*, 2 to 3 lbs., or even 4 lbs. In chronic inflammations, glandular enlargements and indurations, chronic rheumatism and affections of the joints, leucorrhoea, chilblains, frost-bites, &c.

Bath, Chlo'rine. *Syn.* BAL'NEUM CHLORINI, B. CHLORINATUM, L. *Tepid water* to which a little *chlorine* has been added. Antiseptic, stimulant, and subsequently sedative and antiplogistic; in itch, foul and gangrenous ulcers, chronic liver affections, &c. Chloride of lime is commonly substituted for chlorine.

2. (Magendie; Wallace.) *Chlorine gas* (obtained from *salt*, 1½ oz.; *oil of vitriol and water*, of each, 1 oz.; and *black oxide of manganese*, $\frac{1}{2}$ oz. to 1 oz.) diluted with *air*, at a temperature of 104° to 150° Fahr., and applied, by means of a suitable apparatus, for 10 minutes to $\frac{1}{2}$ an hour; every possible precaution being taken to prevent it being inhaled. In chronic liver affections, gradually and cautiously increasing the ingredients to three times the above quantity, and decreasing the dilution with *air* until the gas is used nearly pure.

Bath, Cold. *Syn.* BALNEUM FRIGIDUM (frîj'-), FRIGIDA'RIVM, L.; BAIN FROID, Fr. *Water*, fresh, saline, or mineral, at a temperature varying from 33° to about 75°; but usually understood to apply to water between 50° and 70° Fahr. When below 50° it is considered *very cold*. At a temperature ranging from 60° to about 75° it is commonly used by the healthy and vigorous as a luxury, and for cleanliness.

"The immediate effects of the cold bath are a sensation of cold (speedily followed by one of warmth), contraction of the cutaneous vessels, paleness of the skin, diminution of

1 A dangerous remedy in careless or unskilful hands; and even with the experienced, not always free from danger. The writer of this article once nearly lost his life from a single inspiration of the gas which accidentally escaped its proper limits. Terrific spasms of the glottis and a convulsive cough immediately came on, and lasted, with more or less severity, for nearly 14 hours.

perspiration, and reduction of the volume of the body. Shivering, and, as the water rises to the chest, a kind of convulsive sobbing, are also experienced. Continued immersion renders the pulse small, and ultimately imperceptible, and the respiration difficult and irregular. A feeling of inactivity succeeds; the joints become rigid and inflexible; pain in the head, drowsiness, and cramps, come on; the temperature of the body falls rapidly; and faintness, followed by death, ensues." "Its primary effects constitute the SHOCK—its secondary effects, the REACTION or GLOW."¹ Hence it is that immersion of the body in water below about 65° Fahr. cannot be tolerated for any length of time without such a loss of animal heat, as frequently to induce highly sedative and depressing effects, from which the constitution does not readily recover. Water at a temperature of below about 50° Fahr. can only be safely used as a plunge-bath. The sedative effects of sea and mineral waters, is much less than that of pure water, or of spring or river water.

The cold bath, medically considered, is tonic, stimulant and restorative, when judiciously taken, and when not too long continued or too often repeated. When beneficial, the patient feels a pleasant glow on the surface of the body immediately following it. If a sensation of coldness or shivering ensues, it acts injuriously, and should not be repeated. The duration of the immersion may vary from 2 to 15 minutes, the precise time depending upon the temperature of the water, and the feelings of the bather; the longer period being only proper in fine weather, and when accompanied by swimming or violent exercise.

As a remedial agent, the cold bath is principally recommended to increase the tone and vigour of the system; and is contra-indicated when there is a tendency to apoplexy, or to chronic affections, functional or organic, of the heart, lungs, or kidneys. It should never be taken when the party feels chilly, languid, or depressed; or if drowsiness and shivering follow it.

The temperature of the water of the rivers and the coasts of England varies, in summer, from 55° to 70 or 72° Fahr.

Bath, Douche. See SHOWER-BATH, DOUCHE, &c.

Bath, Dry. *Syn.* BAL'NEUM SIC'CUM, L. The immersion of the body in any dry material, as *ashes, salt, sand, &c.* EARTH-BATHING, as administered by the once notorious quack, Dr. Graham, was of this kind. In the *sudatorium*, or sweating room, of the ancients, the body was immersed in heated sand.

Bath, Electric. *Syn.* BAL'NEUM ELECTRICUM, L. The patient, placed on an insulated stool, is put in contact, by means of a metallic wire, with the prime conductor of an electrical machine in action. The surface of the body is thus rendered electro-positive, and

the surrounding air, by induction, electro-negative. It has been recommended in chronic rheumatism, scirrhus tumours, &c.

Bath, Electro-chemical (of Dr. Caplin). This is founded on the supposition that all diseases arise from the presence of mineral, or other extraneous morbid matter, in some organ, or the whole organism, and which is capable of removal by electrolysis. The patient is placed in an appropriately arranged voltaic bath, and there "saturated with the electric fluid." This "decomposes everything which is foreign to the organism, the vital parts being protected by the law of conservation belonging to every organic production." These foreign substances are said to be thus carried out of the system by the electric current, and to be "fixed and plated on the copper in the same way, and according to the same law and principle (only reversed), as in the process of electro-plating."²

Bath, Fecula. *Syn.* BAL'NEUM AM'YLI, B. FÆC'ULÆ, L. *Potato-starch or wheat-Starch*, 1 to 4 lbs.; *boiling water*, q. s. to dissolve. Resembles the BEAN-BATH.

Bath, Ferruginous. *Syn.* CHALYB'EATE BATH; BAL'NEUM FERRUGIN'EUM, B. CHALYBEA'TUM, L. *Green sulphate of iron*, 1 to 2 lbs. A well-tinned copper, wooden, or japanned bath, may be used. In general debility when chalybeates are indicated, and the stomach will not bear iron; also in piles and prolapsus. The stains on the towels used to wipe the patient, may be removed by at once soaking them in water acidulated with hydrochloric acid.

2. (Ioduretted.) See BATH OF IODIDE OF IRON.

Bath, Foot. *Syn.* PEDILU'VIUM, L. Warm (or hot). Revulsive, counter-irritant; in colds, menstrual and hæmorrhoidal suppressions, rheumatism, stiffness of the ankles, tender feet, &c. A little common salt, flour of mustard, or sal-ammoniac, is often added to render it more stimulant, to prevent 'taking cold,' &c. See FEET, &c.

Bath, Gelatinous. *Syn.* BAL'NEUM GELATINOSUM, B. GELATIN'II, L. *Gelatine* or fine *Salisbury glue*, 3 or 4 lbs.; dissolved in *boiling water*, 2 galls., or q. s.; and added to a warm bath. At the 'Hospital for Cutaneous Diseases' 8 lbs. of patent size is used for a bath of 30 to 35 galls. Emollient; formerly, but erroneously, considered nutritive. Used in skin diseases; generally combined with sulphur. See BAREGES BATH.

Bath, Glycerin (glis'). *Syn.* BAL'NEUM GLYCERIN'II, B. G. COMPOSITUM, L. *Glycerin*, 2 lbs.; *gum arabic* (dissolved), 1 lb. Used as a soothing emollient, in itching, dryness, irritation, and hardness of the skin, &c. Where expense is an object, 3 or 4 lbs. of good honey, and 1 oz. of salt of tartar, form an excellent substitute for the glycerin.

Bath, Hemlock. *Syn.* BAL'NEUM QU'NI, L. 1. *Dried hemlock-leaves* (or herb), 4 to 6 hand-

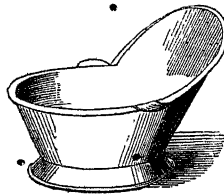

² "Hist. Records of the Electro-chem. Bath," by Mons. J. F. J. Caplin, M.D. Baillière, 1869.

¹ Pereira, "Mat. Med. and Therap.," 4th ed., i, 39.

fuls; *water*, 1 gall.; infuse 2 hours, and strain. The part to be immersed in, or bathed with, the warm infusion, observing not to apply it, if the skin is unsound; or it may be added to the water of a bath in the usual manner. In gout, cancer, chronic rheumatism, and certain skin diseases.

2. (Cut. Hosp.) *Extract of hemlock*, 2 oz.; *starch*, 1 lb.; *boiling water*, 1 gall.; dissolve. For a bath of about 30 galls. As the last.

Bath, Hip. *Syn.* COXÆLUVIUM, L. Usually warm; sometimes fully warm, or somewhat hot. In inflammatory, spasmodic, and chronic affections of the abdominal and pelvic viscera; in suppressed and painful menstruation, hæmorrhoids, stranguy, prolapsus, ischuria, &c.; also as a substitute for a full bath, when this

last is contra-indicated by some affection of the lungs, heart, brain, or great vessels. Like full baths, it may be often advantageously medicated. See BIDEZ.

Bath, Hot. *Syn.* BALNEUM CALIDUM, CALDA'RIVM, L.; BAIN CHAUD, Fr. Usual temperature, 98° to 106° Fahr.

The hot bath has a remarkably tranquillising effect upon the nervous system, producing a strong tendency to quietude and sleep. It also acts as a powerful antispasmodic, and by determining the blood to the surface of the body, tends to relieve visceral inflammation and congestion. In chronic affections arising from the action of cold and damp and from exhausted energy, in stiff joints, rheumatism, neuralgia, diarrhoea, and numerous other affections, its effects are often rapid and remarkable. At higher temperatures it strongly stimulates the arterial system, and arouses nervous energy and vital action, producing excessive excitement and perspiration, followed by copious perspiration, which has been often found successful in cholera, paralysis, &c. If the immersion be too long continued, or the bath be injudiciously employed, lassitude, debility, and somnolency ensue, and the good effect of the bath is more or less lost. In these cases violent throbbing and painful distension of the vessels of the head, with a distressing feeling of suffocation and anxiety, are premonitory symptoms of impending apoplexy, an accident which sometimes, though seldom, follows its improper use.

Bath, Hydrochlorate of Ammonia. See HYDROCHLORIDE OF AMMONIUM BATH.

Bath, Hydrochloric Acid. *Syn.* MURIATIC ACID BATH; BALNEUM HYDROCHLORICUM, in

B. ACIDUM H., B. MURIATICUM, &c., L. *Commercial hydrochloric acid*, 1 to 3 lbs. (in chronic liver affections); or 3 to 6 fl. oz. (in prurigo and lichen).

Bath, Hydrosulphuretted. *Syn.* BALNEUM HYDROSULPHURETUM, L.—1. A tepid sulphuretted bath with the addition of *hydrochloric acid*, 2 or 3 fl. drs., immediately before immersion. In rheumatism, chronic skin diseases, whooping-cough, and certain forms of paralysis:—2. A tepid bath to which 3 to 6 fl. oz. of (liquid) *hydrosulphate of ammonia* is added immediately before use. Used as the last. It often acts almost as a specific in whooping-cough and certain breath-ailments.

Bath, Iodide of Iron. *Syn.* BALNEUM FERRI IODIDI, L. *Prep.* (Pierquin.) *Iodide of iron*, $\frac{1}{2}$ oz. to 2 oz. In amenorrhœa, leucorrhœa, chlorosis, scrofula, &c.; gradually increasing the quantity of the iodide until 4 oz., or more, is used for a bath.

Bath, Iodine. *Syn.* BALNEUM IODINI, L.:—1. *Iodine*, 3 to 5 drs.; *dry siliceous sand*, 2 oz.; triturated together until reduced to fine powder, and then agitated with the water of a tepid bath for 10 or 15 minutes:—2. (Cutan. Hosp.) *Iodine*, 4 drs.; *liquor of potassa*, 4 oz.; *water*, 2 pints; dissolve; for a bath of 30 galls. In skin diseases complicated with scrofula, glandular enlargements, amenorrhœa, &c.

Bath, Ioduretted. *Syn.* IODURATED BATH, IODISED B., COMPOUND IODINE-B., &c.; BALNEUM IODURETUM, B. IODURATUM*, B. POTASSII SUPERIODIDI, &c., L. Lugol, the leading authority on this subject, employs this bath of the different strengths, &c., shown in the following Tables:—

a. FOR ADULTS:—			
Degree.	Iodine.	Iodide of Potassium.	Water for the bath.
1	dr	dr.	gal.
2	2 to 2½	4 to 5	50
3	2 „ 3	4 „ 6	60
3	3 „ 3½	6 „ 7	75

b. FOR CHILDREN:—			
Age.	Iodine.	Iodide of Potassium.	Water.
4 to 7	gr.	gr.	gal.
7 „ 11	30 to 36	60 to 72	9
11 „ 14	48 „ 72	96 „ 144	18
	72 „ 96	144 „ 192	31

* * The dry ingredients of the first Table are to be dissolved in a pint of *water*, and of the second, in $\frac{1}{2}$ pint of *water*, before adding them to the bath.

In scrofulous affections and the other cases in which the external use of iodine or the

iodides is indicated. Enamelled ware, stone-ware, or wooden vessels must be employed.

Bath, Lime. *Syn.* BAL'NEUM CUM CAL'CE, L. *Lime, 3 lbs.*; slaked, and added to the bath. In gout, lithic diathesis, itch, &c. See VAPOUR BATH.

Bath, Mercu'rial. *Syn.* ANTISYPHILIT'IC BATH; BAL'NEUM MERCURIA'LE, B. HYDRAR'GYRI BICHLORID'I, B. ANTISYPHILIT'ICUM, &c., L.; BAIN MERCURIEL, B. ANTISYPHILITIQUE, &c., Fr. *Bichloride of mercury*, in fine powder, 1 to 3 drs.; *hot water*, 1 pint; agitate together until solution is complete, before adding them to the bath, the 'water' of which (contained in an enamelled or wooden vessel) must be soft (rain) and pure. At the 'Cutan. Hosp.' *hydrochloric acid* ($=\frac{1}{3}$ rd the weight of the chloride), is commonly added; and at the 'Fr. hospitals,' an equal, or rather more than an equal weight, of sal-ammoniac. These additions facilitate the solution of the chloride, and retard its decomposition by any slight impurity in the water forming the bath.

Uses, &c. In syphilitic affections, either with or without skin disease; in chronic rheumatism, swelled joints, and chronic skin diseases generally, where the use of mercury is indicated, and the remedy is rejected by the stomach; especially in these affections in women and children (for the last, proportionately reduced in strength and quantity). Also used in itch, and to destroy pediculi on the body.

Bath, Met'al. See BATH (in *Chemistry*), FUSIBLE METAL, &c.

Bath, Mud. *Syn.* BAL'NEUM LU'TEUM, B. LU'TI, L. Mud-bathing (ILLUTA'TION) was common among the ancients. The slime of rivers, and the mud on the sea-shore, were especially prized for this purpose. The Tartars and Egyptians still employ baths of this description in hypochondriasis, scrofula, and scurvy. At Franzenbad, in Germany, an acidulous species of black *bog-earth* found there, is beaten up with warm water to a semi-liquid consistence, and used as a bath. This is said to render the skin satin-like and soft; and to be useful in debility, and in paralytic affections of a gouty origin. In France, hot dung (DUNG BATH) is occasionally used in rheumatism; and in Poland, in syphilis. The husk of grapes and the refuse of olives, after undergoing a partial fermentation, have been successfully employed in France against acute rheumatism.¹

Bath, Muriat'ic*. See HYDROCHLORIC ACID BATH.

Bath, Mus'tard. *Syn.* BAL'NEUM SINA'PIS, L.:—1. *Flour of mustard, 2 lbs.*; *warm water*, 1 gall.; make a thin soup; in fifteen minutes pour it into a coarse linen bag or cloth, and press out the liquid, which is to be stirred up with the bath. In cholera, diarrhœa simulating cholera, &c.; also to cause reaction; the patient remaining in the bath until a somewhat painful sense of burning and irritation is experienced:—2. *Flour of mustard, 3 to 8*

oz.; as before. *Used* as a gentle stimulant to excite the skin, and promote its healthy action, &c.

Bath, Nitro-hydrochl'ric. *Syn.* ACID BATH† (âs'-), NITRO-MURIAT'IC B.*, N. A. B.*; BAL'NEUM NITRO-HYDROCHLO'RICUM, B. ACIDI (âs'-), B. A. NITRO-HYDROCHLO'RICI, B. A. NITRO-MURIAT'ICI*, &c., L.:—1. *Water* slightly acidulated with the *acid*, so that its sourness to the taste is about that of common vinegar. According to Ainslie, 1 oz. of *acid* is sufficient for 1 gall. of *water*.² Other formulæ in use are—

2. (Cutan. Hosp.) *Nitric acid*, 1½ lb.; *hydrochloric acid*, 1 lb.; for a bath of 60 to 70 galls.

3. (Soubeiran.) *Nitro-hydrochloric acid*, 4 to 16 fl. oz.; according to the case.

4. (Dr. Scott.) *Nitric acid*, 2 fl. oz.; *hydrochloric acid*, 3 fl. oz.; *water*, 5 fl. oz.; mix. 1½ to 2 fl. oz. to each gall. of *water* for a general bath; 3 fl. oz. to the gall. for a foot, knee, or sponge bath.

Uses, &c. In its weaker forms, in skin-diseases depending on disordered liver; in others, chiefly in liver complaints, and to relieve the pain on the passing of gall-stones. It must be contained in an enamelled or wooden vessel, and may be used as a hip, knee, or foot-bath; a knee-bath being the one generally adopted in England. Dr. Scott, of Bombay, who first brought this bath into notice, once plunged the Duke of Wellington up to his chin in one, in India, and thus cured him of a severe hepatic affection. In its stronger form it causes tingling and pricking of the skin, and a peculiar taste in the mouth, and affects the gums and salivary glands, often producing plentiful ptyalism, without which, indeed, its advocates regard its action as incomplete. Time of application, 15 to 20 minutes daily, for a fortnight or three weeks; and afterwards, every second or third day.

Bath, Oak-Bark. *Syn.* BAL'NEUM QUER'CÛS B. QUER'CI, L. *Oak-bark, 3 or 4 handfuls* for a child; 10 to 15, for an adult; made into a decoction, and strained with pressure into the bath. In hæmorrhoids, prolapsus, leucorrhœa, hernia, diarrhœa, ill-conditioned and bleeding ulcerations, &c. Drs. Elaesser, Eberle, and Fletcher, have successfully employed it in the intermittents of infancy and childhood, tabes mesenterica or scrofula, &c. It has also proved useful in phthisis.

Bath, Oil. *Syn.* BAL'NEUM OLEO'SUM, L. *Olive* or other oil (hot), strongly aromatised with the oils of *cassia, cloves, nutmegs, cedar*, and *juniper*; and digested for a week on *ambergris* and *vanilla*, of each (bruised), about 10 grs. to the gallon. *Used*, in the East, to anoint the body, as a preservative against the plague and other contagious diseases; also as a full bath or hip-bath, the immersion being for 15 to 20 minutes.

Bath, Pneumat'ic. See AIR BATH.

Bath, Saline' (Gelatinous). *Syn.* BAL'NEUM

¹ Mérat and De Lens, "Dict. Univ. de Mat. Méd."

² "Mat. Méd. Indica," ii, 340.

SALINO-GELATINOSUM, L.; BAIN DE PLOMBÈRES, Fr. *Prep.* Common salt and *Flanders glue*, of each 2 lbs.; water, 1 gall.; dissolve separately, and add the solutions to the bath. In scrofula, &c.

Bath, Salt. See SALINE BATH, SEA BATH, &c.

Bath, Sand. Syn. BAL'NEUM ARE'NE, L.; BAIN DE SABLE, Fr. See BATH (in *Chemistry*), DRY BATH, &c.

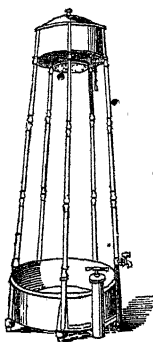

Bath, Sand. Syn. BAL'NEUM MARI'NUM, L.; BAIN MARIN, Fr. Immersion in the sea or in recent sea-water (temperate, tepid, warm, or hot). Owing to the saline matter which it contains, it possesses stimulant, alterative, and resolvent properties, superadded to those of pure water at the corresponding temperature. When taken, in summer, on our coasts, the reaction and glow follow more speedily and certainly than after a common water bath; and it may be taken with greater safety, and for a longer period. It often proves very serviceable in diseases accompanied with debility, in phthisis, scrofula, glandular enlargement, &c. A warm or hot sea-water bath is one of the most restorative imaginable; often removing the effects of fatigue and exposure — exhaustion, stiff joints, cramps, rheumatism, &c. — like a charm. See BATH (above), WATERS, &c.

Bath, Sea (Factitious). Syn. BAL'NEUM MARI'NUM FACTI'TIUM, L. Artificial sea-water, or rather a substitute for sea-water, for this purpose, is commonly prepared by adding about 3½ of common salt to ordinary water. The following are, however, more serviceable imitations:—

1. As above, with the addition of 1 dr. of iodide of potassium to every 3 or 4 galls. of water.

2 (Cutan. Hosp.). Common salt, 8 lbs.; sulphate of magnesia, 2 lbs.; chloride of calcium, 1 lb.; water, 50 to 60 galls.

3. Salt, a handful; water, a pailful; flour of mustard, 1 oz. For a foot-bath.

Bath, Shower. Syn. IMPLUVIUM, BAL'NEUM PEN'SILE, &c., L.; DOUCHE, Fr. Similar in its effects to the cold bath or plunge-bath; but without many of its advantages. It is less alarming to nervous persons, and less liable to produce cramp, than immersion in cold water; whilst the reaction or glow follows more speedily and certainly. It is considered the best and safest mode of cold bathing, and is often highly serviceable in ner-

¹ Or (say) for small quantities—

1½ oz. to the quart;

5 oz. to the gallon.

And for large quantities, as a full bath—
2 lbs. to every 7 gallons.

BATH.

vous affections. A good plan is to allow the water to remain in the bedroom all night, by which any undue degree of coldness is removed. Tepid water may be commenced with; and at first, in extreme cases, the patient may stand in hot or warm water at the time of taking the bath. The reaction following its use is greatly promoted by friction of the surface with dry rough towels.

Bath, Soap. Syn. BAL'NEUM SAPO'NIS, L. *White soap*, 2 to 3 lbs.; water, 3 quarts; dissolve by heat, and add it to a warm bath. Detergent, lubricating, and discutient; in itch and other skin diseases, &c.

Bath, Spon'ging (spünje-'). This title explains itself. In the sponging bath exercise and ablution are combined, and its employment by persons of sedentary habit is highly advantageous.

Bath, Sulphur. Syn. BAL'NEUM SUL'PHURIS, L. 1. *Flowers of sulphur*, ¼ to 1 lb.; water, a pailful; mix, agitate occasionally for 12 to 24 hours, and then add the whole to an ordinary bath. Useful in various mild, but obstinate, skin diseases. Its occasional employment, even in health, seldom fails to render the skin soft, smooth, and delicate. Soap may be used with it.

2. (Compound; B. S. COMPOSITUM, L.)—a. (Cutan. Hosp.) *Precipitated sulphur*, 2 lbs.; *hyposulphite of soda*, ½ lb.; water, 1 gall.; dissolve, and add of *sulphuric acid*, 1 dr. One pint to every 30 galls. of water. In various skin diseases (see below).

b. See SULPHURETTED BATH.

Bath, Sulphurous. Syn. SUL'PHUROUS ACID BATH; BAL'NEUM SULPHURO'SUM, B. SUL'PHURIS; L. From sulphur, ½ oz., sprinkled on a hot plate placed under or near the patient; the proper precautions being taken as directed under CHLORINE BATH. In itch, lepra, psoriasis, &c. Cleanly, but seldom used, chiefly on account of the number of baths required to prove serviceable. See SULPHURETTED BATH.

Bath, Sulphuretted. Syn. BAL'NEUM SULPHURETUM, B. SULPHURATUM, B. SULPHUREUM, &c., L.; BAIN SULFURE, &c., Fr. 1. *Sulphurated potash*, 1 oz.; for every 10 or 12 galls. of water employed. Sometimes *sulphurated soda*, or (in the Ger. hosp.) *sulphurated lime*, is the sulphur-salt employed. ½ dr. of *sulphuric acid* is also occasionally added to the bath; but this increases its fætor, without adding much, if anything, to its curative power; whilst, without care, the evolved gas may impede respiration.

2. (Gelatinous; GELATINO-SUL'PHUROUS B.; B. S. GELATINOSUM, L.). *Flanders glue*, 1½ to 2 lbs.; dissolved and added to a 'sulphuretted bath.' Recommended, by Dupuytren, as a substitute for the 'Barèges bath.'

Obs. The sulphur or sulphuretted bath, under any of its forms, is a powerful remedy in almost every description of skin disease. Leprosy, the most-obstinate of all, has been

completely cured by it; the *common itch* requires only one or two applications to eradicate it entirely; all the *scurfy* and *moist skin-affections*, *local irritation*, *pimples*, *inflammatory patches*, &c., speedily yield to its influence; *scrofula*, and, indeed, *all* those affections in which the warm or vapour bath is serviceable, also derive powerful assistance from the sulphur bath.

Bath, Tem'perate. *Syn.* BAL'NEUM TEMPERAT'US*, L.

Bath, Tep'id. *Syn.* BAL'NEUM TEPIDUM, B. EGELIDUM, TEPIDA'RIVM, L.; BAIN TIEDE, &c., Fr. Approaches the warm bath in its hygienic and medical properties; and is, perhaps, the one best adapted for the mere purposes of personal cleanliness. In the spacious public tepid baths of London, swimming may be safely indulged in, even in cold weather.

Bath, Tum'ble. An obsolete form of the shower bath.

Bath, Turk'ish. *Syn.* BAL'NEUM TURCICUM, L. A hot vapour bath or sweating bath, with massing or shampooing, ending with a warm bath or warm ablutions and friction. The EGYPTIAN, PERSIAN, and RUSSIAN BATHS, are essentially similar. In the ANGLO-TURKISH BATH, recently introduced to this country, hot dry air wholly takes the place of vapour. See AIR BATH (*anté*).

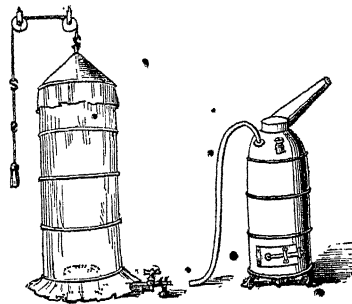

Bath, Turpentine. *Syn.* BAL'NEUM TEREBINTHINATUM, L. *Prep.* (Dr. T. Smith.) *Camphire* (rectified oil of turpentine), $\frac{1}{2}$ to $\frac{3}{4}$ pint; *Scotch soda*, 2 lbs.; *oil of rosemary*, $\frac{1}{2}$ dr.; for an adult. It calms the pulse, softens the skin, and renders the perspiration freer.

Bath, Va'pour. *Syn.* DEW'-BATH*; BAL'NEUM VA'PORIS, B. RO'RIST, AS'SA SUDA'TIO, A. VAPORA'TIO, VAPORA'RIVM*, L.; BAIN DE VAPEURS, Fr. The vapour of hot water, either pure or medicated.

The simplest form of vapour bath is, perhaps, produced by placing some wet cloths, or sprinkling a little water, on two or three heated bricks, laid under a chair on which the patient is seated; both the patient and whole apparatus being covered with a sheet or blanket, or, better still, a spacious waterproof cloak, to keep in the heated vapour. A large lump of quick-lime, set in a pan or an old iron pot and sprinkled with a little water, or else wrapped up in a thick coarse towel which has been previously soaked in water, may be substituted for the hot bricks; and often advantageously so. The slaking of the lime, and the consequent evolution of vapour, may be kept up or renewed, when necessary, by sprinkling on a little more water. This forms the "POOR MAN'S VAPOUR BATH" of the French. Dr. Serres has suggested, as something apparently original, that—a lump of quick-lime, wrapped in a wet cloth, and covered with a dry one, be placed on each side of the patient;¹

¹ "In bed" (!) says the Dr.; but surely one who could only afford such a bath, would find it difficult to obtain a fresh, dry bed; whilst it would be equally improper for him to lie in a wet or damp one.

and the whole being covered up, allowed to remain until copious perspiration is e-

lished. It must, however, be recollected, that by none of these minor contrivances, can the temperature of the vapour, and its supply, be regulated, as in a perfect bath, even a portable one, such as is shown in the engraving.

The following are the temperatures, &c., of this bath:²—

	Temperature of Vapour, Fahr.	
	Breathed.	Not breathed.
Tepid vapour bath	90° to 100°	96° to 106°
Warm "	100 " 110	106 " 120
Hot "	115 " 130	120 " 160

Uses, &c. It is one of the most powerful diaphoretics known, and is almost specific in nearly all those cases wherein warm or hot bathing proves advantageous. It is one of the most certain agents existing in cases of chronic rheumatism, contracted muscles and tendons, stiffness of joints, indurations, dysentery, diarrhoea, suppressions, &c. Instances are numerous, in which the lame have thrown aside their crutches, and the bedridden have again mixed with the world, after a few applications of this bath. It is no uncommon thing to hear a patient start and shriek with agony before entering the bath, and to receive his congratulations and thanks on his coming out. They often exclaim—"It is wonderful. I could not have believed it!"³

Bath, Warm. *Syn.* BAL'NEUM CALIDUM, B. CALID'ULUM, B. THERMA'LE, THERM'A, &c., L.; BAIN THERMAL, B. CHAUD, &c., Fr. A bath at a temperature equal, or nearly equal, to that of the human body.

The sensations attendant upon immersion in a warm bath are most delicious. Its first effect is to increase the circulation of the blood, and to determine it to the skin. After a few minutes an agreeable and universal increase of heat is experienced; the face and head are

² The temperatures of baths given here, and previously, are those now generally adopted in the profession. See Dr. Forbes's "*Opus. of Prac. Med.*," v. i, 265; Pereira's "*Mat. Med.*," i, 17; &c.

³ Gulverwell "*On Baths and Bathing.*"

generally soon bedewed with perspiration; a pleasing and prevailing calm, both mental and physical, follows; and after remaining in it some 12 or 15 minutes the effect is of the most refreshing and happy character.

The idea that the warm bath is relaxing, is erroneous. It is only so where persons remain in it too long, or take it too frequently. Nor are those who indulge in it more liable to take cold than others. On the contrary—they are less liable, unless they wilfully expose themselves, insufficiently clad (particularly about the neck and chest), to draughts of cold air.¹

As a remedial agent, the warm bath is adapted to general torpor of the system, liver and bowel complaints, hypochondriasis, hysterical affections, morbid suppressions, dryness of the skin, nearly all cutaneous and nervous diseases, chronic rheumatism, &c. As a tonic or stimulant after excessive fatigue, great mental excitement, or physical exertion, it is unequalled, and furnishes one of the most wholesome, and at the same time luxurious sources of refreshment we are acquainted with. "To those who are past the meridian of life, who have dry skins, and begin to be emaciated," the warm bath for half an hour, twice a week, I believe to be eminently serviceable in retarding the advances of age." (Darwin.) The healthy longevity of the late Duke of Wellington, after a period of exposure and trials equal to the entire life of many individuals, has been by some, and we think correctly, mainly attributed to the free and constant use of the warm bath. See BATH (*anté*), &c.

Bath, Wa'ter. *Syn.* BAL'NEUM A'QUE, B. AQUO'SUM, B. MA'RIE, B. MA'RIS, L.; BAIN-MARIE, Fr. A water bath; in *chemistry* and *cookery*, applied to a bath of *hot* or *boiling* water. See BATH (in *chemistry*), BAIN-MARIE, &c.

BATH'ING (bâthe'-). See BATH.

BATH METAL. A species of brass having the following composition:—

1. Zinc, 3 parts; copper, 16 parts; melted together under charcoal.

2. Fine brass, 32 parts; spelter, 9 parts; See BRASS and ALLOYS.

BATH PIPE. See PIPE.

BATHS and WASH-HOUSES. See BATH.

BATTER. Ingredients beaten together so as to form a semi-fluid mass. In *cookery*, a semi-fluid paste, which becomes hard in dressing, formed of flour, and milk or water, or a mixture of them, enriched and flavoured with eggs, butter, and (frequently) spices, currants, &c., at will. *Used* for frying vegetables, fillets, &c., and as a material for fritters and pancakes; also to form puddings, which are either baked alone, or under meat; and to

cover various articles during the operation of cooking them. Miss Acton gives the following formulæ:—1. (For the Frying-pan.) *Butter*, 2 oz.; *boiling water*, (nearly) $\frac{1}{2}$ pint; mix, and stir in, gradually, of *cold water*, $\frac{1}{2}$ pint; when quite smooth, mix it by degrees, very smoothly with fine dry *flour*, $\frac{1}{2}$ lb.; adding (for fruit) a small pinch of *salt* (but more for meat or vegetables); just before use, stir in the *whites* of two eggs (or the *white* and *yell* of one—and fry until light and crisp. In humble cookery, the eggs may be omitted.

2. (For Puddings.) *Eggs* (yell and white), about 4 in no.; *flour*, $\frac{1}{2}$ lb.; *milk*, q. s.

Obs. When *fruit*, &c., are added, the batter must be made thicker than when none is used, to prevent it sinking. When sufficiently dressed it should cut smoothly and not stick to the knife. Eggs increase its firmness.

BATTERY. In *frictional electricity*, a series of Leyden jars so arranged as to admit of being charged and discharged together. See ELECTRICITY, &c.

Battery. In *electro-chemistry*, *galvanism*, &c., a pair, or series of pairs, of 'excited' metallic plates, so arranged as to act in unison, producing an electrical current by chemical decomposition.

Baume Nerval. See OINTMENTS.

BAUME (Baumé). See AREOMETER.

BAY. See SWEET BAY.

BDELLIUM (dél'-yûm). The commercial name of two gum-resins:—

Bdellium African. *Syn.* BDELLIUM AFRICANUM, L. From the *heudolatia africana* (Guillemin), a terebinthaceous tree, of Senegal.

Bdellium Indian. *Syn.* INDIAN MYRRH, FALSE M.; BDELLIUM (of *Scripture*); BDELLIUM INDIGM, L. From *am'yris comiph'ora* (Roxb.), or *balsamodendron Roxbur'gii*, a terebinthaceous tree of India.

Prop., &c. Once considered slightly deobstruent; sometimes used as a pectoral and emmenagogue, and, externally, as a stimulant and suppurative. It is now seldom met with in this country.

BDELLOMETER (dél-). *Syn.* MECHANICAL LEBOR; BDELLOMETRUM, L.; BDELLOMÈTRE, Fr. In *surgery*, a contrivance combining the principle of the cupping-glass, scarificator, and exhausting-syringe, in one small instrument.

BEAD (bêde). *Syn.* GLOBULUS, SPHERULA, &c., L.; GRAIN (de *collier*), &c., Fr.; BETHE, PERLE, &c., Ger. A little ball or spheroid pierced for stringing; any very small globular body; a bubble (f or tech.). A number of the first mounted on a thread or ribbon form a 'string of beads' or 'chaplet.'

Materials, Manuf., &c. Beads are often formed of coral, gems, jet, pearls, porcelain, rock-crystal, &c.; but much more frequently of white and coloured glass. The mode in which these last are produced is as follows:—Glass tubes, appropriately ornamented by co-

¹ We have been for many years accustomed to take baths at 98° to 100° Fahr., in all weathers and seasons, even during our severest winters, and on leaving the bath have often been engaged, for hours, moving about in the open air, even until midnight, without 'catching cold,' or the slightest inconvenience. However, we do not recommend others to follow our practice without due care.

lour, reticulation, &c., are drawn out in various sizes, and from 100 to 200 feet in length. These tubes are cut into two-foot lengths, and then, by means of a steel knife, divided into pieces having, as nearly as possible, the same length as diameter. The resulting small fragments or cylinders are next well stirred with a mixture of sand and wood-ashes, in order to prevent the closure of the perforations and their adhering together during the subsequent part of the process. They are then placed in a revolving cylinder and gradually heated until they become sufficiently spherical. They are next sifted from the sand and ashes, sorted into sizes, first by means of sieves, and afterwards by hand, and are lastly, either put up in weighed parcels or strung by women and children for the market.

The manufacture of *coral, gems, jet, and minerals generally, into beads*, belongs to the lapidary.

Uses. Chiefly to form *necklaces, bracelets*, and other articles of personal ornament; by *milliners*, to decorate head-dresses, &c.; and for other like purposes. They are also employed among Catholic and Mohammedan nations for devotional purposes; and among savage tribes in lieu of money. They are still sometimes worn as amulets. See BUGLE, CORAL, GLASS, PASTE, PEARLS, &c. (also below).

Beads, Jum'ble (bédz). The dried seeds of *d'brus precatorius* (Linn.) or Jamaica wild liquorice. Hard and indigestible; accounted cephalic and ophthalmic by the vulgar.

Beads, Lo'vi's. Syn. SPECIFIC GRAVITY BEADS. Small 'hollow spheres of glass' carefully adjusted and numbered, in sets, intended to supersede the hydrometer in determining the density of fluids. They are used by dropping them into the liquid, in succession, until one is found that exhibits indifference as to buoyancy, and will float under the surface at any point at which it may be placed. The number on this ball indicates, in thousandths, the sp. gr. sought. They are particularly serviceable in the hurry of the commercial laboratory, and have the advantage of being applicable to very small quantities of liquid; but their use, of course, requires the same precautions, and the results obtained the same corrections for deviations from the normal temperature, as with other instruments. See HYDROMETER, SPECIFIC GRAVITY, &c.

Bead. Syn. BEADING. In *architecture, cabinet-work, &c.*, any small moulding or continued projection of which the vertical section is semicircular.

Bead (of Liquors). [Tech.] The small bright iridescent bubbles, possessing some slight degree of permanence, which form on the surface of alcoholic liquors of sufficient strength, when agitated. See ALCOHOLOMETRY, PROOF, &c. (also below).

BEADING. In the *liquor-trade*, anything added to commercial spirits to cause them to carry a 'bead' and to hang in pearly drops

about the sides of the glass or 'bottle' when poured out or shaken. The popular notion being that spirit is strong in proportion as it 'beads,' the object is to impart this property to weak spirit, so that it may appear, to the eye, to be of the proper strength. Various formulæ are current among the 'knowing ones' of the trade, most of which are unscientific, and many of them absolutely ineffective. The following are those now usually employed:—

Prep. 1. Oil of sweet almonds and oil of vitriol, of each, 1 oz.; rub them together in a glass, porcelain, or wedgewood-ware mortar or basin, adding, by degrees, of *crushed lump-sugar*, 2 oz.; continue the trituration until the mixture becomes pasty, then add, gradually, sufficient *rectified spirit* (strongest) to render the whole perfectly liquid; pour it into a quart bottle, and wash out the mortar twice, or oftener, with a little fresh spirit, until about 1 pint of *rectified spirit* has been employed, adding the washings each time to the bottle; lastly, cautiously shake the bottle (loosely corked) until admixture appears complete, and then set it aside in a cool place. For use, this compound (after agitation) is thrown into a two-gallon can or measure, which is then filled, from a tap, with the spirit to be 'beaded,' when the whole is thrown into the cask, and the measure washed out by refilling it and returning it two or three times; after which the contents of the cask are well 'rummaged up.' *Gin* is usually 'fined' a few hours afterwards; but it is better not to add the 'finings' for two or three days. *Other spirits* are allowed to become 'fine' by simple repose.—According to Mr. Hartley, and others, this quantity is "sufficient for 100 galls. of any spirit;" but it is more commonly used for a puncheon of 80 to 85 gallons.

2. Oil of vitriol, 2 to 3 oz.; *rectified spirit* (strongest), 1 pint; cautiously agitate them together in a loosely corked quart bottle; in 2 or 3 hours add another pint of *rectified spirit*, and again agitate. It will be fit for use in a week; as before.

3. Sulphuric ether, $\frac{1}{2}$ lb.; strongest *rectified spirit*, 1 quart; mix. May be used at once, as before; but if otherwise, should be kept, like the last, closely corked, and in a cool place.

4. Soapwort-root (saponaria officinalis), bruised or rasped small, 1 lb.; *rectified spirit* and *water*, of each, $\frac{1}{2}$ gal.; macerate in a corked jar, with occasional agitation, for 8 or 10 days, strain with pressure, and, after a few days' repose, decant the clear portion. *Used as before.*

Obs. The above are not injurious when employed for 'beading,' since the quantity employed is much too small to injure the wholesomeness of the liquor. The fraud consists in their being used to disguise the presence of 10 to 12% of water, which is thus sold at the price of spirit. Beyond a certain degree of dilution they fail, however, to produce the intended

effect, the bubbles becoming 'soapy,' and without the requisite permanence. The addition of a little powdered *white sugar* ($\frac{1}{2}$ oz. to 1½ oz. per gal.) increases the efficacy of all of them. This may be dissolved in the water, if any is added at the time; but its effect on the hydrometer must be recollected. See ALCOHOLOMETRY, GIN, SPIRIT (Management of), &c.

BEAKER (bêk'êr). *Syn.* BEAK'ER-GLASS. In chemistry, a beaked cup or glass, more or less of the tumbler-pattern, used to collect precipitates and to heat liquids in.

BEAL (bêle). *Syn.*

BOUTON, PUSTULE,

Fr. A pimple or pustule; a small inflamed tumour.

BEAM (bême). See BALANCE, SCALES, &c.

BEAM-TREE. *Syn.* WHITE BEAM-TREE. The '*pyrus aria*' or wild pear. Wood, hard, compact, and tough; used for axle-trees, naves and cogs of wheels, &c.

BEAN (bêne). [Sax., Eng.] *Syn.* FA'BA, L.; FÈVE, Fr.; BOHNE, Ger. The general name of leguminous seeds, as also of the plants which produce them; appr. *fa'ba vulgaris* (Möncb.; *vicia faba*, Linn.) or common GAR'DEN-BEAN,¹ *phaseolus multiflorus* (Willd.) or SCARLET-RUNNER,² and *ph. vulgaris* (Sav.), FRENCH BEAN, KID'NEY-B., or HAR'ICOT (-ko),³ with their varieties, all of which are annuals cultivated in our gardens—the first, chiefly for its seeds—the others, both for their green pods and ripe seed. The name is also often popularly applied, as an appellative, to the fruit or seeds of other plants which, in size and appearance, resemble common beans, as noticed below.

Those principally cultivated in our gardens are the SMALL LIS'BON, SAND'WICH, SPAN'ISH, TOKAY, WIND'SOR, and MAZ'AGAN (from north Africa), with almost innumerable sub-varieties of each. The exquisite perfume of beans in blossom is referred to by the poet Thomson:—

"Arabia cannot boast a sweeter gale."

Preparations including their fragrant principle are highly prized in modern perfumery.

Qual., &c. The pods eaten in the green state, properly dressed, are regarded as antiscorbutic and wholesome; but are apt to produce flatulence, unless combined with spices. In the dried or ripe state they are rather difficult of digestion, and very apt to distend the stomach and intestines with wind. This objection does not exist, to the same extent, to

¹ Var. β , HORSE-BEAN (*fa'ba equina*, f. *minor*, &c., L.).

² Var. α , *phaseolus coccineus* (red-flowered).— β , *ph. albidus* (white-flowered).

³ Var. α , *ph. unicolor* (seeds of one colour).— β , *ph. fasciatus* (seeds striped) or ZEBRA-STRIPED BEAN.— γ , *ph. variegatus* or SPECK'LED BEAN.— δ , *ph. nanus* or DWARF-BEAN.

their use in the form of flour or meal. The amount of nutritious nitrogenous matter in beans rather exceeds that in wheat, and independently of a disposition to produce constipation in some habits, and being rather less easy of digestion, they must be considered nearly as wholesome as that cereal. The London millers and bakers use immense quantities of bean flour to adulterate their flour and bread.

Green beans (pods or legumes) are COOKED by simply throwing them into boiling water, and simmering them until quite tender; a 'pinch' of salt of tartar, or a little common salt, being usually added to preserve their green colour. Young and small ones take from 12 to 18 minutes—large or older ones, longer. The first are merely 'topped and tailed' with a knife, before being dressed; the others require also the side 'strings' to be drawn off, and to be cut obliquely into pieces of a lozenge form, or else to be split lengthwise into strips, and then divided once across. Old ones never boil tender. Windsor beans, and other 'shelled beans,' take 15 to 30 minutes according to age. These last are sometimes skinned after being dressed. All of them are commonly 'served up,' or eaten, with melted butter. See LEGUMINOSÆ, PULSE, &c. (also below).

Bean, Algaroba. See ALGAROA.

Bean, Earth. American earth-nut.

Bean, French; Horse-bean; Kidney-bean, &c. See BEAN (*antè*).

Composition. (Einhof.)

	Kidney beans.	Field beans.

Starch, sugar, gum, &c.	44.7	58.3
Oil and fat	0.7	2.
Husk	7.0	10.0
Salts (ash)	1.0	4.4
	100.	100.

Bean, St. Ignatius's. The poisonous seed of the fruit of *Ignatia amara* (Linn.; *strychnos Ignatia*, Berg.), a tree indigenous to the Philippine Islands.—*Prop., Uses, &c.* Similar to those of *nux vomica*. Contains strychnia (which see).

BEAR (bare). *Syn.* UR'SUS, L.; OURS, Fr.; BÄR, Ger.; BERA, Sax. In zoology, a Cuvierian genus of the 'plantigrade carnivora,' of several species, found both in the Old and New World. Those generally known under the name are omnivorous or frugivorous. The skin of the American black bear (*ursus americanus*, Pallas) was formerly highly prized, and fetched an extravagant price. The brown bear (*u. arctos*, Linn.) supplies

the Kamschatkans, and some other northern races, with many of the necessities, and even the comforts of life. The fat or grease (BEAR'S GREASE; AD'EPS UR'SI, L.) of all the common species has long been highly esteemed for promoting the growth of the human hair; but apparently without sufficient reason. The mass of that sold under the name in England is simply hog's lard or veal fat, or a mixture of them, variously scented and slightly coloured. The quantity annually consumed in Great Britain, and exported, is estimated at many tons; being a larger quantity than all the bears at present procurable in Europe would supply, if slaughtered and stripped of their fat.

BEAR'BERRY, Bear's Bil'berry, &c. See UVA URSI.

BEAR'S GREASE. See BEAR (*above*), HAIR COSMETICS, MARROW, POMMADES, &c.

BEARD (bêerd). [Sax., Eng.] *Syn.* BAR'BA, L.; BARBE, Fr.; BART, Ger., Dan.; BAARD, Dut. The hair of the lips and chin; but *appr.*, only the last—that on each lip being distinguished, in toilet-nomenclature, by a separate name. In popular *botany* and *zoology*, any beard-like appendage; the 'awn' of corn or grass; the 'gills' or breathing organs of oysters and other bivalves, &c.

BEARD'ED. *Syn.* BARBA'TUS, L.; BARBU, Fr.; BARTIG, Ger. In *anatomy*, *botany*, and *zoology*, having a beard, or a beard-like appendage; prickly, barbed, jagged; awned.

BEA'VER (bê'-). *Syn.* CAS'TOR, L.; CASTOR, Bièvre, Fr.; BIBER, Ger. The *fi'ber castor* (Linn.), an animal belonging to the *rodentia* of Cuvier, and remarkable for the great ingenuity which it exercises in the construction of its lodges or habitations. *Hab.* Europe and America. Those of the former are burrowers; those of the latter, builders. The fur has long been employed in the manufacture of the best quality of hats (BEAVER HATS). The fat was official in the Ph. L. 1618. *Castor* (CASTO'REUM) is obtained from this animal.

BE'BEERINE (bêbe'-ër-in'). $C_{19}H_{21}NO_3$. [Eng., Fr.] *Syn.* BI'BIRINE (bê'-bêr-in); BEBEER'INA, BIBIRI'NA, &c., L. A peculiar alkaloid, discovered by Dr. Rodie, in the bark and seeds of the bebeeru, bibiri, or green-heart tree (*nectan'dra Rodie'i*, Schomb.), of British Guiana; and since minutely examined by Mac-lagan and Tilley, and by Von Planta.

Prep. 1. That of commerce, which generally contains some sipirine (—? altered bebeerine), and a little lime, is generally first obtained in the form of sulphate, by a process analogous to that employed in the preparation of sulphate of quinine; and from this salt it is precipitated by the addition of ammonia or an alkali.

2. (Pure.) By precipitating the sulphate with ammonia, washing the precipitate with very cold water, and triturating it, whilst still moist, with fresh hydrated oxide of lead: next

drying the mixture by a gentle heat, exhausting the residuum with alcohol, distilling off the alcohol, and treating the last residuum with ether; the ethereal solution on evaporation leaves pure bebeerine, under the form of a white or yellowish-white, resinous-looking substance, which is pure white when powdered.

Prop., &c. Amorphous; uncrystallisable; non-volatile; bitter-tasted; inodorous; unalterable in the air; very slightly soluble in water; very soluble in alcohol; less so in ether; reaction, alkaline; when quite pure, melts at 355° Fahr., and on cooling forms a vitreous or semi-vitreous mass (Winckler); at a higher temperature it suffers decomposition; ignited on platinum-foil, it burns without leaving any carbonaceous residue; neutralises acids forming uncrystallisable salts, most of which are soluble in water.—*Prod.* From the bark, 1.5 to 1.75%; dried seed, 2.5% (nearly).

Use, &c. Bebeeru-bark has been proposed and occasionally employed as a substitute for cinchona bark, and bebeerine for quinine, in the usual cases; but whether as a tonic, febrifuge, or antiperiodic, they appear less powerful and certain than these last.—*Dose.* 2 to 12 grs. or more. (See *below*.)

Sul'phates of Bebeerine. Of these there are two, both of which are obtained in a similar manner to the Ph. B. formula for sulphate of quinine, and merely differ in the amount of acid finally left in combination with the alkali:—

1. *Sulphate.* *Syn.* NEU'TRAL SULPHATE OF BEBEERINE; BIBIRINE SUL'PHAS, &c., L. Easily soluble in water. Contains 86.4% of bebeerine, and 13.6% of sulphuric acid.

2. *Subsul'phate.* *Syn.* BAS'IC SULPHATE OF BEBEERINE, DISUL'PHATE OF B.; BIBIRINE SUBSUL'PHAS, &c., L. Soluble in alcohol; sparingly soluble in water unless acidulated. Contains 90.8% of bebeerine, and 9.2% of sulphuric acid. This is the sulphate of bebeerine of commerce, and the one usually employed in medicine. It is generally met with in thin brownish-yellow scales, which are formed in a similar manner to those of ammonio-citrate of iron.—*Dose.* As a tonic, 1 to 3 grs.; as a febrifuge or antiperiodic, 5 to 20 grs.; in similar cases to those in which disulphate of quinine is employed.

BECH'AMEL (bêsh'-â-mêl'). *Syn.* BÉCHAMEL, Fr. In *French cookery*, a fine white sauce, essentially consisting of concentrated veal gravy or veal consommé and cream, with or without flavouring. See SAUCES.

BE'CHIC* (-kik). *Syn.* BÉCHICUS†; BÉCHICUS (bêk'ik), L.; BÉCHIQUE, Fr.; HUSTEND, &c., Ger. In *medicine*, &c., of or for a cough; pectoral; also *subst.*, applied to remedies (BÉCHICS; BÉCHICS, L.) used to relieve cough.

BED. [Eng., D., Sax.] *Syn.* LIT, COUCHE,

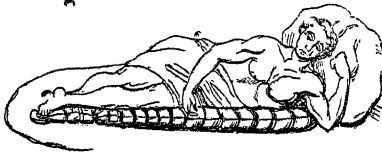

1. Three as French

Fr.; BETT, &c., Ger.; CUBILE, LECTUS, LECTUUS, GRABATUS, &c., L. A couch; that in or on which we sleep; that on which anything is generated, deposited, or rests.

[On the connection of BEDS and BEDDING with comfort and health, see COTTON, DAMP, FRATHERS, LINEN, SLEEP, VENTILATION, VERMIN, &c.; also *below*.]

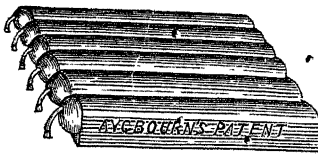

Bed, Air. *Beds, pillows, cushions, &c.*, when properly constructed, and inflated with air, are clean, luxurious, and healthy substitutes for those in common use. For this purpose the air-proof part should be formed of separate cells or tubes, arranged in ridges (see *engr.*), or in any similar manner to admit of

1.

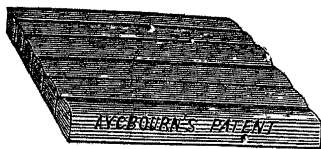

free ventilation; and in the case of beds, or of cushions for the sick, two or three folds of flannel or blanket, or of any loose porous fabric, should be placed between them and the under sheet or the person of the sleeper or patient. Without this precaution, discomfort and restlessness, excessive warmth and perspiration, and even bed-sores, are apt to follow their use by invalids, when badly constructed. To obviate these objections to articles of this class commonly sold, a new one has been produced under the name of the 'INCOMPARABLE BED (Aycbourn's Patent)', which is thoroughly applicable to all purposes—domestic, medical, naval, or military—and

2.

(Opened.)

3.

(Closed.)

superior to any feather, flock, or spring bed, however good or carefully made up. This bed consists of an outer case made of ordinary bed-ticking divided internally into numerous separate cells, into each of which is placed a suitably constructed bag, which may be either wholly or partially filled with air or water;

the latter either hot or cold. (See *engr.* 2, 3.) It is incapable of bursting, and is very agreeable to lie on. It retains its shape, saves the time, trouble, and wear and tear ordinarily bestowed or produced by servants in daily tossing about one of down or feathers, is easily washed and kept clean, allows all the ventilation essential to health, and is so portable that it may be easily packed in a carpet-bag. In almost an instant it may be converted into six, or more, separate life-preservers; and what is equally important, it will stand any climate. Hitherto the use of air-beds and water-beds has been almost exclusively confined to the upper and wealthy classes, and to hospital practice; but the moderate prices¹ at which Aycbourn's beds, cushions, &c., are sold, place these luxuries, and in many cases—absolute necessities—within the reach of the masses of the people.

Bed, Water. *Water-beds, cushions, &c.*, are chiefly employed for patients labouring under bed-sores, paralysis, spinal affections, &c., or who are the subjects of active surgical treatment in which equable support for the body or a limb is absolutely necessary. Their construction and use are similar to those previously noticed, except that, instead of being inflated with air, they are filled with water, either warm or tepid. For the bedridden and for long-continued use generally, they are much inferior to air-beds. See AIR-BED (*above*).

Bed. *Syn.* STRATUM, L.; STRATE, &c., Fr.; SCHICHT, &c., Ger. In *geology*, a mineral layer, seam, or stratum, thick or thin.

Bed. In *horticulture*, a small plot of land, usually raised a little above the general surface, in which flowers, or other plants, are raised or grown.

BED'EGUAR (-e-gahr). *Syn.* BÉDÉGUAR (or -GAR), Fr. Sweet-briar sponge (which see).

BEE (bē). *Syn.* HIVE-BEE, HONEY-B. (hūn'), DOMESTIC B.; A'PIS, L.; ABÉILLE, A. MELLIFIQUE, &c., Fr.; BIENE, HONIGBIENE, &c., Ger. The *apis mellifica* (Linn.; Ph. L., E., & D.), one of the hymenoptera best known and most useful to man.

[Those desirous of studying the *habits* and *economy* of bees are referred to the works of Huber and Latreille; and for their *management* to Mr. Collett's little book on the subject.] See APIARY, APIS, HIVE, HONEY, WAX, &c.

BEE'-BREAD. The pollen of flowers collected by bees as food for their young.

BEE'-GLUE. *Syn.* PROPOLIS, L., Fr. The resinous matter with which bees cement the combs to the hives, and close up and repair the cells.

BEECH (bêche). *Syn.* BEECH'-TREE; FAGUS, L.; HÊTRE, H. COMMUN, Fr.; BUCHE, GEMEINE B., Ger. The *fagus sylvatica* (Linn.), a magnificent English forest-tree, of the nat.

¹ These are less than those of feather beds of corresponding dimensions.

ord. Amentaceæ (DC.). *Fruit* (BEECH'-MAST, B.-NUTS), used to feed swine, and, sometimes, in obstinate headaches, and in gravel-complaints; yields oil by expression; inner bark, occasionally used in hectic fevers. Wood (BEECH, B.-WOOD), handsome and very hard, but brittle and perishable, and particularly liable to become worm-eaten; its durability is increased by steeping it, when fresh-hewn, for some time in water; chiefly used by cabinet-makers, coach-builders, millwrights, and turners; and, sometimes, by coopers; also burnt for charcoal.

BEEF (*bêfe*). *Syn.* CHAIRE DE BŒUF, DU BŒUF, Fr.; RINDFLEISCH, &c., Ger.; BU'BULA, CA'RO BO'VIS, &c., L. The flesh of bovine animals generally; but *appr.*, only that of the domestic ox, cow, or bull.

Qual. Good beef is highly wholesome and nutritious; and is well adapted to persons of good appetite, or that labour or take much exercise. For the delicate, especially those labouring under debility, partial anæmia, amenorrhœa, and similar ailments, it is, perhaps, superior to every other kind of animal food. If cooked so as to be left full of gravy, it sits lightly on the stomach, and its fat proves even more digestible than that of either veal or mutton.

Choice. OX-BEEF is known by having a fine smooth, open grain, a lively and agreeable red colour, and a tender texture, with the fat of a pleasing pale whitish-yellow or but slightly yellow, and the suet white and hard. When fine and well fed, the flesh is intergrained or marbled with fat.—COW-BEEF has a closer grain than ox-beef, and the lean is of a deeper red.—BULL-BEEF is closer still, the fat dark, hard, and skinny, the lean of a deep coarse red, and it has a strong smell and flavour.—HEIFER-BEEF resembles ox-beef, except in being smaller, often an advantage; but it lacks the rich flavour of the flesh of full-grown oxen.

Joints, Managem., &c. Beef is CURED, SALTED, and DRESSED, in all the ways common to the other meats; the only care necessary being in the selection of the appropriate joint or part. The *ribs*, *sirloin*, *rump*, and *veiny piece*, are the proper joints for ROASTING or BAKING. The *buttock* or *round*, *edge-bone*, *second round* or *mouse-buttock*, *brisket*, *flank*, *shoulder* or *leg-of-mutton piece*, and the *cod*, those generally BOILED, STEWED, or SALTED. The choicest STEAKS are cut from the middle of the rump; the next best from the veiny piece, or from the *chuck-rib*. In summer, excellent ones may also be cut from the *shoulder*. In France, steaks cut from the *sirloin* (without bone) are preferred to all others, and are exceedingly delicate and tender. The neck may be either stewed or boiled, and is much used to make soup and gravy. In the country, the *round*, when fine, and well hung, is also often roasted or baked.

According to Miss Acton, "the finest part of the *sirloin* is the chump-end, which contains

the larger portion of the fillet; of the *ribs*, the middle ones."

Beef is in *season* during the whole year, but is finest—when it is most relished—during the winter months, when, owing to the temperature of the air, it may be 'hung' a long time, and thus increased in tenderness and flavour. See OX, BAKING, BOILING, ESSENCES, ROASTING, SALTING, TEA, &c. (also *below*).

Beef, Alamo-de'. *Syn.* BŒUF À LA MODE, Fr. The true 'beef à la mode' is made as follows; and is not a mere kind of rich stew, such as is daily sold under the name in the 'cook-shops' of London:—

1. (M. Alexis Soyer.) *Rump*, *sirloin*, or *rib of beef*, (about) 12 *lbs.*; lard it through with 10 or 12 *long pieces of fat bacon*; put it into an earthen pan with a *calf's foot*, 4 *onions*, 2 *carrots* (sliced), a *batch of parsley*, 2 *bay leaves*, 2 *sprigs of thyme*, 2 *cloves*, $\frac{1}{2}$ *teaspoonful of pepper*, 1 *do.* of *salt*, 4 *wine-glassfuls of sherry*, 4 *do.* of *water*, and 1 *lb.* of *sreaky bacon* (cut into small squares); place on the cover, make it air-tight round the edges with a little flour-paste, and expose it in a moderate oven for about 4 hours. *Dish up* with the vegetables and bacon placed tastefully round it, the gravy (skimmed) being poured over all. Or it may be eaten cold, in which case the pan should not be opened until the whole has thoroughly cooled.

2. (Mrs. Rundell.) *Rump of beef* (or any part of the beef which will stew well), 3 or 4 *lbs.*; trim it, and cut off the fat; add several sorts (according to taste) of *sweet herbs* chopped very fine, a little *shalot*, and a great deal of *spice* (cayenne, white pepper, allspice, cloves, and mace; or mixed spices), and put them, with *vinegar*, into a saucer that has been rubbed with *garlic*; add *fat bacon* cut into long slips; lard the beef regularly on both sides, and rub it over with the herbs and spices; next flour it, and add a small piece of butter, and a pint of *water*; bake it in an oven until thoroughly 'done,' then strain the gravy, and serve it up with pickles on the top. Excellent either hot or cold.

Obs. Miss Acton—a high authority in these matters—tells us, that 7 or 8 *lbs.* of *beef*, thus treated, takes 4 to 5 hours to dress it properly; and that if a stew-pan be used, it should be as nearly the size of the meat as possible, the whole being allowed to simmer very gently, and the meat turned when half done. She also states that "*veal* dressed in this way is even better than beef;" but, of course, it takes less time in cooking.

Beef, Collared. *Prep.* J. (Miss Acton.) The piece of beef is rubbed with a little *coarse sugar*, and set aside for two or three days; it is then slightly salted (about 1 *oz.* of *salt*, containing a little *saltpetre*, to each *lb.* of meat); and allowed to rest 8 to 10 days; the bones and tougher skin are next removed, and the under side is sprinkled thickly with *parsley* and other savoury herbs (shred small), after

which it is very tightly rolled up, secured with a cloth, and bound as closely as possible with broad tape. A piece of 8 lbs. will require about 5 hours' gentle boiling, and should be placed, in the same state, whilst still hot, under a heavy weight, or in a press, for a few hours. The ribs, or (better) the thinnest part of the flank, is generally selected. The last should be 'hung' in a damp place for a day or two before curing it.

2. (Mrs. Rundell.) From stewed shin of beef and ox-tail, re-stewed with a glassful each of wine and ketchup, and some of the old broth, and then poured into moulds. Sweet herbs, sliced eggs, and pickles, may be added at will.

Beef, Dutch, Hung Beef. The round, rump, *veiny-piece*, or *thick flank*, cured, for 10 or 12 days, with dry salt to which a little saltpetre and some sugar and black pepper has been added; and afterwards 'hung' for use. It eats well if boiled tender with greens or carrots. If to be grated or shred, as Dutch, and eaten as a relish on bread and butter, then cut a lean bit, boil it till extremely tender, and while hot put it under a press. When cold, fold it in a sheet of paper, and hang it in a very dry place. It will then keep two or three months.

Beef, Potted. See POTTED MEATS, &c.

Beef, Spiced (spit'). Salted beef when spices (usually *black-pepper* and *allspice*) have been added to the salt, &c., used in curing it. See COLLARED BEEF (*above*).

BEER (bère). *Syn.* BIÈRE, Fr.; BIER, D. Ger.; BIERA, It.; CEREVI'SIA (-vîzh'-sî), CERVI'SIA (Pliny), C. LUPULA'TA* (i. e. hopp'd or modern h.), VITUM ANGLICANUM*, V. HORDEACEUM* (-sh'ûm), ZYTHUM* (or -THUS*; ζύθος, Gr.), &c., L.; BEERE, BEERE, Sax.; BIR, W. An aqueous infusion of malted grain which, after being boiled with hops, has undergone the vinous fermentation; malt-liquor. The word BEER is now the common generic term for all fermented malt-liquors, and, indeed, for all other beverages prepared by a process of brewing. Whenever the term is used in a special sense, it is with a descriptive prefix, as, for example, *spruce beer*, *ginger beer*, &c.

Hist. Ale and wine are fabled to have been invented by Bacchus; the former, in Egypt, where the soil and climate would not permit of the cultivation of the grape. Herodotus ascribes the origin of the art of brewing to Isis, the wife of Osiris, and notices *zythum* (ζύθος), a beer obtained from barley. Malt-liquor was undoubtedly employed as a beverage in the fifth century before Christ; and, probably, very much earlier. Xenophon distinctly alludes to it in his famous retreat (B.C. 401). Aristotle speaks of 'beer-drunkness;' and Theophrastus calls it 'barley-wine.' The Romans learned the art of brewing from the Egyptians, and gave the liquor thus made the appropriate name of *cerevisia* (quasi *Cererisia*), from its

being the product of corn, the gift of Ceres. The most celebrated beer of ancient times was the '*Pelusian potation*,' so named after a town at the mouth of the Nile where beer was prepared in great perfection. The use of beer was likewise known to the ancient Gauls and Germans, and probably also to most other ancient nations inhabiting the temperate zone. Pliny says "*Zythum* is made in Egypt, *celia* and *ce'ria* in Spain, and many other sorts (of beer) in Gaul." In our own country, ale was early known and valued as a beverage. The art of its preparation appears to have been obtained either from the Romans or the Saxons. According to Verstegan, "This excellent and healthsome liquor, *beere*, antiently called *ale*, as of the Danes it yet is, was of the Germans invented and brought into use." *Alehouses* are mentioned in the laws of Ina, king of Wessex (A.D. 680). *Alebooths* were regulated by law, A.D. 728. By the beginning of the 13th century ale was drunk generally in England. By a statute of James III, of Scotland, it was made a capital offence to mix wine with beer (A.D. 1482). In 1492, a licence was granted to a brewer at Greenwich, to export 50 tons of that "*ale*" called "*beer*" or "*bere*," the distinction between the two apparently being, that the latter was flavoured with worm-wood or others bitters; whereas ale was not. Ale was originally made from barley-malt and yeast alone, and those who put in anything else, were held to sophisticate the liquor. Hops were introduced A.D. 1524; and to this date, modern, or hopp'd beer, may be traced.

By statute of James I the "*ale*" called "*bere*" was taxed, and "one quart of the best thereof," ordered to be sold for a penny (A.D. 1610). *Alehouses* were first licensed in 1621, and during the reign of Charles II were, together with all *malt-liquor*, placed under the control of the Excise (A.D. 1660). By the Statutes 1 & 4 Will. IV (1834), previous enactments respecting malt liquors and their sale, were reduced to their present form. Beer is now the common beverage in all European countries where the vine is not a subject of rustic husbandry.

Qual. Pure malt-liquor which has undergone sufficient fermentation, is perhaps, when taken in moderation, one of the most wholesome beverages that can be drunk. Ale is the most nutritious variety, and, when moderately mature, is the one best adapted to the debilitated and delicate; but good porter, owing to being less rich in extractive and gummy matter, and from being slightly astringent from high-dried or scorched malt being used in its preparation, occasionally agrees better with bilious constitutions and the dyspeptic. Much, however, depends on acquired taste and habit. The most wholesome, and perhaps the least exceptionable beverages obtained from malt, are those known as *East-India*, *Scotch*, and *Bavarian ales*, when honestly prepared and not highly 'bit-

tered' with the hop, as is, unfortunately, now so general. A late writer has described good beer as nutritious, from the sugar and mucilage which it contains; exhilarating, from its spirit; and strengthening and narcotic, from its hops. Pereira says, "Beer is a thirst-quenching, refreshing, intoxicating, and slightly nutritious beverage." Its effects, when taken judiciously, or in excess, for the most part resemble those of other intoxicating liquors—disease, misery, and crime; and these in direct proportion as it deviates from the true standard of purity and excellence.

Var. The numerous varieties of malt-liquor met with in commerce, may be resolved into two great classes—ALE and PORTER. ALE of all kinds is brewed chiefly from pale malt, and is generally of a light amber colour. PALE ALE is manufactured from the finest and lightest dried malt, and the choicest hops, the latter in excess. MILD ALE differs from pale ale in being sweeter, stronger, and almost free from the flavour of the hop. BITTER ALE or BITTER BEER has, as a rule, less body than pale ale, and is more highly hopped. TABLE BEER is a weak liquor commonly containing three or four times the proportion of water usually present in ordinary beer or ale. PORTER differs from ale chiefly in its being artificially coloured by the use of roasted malt, which also imparts to it a peculiar bitter flavour. In point of strength, it stands about midway between light and strong ales, although frequently brewed of a strength very slightly above that of table beer. SOUT, BROWN SOUT, &c., are simply richer or stronger descriptions of porter, and may be said to have nearly the same relation to the higher qualities of mild ale that porter holds with regard to pale ale or bitter beer. In London, PORTER is called BEER; and, indeed, in all parts of the kingdom, the prevailing beverage of this kind consumed by the masses, of whatever class, commonly goes by the name of beer.

The two great classes of malt-liquor above referred to, are, independently of mere differences of strength, excellence, and commercial value, practically subdivided into an almost infinite number of varieties. Every county, every town, and almost every brewer, is distinguished by the production of a different-flavoured beer, readily perceived, and highly appreciated by their respective votaries. These differences may be traced to—variations in the quantity and quality of the materials employed in their manufacture—the temperature of the water used for mashing—the duration of the boiling—the temperature at which the fermentation is conducted, and the extent to which it is carried, together with numerous other circumstances, which, though usually of an accidental and uncertain character, are nevertheless sufficient to affect the flavour and quality of a brewing. Among these, those depending on the condition of the building, the locality, the apparatus, the water, mismanagement, &c.,

are not the least important. In general, however, when the same quantity and quality of materials are employed, and the same time allowed for the maturation of the liquor, the chief causes of this diversity will be found to depend on the water used in the brewing, and the method followed in the preparation of the malt. Thus, *Bavarian, Scotch, and Burton ales*, differ in style from other ales chiefly from being fermented at a lower temperature, and from the water employed in the brewing being that usually denominated 'hard'; whilst *porter* and *stout* differ from all these, because they are brewed from a mixture of pale and roasted malt. It is from causes like these, though apparently trivial, that the many varieties of malt liquor met with, at the present day, originate.

Materials, Manuf., &c. See MALT, HOPS, BREWING, &c.

Purity. The leading characteristics of good beer are transparency, a fine colour, an agreeable semi-vinous flavour, and the property of remaining for several hours exposed in a glass or cup without becoming 'flat' or insipid. If the materials used were good, if the brewing was skilfully conducted, if the liquor has been carefully stored in perfectly sweet casks or vessels, in a suitable cellar, for a sufficient time, and has not been tampered with, this will almost always be the case. Hence colour, transparency, and flavour, and the power of resisting exposure, are tests of the purity and quality of beer, which should not be lightly treated. There are none more simple and effectual; and, together with a good 'palate,' and a close observance of its effects on the head and on the stomach, will readily distinguish pure and wholesome beer from 'doctored' and inferior liquor. If, therefore, we find a sample of beer possessing the above qualities and in good condition, and on testing it for its alcohol and saccharine matter, find these substances in such quantities as fairly to represent the amount of malt which should have been used in the brewing of such a liquor, we may, in the absence of proof to the contrary, infer it to be pure; because the object for which adulteration is practised—the saving of malt and hops—did not exist in this case. To demonstrate the purity of beer, requires an elaborate and troublesome analysis, which can only be performed by those accustomed to chemical operations. Good and pure beer should contain nothing but what exists in the malt, the hops, and the water, from which it is brewed, or which is produced from them in the processes of 'mashing,' 'fermentation,' and 'maturation.'

Adulteration. Until the year 1862, nothing was allowed to enter into the composition of beer but malt and hops; and the Act 56 Geo. III., cap. 58, imposes a penalty of £200 on any "brewer, dealer, or retailer of beer," who "shall receive, or have in his possession, or use, or mix with, or put into any worts or beer,

any molasses, honey, liquorice, vitriol, quassia, cocculus indicus, grains of paradise, Guinea-pepper, or opium, or any extract or preparation of these substances, for, or as a substitute for, malt or hops;" and a further penalty of £500 on any "druggist, or vendr of, or dealer in drugs, or chemist, or other person whatever," who shall "sell, send, or deliver to any licensed brewer," &c., any of the above materials. However, by the Act 25 Vic., cap. 22, s. 20, so much of the above is repealed as relates to hops. This Act provides that—

"On and after the 16th Sept., 1862, so much of an Act passed in the 56th year of the reign of King George the Third, cap. 58, and of an Act passed in the 7th and 8th years of the reign of King George the Fourth, cap. 52, and of any other Act relating to the revenue of excise, as imposes any excise penalty upon any brewer of, or dealer in, or retailer of beer, for receiving into, or having in his possession, or using or mixing with any worts or beer, any article for, or as a substitute for hops, or as prohibits the sale of any such article to the said persons, shall be, and is hereby repealed: provided always, that nothing herein contained shall be construed to extend to repeal any such penalty or prohibition so far as regards any article which may be used as a substitute for malt, notwithstanding that it may be also a substitute for hops."

Prior to this an Act (10 Vic., c. 5) had been passed allowing brewers to use sugar under certain restrictions.

As the law now stands, a brewer may use hops, quassia, wormwood, gentian, or any other simple bitter; but he is forbidden to use any substitute for malt, such as unmalted grain, sugar in a liquid state, molasses, or any substance which would give pungency or intoxicating properties to the beer, such as cocculus indicus, grains of paradise, tobacco, &c. It is a well-known and authenticated fact, that beer is commonly and sometimes dangerously adulterated. The cupidity of fraudulent brewers and publicans frequently induce them to introduce *other ingredients* than malt and bitters into their liquors, with a view of giving them a false appearance and strength. Thus, to give pungency—capsicum; grains of paradise, ginger, &c., have been added; to give intoxicating properties—opium, cocculus indicus, tobacco, &c.; as a substitute for malt—molasses, treacle, colouring, honey, &c.; to impart a false appearance of age—sulphuric acid, alum, green vitriol, glycerin, mustard, &c.; to remove acidity—pearlash, soda, chalk, &c.; and to impart a frothy head—alum, foots, table-salt, &c.

The publicans generally 'reduce' their strong beer with *water* (which they call 'liquor'), and add treacle, together with a mixture of *copperas*, *salt*, and *alum* (termed 'heading'), to make it bear a frothy head. The cheap beer sold in many of the low taverns of London is made by dividing the contents of two butts between three butts, filling them up with water, and

adding a bladder of porter-extract (technically termed 'P. E.') to each. This 'P. E.' is a mixture of powdered cocculus, Spanish juice, caramel, capsicum, &c., boiled up with treacle and water to the consistence of a thin extract, and then put into bullocks' bladders.

Exam., Tests, &c. The analysis of beer, both qualitative and quantitative, as already noticed, is a matter of considerable difficulty. We shall therefore defer its consideration until we come to the article PORTER, as that description of beer, on account of its colour, is not only the one most difficult to examine, but also the one most frequently adulterated. See ALE, BREWING, HOPS, MALT, PORTER, &c.

Beer, Am'ber. Syn. AMBER. A liquor, formerly much drank in London, brewed from a mixture of 3 parts of *amber malt*, and 1 part of *pale malt*, with about 6 lbs. of hops to the quarter. It was generally 'tapped' within a few days after it had done 'working,' and was chiefly used *mixed with bitters*, or made into 'PURL.'

Beer, Wheat'en, Wheat-malt Beer. See MUM.

*** Besides *malt liquor*, or BEER properly so-called, a somewhat similar beverage, though of inferior quality, may be prepared from any vegetable substance rich in starch and sugar, as noticed in our article on BREWING. Certain summer beverages also pass under the name; but in both the cases referred to, the name of the characteristic ingredient, or that of the vegetable employed, is always conjoined; as in *pea-shell beer*, *potato-beer*, *ginger-beer*, &c. Examples of some of these are given below:—

Beer, Gin'ger. Syn. CEREVISIA (-vîzh'-) ZINGIBERIS, C. ZINGIBERATA*, C. CUM ZINGIBERE* (-êr-e), L. Prep. 1. *Lump-sugar*, 1 lb.; good *unbleached Jamaica ginger* (well-bruised), 1 oz.; *cream of tartar*, $\frac{3}{4}$ oz. (or *tartaric acid*, $\frac{1}{2}$ oz.); 2 or 3 *lemons* (sliced); *boiling water*, 1 gal.; macerate, with frequent stirring, in a *covered vessel*, until barely luke-warm, then add of *yeast*, 1½ or 2 oz. (about $\frac{3}{4}$ a wine-glassful), and keep it in a moderately warm place, to excite a brisk fermentation; the next day rack or decant the liquor, and strain it through a jelly-bag or flannel; allow it to work for another day, or two, according to the weather; then skim it, again decant or strain, and put it into bottles, the corks of which should be 'wired' down.

2. *Good white sugar*, 18 to 24 lbs.; *lemon-juice* or *lime-juice*, 1 quart; finest *Narbonne honey*, 1 or 2 lbs.; *bruised Jamaica ginger*, 1½ lb.; *pure soft water* (that has been boiled, and then allowed to settle), q. s. Boil the ginger in 3 galls. of the water for half an hour; then add the sugar, the juice, and the honey, with sufficient water (see above) to make the whole measure 18½ galls., and strain the mixture as before. When the liquor has become almost cold, add the *white* of 1 egg, and ½ fl. oz. of *essence of lemon*, and strongly agitate the cask or vessel for about half an hour. After standing

3 to 6 days, according to the state of the weather, bottle it, and place the bottles on their sides in a cellar, just as is done with wine or beer. It will be ready for use in about 3 weeks, and will keep good for several months. If wanted for immediate use, about $\frac{1}{2}$ pint of yeast may be added, as in formula 1; but then it will not keep so well, or be quite so transparent and free from deposit. The lemon-juice and essence of lemon may be replaced, at will, by *cream of tartar* (in powder) or *tartaric acid*, 4 oz.; and lemons (sliced) $1\frac{1}{2}$ to 2 doz.; added with the sugar, &c.; but the original formula is preferable.—*Prod.* 18 galls. = 24 doz. $\frac{1}{2}$ -pint bottles, or 30 doz. ordinary sized ones.

3. EXTEMPORANEOUS:—*a.* Into each bottle put concentrated essence of ginger, 1 drop; simple syrup or capillaire, $\frac{1}{2}$ oz.; (or in lieu of them, syrup of ginger and simple syrup, of each, a dessert-spoonful); and fill with aerated soda-water at the 'bottling machine,' in the usual way. Very superior.

b. Into each bottle put two or three lumps of sugar, fill them to the proper height with pure water, throw in (quickly) an effervescing ginger-beer powder, and instantly cork the bottle, and secure the cork with wire.

Use. As a cooling and refreshing drink in warm weather; and as a restorative after hard drinking, fatigue, &c.

Obs. The products of all the above formulae, if well-managed, are excellent; those of No. 2, and 3*a.*, of the very finest description, much stronger and superior to nine tenths of that sold for the best in the shops. They are often called, by way of distinction, LIMONATED GINGER-BEER, IMPERIAL G.-B., &c. Cheaper articles are made by omitting some of the ingredients, and particularly a portion of the sugar. The ginger-beer vended at 1*d.* and 2*d.* a bottle, with that known as GINGER POP, IMPERIAL POP, &c., are generally made with moist sugar ($\frac{1}{2}$ to $\frac{3}{4}$ lb. to the gal.), and merely flavoured with a little coarse ginger. No. 2, made with 2 lbs. of sugar to the gal. may be kept 2 years, if not bottled for six months, and well-stored; and with 3 lbs. to the gal., for 4 years, when it forms a splendid article (GINGER-CHAMPAGNE).

Beer, Pine. See SPRUCE-BEER.

Beer, Spruce. *Syn.* CEREVISIA (-vîzh'-) ABIETIS, C. ABIETINA, C. ABIETICA*, L. *Prep.* 1. Sugar, 1 lb.; essence of spruce, $\frac{1}{2}$ oz.; boiling water, 1 gal.; mix well, and when nearly cold, add of yeast, $\frac{1}{2}$ a wine-glassful; and the next day bottle like ginger-beer.

2. Essence of spruce, $\frac{1}{2}$ pint; pimento and ginger (bruised), of each, 5 oz.; hops, $\frac{1}{2}$ lb.; water, 3 galls.; boil the whole for 10 minutes, then add of moist sugar, 12 lbs. (or good treacle, 14 lbs.); warm water, 11 galls.; mix well, and, when only lukewarm, further add of yeast, 1 pint; after the liquid has fermented for about 24 hours, bottle it.

Prop., Uses, &c. Diuretic and antiscorbutic.

Regarded by some persons as an agreeable 'summer-drink,' and often found useful during long sea-voyages. When made with lump-sugar it is called WHITE SPRUCE-BEER; when with moist sugar or treacle, BROWN SPRUCE-BEER. An inferior sort is made by using less sugar, or more water. If made with $1\frac{1}{4}$ to $1\frac{1}{2}$ lb. of lump-sugar per gal., and without yeast, in a similar manner to that described under GINGER-BEER (No. 2), it may be kept a twelvemonth, or longer, in a moderately cool place.

Beer, Sugar. *Syn.* CEREVISIA (-vîzh'-) SACCHARI, L. From moist sugar (1 to 2 lbs. to the gal.) and a little hops; as treacle-beer.

Beer, Treacle (trē'kl-). *Syn.* CEREVISIA FÆCIS SACCHARI, &c., L. *Prep.* 1. From treacle or molasses, $\frac{3}{4}$ to 2 lbs. per gal. (according to the desired strength); hops, $\frac{1}{4}$ to $\frac{1}{2}$ oz.; yeast, a table-spoonful; water, q. s.; treated as below.

2. Hops, $1\frac{1}{2}$ lb.; corianders, 1 oz.; capsicum-pods (cut small), $\frac{1}{2}$ oz.; water, 8 galls.; boil for 10 or 15 minutes, and strain the 'liquor' through a coarse sieve into a barrel containing treacle, 28 lbs.; then throw back the hops, &c., into the copper, and reboil them, for 10 minutes, with a second 8 galls. of water, which must be strained into the barrel, as before; next 'rummage' the whole well with a stout stick, add of cold water 21 galls. (sufficient to make the whole measure 37 galls.), and, after again mixing, stir in $\frac{1}{2}$ a pint of good fresh yeast; lastly, let it remain for 24 hours in a moderately warm place, after which it may be put into the cellar, and in two or three days 'bottled,' or 'tapped' on 'draught.' In a week it will be fit to drink. Very superior.—*Prod.* 1 barrel, or 36 gallons. For a stronger beer, 36 lbs., or even $\frac{1}{2}$ cwt. of treacle, may be used. It will then keep good for a twelvemonth.

Obs. A wholesome drink; but one apt to prove laxative when taken in large quantities. See BREWING, GINGER-BEER, POWDERS, &c.

BEERS. (In pharmacy.) *Syn.* CEREVISIAE (-vîzh'-e-ē) MEDICATAE, L. The general nature and preparation of these articles have been already noticed.¹ They are little employed in this country. The ingredients should be so proportioned that from $\frac{1}{4}$ to $\frac{1}{2}$ a pint may form the proper dose. The following are examples:—

Beer, Antiscorbutic. *Syn.* CEREVISIA ANTISCORBUTICA, L.; SAPINETTE, Fr. *Prep.* 1. (P. Cod. 1839.) Scurvy-grass and buds of the spruce-fir, of each, 1 oz.; horse-radish root, 2 oz.; (all fresh, and bruised or sliced); new ale or beer, $3\frac{1}{2}$ pints (say, $\frac{1}{2}$ gal.); macerate 4 days, press, and strain for use.

2. (Ph. Castr. Ruth. 1840.) Horse-radish (fresh), 4 lbs.; juniper berries, 3 lbs.; root of calamus aromaticus and buds of pinus abies, of each, 1 lb.; ginger, 1 oz.; syrup (of brown sugar), 6 lbs.; beer, 120 lbs. (say, 12 galls.); macerate 4 days, or until it ferments, then

¹ See ALES (Medicated).

decant, strain, and add of *cream of tartar*, $\frac{1}{2}$ lb.; *incture of mustard*, (*flour of mustard* 2 oz., to *proof spirit* 12 oz.), 5 lbs. (say, $\frac{1}{2}$ gal.). In scurvy, &c.

Beer, Cincho'na. *Syn.* A'GUE-BEER, BARK'-BEER; CEREVIS'IA CINCHO'NÆ, &c., L. *Prep.* 1. Bruised *cinchona-bark*, 1 oz.; *proof spirit* or *brandy*, 2 oz.; mix; the next day add of *new beer*, 1 quart, and in 3 days decant or filter.—*Dose.* 2 or 3 wine-glassfuls.

2. (*Mutis.*) *Cinchona*, 4 oz.; *sugar*, 2 lbs.; *boiling water*, 5 pints; when *lukewarm*, ferment with a little *yeast*, as for ginger-beer.—*Dose.* 1 or 2 wine-glassfuls.

3. (*Ph. Ferraz.*) *Bruised Peruvian bark*, $\frac{1}{2}$ oz.; *cinnamon*, 2 drs.; *nutmeg* (rasped), 7 drs.; *sugar*, 25 oz.; *yeast*, 2 oz.; *water*, 5 pints; mix, ferment, decant, and strain, as before.—*Dose.* 3 or 4 wine-glassfuls. They are all administered during the intermission of *ague*.

Beer, Pipsissewa. *Syn.* CEREVIS'IA CHIMAPH'ILE, &c., L. *Prep.* (*Dr. J. Parrish.*) *Pipsissewa* (*chimaphila umbellata*), $\frac{1}{2}$ lb.; *water*, 1 gal.; boil, strain, add of *sugar*, 1 lb.; *powdered ginger*, $\frac{1}{2}$ oz.; *yeast*, q. s.; and ferment, strain, and bottle, as for ginger-beer. In scrofulous affections; especially of the joints.—*Dose.* Half a tumblerful. It is a favorite remedy with some American practitioners.

Beer, Sarsaparilla. *Syn.* LIS'BON D'ET-BEER, SPAN'ISH JARAVI; CEREVIS'IA SAR'ZÆ, C. SARSAPARILLÆ, INFUSUM S. PARA'TUM FERMENTATIO'NÆ, &c., L. *Prep.* 1. *Compound extract of sarsaparilla*, $\frac{1}{2}$ oz.; *hot water*, 1 pint; dissolve, and when cold, add of good *pale* or *East-India ale*, 7 pints.

2. *Sarsaparilla* (sliced), 1 lb.; *guaiacum-bark* (bruised small), $\frac{1}{2}$ lb.; *guaiacum-wood*, (rasped), and *liquorice root* (sliced), of each, 2 oz.; *quiseed* (bruised), $\frac{1}{2}$ oz.; *mezereon root-bark*, 1 oz.; *clones*, (cpt small), $\frac{1}{2}$ oz.; *moist sugar*, $3\frac{1}{2}$ lbs.; *hot water* (not boiling), 9 quarts; mix in a clean stone jar, and keep it in a moderately warm room (shaking it twice or thrice daily) until active fermentation sets in, then let it repose for about a week, when it will be fit for use.

Obs. It is said to be superior to the other preparations of sarsaparilla as an alterative or purifier of the blood, particularly in old affections. That usually made has generally only one half the above quantity of sugar, for which treacle is often substituted; but in either case it will not keep well; whereas, with proper caution, the products of the above formulæ may be kept for one, or even two years. No yeast must be used.—*Dose.* A small tumblerful 3 or 4 times a day, or oftener.

Beer, Stomach'ic. *Syn.* MED'ICATED PURG; CEREVIS'IA STOMACH'ICA, L. *Prep.* (*Dr. Quincy.*) *Centaury-tops* and *Roman worm-wood*, of each, $\frac{1}{2}$ handfuls; *gentian root* (bruised), 2 oz.; *the yellow peels* of 6 *Seville oranges*; *Spanish angelica-root* and *Winter's lard*, of each (bruised), 1 oz.; *new ale*, or *beer*,

3 quarts (say, 1 gal.); digest for a few days, as before. One or two wine-glassfuls early in the morning, and an hour before a meal.

Beer, Sulphu'ric Acid. *Syn.* SULPHURIC LEMONADE; CEREVISIA ACIDI SULPHU'RICI, C. ANTIOOL'ICA, L. *Prep.* 1. *Treacle beer*, or other *weak mild beer* of *ale*, to which a little *concentrated sulphuric acid* has been added, in the proportion of about 1 dr. to every 8 or 10 pints; the whole being well agitated together, and allowed a few hours to settle.

2. *Treacle*, 14 lbs.; *bruised ginger*, $\frac{1}{2}$ lb.; *coriander*, $\frac{1}{2}$ oz.; *capsicum* and *cloves*, of each, $\frac{1}{4}$ oz.; *water*, 12½ galls.; *yeast*, 1 pint; proceed as for ginger-beer, and when the fermentation is nearly over, add of *oil of vitriol*, $\frac{1}{2}$ oz. (diluted with 8 times its weight of water), and of *bicarbonate of soda*, $\frac{1}{2}$ oz. (dissolved in a little water). It is fit to drink in 3 or 4 days.

Uses, &c. It is taken with great benefit by workers in lead, especially by those employed in white lead works; also in cases of lead colic, poisoning by lead or its salts, &c. A tumblerful twice or thrice daily. It is both harmless and wholesome.

Beer, Tar. *Syn.* CEREVIS'IA PI'ICIS, C. P. LIQ'UIDÆ, L. *Prep.* (*Duhamel.*) *Bran*, 2 pints; *tar*, 1 pint; *honey*, $\frac{1}{2}$ pint; *water*, 6 pints; mix, and gently simmer together for 3 hours; when lukewarm add of *yeast*, $\frac{1}{2}$ pint; let it ferment for 36 hours, and strain. Pectoral, anti-asthmatic, antiphthisic, &c.—*Dose.* One wine-glassful before each meal, in bronchial and chest diseases, and incipient consumption. See BEERS (In Pharmacy; above).

BEES'WING. The second or pseudo-crust so much admired in *port* and a few other wines, and which forms in them only when kept for some time after the first or true crust has formed. It consists of minute, glittering, floating particles or lamellæ of tartar, purer, and freer from astringent matter, than that deposited in the first crust. See CRUST, WINES, &c.

BEET (bête). *Syn.* BE'TA, L.; BIET, D.; BETTE, Fr.; BEETE, MANGOLD, M.-KRAUT, Ger.; BIETOLA, It. The common name of plants of the genus 'beta,' and the *nat. ord.* Chenopodæa (DC.). There are said to be only two distinct species cultivated—*beta vulgaris* and *b. hortensis*—each of which occurs in several varieties; those of the first, and which we have chiefly to consider, producing a large fleshy root (BEET'-ROOT, MAN'GOLD-R.; RA'DIX BE'TÆ, L.; BETTERAVE, Fr.; ROTHE RÜBE, &c., Ger.) which is both sweet and succulent; those of the other, only succulent leaves. The varieties most useful, and now the most extensively cultivated in England, are of comparatively recent introduction; field-beet, the mangold-wurzel of the Germans, having been only brought under the notice of our agriculturists towards the end of the last century.

Field Beet. See HYBRID BEET.

Hy'brid Beet. *Syn.* COMMON BEET, FIELD'-

B.; BE'TA HY'BRIDA, B. VULGAR''IS H., L.; BETTE COMMUNE, BETTERAVE C., RACINE D'ABONDANCE, R. DE DISETTE, &c., Fr.; MANGOLD, M.-WURZEL, MANGEL-W., &c., Ger. A variety of *beta vulgaris* (Linn.), and that usually cultivated by English farmers. Root, red on the outside, white inside; chiefly grown as winter-food for cattle, being vastly superior to turnips. It has been used, in Germany, as a substitute for bread in times of scarcity. Leaves, dressed and eaten like spinach.

Red Beet. *Syn.* CULINARY BEET, GARDEN B., BEET-RADISH, BEET-RAVE, &c.; BE'TA RU'BRA, B. VULGA'RIS R., L.; BETTERAVE, &c., Fr.; ROTHE RÜBE, &c., Ger. Root, tender, well-flavoured, and of a rich red colour throughout, and hence much used in salads, pickles, and cookery; also made into a conserve, jam, or confection. The kinds most esteemed for salads are the SMALL RED and the YELLOWISH-RED varieties of Castelnaudari.

Sea Beet. *Syn.* BE'TA MARITIMA, L. Said to be the best variety for dressing as spinach.

White Beet. *Syn.* BE'TA ALBA, B. VULGA'RIS A., B. CYCLA, L.; BETTE BLANCHE, POIRÉE, &c., Fr. A sub-variety of the red beet. Root, white, and hence preferred for making sugar; that with a purple crown being the most esteemed.

Obs. The preceding varieties of beet resemble each other in their general properties. They are all antiscorbutic, detergent, emollient, and nutritious; and their roots contain about 8% of sugar, which, by proper treatment, may be obtained from them of excellent quality. The grated root is sometimes used to dress blisters and foul ulcers. When sliced, and dried in a malt-kiln, a very palatable beer may be brewed with it. The leaves of each variety are dressed and eaten like spinach. The roots, for the table, after being carefully washed, are dressed whole—neither scraped nor cut—and, according to their size and age, require from 1 to 4 hours' simmering or baking. They are mostly served in slices, cold, intermingled with other winter salad-vegetables. See BREWING, CATTLE, SALADS, SUGAR, &c. (also *anté*).

BEE'T ROOT. See REET.

BEE'TLE (bē'tl). *Syn.* SCARAB†*, SCARABEE†* (-bē); SCARABE'US, L.; ESCARBOT, SCARABÉE, Fr.; KÄFER, Ger.; BETEL, Sax. In *zoology*, the common name of an extensive genus of insects (*scarabæus*, Linn.), of numerous species. It is also popularly applied to all coleopterous insects, or such as have hard or shelly wing-cases, especially to those of a dark or obscure colour. The common pests of our kitchens and basement floors which pass familiarly under the name of beetles, black beetles, or cockroaches, belong to the order orthoptera, and not to the coleoptera or beetle tribe, as the name implies. See COLEOPTERA, INSECTS, &c.

Black Beetle; Domestic Beetle. See BLATTA, COCKROACH, &c.

Blis'tering Beetle. See CANTHARIS.

BELL. *Syn.* CAMPANA,¹ CAMPANULA,² NO'LA*,³ TINTINNAB'ULUM,⁴ L.; CLOCHE, CLOCHETTE,⁵ GRELOT,⁶ Fr.; GLOCKE, SCHELLE, &c., Ger.; BELL, BELLA, BELLE, Sax. A hollow vessel or body, usually of cast metal, with a wide cup-like mouth expanding outwards, so formed as to emit sound when suspended and struck with a hard substance. The word is also applied, either alone or in composition, to substances having the figure of a bell; as *bells* (of flowers), *bell-animal*, *b.-flower*, *b.-glass*, &c.

Form, Manuf., &c. Bells of "the common and well-known shape, with a thick lip or sound-bow, are the most effective known instruments for producing a loud and musical sound, such as you want when you erect a large public clock, or put up a peal of church bells." "After trying a number of experiments, at Messrs. Warner's, I am quite satisfied that there is nothing to be gained by deviating materially from the established proportions of the best old bells."⁷ This view is borne out by the researches of the Government commissioners⁸ who visited the Paris Exhibition, who report, that among the 'founders' of France and Belgium, there are no traditions of the art, nor any discoveries or appliances of modern science, tending to the improvement of bells, or to provide efficient substitutes for them; nor is there any known improvement on the established mode and usual material (BRONZE or BELL-METAL) for casting them. Sir C. Barry, indeed, according to Mr. Dennison, "seemed rather impressed with the merits of cast-steel bells;" but both Prof. Wheatstone and Mr. Dennison differ from him in opinion. Undoubtedly some cast-steel bells, of small size, have been produced, capable of yielding sounds of extraordinary clearness and richness; but, in most cases, owing to the difficulty in giving the peculiar molecular condition to the metal essential to a high degree of sonorousness, their tones are comparatively harsh and disagreeable. Well-annealed glass offers a cheaper and better material than steel for large bells up to a certain size, whilst its tones are exquisite. As the depth of the tone of a bell depends chiefly upon the dimensions and weight of the sound-bow, it appears likely that by directing our experiments to the increase of these, and the diminishing of the thickness of the metal in the other parts, the quantity of metal required to produce large bells might be very greatly reduced. The

¹ Appropriately, a large bell suspended or adapted for suspension; as that of a church, &c.

² A small bell.

³ Id.

⁴ Id.; *appr.*, one suspended as a door-bell, servants' bell, &c.

⁵ A little bell, a hand-bell.

⁶ A little round-bell.

⁷ Lecture on the "Form of Bells," deliv. at the Royal Institution, by Mr. B. Denison, to whom the Government intrusted the construction of the 'great bells' for the New Houses of Parliament.

⁸ Prof. Wheatstone and Sir Charles Barry.

sound of an Indian gong that may be easily held suspended by the hand, is always rich and usually as loud and deep as a bell of ordinary construction which it would take several men to lift. The Chinese often use bells made of porcelain. Small hand-bells for the toilet and boudoir are often made of silver, and then yield tones which are remarkably soft, clear, and pleasing. The tongue, clapper, or hammer, of bronze bells should be of iron; and steel bells, of bronze. Glass and porcelain bells require the striking part of the tongue to be of box-wood, the proper weight being given by a ball of iron cast on the rod immediately above it, and a similar one screwed on the end of the rod immediately below it. In all cases the hammer-head, preferably globular, should strike the bell near the verge, and should be free from projections or asperities.

The casting, &c., of bells is essentially similar to that of other articles in bronze, of corresponding size, and particularly of cannon. See BELL-METAL, BRONZE, &c.

BELL-METAL. *Syn.* *ÆS CAMPANA* "RUM, L.; MÉTAL DE CLOCHE, Fr.; GLOCKENGUT, GLOCKENSIEISE, Ger. The alloy, usually bronze, of which bells, &c., are made.

The composition of BELL-METAL varies considerably, as may be seen below:—

1. (Standard.) *Copper*, 78 parts; *tin*, 22 parts;¹ fused together and cast in the manner described under BRONZE. The most sonorous of all the alloys of copper and tin. It is easily fusible, and has a fine compact grain, and a vitreous-conchoidal and yellowish-red fracture. According to Klaproth, the finest-toned Indian gongs have this composition.

2. (Founder's Standard.) *Copper*, 77 parts; *tin*, 21 parts; *antimony*, 2 parts.² Slightly paler and inferior to No. 1.

3. *Copper*, 80 parts; *tin*, 20 parts.³ Very deep-toned and sonorous. Used in China and India for the larger gongs, tam-tams, &c.

4. *Copper*, 78 to 80 parts; *tin*, 22 to 20 parts. Usual composition of Chinese cymbals, tam-tams, &c.

5. *Copper*, 75 (= 3)⁴ parts; *tin*, 25 (= 1) parts.⁴ Somewhat brittle. In fracture, semi-vitreous and bluish-red. Used for church and other large bells.

6. *Copper*, 80 parts; *tin*, 10½ parts; *zinc*, 5½ parts; *lead*, 4½ parts. English bell-metal, according to Thomson. Inferior to the last; the lead being apt to form isolated drops, to the injury of the uniformity of the alloy.

7. *Copper*, 68 parts; *tin*, 32 parts.⁵ Brittle; fracture, conchoidal and ash-gray. Best proportions for house-bells, hand-bells, &c.; for

which, however, 2 of *copper*, and 1 of *tin*, is commonly substituted by the founders.

8. *Copper*, 72 parts; *tin*, 26½ parts; *iron*, 1½ part. Used by the Paris houses for the bells of small clocks or pendules.

9. *Copper*, 72 parts; *tin*, 26 parts; *zinc*, 2 parts. Used, like the last, for very small bells.

10. *Copper*, 70 parts; *tin*, 26 parts; *zinc*, 2 parts. Used for the bells of repeating watches.

Concluding remarks. Castings in bell-metal are all more or less brittle; and, when recent, have a colour varying from a dark ash-gray to grayish-white, which is darkest in the more cupreous varieties, in which it turns somewhat on the yellowish-red or bluish-red. The larger the proportion of copper in the alloy, the deeper and graver the tone of the bells formed of it. The addition of tin, iron, or zinc, causes them to give out their tones sharper. Bismuth and lead are also often added to modify the tone, which each metal affects differently. The addition of antimony and bismuth is frequently made by the founder to give a more crystalline grain to the alloy. All these additions are, however, prejudicial to the sonorousness of bells, and of very doubtful utility. Rapid refrigeration increases the sonorousness of all these alloys. Hence M. D'Arcet recommends the 'pieces' to be heated to a cherry-red after they are cast, and after having been suddenly plunged into cold water, to be submitted to well-regulated pressure by skilful hammering, until they assume their proper form; after which they are to be again heated and allowed to cool slowly in the air. This is the method adopted by the Chinese with their gongs, &c., a casing of sheet-iron being employed by them to support and protect the pieces during the exposure to heat. In a general way, however, bells are formed and completed by simple casting. This is necessarily the case with all very large bells. Where the quality of their tones is the chief object sought after, the greatest care should be taken to use commercially pure copper. The presence of a very little lead or any similar metal, greatly lessens the sonorousness of this alloy; whilst that of silver increases it. This last metal has been detected in many old church bells remarkable for the richness of their tones—articles of silver plate having been cast into the crucibles of the founders, as votive offerings, by the pious Christians of former ages.

The specific gravity of a large bell is seldom uniform throughout its whole substance; nor can the *sp. gr.* from any given proportion of its constituent metals be exactly calculated, owing to the many interfering circumstances. The nearer this uniformity is approached, or in other words, chemical combination is complete, the more durable and finer-toned will be the bell.

In general it is found necessary to take

¹ The resulting alloy probably contains 7 Cu + Sn.

² More antimony, or some other metal, is often added, as subsequently noticed; but always to the injury of the alloy as bell-metal.

³ Equal to about 8 Cu + Sn. In some gongs the proportion of tin is so low as 22, or even 20 parts, to 100 parts of copper.

⁴ Nearly equal to 6 Cu + Sn.

⁵ Equal to about 4 Cu + Sn.

about 1-10th more metal than the weight of the intended bell, or bells, in order to allow for waste and scorification during the operations of fusing and casting. See BELL (*above*), BRONZE, COPPER, &c.

BELLADONN'A (-dōn'-ā). [It., Sp., Port.; Eng., L., Ger.;¹ B. P.] *Syn.* DEAD'LY NIGHT-SHADE, DWALE; BELLEDAE, BELLADONNE, &c., Fr.; TÖDTLICHER NACHTSCHATTEN, TOLLKERSCHE, TOLLKRAUT, WOLFSKIRSCH, &c., Ger.; ATROPA LETHALIS*, SOLANUM FURBOSUM*, S. LETHALE*, S. MANIACUM*, S. MELANOCERASUS†, &c., L., Bot. var. *Literally*, fair lady; in *materia medica, botany*, &c., the usual name (adopted from the Ital.) of *atropa belladonna* (Linn.), an indigenous, poisonous, perennial, herbaceous plant, of the *nat. ord.* Solanæ (DC.; Solanaceæ, Endl., Lind.). It flowers in June and July, and its drooping, purple blossoms are common ornaments of our hedges and wastes where the soil is calcareous. It is supposed to be the '*insane root*' of Shakespeare.²

The parts of this plant used in medicine and pharmacy are the "fresh leaves and branches to which they are attached; also the leaves separate from the branches, carefully dried, of *atropa belladonna*; gathered, when the fruit has begun to form, from wild or cultivated plants in Britain" (B. P.).

Prop., Uses, &c. Every part of this plant contains ATROP'IA, and is consequently highly poisonous. Every part, except the berries, is fœtid when bruised, and of "a dark and lurid aspect, indicative of its deadly narcotic quality."³ Its berries, which are of a glossy violet-black, and of the size of a small cherry, are sweet-tasted, and not at all nauseous. Children and tired travellers and soldiers, allured by their beauty and the absence of disagreeable flavour, have frequently been induced to eat them; but in all cases poisoning, often fatal, has followed the indulgence.⁴ Belladonna is, however, in qualified hands, a safe and most valuable medicine. Its chief *use* is as an anodyne, antispasmodic, sedative, and discutient, and particularly to diminish sensibility and allay pain and nervous irritation in a variety of diseases—neuralgia, arthritic and migratory rheumatic pains, painful ulcers, cancer, spasmodic rigidity, strictures, and contractions (especially of the bladder and uterus), angina pectoris, iritis, epilepsy, chorea, hooping-cough, hysteria, mania, fevers, phthisis, asthma, &c.; also as a prophylactic of scarlet-fever,⁵ hydrophobia, and salivation,

as a solvent in enlarged and indurated glands (particularly when painful), as an agent to produce dilation of the pupil during surgical examinations and operations, &c. &c. It is employed both internally and externally, and in various forms, as is noticed under its 'preparations' elsewhere. — *Dose.* (Of the *powder*) $\frac{1}{2}$ to 1 gr., twice a day, gradually and cautiously increased until dryness of the throat, or dilation of the pupil occurs, or the head is affected.

Pois., &c. Belladonna, and its preparations, are *poisonous* to all animals, but very much more so to the carnivora than to the herbivora. It also acts as a poison on vegetables.

Treatm., Ant., &c. These may be the same as those employed in poisoning by *aconite*, *atropia*, and *opium*. The stomach must be cleared as soon as possible, followed by active purgation. Unfortunately emetics have scarcely any action, and, therefore, must be given in large doses, assisted by tickling the fauces, &c. If copious vomiting does not rapidly follow, the stomach-pump may be had recourse to. When the poison has been removed from the stomach, copious and continued draughts of astringent vegetable solutions (weak decoction of galls or oak-bark, or strong coffee or green-tea), should be persisted in for some time; followed by like draughts of water soured with any mild vegetable acid (as vinegar, lemon-juice, citric or tartaric acid, &c.—*Detec.* The contents of the stomach or vomited matter may be searched for the berries, leaves, seed, or portions of the root; all of which are easily recognisable. The usual physiological and chemical tests of *atropia* may also be applied to these, and to the organic liquids supposed to contain the poison. See ALKALOID, ATROPIA, EXTRACTS, OINTMENTS, TINCTURES, VEGETABLE JUICES, &c.

BELL'Y (-e). The abdomen (which *see*).

BELTS. In their connection with health and disease, *see* BANDAGE, DRESS, STAYS, &c.

BENGAL' (-gawl'). A thin fabric of silk and hair interwoven, originally from Bengal'.

Beng'al Light. A firework used as signals. *See* FIRES (Coloured).

Beng'al Stripes. Cotton cloth, woven with coloured stripes, orig. from Bengal; ging-ham.

BEN'JAMIN†*. Benzoin.

BENZENE. *See* BENZOL.

BEN'ZINE (-zin). Benzol.

BEN'ZOATE (-zo-âte). [Eng., Fr.] *Syn.* BENZOAS, L. A salt in which one atom of benzoic acid is replaced by a metal or other basic radical. The benzoates may, in general, be easily prepared by either neutralising the acid with the base, or by double decomposition. Most of them are more or less soluble in water, and crystallisable. Those of the alkalies and ammonia are very soluble, and rather difficult to crystallise. *See* BENZOIC ACID and the *respective bases*.

BEN'ZOENE* *See* THYMOL.

¹ As a borrowed word.

² "*Macheth*," a. i., s. 3.

³ Pereira, 4th ed., ii., 545.

⁴ One hundred and fifty French soldiers were thus poisoned at Pirna, near Dresden. (Orfila, "*Tox. Gén.*")

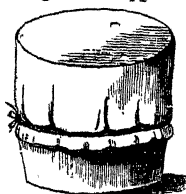

⁵ Of 2027 persons who took it, and were exposed to the contagion of scarlet fever, 1948 escaped. Bayle, "*Bibl. Thérap.*," t. ii., p. 504.) Of 1200 soldiers who took it only 12 became affected. (Oppenheim, "*Lond. Med. Gaz.*," xiii., 814.) In this country, however, except among homœopaths, it has not found much favour as a prophylactic.

BENZOIC ACID (-zō'ik). $\text{HC}_7\text{H}_5\text{O}_2$. *Syn.* FLOWERS OF BENZOIN; HYDRATED BENZOYL; ACIDUM BENZOICUM (B.P.); ACIDE BENZOIQUE, FLEURS DE BENJOIN, &c., Fr.; BENZOESÄURE, &c., Ger. A substance which is commonly stated to be the characteristic constituent of the true balsams. Pure oil of bitter-almonds suffers gradual conversion into this acid by exposure to the air.

Prep. The acid of commerce is principally obtained from gum-benzoin, either by sublimation (dry way), or by dissolving it out by means of an alkali, or an alkaline earth, in the form of a salt (moist way); but chiefly by the first method.

1. BY SUBLIMATION.—

a. Good benzoin, crushed small or in the state of coarse powder, is placed in a cylindrical iron pot with a flat bottom, and from 8 to 9 inches in diameter, so as to form a layer of from 1 to 2 inches deep. The open end of the pot is next covered with a sheet of soft and loose blotting-paper,¹ which is attached to the rim with paste. A cone, cap, or cylinder, formed of strong thick paper (cartridge paper), open at its lower end, is then placed over the top of the pot, including the blotting-paper; and this is also attached with paste and string. The apparatus, thus prepared, is then

placed on a sand bath,² and exposed for 4 to 6 hours to a gentle and uniform heat. It is next removed from the sand bath, and, when it has sufficiently cooled, inverted, and the string detached, when crystals of benzoic acid are found in the paper cone. If, owing to want of care in manipulating, the product is either coloured or empyreumatic, it must be enveloped in several folds of bibulous paper, then submitted to powerful pressure, and afterwards resublimed. The simple form of apparatus figured in the engr. answers well on the small scale, and is that recommended by Dr. Mohr.

b. (Ph. D. 1850.) The subliming pot is ordered to be of sheet-iron. It is to be fitted into a circular hole in a sheet of pasteboard, and a collar of tow interposed between it and the flange, so as to produce a nearly air-tight junction. The paper receiver or cap is to be cylindrical, open at one end and about 18 inches high, with a diameter at least twice that of the pot; and it is to be secured, in an inverted position, on the pasteboard, and fastened to it by slips of paper and flour-paste. A couple of inches of the pot is to be passed through a corresponding hole in a plate of sheet-tin, which is to be kept in contact with the pasteboard by the interposition of a

few corks; and a heat³ only just sufficient to melt the benzoin is to be applied for at least six hours.

c. (Process adopted at *Apothecaries' Hall*, London.) The best gum-benzoin is put into an iron pot, set in brickwork over a suitable small fire-place (or flue),⁴ and communicating by a conical metal neck, with a wooden box (technically termed a 'house') lined with white blotting-paper, as a receiver for the flowers. A piece of fine muslin, or of bibulous paper, is interposed between the top of the subliming-pot and the receiver, to prevent the sublimate falling back into the former. The sublimation is conducted rather rapidly, and the acid condenses in beautiful white, soft, flexible crystals, which are at once ready for the market. When the process is conducted more slowly, the product is proportionately scaly.

Obs. Good samples of benzoin yield from 10 to 12%, or even 12½%, of 'flowers' or 'acid of the first sublimation.' This, after being pressed in blotting-paper and again sublimed, gives 8½ to 10% of nearly pure benzoic acid. The loss arising from a second sublimation is thus so great, that the utmost care should be taken to avoid its necessity.

2. IN THE MOIST WAY:—

a. (Ph. D. 1826; Scheele's Process.) Equal parts of benzoin and hydrate of lime, in fine powder, are intimately mixed together, and boiled for about an hour, with 40 parts of water; the liquor, after filtration, is evaporated to ½th, and the lime saturated with hydrochloric acid; the benzoic acid crystallises out as the liquor cools, and is then either washed with very cold water, and dried by a gentle heat, or it is dried and sublimed in the manner already explained. The product of the sublimation is extremely white and pure.

Obs. An economical and productive process; but, to ensure success, a perfect mixture of the dry ingredients must be first made; as otherwise the benzoin runs into a solid mass in the boiling water, and the operation fails.—*Prod.* "1 lb. of (gum) benjamin yields 1 oz. 6 drs. 2 scr. of flowers." (Gray).⁵

b. (Process of Stoltze.) The benzoin is dissolved in 3 times its weight of alcohol, the solution introduced into a retort, and a solution of carbonate of soda in weak spirit-and-water, is gradually added, until all the free acid present is neutralised; water, equal to about twice the weight of the benzoin employed, is next poured in, and the alcohol removed by distillation. The floating resin is now skimmed off the residual liquid, and washed with a little water, and the washings added to the contents of the retort, which will deposit crystals of benzoate of soda on cooling, and more by subsequent evaporation. From this salt the

¹ That of a gas-flame is recommended. A ring of very small gas-jets answers better.

² A pan with a steam-jacket answers well, and is very manageable.

³ A quantity which, in our own experiments, we were never able to obtain.

¹ Felt—Liebig.

² On an iron plate on which sand has been spread—Ph. Bor.

benzoic acid is obtained by saturating the alkali with an acid (as the hydrochloric), and by subsequent sublimation of the crude precipitated crystals.

3. Other Methods:—

a. Ordinary hippuric acid is very gently boiled, for about 15 minutes, in nitric acid¹ (sp. gr. 1.42); water is then added, and the solution allowed to cool and crystallise. The crystals are collected on a filter, washed with a little very cold water, dried by pressure in bibulous paper, and lastly, purified by sublimation, as before.

b. From the urine of horses, cows, and other graminivorous animals, in a similar way to that by which hippuric acid is obtained, only allowing the urine to acquire a slight degree of putridity before evaporation, which last should be effected by a heat slightly under that of ebullition. The crude acid thus obtained is purified as previously directed.

Obs. Large quantities of benzoic acid are said to be obtained in this way on the Continent; but, owing to the process being clumsily conducted, it is generally of inferior quality, and hence unsaleable. It may, however, by skilful purification, be rendered quite equal to that obtained from gum benzoïn.²

Prop. When obtained by sublimation benzoic acid forms soft, light, feathery, white, flexible crystals, which are transparent or semi-transparent, with more or less of a mother-of-pearl lustre; when by slowly cooling its aqueous solution, or by precipitation from a solution of a benzoate, it forms either thin plates or scales, or a dazzling white crystalline powder. It is inodorous when cold,³ but acquires a faint balsamic odour when gently warmed; fuses at about 212° Fahr., and begins to sublime freely at a temperature a little above it, but does not boil until heated to about 460°; burns with a bright yellow flame; is very soluble in alcohol, dissolves in about 200 parts of cold water, and about 25 parts of boiling water; resists the action of ordinary nitric acid even when boiling; and forms salts (BENZOATES) with the bases. Sp. gr. 0.667. Its vapour, which is very suffocating and irritating, has a density of 4.27. Added to fat and fatty substances it either prevents, or greatly retards, the accession of rancidity.

Tests, &c. It may be recognised—1. By its physical properties (appearance, fusibility, volatility, odour, &c.) already enumerated:—2. By its ready solubility in solutions of the alkalies; and by being precipitated from these solutions, on the addition of one of the stronger acids, under the form of a dazzling white powder, which is only sparingly soluble in cold

water:—3. By its neutral salts with the alkalies, or its neutral solution in an alkali, giving a bulky, flesh-coloured precipitate with perchloride of iron, which is insoluble in water:—

4. By its solution not being precipitated by acetate of lead until after neutralisation with a fixed alkali, when the acetate produces a white, flocculent precipitate:—5. By a mixture of alcohol, ammonia, and solution of chloride of barium, neither disturbing a solution of the free acid, nor that of one of its salts with the alkalies.

It is chemically distinguished from cinnamic acid by not yielding essential oil of almonds when it is distilled with oxidising agents, as chromic acid or a mixture of bichromate of potassium and sulphuric acid; and from succinic acid, by its different deportment with sesquichloride of iron (*Test 3, ante*), and with a mixture of alcohol, ammonia, and solution of chloride of barium (*T. 5, ante*).

Estim.—1. By weighing it as benzoic acid, obtained either by precipitation, or by very careful sublimation in a glass apparatus:—2. By neutralising its alcoholic or aqueous solution, by the usual method of acidimetry:—3. By precipitating its neutral solution with acetate of lead, or with sesquichloride of iron, and weighing the carefully washed and dried precipitate either as benzoate of lead, or as ferric benzoate.

Pur. &c. White crystalline silky plates and needles, having an aromatic odour. Solubility in cold water, 1 in 300; in boiling water, 1 in 12; in spirit, 1 in 4. Also soluble in caustic alkalies and lime. Borax considerably increases its solubility in water; 1 of benzoic acid and 1 of borax are soluble in 100 of water. It sublims without residue when heated. It is sometimes met with adulterated with hippuric acid, which may be easily detected by its altered form, by its diminishing solubility in cold water, and by its exhaling an odour of tonquin-beans, and afterwards of hydrocyanic acid, when sublimed. The presence of succinic acid may be readily detected by its greatly increased solubility in cold water; that of sugar, not only by its increased solubility, and partial volatility, but also by the odour of caramel being evolved on the application of sufficient heat, and the residuum being black and carbonaceous; that of camphor, by its peculiar odour when gently heated. Spermaceti, specially prepared for the purpose, is also an occasional adulterant, easily detected by its insolubility and other well-known properties. All these substances either destroy or lack the proper crystalline form of benzoic acid, which is one of the best proofs of its purity. They also greatly increase its sp. gr.

Uses, &c. Its chief use in medicine is as a stimulant and expectorant. It is an ingredient in the compound tincture of camphor (*paregoric elixir*) of the pharmacopœia.—*Dose.* 10 to 30 grs., dissolved in water by the

¹ Hydrochloric acid as well as sulphuric acid also convert hippuric acid into benzoic acid; as does likewise a sufficient degree of heat. See HIPPURIC ACID.

² "A manufactory of sal-ammoniac, near Magdeburgh, which uses urine, is able to supply flowers of benjamin by the cwt." (Gray.)

³ That of the shops usually smells slightly of benzoïn, owing to the presence of a trace of volatile oil.

aid of a little ammonia or potassa; in old coughs, &c.

BENZOIC ALCOHOL. A peculiar oily fluid, discovered by M. Cannizzaro, and obtained by the action of an alcoholic solution of potassa on pure oil of bitter almonds.

BENZOIN, B. P. (-zoyn', -zō'in). *Syn.* GUM-BENZOIN*†, BENJAMIN†*, GUM-B†*; BENZÖNUM, L.; BENJOIN, Fr.; BENZÖE, Ger. The balsamic resin exuded from incisions made in the stem of the *styrax benzoin*, a native of Sumatra, Java, Borneo, Laos, and Siam. Several varieties of benzoïn are in the market; two only, however, are chiefly used in medicine, one in agglutinated masses, the other (from Siam), in tears, being the purer and having the stronger odour.

Prop., &c. Odour agreeable, and somewhat like that of vanilla, but more balsamic; fracture conchoidal; lustre greasy; sp. gr. 1.063 to 1.092. It fuses at a gentle heat, and exhales white fumes, which, on condensation, are found to be benzoic acid contaminated with a little volatile oil. Alcohol dissolves the larger portion of it, ether much less, and the volatile and fixed oils only a little. It contains from 9½ to 13, or (occasionally) nearly 20%, of benzoic acid, according to the quality. It burns with an agreeable odour. The resin and its alcoholic solution strike a bright red colour with oil of vitriol, and a green colour with chloride of iron.

Uses, &c. It is chiefly employed in perfumery, and as an ingredient in incense, fumigating pastilles, &c.; also in court-plaster, in certain cosmetics, and to scent the varnish used for snuff-boxes, walking-sticks, &c. As a medicine, its general effects resemble those of the other true balsams, and of benzoic acid. —*Dose.* 5 or 6 to 20, or even 30 grs., in powder, and usually in combination with some other remedy; chiefly in chronic pulmonary and bronchial affections, when occurring in torpid habits, and unaccompanied by inflammatory symptoms or gastric irritation. Also as a fumigation in the same diseases, hooping-cough, &c. Like benzoic acid, it is used to prevent rancidity in ointments, pomades, and other fatty preparations.

BENZOINUM. See BENZOIN.

BENZOL (-zôle). C_6H_6 . [*benz(oin)-oleum*.] *Syn.* BENZENE*, BENZINE, BENZÖLE*, HYDRIDE OF PHENYL*, PHENET*, &c.; BENZÖLEUM, L.; BENZINE, Fr.; BENZÖL, Ger. A peculiar ethereal hydrocarbon discovered by Faraday, among the products of the destructive distillation of whale oil and other organic substances (A.D. 1825); and subsequently shown, by Mitscherlich, to form the principal ingredient in the distillate procured by the action of heat on a mixture of benzoic acid and hydrate of lime. In 1849, Mr. C. B. Mansfield¹ discovered its presence in coal-tar naph-

tha, from which the benzol of commerce is now chiefly, if not wholly, obtained.

Prep. 1. **PURE**.—*a.* A mixture of *benzoic acid*, 1 part; *fresh-slaked lime*, 3 parts; is submitted, in a coated glass or earthenware retort, to a heat slowly raised to redness; the oily portion of the resulting distillate is then separated from the water, and carefully rectified, with the proper precautions, at a temperature not exceeding 190° Fahr. The product is usually stated to be pure benzol; but to ensure this it may be submitted to one refrigeration and rectification, in the manner and at the temperature noticed below.

b. From good commercial benzol, agitated with 1-4th or 1-5th of its weight of concentrated sulphuric acid, and, after repose and decantation, rectified at a temperature under 195° Fahr.; the resulting distillate is exposed to a temperature below 32° Fahr., and the mass of crystals that form are thrown on a funnel, kept at the same temperature, to drain, after which they are pressed between folds of bibulous paper,³ and then allowed to liquefy by simple exposure, in a close vessel, to the ordinary temperature of the atmosphere. The product, after rectification at a temperature not exceeding 190°, is nearly pure benzol. It may be rendered absolutely pure by repeating the refrigeration a second and a third time, followed by a final rectification at 180-185° Fahr.

2. **COMMERCIAL**.—By submitting light coal-tar naphtha to distillation, either at once, or after it has been agitated with a little oil of vitriol, and decanted, care being taken that the temperature does not exceed 200° Fahr.

Prop. Pure benzol is a clear, colourless, very mobile liquid, having a strong, characteristic, and rather agreeable ethereal odour. It is neutral to test-paper; exceedingly volatile at all temperatures; insoluble in water; miscible with alcohol and with ether; highly inflammable; burns with a brilliant flame, emitting clouds of smoke, which rapidly condense and fall as a shower of fine sooty, carbonaceous matter; boils at 176° Fahr.,⁴ solidifies, at 32°, to a snowy white camphor-like mass, or, when very slowly refrigerated, to beautiful transparent cruciform leaflets, which aggregate together into forms resembling fern-fronds; remelts at 40-1° Fahr.; and when solidifies burns, like camphor, without previous fusion. Sp. gr. 850;⁵

² Preferably considerably below. If the distillate be not rich in benzol, a temperature so low as 8 or 10°, or even 4-5°, Fahr. may be necessary or, at all events, advantageous.

³ Filtration under pressure is thought by some chemists to be preferable. For this purpose a 'Beart's Coffee-pot' (or a similarly constructed apparatus), was often employed by Mansfield, and is recommended by Prof. Muspratt.

⁴ Fownes, Mansfield, Muspratt, and others; 186°—Mitscherlich; 187°—Mr. C. G. Williams (in Ure's 'Dict. of A. M. & M.' 5th ed.). See Note 5 (below).

⁵ Williams, Ure, Muspratt; 855°—Fownes, Mitscherlich.

The different sp. gr. and boiling-points assigned to benzol, by authors, can only be accounted for by samples of different degrees of purity having probably been ex-

¹ This unfortunate chemist lost his life (Feb. 25, 1855), in consequence of being severely burned whilst experimenting on benzol.

sp. gr. of vapour, 2.770.¹ It is unaffected by the ordinary hydrated acids, and has no action on the alkaline metals. Highly concentrated nitric acid readily dissolves it, and from this solution nitrobenzol is precipitated on the addition of water. Its vapour is dangerously inflammable, and, when mixed with the air, is highly explosive. Its solvent power extends over a numerous list of substances. Commercial benzol has a less agreeable odour, and not unfrequently a slight colour, with other modifications of the properties just enumerated, depending on the relative amount of impurities contained in it.

Pur.—1. It should be colourless, without action on either litmus or turmeric paper, and have the boiling-point, sp. gr.,² &c., already indicated:—2. A few drops thrown on a slip of glass, or a piece of white paper, should rapidly and entirely evaporate by simple exposure to the air, without leaving a stain behind, or evolving any disagreeable or foreign odour:—3. Agitation with a little sulphuric acid should not discolour it:—4. It should not perceptibly lose weight or volume by agitation with a little cold water.

Detect.—1. From the physical and other properties already enumerated:—2. By converting it into aniline and then testing it accordingly. For this purpose a little of it is dissolved in concentrated nitric acid, and the nitrobenzol thus formed is precipitated by the addition of water. The fluid is then agitated with ether, to dissolve out the nitrobenzol, and the resulting ethereal solution is mixed with an equal bulk of alcohol and hydrochloric acid, and a little granulated zinc at once added. Hydrogen is evolved, and by its action the nitro-compound is converted into aniline. The liquid is next alkalisied with potassa in excess, and the alkaline fluid agitated with ether. The ethereal solution, on evaporation, leaves a residue (aniline), which, after the addition of a little water, may be tested with a few drops of solution of chloride of lime, when a characteristic purple colour will be developed, provided the original liquor was benzole, or contained it. In this way very minute traces of benzol may be detected.

Uses, &c. In its impure or commercial form, chiefly as a solvent for gutta serena, and india-rubber; but it leaves the first in a spongy, friable state, and the latter glutinous or sticky, unless heat is applied to it for some time; also as a solvent in the manufacture of varnishes, as a diluent, in lieu of oil of turpentine, for oil-paints, as a material for the pro-

duction of artificial light, &c. &c. In the pure, or nearly pure form, it is largely employed in the laboratory and in chemical analysis as a solvent of many resins,³ mastic, wax, camphor, fat, the fixed and essential oils, sulphur, phosphorus, i'dine, several of the alkalis,⁴ &c. &c. Under the name of BENZINE and BENZINE-COLLAS it has been recently extensively vended for the removal of spots of grease, paint, &c., from woven fabrics, which it does most readily and completely, without detriment to the material. As a source of artificial light it has been the subject of innumerable applications and patents. It may be burned in a 'wickless' lamp, provided a proper cap-burner be employed. Alcohol or pyroxic spirit containing 1-3rd, or even 1-4th of it, burns with a rich white flame. Air driven through it becomes sufficiently inflammable to serve as illuminating gas; whilst ordinary coal-gas by merely passing over it yields a flame of greatly increased brilliancy; but in all these applications the greatest possible care is necessary to prevent accidents.⁵ See NAPHTHA (Coal-tar).

BENZOYL. C_7H_5O . * The radical of an extensive series of compounds, of which the hydride, C_7H_5OH (essential oil of bitter almonds), and benzoic acid, $HC_7H_5O_2$, are the most important members.

Benzoyl Hydride of. C_7H_5OH . *Syn.* ESSENCE OF BITTER ALMONDS, ESSENTIAL OIL OF BITTER ALMONDS, VOLATILE OIL OF BITTER ALMONDS.

Prep. 1. The crude oil of bitter almonds is agitated with a moderately dilute solution of protochloride of iron which has been previously mixed with fresh hydrate of lime in excess, and the whole, after having been placed in a retort connected with a suitable receiver, is subjected to distillation. The hydride passes over mixed with water, from which it is easily separated after repose. By subjecting it to a second agitation and distillation with a fresh mixture of the protochloride and hydrate, and, after careful separation from the water which distils over with it, allowing it to remain for some hours in contact with a few fragments of fused chloride of calcium, to free it from all traces of adhering water, the product will be nearly chemically pure, provided the whole process has been conducted with as little access of air as possible.

³ Anime and copal are scarcely affected by it in the fluid state, but readily dissolve in its vapour at the point of condensation.

⁴ Particularly quinine, which it dissolves readily, but not cinchonine. Hence it is invaluable for the separation of them. It may be economically and conveniently substituted for ether in the preparation of many alkaloids, with the advantage of being applicable in many cases in which ether cannot be employed.

⁵ Workmen constantly exposed to the vapour of benzol are very subject to nervous irritability, and, where the apartment is ill-ventilated, even fits of nervous prostration and trembling, of a truly alarming character. In two or three cases which we have seen, the symptoms, to the inexperienced eye, closely resembled those occasionally resulting from the long-continued use of very minute doses of strychnia, or of the alcoholic extract of nuxvomica.

aminated. The numbers given in the text are those now usually adopted; but we are not prepared to say, that they are definitely settled. On the contrary, we think not unlikely that further investigations may show that the apparently greater levity of the benzole obtained from asphaltum may arise from the presence of some other hydrocarbon which has hitherto escaped detection.

¹ Theoretically, 2.738.

² If it has a less sp. gr. than .850, it is probably adulterated with the naphtha obtained from the Torbane-hill mineral or Boghead-coal, of which the sp. gr. is only .750.

2. (Liebig.) Agitate the crude oil of bitter almonds with mercuric oxide, in slight excess, and, after a few days' contact, rectify the oil from a little fresh oxide of mercury. The product is quite pure, when the process is properly managed. The bicyanide of mercury thus formed may be either employed as such, or reconverted into oxide of mercury and hydrocyanic acid.

Prop., &c. A rather thin, colourless liquid, of great refractive power, and characteristic and agreeable odour; soluble in 35 parts of water; miscible in all proportions with alcohol and ether; it boils at 356° Fahr.; on exposure to the air it rapidly absorbs oxygen, and becomes converted into a mass of crystallised benzoic acid; heated with solid hydrate of potassa, hydrogen is evolved, and benzoate of potassium formed; with the alkaline bisulphites it forms beautiful crystalline compounds. Its flame, and that of its vapour, is bright but very smoky. Sp. gr. 1.043. It differs from the crude or common oil of bitter almonds chiefly in the absence of hydrocyanic acid, and consequently in not being poisonous. It has hence been proposed as a substitute for the crude oil as a flavouring ingredient in cookery, confectionery, liqueurs, &c.; but is unfitted for the purpose owing to the rapid deterioration it suffers unless it be kept absolutely excluded from the air.

Formiate of Hydrate of Benzoyl. See FORMOBENZOIC ACID.

BERBERINE (-een).¹ $C_{29}H_{17}NO_4$. [Eng., Fr.] *Syn.* BAE'BERINE*, BEE'BERITE* (of Thomson); BERBERINA, L. A substance discovered by Buchner and Herberger in the root of the common barberry shrub (*berberis vulgaris*, Linn.); and subsequently, by Bödecker, in calumba-root; and more recently, by Mr. Perrins, in the calumba-wood (*menispermum fenestratum*) of Ceylon, which contains a considerable quantity of it.

Prep. 1. A soft watery extract of the root, or of the wood, is digested in rectified spirit, with trituration, as long as anything is taken up; the resulting tincture, after repose, is filtered, and the alcohol gradually distilled off until the residuum has the consistence of a thin syrup. The crystals which form as the liquid cools are drained in a funnel, washed with a few drops of ice-cold water, pressed dry in bibulous paper, and then purified by solution and crystallisation, first in rectified spirit, and next in distilled water.

2. By digesting the root, or the wood, (coarsely powdered,) in rectified spirit, and then proceeding as before.

Prop. Berberine may be classed with the azotised colouring substances; or, from its composition and its possessing feeble basic properties, with the alkaloids. It crystallises in fine needles, or in stellated prisms, which are yellow, odourless, very bitter-tasted, neutral

to test-paper, and contain 12 equiv. of water. At 212° Fahr. it acquires a red colour; but recovers its normal yellow on cooling. A much higher temperature decomposes it, yellow vapours being evolved. It is freely soluble in boiling water, and in alcohol, from either of which solutions it may be readily obtained in crystals. It requires 500 parts of water at 60° to dissolve it, and very much more at lower temperatures. Its solutions are yellow; that in alcohol appears green, by reflected light. The concentrated mineral acids destroy it. Its salts are more or less soluble.

Uses, &c. Chiefly in medicine, in similar cases to those in which the use of calumba-root is indicated. It has been highly recommended in dyspepsia and heartburn, in disturbed action of the liver, and combined with iron (lactate, phosphate, or hyposulphite), in chlorosis, anæmia, &c. According to M. Altin, it is an effectual remedy for the mucal, colourless diarrhoea, and the derangement of the urinary secretion, which commonly follow cholera.—*Dose.* 3 to 10 grs.; in larger doses it proves laxative. See CALUMBA, &c.

BERGAMOT. *Syn.* BERGAMO'TA, L.; BERGAMOTE, Fr.; BERGAMOTTE, Fr., Ger. The bergamot-lemon, or fruit of *citrus bergamia*; also sometimes, colloquially, the fragrant oil obtained from its rind. See OILS (Volatile).

BER'RY (bër'-re). *Syn.* BAC'CA (pl. bac'cæ, -sæ), L.; BAIE, Fr.; BEERE, Ger. Any small succulent or pulpy fruit containing several naked seeds or granules. In *botany*, an indehiscent pericarp or seed-vessel, pulpy, many-celled, and many-seeded; the seeds being naked, and for a time connected by a slender membrane, from which they become detached at maturity, and then remain dispersed through the pulp. It is distinguished by its figure, &c., into several varieties.

The leading berries employed in domestic economy and the arts are noticed in their alphabetical places (which see).

BER'YL (bër'-ril). *Syn.* AQUAMARINE' (-rène'); A'QUA-MARI'NA, BERYLLUS, L.; AIGUE-MARINE, BÉRI, Fr.; BERYLL, &c., Ger.; SMARAGD, It. A beautiful mineral, which, in its richer forms, is classed with the gems. It is usually of a green colour of various shades, passing into honey-yellow and sky-blue. It is allied in composition to the emerald; but occurs in much larger crystals than that gem, and owes its colour to oxide of iron, instead of oxide of chromium. According to Gmelin its composition is—Silica, 68.7%; alumina, 17.6%; glucina, 13.4%; red oxide of iron, 2.4%. Other (previous) authorities state that it contains fully 14% of glucina, 2% of lime, and 1% of oxide of iron.

The finest beryls come from Dauria on the frontiers of China, from Siberia, and from Brazil. Some of gigantic size have been found in the U. S., at Ackworth and Grantham, New Hampshire, and at Royalston,

¹ This substance must not be confounded with BEEBERINE or BIBERINE (which see).

Mass. One of these measured $32 \times 22 \times 15$ inches, and weighed 2900 lbs.; another, $12 \times 24 \times 45$ inches, and weighed 1076 lbs.

Apatite or Saxony beryl, chrysolite or pierre d'asperge, coloured fluor-spar, and even natural crystals of phosphate of iron, are often worked up by the lapidaries and passed off as beryls, or false beryls, emeralds, topazes, &c. See GEMS, PASTES, &c.

BERYL*. See GLUCINA.

BERYLIUM*. See GLUCINIUM.

BETEL (bē'tl). [Eng., Ger.] *Syn.* BÉ'TLE, BÉ'TEL-TREE, B. PEPPER-TREE; BÉTEL, Fr.; WASSERPEFFER, &c., Ger.; PÍPER BÉTEL (Linn.), CHAVICA BETLE (Miquel), L. A climbing plant of the *nat. ord.* Piperacæ, common in India and the East. Its leaves, which somewhat resemble those of the citron, are bitter, stomachic, tonic, stimulant, and sialogogue.

Betel. A common masticatory in the East, where it is chewed in the same way as tobacco is by Europeans and Americans, but much more generally, being regarded by the Malays, Sumatrans, &c., as an absolute necessary of life. It is commonly formed by dividing *areca-nuts*¹ into four or six equal parts or slices, one of which is rolled up, with a little *chunam*,² in a *sirik* or leaf of the *piper-betel*,³ and then constitutes a 'quid' ready for use.

Prop., &c. Betel, in those accustomed to its use, produces a species of pleasing excitement or intoxication, stimulates the action of the salivary glands, stomach, and kidneys, corrects acidity, diminishes cutaneous perspiration, restrains excessive discharges, increases the power of physical exertion and endurance, moderates the effects of climate, and appears to act as a general tonic on the system. It darkens the teeth, and tinges the saliva, as well as the mouth and lips of a bright red colour. In those unhabituated to its use, it causes giddiness, astringes and excoriates the mouth and fauces, and temporarily deadens the sense of taste. The Indians conceive that it preserves and fastens the teeth, cleanses and strengthens the gums, sweetens the breath, cools the mouth, assists respiration, and acts as a general aphrodisiac on both sexes. Peron states that he preserved his health during a long and very trying voyage by the habitual use of betel, whilst his companions, who did not use it, died mostly of dysentery.⁴

BETEL-NUT. *Syn.* ARECA-NUT; NUX ARECÆ CATECHU, N.-BÉTEL, &c., L. The seed of the catechu-palm (*areca catechu*, Linn.), divested of the husk or fibrous pericarp. The whole fruit (ARECA-NUT of commerce) is about the size of a small egg; the husked nut is of the size of a large nutmeg. The whole fruit

is remarkable for its narcotic or intoxicating power. It has, however, been thought doubtful whether its intoxicating effect is not owing to the piper-leaf in which it is wrapped when eaten (chewed), rather than to any special property of its own. See ARECA CATECHU.

BETULINE (-ū-līn; bē'-tū). [Eng., Fr.] *Syn.* BETULINA, L. A crystalline substance obtained from the bark of the white birch (*bē'tula alba*, Linn.).

BEZOAR (-zōre). [Eng., L. indecl.; *prim.* Pers.⁵] *Syn.* BEZOAR-STONE; BEZOAR'DUS, LA'PIS BEZOAR'DICUS, &c., L.; BÉZOAR, BÉZOARD, Fr.; BEZOARSTEIN, Ger. The name of preternatural concretions found in the stomach, intestines, &c., of certain animals, and formerly supposed to possess the most extraordinary antidotal power and medicinal virtues. So far, indeed, did this belief extend, that other substances regarded as antidotes were called BEZOAR'DICUS†, or otherwise named after them; whilst the adj. BEZOAR'DIC† (bēz-) and BEZOAR'TICAL† (*bézoardique*, Fr.; *bezoar'dious*, L.), came to be synonymous with antidotal. Certain bezoars were once valued at even ten times their weight in gold. They were not only taken internally, but also worn as amulets. They have, however, long since fallen into disuse in this country.

Among the leading bezoars of old medicine are—

Bezoar, Ger'man. *Syn.* BÉZOAR GERMANI-CUM, B. CAPRINUM, L. From the Alpine goat.

Bezoar, Hn'man. *Syn.* B. HOMINIS, L. Falsely stated to be found occasionally in man.

Bezoar, Microcos'mic. *Syn.* B. MICROCOSMICUM, L. Human urinary calculi.

Bezoar, Mon'key. *Syn.* B. SIMIÆ, LA'PIS S., L. From certain species of ape or monkey, obtained by giving an emetic.

Bezoar, Occiden'tal. *Syn.* WESTERN, B.; B. OCCIDENTALE, L. Found in the fourth stomach of the chamois or wild goat of Peru, &c.; or, according to others, of a species of antelope.

Bezoar, Orien'tal. *Syn.* EASTERN B.; B. ORIENTALE, LAPIS B. ORIENTALIS, L. From the fourth stomach of *ed'pra ag'd'grus*, a species of goat inhabiting the mountains of Persia, &c.

Bezoar, Ox. *Syn.* B. BOVINUM, L. From the ox, and other bovine animals.

Bezoar, Porcupine. *Syn.* B. HYS'TRICUS, B. HYS'TRICUS, LA'PIS H., L. PORCINUS, &c., L. Said to be found in the gall-bladder of the Indian porcupine. Chiefly from Malacca. Has an intensely bitter taste, which it imparts to water.

Bezoar, West'ern. See OCCIDENTAL BEZOAR (*anté*).

⁵ Some authorities derive this word from *badeahr* or *pazahar*, Persian compounds implying 'antidote to poison'; others, from *paseng*, or *pasahr*, the name of the goat in Persia. Mayne's notation—*be'zoar*, is unusual; and several of his analogues, synonyms, &c., are incorrectly given (? misprinted).

¹ In many cases suitable pieces of the whole fruit, including the husk, are used; and in others, only the husk (PINANG); there being different strengths and qualities of 'betel' employed.

² Lime made by burning shells.

³ In some cases, the leaf of *chavica siriboa* (Miq.), which possesses similar properties, is employed.

⁴ "Voyage aux Terres Australes."

Of the preceding, those from the stomach of ruminants vary in size from that of a bean to that of a hen's egg, and have a composition and appearance closely imitated by the following formula, the product of which is commonly sold for them:—

Bezoar, Factitious. *Prep.* From pipe-clay, or clay and chalk, equal parts, made into a stiff paste with ox-gall; a little hair or wool being added, and the resulting mixture pressed by the hands into small masses of a flattened spheroidal or egg-like form. These give a yellow tint to paper rubbed with chalk, and a green one to quick-lime, which tests are used for genuine bezoars. Like the latter, they are antacid or absorbent, which is probably the only virtue they possess.

Amongst 'chemical bezoars' now obsolete, even on the Continent, were—

Bezoar, Argentine†; **B. LUNA'RE**, L. Made by distilling butter of antimony with a solution of nitrate of silver. Once highly esteemed in epilepsy and head diseases.

Bezoar, Mineral; **B. MINERALE**, L. Powder of algaroth deflagrated with nitre in a red hot crucible, and then well washed with water. Once used as a diaphoretic. Other similar preparations were **B. JOVIALLE** (from tin), and **B. MARTIALE** (from iron).⁵

Bezoar, Saturnine, **B. OF LEAD**; **B. SATURNI**, L. Made by distilling a mixture of oxide of lead, butter, of antimony, and nitric acid. Once highly esteemed in diseases of the spleen.

BHAURTA. In Indian cookery, a dish made of mashed potatoes and onions, strongly spiced with capscum, and sometimes also with curry-powder, shaped in a mould, and then slightly baked.

BIBAS'IC. *Syn.* **BIBAS'ICUS**, L.; **BIBASIQUE**, Fr. In chemistry, having two bases, or two atoms of the base or basic radical in its composition. See **ACID**, **NOMENCLATURE**, **SALT**, &c.

BIB'ERON (bib'-rōng). [Fr.] A sucking-bottle or 'artificial mother.' See **BOTTLES**.

B'IBIRINE (bē'-). See **BERBERINE**.

BIB'ULOUS (-ū-). *Syn.* **BIB'ULUS**, L.; **SPONGIEUX**, Fr. Absorptive; spongy.

BICARBONATE. A salt in which only half the hydrogen in (hypothetical) carbonic acid (H_2CO_3) is replaced by a metal, e.g. bicarbonate of sodium, $NaHCO_3$.

BICE (bise). *Syn.* **BLUE BICE**. See **BLUE PIGMENTS**.

Bice, Green. See **GREEN PIGMENTS**.

BID'ERY (bē'-). *Syn.* **VID'ERY**. An alloy of which the chief seat of the manufacture is the city of Bider, near Hyderabad, India. It was first brought under the notice of the British public at the International Exhibition of 1851, where many articles made of it were greatly admired for the elegance of their forms, and the gracefulness of their engraved and enchased patterns.

Prep. 1. Zinc, 31 parts; copper and lead,

of each, 2 parts; melted together, with the usual precautions, under a mixture of resin and bees'-wax, to prevent oxidation.¹

2. (Dr. Heyne.) Copper, 8 parts; lead, 2 parts; tin, 1 part; melted together, as before. For use, the resulting alloy is remelted, and to every 3 parts of it, 36 parts of zinc are added.

Prop., &c. Colour, between that of pewter and zinc; does not corrode by exposure to air or damp; yields little to the hammer, and can only be broken by extreme violence. It possesses a convenient degree of fusibility, above that of zinc and tin, but much lower than that of copper. For the turner it is usually cast in moulds of baked clay; but otherwise in moulds of iron or other hard metal. The beautiful black colour, which the finished articles possess, is imparted by dipping them into a solution of sal-ammoniac, saltpetre, sea-salt, and blue vitriol. See **BRASS**, **BRONZE**, **PEWTER**, &c.

BIDET' (bid-ēt'; -ā—Fr.). An article of bedroom furniture conveniently formed for having the lower part of the body. Besides the value of its use as an instrument of personal cleanliness and health, it offers a ready means of medicating the parts, often highly serviceable in piles, prolapsus, affections of the scrotum and prostate gland, strangury, ischuria, suppressed or difficult menstruation, &c. See **ABLUTION**, **BATHS**, &c.

BIEN'NIAL (bi-ēn'-yāl). *Syn.* **BIEN'NIS**, L.; **BIENNAL**, **BISANNUEL**, **DE DEUX ANS**, Fr.; **ZWEIJÄHRIG**, Ger. Occurring once in, or lasting, two years. In botany and gardening, applied to plants that do not produce flowers and seed until the second year or season of their growth, and which then die; *subst.*, a biennial plant.

The existence of the biennials, like that of the annuals, may be prolonged by art; indeed, many of them, by carefully removing the flowers ere the seed-vessels begin to form, may be made to bloom a second season, and even for several seasons following, like perennials. See **ANNUALS**, **FLOWERS**, **PLANTS**, &c.

BIFF'IN. A baked apple, flattened by pressure.

Prep. The apples are placed in a cool oven, 6 or 7 times in succession, and flattened each time by gentle pressure, gradually applied, as soon as they are soft enough to bear it; after which they are taken out, and as soon as cold put on clean dishes or glass plates. The sour or tart variety of apples is the best for baking. If the process be well managed, the appearance of the prepared fruit is very rich, and the flavour delicious.

BIL'BERRY. The whortleberry.

Bilberry, Bear's. *Uva ursi*.

BILE. *Syn.* **BYLLIS**,² **CHO'LE**,³ **FEL**,⁴ L.;

¹ These are very nearly the proportions which Dr. Hamilton says he saw used in India.

² Properly, the 'gall' after it leaves the 'gall-bladder'—a sense retained in its English analogue.

³ Χολή, Gr.

⁴ Strictly, the gall-bladder with the gall.

BILE, FIEL, GALLE, Fr.; GALLE, &c., Ger. A bitter fluid secreted by the liver, from venous blood; in part flowing from the intestines, and in part regurgitating into the gall-bladder. Its composition is of a very complex character; and its uses in the animal economy appear to be—to separate the chyle from the chyme, to promote the digestion and assimilation of oleaginous substances, and to assist in exciting the peristaltic action of the intestines. The fæces appear to owe their colour chiefly to the presence of bile; as, without it, they possess a dirty pipe-clay colour. Several of the substances which enter into its composition, or which are formed from those which do so, are noticed elsewhere, under their respective names. Its analysis, detection, and uses in the arts, are given under GALL.

Bile (of Animals). See GALL.

BILE, Biliousness. Under these terms are popularly included all those slight affections of the stomach, usually accompanied with derangement of the head and bowels, apparently arising from excess of bile. Persons subject to attacks of this description should be particularly careful to avoid excess in both eating and drinking, and should more especially shun those articles of food, and those liquors, which, from experience, they find are apt to disagree with them. A mutton chop, slightly underdressed, is an excellent article for the breakfast, or the lunch, of bilious patients; and good beef or mutton, either broiled or roasted, so that the gravy be retained, is better for dinner than many dishes apparently more delicate. These, with fresh game and venison, form a good variety from which to choose a bill of fare. New beer and porter should be particularly avoided, as well as boiled meat, stews, soups, greasy or rich puddings, much butter or fat, and most articles of pastry, as they are very indigestible, and, by overtasking the powers of the stomach, very apt to derange it. Strong cheese,¹ salads (particularly cucumbers), over-ripe or unripe fruit, new bread and rolls, cabbages and green vegetables, and especially peas, beans, nuts, almonds, and the like, are also objectionable for parties with delicate stomachs or a bilious tendency. The bread eaten by such persons should be perfectly free from alum, and preferably prepared with meal retaining the whole of the bran in it; and should be two days, or at the least, one day old. The quantity of animal food per day, except for the laborious, should be limited to from 6 or 8 to 12 oz.; and warm slops of all kinds, except moderately strong tea and coffee, should be taken as seldom as possible, and, in general, avoided altogether. Even cocoa and chocolate prove injurious to the delicate and bilious. Out-door exercise and plenty of fresh air are essential to the health of such persons. Those who indulge in them freely are never attacked with affections of this kind, unless it be after gluttonising or

heavy drinking. Above all things heavy and late suppers should be abandoned; indeed, the better plan is to take nothing more than a hard biscuit, or dry crust, after tea.

In general, attacks of bile may be prevented by the exercise of moderate judgment and temperance in living; and, in those hitherto subject to them, by the occasional use of an aloetic, mercurial, or saline aperient; and they may be generally rapidly removed by an emetic, followed by a dose of castor oil, Epsom salts, or Seidlitz powder. A tumbler of pure cold water taken on retiring to rest, and another (or even two) on rising in the morning, will often remove both the tendency and the fit, when all the usual remedies have failed. See ABERNETHY MEDICINES, ANTIBILIOUS, DYSPERSIA, STOMACH AFFECTIONS, &c.

BIL'ARY AFFECTIONS (-yâr-e). See BILE (*anté*), CALCULI, JAUNDICE, LIVER, &c.

BI'LINE (-lîn). *Syn.* BILI'NA, L. This name has been loosely applied to two substances:—1. Bile, or pure bile, freed from the mucus of the gall-bladder, and gently evaporated to dryness. A gummy pale yellow mass, white when powdered;—2. Taurocholic or choleic acid. See GALL, &c.

BILIOUS (-yüs). *Syn.* BILIO'SUS, L.; BILIEUX, Fr.; GALLIG, GALLICHT, &c., Ger. Pertaining to, caused by, full of, or having excess of bile. See BILE, BILIOUSNESS.

BILIPH'EINE (-e-în). Cholepyrrhine.

BILIVERDINE (-dîn). A green colouring matter, identical with chlorophyll, found in bile, and in the green dejections of children.

BILL OF FARE. In *cooking, domestic economy*, &c., a list of things ready dressed or prepared for the table (*CARTE, C. D'UN RESTAURANT, MENU, &c., Fr.*); also a list of articles of food in season. For *Tables* of the latter, see FOOD.

BIN'ARY. *Syn.* BINA'RIOUS, L.; BINAIRE, Fr. Consisting of two parts. In *chemistry*, compounded of two elements, or of two bodies performing the function of elements.

BINOC'ULAR (-û-). Having two eyes. In *optics*, of or with two eyes, as *binocular vision*; or formed with two eye-pieces or tubes, so as to be used with two eyes, as a *b. microscope, b. telescope, &c.*

BIRCH. *Syn.* BE'TULA, L.; BOULEAU, Fr.; BIRKE, Ger. The common name of trees of the genus *betula*; *appr., b. alba* (Linn.), or white birch; also its wood. See BETULINE, and below.

Black Birch. *Syn.* CHER'BY B., SWEET B., MOUNTAIN MAHOGANY; BETULENTA, L. A forest tree of No. America. Wood, used for cabinet-work; bark yields a volatile oil similar in odour and taste to that of gualtheria; juice, obtained by tapping, saccharine, and yields BIRCH-SUGAR.

White Birch. *Syn.* BIRCH, (or) COMMON B.; BE'TULA, L. A tree found in the woods of England. Wood, neither very hard nor durable; leaves formerly used in itch and dropsy;

¹ Rotten cheese is absolute poison to the bilious.

bark febrifuge, yields a pyroligneous oil by distillation. See OILS (and *above*).

BIRD.¹ [Eng., Sax.] *Syn.* A'VIS, L.; OISEAU, Fr.; VOGEL, Ger. Any fowl, or animal of the feathered kind. In fashionable and gourmandic cant, *appr.* a partridge. See BIRDS (*below*).

BIRD'LIME. *Syn.* VIS'OUS, L.; GLU, Fr.; VOGELLEIM, Ger. *Prep.* The middle bark of the holly (gathered in June or July), is boiled for 6 to 8 hours in water, or until it becomes quite soft and tender; the water is then drained off, and it is placed in a heap, in a pit underground (commonly on layers of fern), and covered with stones. Here it is left to ferment for 2 or 3 weeks, and watered, if necessary, until it assumes a mucilaginous state. It is next pounded in a mortar until reduced to a uniform mass, which is then well kneaded with the hands, in running water, until all the refuse matter is worked out. It is, lastly, placed in an earthen vessel, and covered with a little water; in which state it may be preserved from season to season. In about a week it is fit for use.

Prop. Greenish coloured; very gluey, stringy, and tenacious; when air-dried, brittle and pulverisable, but capable of gradually assuming its previous viscosity when moistened.

Uses. To cover twigs to catch birds, and other small animals. It is said to be discutient, but is now never employed in medicine.

Obs. Birdlime may also be made from mistletoe-berries, the young shoots of the elder, the bark of the wayfaring-tree, and some other vegetables, by a similar process to that above described. Should any of it stick to the hands, it may be removed by means of a little oil of turpentine.

A kind of **FACTITIOUS BIRDLIME** is made by boiling linseed oil either with, or without, a little yellow resin, until it forms a viscid, stringy paste when cold. This is chiefly used, spread on paper or cloth, to catch insects. See FLY-PAPERS, &c.

BIRDS. *Syn.* A'VES, L. Birds, besides their value as food, play an important part in the economy of organic nature, and particularly in that of the vegetable kingdom. They are the best friends of the agriculturist and the gardener; and their presence, in numbers, appears essential to keep down the innumerable races of insects that prey upon our cereals, fruits, and culinary vegetables. M. Florent Prevost, who has for fifty years presided over the Natural History Museum of Paris, and who has, like the ancient Roman augurs, examined the entrails and stomach of fowls with scientific curiosity, avers, as the result of his long experience, that birds, of

whatever sort, are an unmitigated blessing to the farmer, and that the detritus and organic particles found by inspection of them in whole hecatombs, which, by the assistance of the Royal Forest Rangers, he has sacrificed on the altar of utility, show an immense preponderance of insect corpuscula in their digestive organs, whilst the traces of cereal or other valuable products are infinitesimal in comparison. It is found that even sparrows, rooks, and owls—three of the feathered tribe the most persecuted by the farmer—are, in reality, the faithful and vigilant conservators of his fruits and crops. In one of the smaller states of Germany, where, owing to public rewards being given to their destroyers, the whole race of sparrows were exterminated, the crops failed to such an alarming extent, that it became necessary to offer large premiums for the re-introduction of these useful birds from other parts. In some of the agricultural districts of France, where the destruction of small birds has been carried on with relentless activity for years, insects have so prodigiously multiplied as to attack everything green around them. Even the forest-trees are, in many cases, denuded of leaves by them, and are rapidly perishing. Venomous species of caterpillars, previously scarcely known except to entomologists, have now become common; and cases of children losing their lives from attacks of them whilst bird-nesting, have recently been published in the newspapers.² In our own country, the extension of sparrow-clubs—associations disgraceful to the boasted intelligence of the nineteenth century—threatens similar results. Already the gardener finds his fruit-crops lessening year by year; and that many of them, particularly of the smaller and sweeter fruits, have become so precarious, that they now scarcely pay for cultivation. In our own neighbourhood, where small birds have for some years been destroyed by bushels at a time, it is almost impossible to raise a currant, gooseberry, cherry, or plum; whilst seedling flowers and culinary vegetables often entirely disappear on the first night after being planted, or are so completely deprived of the succulent portion of their leaves and stems, that the remaining skeleton of network, in a few days withers and dies. But this is not all—the columns of our diurnals bring us continual reports of failing grain-crops in the neighbourhoods in which these bird-clubs have existed for any length of time, and that even on land previously remarkable for its fertility.³ Did this loss fall only on the benighted beings who so wilfully cast back the blessings of an all-wise, protecting Providence, it would be a just retribution; but, unfortunately, it affects the whole nation, and threatens, ere long, unless arrested by

¹ Properly, a 'chicken' or 'young flying animal.'—It is remarkable, as observed by Webster, that a nation should lay aside the proper generic name of flying animals—'fowl' (*Fugel*, *Fugl*, Sax.; *vogel*, Ger., Dut.; *fugl*, Dan.; *fogel*, Sw.; from the root of the Lat., *fugio*, *fugo*), and substitute the name of the young of those animals, as the generic term.

² A striking fatal case of this description is given in the "Times" of June 12, 1862.

³ See the "Times" and other leading 'journals' for 1862.

legislation, to prove a national calamity. The only apparent remedy for the evil, at present, is the diffusion of information tending to show that the farmer and the gardener, in destroying small birds, destroy their best friends.

[For further information respecting *birds*, see AVES, AVIARY, BIRD (*amè*), GAME, GERMAN PASTE, NESTS (Edible), POULTRY, PUTREFACTION, TAXIDERMY, TRUSSING, &c.]

BIS'COTIN. [Fr.] A small biscuit. In *cookery*, &c., a species of confection made of eggs, flour, marmalade, and sugar, variously compounded and flavoured according to the taste of the operator.

BIS'CUIT (-kît). [Eng., Fr.] *Syn.* BUCCELLATUM, PANIS BIS COCTUS, L.; SWIEBACK, Ger.; BISCOTTO, It.; BIZCOCHO, Sp. *Literally*, 'twice-baked;' *appr.*, a well-known variety of hard, dry, unleavened bread, made in thin flat pieces. Those prepared for seamen (SEA'-BISCUITS, CAP'TAIN'S B.) are composed of flour and water only. When made of fine flour, and a few caraway seeds are added, they are commonly called AR'ERNE'RY BISCUITS. Fancy biscuits generally contain a little sugar and butter, to which almonds, caraways, mace, ginger, lemon, and other articles, technically called 'flavourings,' are frequently added.

Prep. On the small scale, biscuits are made by forming the flour and water into a dough by the common process of hand-kneading, occasionally assisted with a lever, as in making ordinary bread. The dough is then rolled into a sheet, and cut into pieces of the desired size and form. These, after being stamped, are exposed to the heat of a moderately quick oven, when a few minutes (12 to 18, according to their size) are sufficient to bake them.

On the large scale, the whole manual process, from preparing the dough to the point at which the newly made biscuits are ready for baking, is now generally performed by machinery. The articles so prepared are commonly known in trade as 'MACHINE-MADE BISCUITS,' and are not only much cheaper, but of fully equal quality to those 'made by hand.' In the bakehouses of her Majesty's Victualling Yards at Deptford, Gosport, and Plymouth, the ingenious machinery invented by Mr. T. T. Grant, is employed. These establishments are said to be capable of producing annually above 8000 tons of sea-biscuits, at a saving of upwards of £2,000. a year, from the cost that would have been incurred for the purpose on the old system. Under the latter, it is stated, that wages, and wear and tear of utensils, cost about 1s. 6d. per cwt. of biscuit; whilst under the new system, the cost is only 5d.

The allowance of biscuit to each seaman in the royal navy is 1 lb. per day; or, on the average, six biscuits.

Biscuits, Fan'cy. The varieties of these are almost innumerable. In a printed list now

before us, we observe the names of upwards of one hundred different kinds. These are produced by varying the number and proportions of the ingredients used in their composition, and the form and size in which they are turned out of hand. They are further modified by the relative heat of the oven, as well as the length of time they are allowed to remain in it. It would, therefore, be waste of space to give particular directions for the preparation of each. The proportions of butter and sugar, or either of them, may be from 1 oz. and upwards, to flour, 1 lb.; according to the degree of richness desired. In a few cases, milk, or eggs, or both, are introduced. The 'flavourings' embrace a wide range of substances—bitter-almonds, caraways, cassia, cinnamon, ginger, mace, nutmeg, lemon, orange-peel, orange-flower water, essence of peach kernels, vanilla, &c. &c.; many of which give their name to the biscuit.—AR'ROW-ROOT BISCUITS are usually made of equal parts of arrow-root and flour; MEAT'-BISCUITS, from about 1 part of lean meat (minced small and pulped) beaten to a dough with about 2 parts of flour, and a little seasoning, no water being added; SODA BISCUITS, by adding 1 to 2 drs. of carbonate of soda to each lb. of flour. In most other cases, the mere inspection of the biscuit will convey to the experienced biscuit-baker and cook sufficient information to enable him to produce an exactly similar one, or at least a very close imitation. The richest kind of SPONGE-BISCUITS, as we are informed, are made as follows:—Add the whites and yolks of 12 eggs, previously well beaten, to 1½ lb. of finely powdered sugar, and whisk it until it rises in bubbles, then add 1 lb. of the finest pastry-flour, and the grated rind of 2 lemons. Put it into 'shapes,' sift a little sugar over them, and bake them in buttered tin moulds, in a moderately quick oven, for nearly half an hour.

BISCUITS, DEV'ILED, in *cookery*, are captain's biscuits (or any similar kind) buttered on both sides, peppered well, and then covered on one side with a slice of good cheese formed into a paste with made mustard; the whole being seasoned with a little cayenne pepper, is, firstly, grilled. Chopped anchovies, or essence of anchovies, is a good addition.

BISMUTH. Bi. BISMUTH, ETAIN DE GLACE, Fr.; BISMUTH, WISMUTH, W.-METALL, Ger. One of the metals.

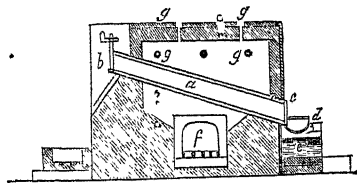

Sources. Bismuth occurs in the mineral kingdom in the metallic state (NATIVE BISMUTH), and in combination with sulphur (BISMUTHINE), and with oxygen (B. OXIDE, &c.). That of commerce is mostly imported from Saxony, where it is chiefly obtained from native bismuth, by the simple process of eliquation. The ore, sorted by hand from the

² For the MEAT-BISCUITS used in the navy, and by travellers, see MEAT.

³ A few fancy biscuits will be found noticed in their alphabetical places. See CRACKNELS, MACAROONS, &c.

¹ A captain's biscuit differs from a common 'sea-biscuit' in being made of finer flour.

gangue, and broken into pieces of about the size of nuts, is introduced into the ignited iron pipes of the furnace (see *engr.*), until

Bismuth-furnace in Section.

- (a.) Eliquation-tube.¹
- (b.) End at which it is charged.
- (c.) End from which the metal flows.
- (d.) Receiving-pan.
- (e.) Water-trough.
- (f.) Grate, &c.²
- (g, g.) Draught-holes.

these latter are filled to about one half their diameter, and to three fourths of their length. From these the liquefied metal is allowed to flow into iron pans containing some coal-cust, and from these into a trough of water, in which it is granulated and cooled. It is subsequently remelted and cast into moulds so as to form 'bars' varying in weight from 25 to 56 lbs. each. In this state it usually contains a small admixture of arsenic, iron, lead, and sulphur; from the first of which it may be freed by exposure, for some time, under charcoal, at a dull red heat. It is best obtained in a pure condition by heating to redness, in a covered crucible, a mixture of oxide, or subnitrate of bismuth, with half its weight of charcoal.

Prop. Colour, grayish-white with a reddish tint; crystalline; very brittle (may be powdered); melts at about 480° Fahr., and does not re-solidify until cooled to 6 or 7° below this point; it volatilises at a strong heat, and, in close vessels, the fumes condense unchanged, in crystalline laminae; little acted on by the air, but when exposed to it at a high temperature burns with a faint blue flame, emitting yellow fumes which condense into a yellow pulverulent oxide; when slowly cooled, in large masses, it forms large cubic crystals, or octahedrons, of great beauty; nitric acid, somewhat dilute, dissolves it freely. It is highly diamagnetic. Sp. gr. 9.8 to 9.83, which, by careful hammering, may be increased to 9.8327. A bar of bismuth, when heated from 32° to 212°, expands exactly $\frac{1}{11}$ in length.

Uses, &c. Bismuth enters into the composition of STERROTYPE-METAL, SOLDER, FEWTER, FUSIBLE METALS, and several other alloys. Added to other metals it renders them more fusible. An alloy of *tin, nickel, bismuth*, and *silver*, is said to hinder iron from rusting. A

¹ Several of these tubes are usually set side by side together.

² Usually one to each eliquation-tube.

mixture of *bismuth, lead*, and *tin*, is much employed for taking impressions from dies, forming moulds, and for other purposes.

Bismuth salts are usually insoluble, or decomposed by any quantity of water into free acid, and a basic salt. They are nearly all colourless, and, except the chloride, more volatile. They are easily recognised by the following reactions:—

Their saturated or concentrated solutions giving a white precipitate on dilution with water:—Sulphuretted hydrogen blackens them, or gives a black precipitate:—The nitric solution is unaffected by the addition of sulphuric acid:—Chromate of potassium gives a yellow precipitate, which differs from that from lead, by being soluble in nitric acid, and insoluble in potassa.

Bismuth, Chlorides of:—

Basic Chloride. Bi_2Cl_3 . *Syn.* SUBCHLORIDE OF BISMUTH, PEARL-POWDER; BISMUTHI SUBCHLORIDUM, L. *Prep.* A dilute solution of hydrochloric acid, is dropped into another of bismuth (prepared by dissolving that metal in nitric acid); and the resulting precipitate, after being well washed in pure water, is dried in the shade.—*Prop., Uses, &c.* Similar to those of the subnitrate.

Chloride. BiCl_3 . *Syn.* TRICHLORIDE OF BISMUTH. *Prep.* A mixture of corrosive sublimate, 2 parts; bismuth, 1 part; (both in powder), is exposed to heat until all the 'mercury' present is expelled, after which it is at once put into bottles. A grayish-white, granular substance.

Bismuth, Nitrates of:—

Basic Nitrate. BiONO_3 . *Syn.* PEARL-WHITE, BISMUTH SUBNITRATE; BISMUTHI SUBNITRAS, BISMUTHI NITRAS, L.; BLANC DE FARD, B. D'ESPAGNE*, &c., Fr.; PERLWEISS, SCHMINKWEISS, &c., Ger. *Prep.* *Bismuth*, 1 oz.; *nitric acid*, 1½ fl. oz.; *distilled water*, 3 pints; mix 1 fl. oz. of the water with the acid, and dissolve the bismuth in the mixture; throw the solution into the remainder of the water, and, after repose, pour off the supernatant liquor, drain the powder that has subsided on a linen cloth, wash it with distilled water, and dry it with a gentle heat.

Prop. A pearly white, inodorous powder, insoluble in water, but freely soluble in nitric acid; long exposure to a strong light turns it grayish. When prepared from a neutral solution, it consists of very fine microscopic crystalline laminae; but when prepared from acid solutions, with less water, the crystals are acicular, and more silky and lustrous. When moistened it exhibits an acid reaction with litmus paper.

Pois., &c. Like the other salts of bismuth, it causes vomiting, purging, giddiness, cramp, insensibility, &c. No certain antidote is known. The treatment may consist of an emetic, followed by the copious use of emollient drinks, as weak broth, barley-water, milk-and-water, &c.; and subsequently, when necessary to

prevent inflammation, by a low diet and aperients.

Uses, &c. In *medicine*, as a sedative, an astringent, or tonic, and an antispasmodic, in chronic affections of the stomach unaccompanied by organic disease of that organ, and apparently of a nervous character; particularly in gastrodynia, troublesome sickness and vomiting, pyrosis or waterbrash, and generally in gastro-intestinal affections attended with fluxes; also in intermittent fever, spasmodic asthma, &c.—*Dose.* 5 to 10, or even 20 grs.

Externally, made into an ointment with 4 parts of lard, it has long been employed in certain chronic skin-diseases. Under the name of PEARL-WHITE it is commonly used by ladies as a cosmetic; but it is stated, that it injures the skin, producing, after a time, paralysis of its minute vessels, rendering it yellow and leather-like—an effect which, unfortunately, it is usually attempted to conceal by its freer and more frequent application. In very large doses it is poisonous.

Both the basic nitrate and the basic chloride of bismuth pass under the names of PEARL-WHITE and PEARL-POWDER, owing to their extreme whiteness and beauty. That of the druggists, however, is usually the former; that of the perfumers, usually the latter, but not unfrequently both.

Nitrate. $\text{Bi}(\text{NO}_3)_3$. *Syn.* NEUTRAL NITRATE, TERNITRATE. *Purified bismuth* (in small fragments), 2 oz.; *nitric acid*, 6 oz.; dissolve with heat, adding more acid, if necessary, to effect entire solution of the metal; to the resulting solution add half its volume of distilled water, filter through powdered glass, and evaporate until crystals form.

Use. Chiefly in chemistry, and as a source of the pure oxide and the subnitrate.

Bismuth Oxides:—

Bismuthous Oxide. Bi_2O_3 . *Syn.* TER-OXIDE OF BISMUTH, PROTOXIDE OF BISMUTH. From either the neutral or the basic nitrate, by exposure, in a crucible, to gentle ignition. Pure. A straw-yellow powder, of rather difficult solubility.

HYDRATED:—By gradually dropping an acid solution of bismuthous nitrate into a concentrated solution of potassium hydrate perfectly free from carbonic acid, and washing and drying the resulting precipitate. Pure. A rich-looking white powder.

Prop., &c. Fuses at a high temperature, and then acts as a powerful flux on siliceous matter without itself imparting-colour, a property of which the enameller and glider has long availed himself. Like the basic nitrate, it has been used as an antispasmodic, and as a cosmetic. Sp. gr. 8.211 to 8.355.

Bismuthic Oxide. Bi_2O_5 . *Syn.* BISMUTHIC ANHYDRIDE, BISMUTHIC ACID. Suspend teroxide of bismuth in a strong solution of potassa, and pass chlorine through the mixture until decomposition is complete; treat the powder with dilute nitric acid (to remove any unde-

composed teroxide), after which wash it in cold water, and dry it.

Prop., &c. A reddish powder, insoluble in water. Its salts, of which little are known, are called BISMUTHATES. When heated it loses oxygen, and a bismuthate of bismuth is formed.

Bismuthous Sulphide. Bi_2S_3 . This compound occurs native (BISMUTHINE), and may be easily prepared artificially by either fusing its elements together, or by passing sulphuretted hydrogen through a solution of nitrate of bismuth.

Bismuthous Valerianate. *Syn.* BISMUTHI VALERIANAS, L. *Prep.* An acid solution of nitrate of bismuth is decomposed with a solution of valerianate of soda in water containing a little free valerianic acid; the precipitate is carefully washed in distilled water, and dried in the shade. Recommended as superior to the subnitrate in some forms of gastrodynia, dyspepsia, intermittents, &c.—*Dose.* 2 to 6 grs., or more.

BISTRE (-ter). [Eng., Fr.] *Syn.* BISTER, Ger. *Prep.* 1. The most compact, best coloured, and well-burnt portions of the soot of beech-wood, or of peat,¹ are selected, reduced to powder, and sifted through a very fine lawn sieve. It is then digested in clear warm water for several hours, with frequent stirring; after which it is allowed to settle, when the liquid portion is decanted from the sediment. This process is repeated a second, and even a third time. The paste is next poured into a tall narrow vessel, which is then filled with pure cold water, and well agitated. The grosser parts only are now allowed to subside,² and the supernatant liquor, containing the finer portion of the BISTRE in suspension, is poured off into another vessel, where it is left to deposit its contents. The deposit is next collected, and carefully dried and powdered; or it is only partially dried, and at once made into cakes with gum-water, or isinglass-size, and then allowed to dry and harden for sale.

2. (Dr. MacCulloch.) The tar-like liquid obtained from the dry distillation of wood, is again carefully distilled until all volatile matter has passed over, and a brittle, pitch-like residuum is obtained, which is either brown or black according to the time and temperature employed; after which the heat is still further prolonged, but with increased care, until the brittle substance becomes pulverulent, and carbonaceous. It is then ground and elutriated with pure cold water, as before.

Uses, &c. As a water colour to tint drawings, in the same way as Indian ink, to which it is esteemed superior when the subjects are intended to be afterwards tinted with other colours. It occupies the same place among water colours that brown-pink does in oil.

According to Dr. MacCulloch, bistre from wood-tar, when carefully prepared, has great depth and beauty of colour, with all the fine

¹ The first is usually employed in England.

² Two or three minutes suffice for this purpose.

properties of sepia; but that if the whole of the oils and acids have not been removed by the process, it is apt to collect in little flocks, which interfere with its use.

BITES AND STINGS. *Syn.* MOR'SUS (-SUS, *sing.*) ET ICTUS (-TUS, *s.*), L. The treatment of the bites of non-venomous and non-rabid animals is the same as that of ordinary lacerated or punctured wounds, as the case may be; that of the bites and stings of venomous and rabid animals, serpents, insects, &c., often require, in addition, the use of special antidotes to destroy the virus, or to prevent its absorption, or to neutralise its effects when absorbed and to promote its elimination from the system.

The bites and stings of ANTS, BEES, WASPS, HORNETS, and similar insects common to this climate, may be treated by washing the part with spirit of hartshorn or dilute liquor of ammonia, or eau de luce, or a weak solution of chloride of lime. Should considerable inflammation ensue, and the part become much swollen, a thing that rarely occurs, leeches may be applied, and a cooling purgative given. The stings of venomous reptiles may be similarly treated, excepting that the strength of the solutions of ammonia, chloride of lime, &c., should be stronger than in the former case, so as to produce some pain and smarting. In cases where the venom is of a very poisonous description, the wound should be first well washed with water of ammonia, and afterwards seared with lunar caustic in every part, including the interior and deep-seated portions. In extreme cases, the surface of the wound, both internal and external, may be removed with the knife; or, in the case of a small joint, as a finger, the injured portion may be amputated. Prior to the use of the washes or caustic, dry-cupping or suction with the mouth may be had recourse to with great advantage. A ligature placed on the limb, above the wound, as soon as possible after the accident, will impede the absorption of the poison whilst the other treatment is in progress. A similar plan may be followed after the bite of a dog supposed to be mad. It has, indeed, been lately asserted by one of our most celebrated veterinarians, that he and his colleagues have been repeatedly bitten by dogs that have afterwards been proved to be mad, but from having fearlessly applied caustic to the parts, they have escaped uninjured.

The poison inserted by the stings and bites of several venomous reptiles is so rapidly absorbed, and of so fatal a description, as frequently to occasion death within a very short space of time, and before any remedy or antidote, under ordinary circumstances, can be applied. But even in these extreme cases it is probable that absorption, and consequently the rapidity of the action of the poison, might be considerably impeded or lessened by the immediate application of a ligature above the part, as before described, the patient accom-

panying the treatment by swallowing a large quantity of liquid, by which partial plethora would be produced, and the functions of the absorbents for a time nearly suspended. A few minutes, thus gained, would permit of the application of appropriate antidotes, by which the poison might be neutralised before it would become necessary to remove the ligature, whilst the kidneys would be in full action. Unfortunately, these wounds are generally inflicted in parts of the world where precautionary measures are seldom thought of, and generally at times when people are least prepared to meet them, as well as so suddenly and unexpectedly as to stagger even those observers who may be in no absolute danger themselves. Such is the bite of the East Indian COBRA DI CAPELLO, against which two Asiatic (arsenical) pills are often prescribed by the Hindoos; but which are generally scarcely swallowed before the poison of the serpent has rendered the patient a stiffened corpse. Eau de luce, a favorite remedy in India, when liberally employed both internally and externally, is said to prove sometimes more successful. The bite of the PUFF-ADDER is well treated, or even a more fatal description made.—Part of the cobra. When the venom of any of these animals, or of a rabid dog, is once absorbed into the system, there appears to be no treatment that can save the patient. A bottle of Madeira wine, or $\frac{1}{2}$ a pint of brandy or rum diluted with twice its weight of water, drank in two doses, about 3 or 4 minutes apart, is a popular remedy in India in such cases. Its effect is to impede absorption.

The secret antidote so long successfully employed by Mr. Underwood, the 'snake-king' of Australia, for the bites of the WHIP-SNAKE and the DIAMOND-SNAKE, two of the most venomous of that region, is now positively asserted to be the common male fern (*polygodium filix mas*, Linn.). Of the powdered root, or preferably, of the green leaves of this plant nearest the root, he prepares a sort of decoction, or broth, which he takes or administers liberally. A more convenient preparation would, perhaps, be a tincture prepared by digesting 1 oz. of the dried, or 3 oz. of the fresh leaves, (bruised,) in a pint of proof spirit or strong brandy or rum, for a fortnight; as in this state it could be kept for any length of time, if well-corked, without deterioration. [See HYDROPHOBIA, POISONS, SNAKE-BITES, STINGS, VENOM, WOUNDS, &c.]

BITTER. [Eng., Ger.] *Syn.* AMA'RUS, L.; AMER, Fr. Tasting like wormwood, quassia, or other similar vegetables; *subst.*, a bitter plant, bark, or root (= AMA'RUM, L.; see below).

Bitter Apple. Colocynth.

Bitter Cup. A cup or tumbler formed by

¹ Notices of several chemical and neurotic antidotes, of great promise, will also be found in different parts of this volume. The names of the respective animals may likewise be referred to.

the turner out of *quassia wood*. Liquor, by standing in it a short time, becomes bitter and stomachic. They are now common in the shops.

Bitter Earth*. Magnesia.

Bitter Herbs. See BITTERS (*infra*) and SPECIES (Bitter).

Bitter Salt†, *Bitter Pur'ging-salt*. Sulphate of magnesia.

Bitter-sweet. Woody nightshade.

Bitt'er-wort‡ (-wür). Gentian.

BITTERN. The 'mother-water' or 'bitter liquor' of salt-works from which the chloride of sodium (sea-salt) has been separated by crystallisation.

Bittern. An intoxicating poisonous mixture sold by the brewers' druggists, composed of 1 part each of *extract of quassia* and *powdered sulphate of iron*, with 2 parts of *extract of cocculus indicus*, 4 parts of *Spanish liquorice*, and about 8 parts of *treacle*; the liquorice being first boiled with a little water until dissolved, and the solution evaporated to a proper consistence before adding the other ingredients. *Used* by fraudulent brewers and publicans to impart a false bitter and apparent strength to their liquors.

BITTERS (-ërz). *Syn.* AMA'RA, &c., L. Vegetable bitters are commonly regarded as tonic and stomachic, and to improve the appetite when taken occasionally, and in moderation. The best time is early in the morning, or half an hour or an hour before a meal. An excessive, or a too prolonged use of them, tends to weaken the stomach, and to induce nervousness. They should not be taken for a longer period than about 8 or 10 days at a time, allowing a similar period to elapse before again having recourse to them.

Among the most useful and generally employed bitters are—*calumba*, *cascarilla*, *chamomiles*, *gentian*, *hops*, *orange peel*, *quassia*, and *wormwood*.

Bitters. In the liquor-trade, a compound prepared by steeping vegetable bitters, and some aromatics as flavouring, in weak spirit, for some 8 or 10 days; a little sugar or syrup being subsequently added to the strained or decanted tincture. In that of the taverns and gin-shops the menstruum is usually gin, or plain spirit reduced to a corresponding strength. BRANDY-BITTERS and WINE-BITTERS are prepared in a similar way with common British brandy, or some cheap white wine (Cape or raisin), as the case may be. Each maker has usually his own formulæ, which he modifies to suit the price, and the palate of his customer.—This class of liquors has been justly charged with being the fertile cause of habitual intemperance, of disease, and even of death! Their occasional use as tonics, or stomachics is also objectionable, owing to the trash, and even deleterious substances, which so frequently enter into their composition. See LIQUEURS.

BITUMEN. [Eng., L.] *Syn.* BITUME, Fr.;

ERDPECH, ERTHEER, &c., Ger. A term of a very comprehensive character, and, in general, very loosely applied, including a variety of inflammable mineral substances, of which *asphaltum*, *naphtha*, and *petroleum*, may be mentioned as examples. The solid bitumens are now extensively employed in the manufacture of *bituminous mastic* or *cement* and similar compositions, which are used for the lining of water-cisterns, and for various other hydraulic purposes; as also for roofs, floors, pavements, &c. For the last purpose, the native varieties of 'asphaltic rock,' consisting of a mixture of bitumen and calcareous earth, when tempered with a proper quantity of crushed granite, or calcareous sand or gravel, is found to be the most substantial and durable. The plan followed in laying down such pavements in Paris, where they have been the most extensively adopted, is—The ground having been made uniformly smooth, is edged, in the usual manner, with curb-stones rising about 4 inches above its level, and then covered, to the depth of 3 inches, with concrete (made with about 1-6th part of good hydraulic lime), which is well pressed upon its bed, the surface being subsequently smoothed over with a very thin coating of hydraulic mortar. On this, when perfectly dry,¹ the 'bituminous mastic,' rendered semi-fluid by being cautiously heated in a suitable iron cauldron,² is evenly spread over so as to form a layer three quarters of an inch, or for less solid work, half an inch thick. Some coarse sand is lastly sifted over and pressed down on the surface, when the work is complete; and in a few days the pavement becomes sufficiently compact and solid to be thrown open to foot passengers.

The asphalt-bitumen mine of the Val de Travers, in the Canton of Neuchâtel, is said to be the richest and most extensive in the world of its particular class. The calcareous bitumen which it yields contains 20% of nearly pure bitumen, and 80% of carbonate of lime; and it has a sp. gr. (2.115) approaching that of ordinary bricks.

The 'Val de Travers Company,' and the 'Bastenne and Gaujac Company,' are those who have hitherto been the most successful in laying down asphalt-pavements. See ASPHALTUM, PETROLEUM, &c.

Bitumen, Elastic. *Syn.* MIN'ERAL CAOUTCHOUC (kōō'-chōōk), ELASTERITE. A rather rare species of bitumen, differing chiefly from the other solid varieties in being elastic.

Bitumen, Liquid. Petroleum.

¹ On this point depends the success of the work. Absolute dryness is a sine qua non in the process. The mastic must also be laid down in dry weather. If laid in wet, damp, or even foggy weather, it will be liable to separate from its bed, and gradually to break up. This is why so much of the asphalt and bituminous pavement laid down in London, has proved a failure.

² It is here that the mixture of the bitumen (previously crushed sufficiently small to pass through means 10 to the inch) is made with the sand or gravel, a small portion of mineral tar or coal-tar (3 to 7 or 8%) being commonly added to promote their fusion and complete union.

BITUMINOUS. *Syn.* BITUMINOSUS, L.; BITUMINEUX, Fr.; ERDPECHIG, Ger. Of bitumen, or resembling or containing it.

BIXEINE (-e-in). The red colouring-principle of annotta. It is obtained by treating bixine with liquid ammonia, with subsequent free contact of air.

Prop., &c. When pure, a rich deep-red powder, soluble in alcohol and in alkalies, and turned blue by sulphuric acid. It appears to be oxidised bixine.

BIXINE (-in). The yellow colouring-principle of annotta.

Prep. A solution of annotta is precipitated with a solution of acetate of lead; the precipitate, after having been washed in cold water, is decomposed by sulphuretted hydrogen; the decanted liquor or filtrate yields crystals by cautious evaporation.

Prop., &c. Yellowish white, turning full yellow by exposure to air; soluble in water, and freely so in alcohol and in alkaline solutions; by oxidation it is converted into bixine. For a correct knowledge of both of these substances we are indebted to M. Preisser.

BLACK. *Syn.* A'TER,¹ N'GER, L.; NOIR, Fr.; SCHWARZ, Ger.; BLAC, BLEC, Sax. In dyeing, &c., of the colour of lamp-soot, or of night; *subst.*, a black colour.

Black Ash. The waste lye of the soapmakers is evaporated in large iron boilers, the salt separated as it falls down, and then heated in a reverberatory furnace until it is partially decomposed and fused, when it is run into iron pots to cool. It is used in the manufacture of alum and common soap.

Black Colours (kül'). See BLACK PIGMENTS.

Black Draught. See SENNA MIXTURE (Compound).

Black Drop. See DROPS, PATENT MEDICINES, &c.

BLACK DYE. *Syn.* TEINTE NOIRE, Fr.; SCHWARZE FARBE, Ger. The following are the processes and materials now commonly employed in dyeing black:—

a. For COTTON:—

1. The goods, previously dyed blue, are steeped for about 24 hours in a decoction of gall-nuts or sumach, then drained, rinsed in water, and passed through a bath of acetate of iron for a quarter of an hour; they are next again rinsed in water, and exposed for some time to the air; after which they are passed a second time through the bath, to which a little more iron-liquor is previously added. The whole process is repeated, if necessary, according to the intensity of the shade of black desired.

2. The goods are steeped in a mordant of acetate of iron, worked well, and then passed through a bath of madder and logwood for 2 hours. Less permanent than No. 1.

¹ Black, deep black; as opposed to *albus*, white.

Obs. About 2 oz. of coarsely powdered galls, or 4 oz. of sumach, are required for every pound of cotton, in the process of galling. The first should be boiled in the water, in the proportion of about $\frac{1}{2}$ gal. of water to every lb. of cotton. The sumach-bath is better made by mere infusion of that dyestuff in very hot water.

3. (For 10 lbs. of cloth.) The goods are put into a boiling bath made of 3 lbs. of sumach, and allowed to steep, with occasional 'working,' until the liquor is perfectly cold; they are next passed through lime water, and, after having drained for a few minutes, immediately transferred to and worked for an hour in a warm solution of 2 lbs. of copperas; after free exposure to the air, for about an hour, they are again passed through lime water, and, after draining, 'worked' for an hour in a bath made with 3 lbs. of logwood, and 1 lb. of fustic; they are then 'lifted,' and $\frac{1}{2}$ lb. of copperas being added, they are returned to the bath, 'worked' well for about 30 minutes, and finished. Good and deep.

Obs. Instead of copperas iron-liquor may be used, observing to take $1\frac{1}{2}$ pint of the latter (of the ordinary strength) for every lb. of the former ordered above.

b. For FLAX and LINEN:—

This, for the most part, closely resembles that employed for cotton; but, in some cases, a mordant of iron-liquor, or of copperas, followed by passing the goods through lime-water, and exposure to the air, precedes the dye-bath.

c. For SILK:—

Silk goods are dyed much in the same way as woollens, but the process is conducted with less heat:—

1. A bath of nut-galls is given for 12 to 36 hours, occasionally working the goods therein; they are next taken out, rinsed, and well aired, after which they are passed for a few minutes through a bath containing sulphate of iron, and are then again drained, rinsed, and aired. The steep in the nut-gall bath may be repeated, if necessary, followed, as before, by the iron-bath previously replenished with a little fresh copperas. The whole quantity of galls to be taken for 1 lb. of silk, varies with their quality from $\frac{1}{2}$ to $\frac{3}{4}$ lb., that of the copperas (for the first bath), from 3 to 4 oz.

2. (For 1 cwt. of silk.) Boil 22 lbs. of bruised Aleppo-galls, for 2 hours, in 90 to 100 galls. of water, observing to add boiling water from time to time, to compensate for that lost by evaporation; to the clear bath add 32 lbs. of copperas, 7 lbs. of iron- filings, and 21 lbs. of gum; digest with agitation, for 1 hour, and when the ingredients are dissolved, pass the silk (previously prepared ['galled'] with $\frac{1}{3}$ rd of its weight of gall-nuts) through the bath for about an hour; then rinse and air it well; next leave it in the dye-bath for 6 to 12 hours; and this immersion or steep may be repeated, if

necessary, at will. This is said to be the process commonly adopted for velvet at Genoa and Tours.

3. (For 5 lbs. of silk.) Turn the goods for an hour through a mordant formed of 1 lb. of copperas and 2 oz. of nitrate of iron (dyer's), with sufficient water; after rinsing in cold water, and airing them, 'work' them, for an hour, in a decoction made of 5 lbs. of logwood and 1 lb. of fustic; then lift them from the bath, add 2 oz. of copperas, re-immerses, and 'work' them well for 10 or 15 minutes longer; lastly, rinse, air, and finish. A full deep black.

4. (For 5 lbs.) For the mordant use $\frac{1}{2}$ lb. of copperas; rinse, and air; for the 'dye-bath,' a decoction of 4 lbs. of logwood to which $\frac{1}{2}$ pint of stale urine has been added; after 'lifting' the goods add 2 oz. more of copperas to the bath, and work for 15 minutes, as before. A good black. By adding 2 oz. of dyer's nitrate of iron to the mordant the same ingredients will give a deep black; and by substituting a little white soap for the urine, and omitting the addition of copperas to the logwood-bath, it will give a blue-black. The last may also be produced by first dyeing the goods deep blue as with 'prussiate,' and omitting the urine and soap, in which case one half only of the logwood will be required.

d. For Wool:—

To produce a good permanent black on wool, or woollen goods, they must be first dyed of a deep blue in the indigo-vat, or, more cheaply, by the Prussian-blue process. When the goods are coarse or common, and price is an object, they are generally 'rooted' instead of being 'blued.' This consists in giving them a dun or brown colour with the husks of walnuts, or the roots of the walnut-tree, or with other like cheap astringent substances.

1. (For 1 cwt. of wool.) Good logwood-chips, 20 lbs., and Aleppo-galls, 18 lbs.; are inclosed in a coarse bag, and boiled with water, q. s., for 5 or 6 hours; $\frac{1}{3}$ rd of this decoction is then transferred into another copper, with verdigris, 2 lbs., and a sufficient quantity of water having been added, the goods (previously dyed dark blue) are passed through the liquor for two hours, at a heat slightly below the boiling-point. The goods are next lifted and drained, another $\frac{1}{3}$ rd of the decoction of logwood and galls, with copperas, 9 lbs., added to the boiler, after which the fire is lowered, and as soon as the copperas is dissolved, the cloth is returned to the bath, and again well 'worked' for at least an hour. It is then taken out, thoroughly aired, and the remaining $\frac{1}{3}$ rd of the decoction added, with sumach, 20 lbs. The whole is then brought to a boil, and sulphate of iron, 2 lbs., together with a pailful of cold water, thrown in; after which the goods are put in a third time, and 'worked' for one hour; they are then taken out, rinsed, aired, and again passed through the bath for another hour. After being thoroughly rinsed, the goods are at once either 'fulled,' dried, and folded, or

are further softened and beautified by passing them for 15 minutes through a hot weld-bath (not boiling), when they are rinsed, &c. (but not 'fulled'), as before. A beautiful though expensive dye. With management, the above quantities of the ingredients will dye $1\frac{1}{4}$ or even $1\frac{1}{2}$ cwt. of wool.

2. (For 1 cwt.) The cloth (previously dyed blue) is 'galled' with 5 lbs. of nut-galls, and then dyed in a bath made with 30 lbs. of logwood, to which about 5 lbs. of copperas has been added; after which it is rinsed, aired, and 'fulled,' as before. This is said, by Lewis, to be the usual proportions and plan adopted by the English dyers.

3. (For 1 cwt.) Make a bath, as before, with fustic, 2 lbs.; logwood, 5 lbs.; and sumach, 10 lbs.; work the (blued) cloth for 3 hours at the boiling heat, or near it; lift it out, add sulphate of iron, $10\frac{1}{2}$ lbs., and when dissolved, pass the cloth through it for 2 hours; rinse, air well, and again pass the goods through the bath for an hour; lastly, rinse until the water runs clear. Inferior to the last, but less expensive.

4. (For 1 cwt., without previous blueing or 'rooting.')—a. Work the goods, at about 200° Fahr., for 1 hour, in a bath made with 6 to 7 lbs. of camwood; lift, add $6\frac{1}{2}$ lbs. of copperas, and again work the goods for an hour, after which withdraw the fire, and allow them to steep for 10 or 12 hours; next drain and rinse them, and work them in a second bath made with 60 lbs. of logwood for $1\frac{1}{2}$ hour; lift, add 3 lbs. of copperas, and again work for an hour; lastly, rinse, air, and finish:—b. The goods are first worked, for about two hours, in a bath of 3 lbs. of fustic, in which 5 lbs. of bichromate of potash and 4 lbs. of alum have been dissolved; after exposure to the air for about an hour, and thorough rinsing, they are worked for a second two hours in a bath made with 45 lbs. of logwood, $3\frac{1}{2}$ lbs. of barwood or camwood, and 3 lbs. of fustic; they are then lifted, and 3 lbs. of copperas having been added to the bath, are again immersed and worked for half an hour to an hour.

5. (For 10 lbs. of wool or w.-cloth.) Work the goods for $\frac{1}{2}$ an hour in a bath of $\frac{1}{2}$ lb. of camwood; lift, add 7 or 8 oz. of copperas, and after working them for 20 minutes, withdraw the fire, and leave them in the liquor for 10 or 12 hours; next rinse them in cold water, drain, and then work them for an hour in a bath made with 5 lbs. of logwood, to which 1 pint of urine has been added; lift, add 4 oz. of copperas, work them for half an hour longer, and, lastly, wash and dry them.

6. (For 7 lbs.) Take of galls (bruised), $\frac{1}{2}$ lb.; logwood chips, $1\frac{1}{2}$ lb.; for the bath; boil or work the goods for 2 hours, take them out, add of copperas, $\frac{1}{2}$ lb.; and when it is dissolved, work the goods through the liquor for at least 2 hours, keeping the bath nearly boiling; again take them out, wash, and air; then add 1 oz. more of copperas to the bath, and pass

the cloth through it for another hour; lastly air, rinse, and finish.

7. (For 5 *lbs.*) For the first bath—bichromate of potash, 8 *oz.*; alum, 6 *oz.*; fustic, 4 *oz.*; for the second bath—logwood, 4 *lbs.*; barwood and fustic, of each, 4 *oz.*; to which add, after the lift, copperas, 4 *oz.*; the process being conducted as in 4, 5. This, as well as the two formulæ immediately preceding it, is particularly suited to articles of dress dyed in the small way, at home. When the articles are only re-dipped, as it is called, a proportionately smaller quantity of the ingredients may be taken.

Concluding remarks. In dyeing black, particularly on wool, it is absolutely necessary to take the goods out of the dye-bath several times, and to expose them to the air. This is called "airing" them, and is done to allow the oxygen of the atmosphere to act upon the ingredients of the dye, and especially on the iron; as without this action of the air a good colour cannot be produced. The usual proportions employed by the dyers of England are 5 *lbs.* each of galls and copperas, and 30 *lbs.* of logwood, for every *cwt.* of cloth; but these weights are frequently increased for choice goods, just as they are always lessened for common ones. The other astringent substances used as substitutes for galls in dyeing black, are taken in quantities proportionate to their respective strengths, that of good Aleppo gall-nuts being referred to as a standard.

The German wool-dyers usually commence their process with a mordant of Salzburch vitriol (3 parts) and argol (1 part); and after exposure of the goods, in a cool place, for 24 hours, work them in a bath of logwood (5 to 6 p.) and fustic (2 p.); after which the bath is restored by the addition of verdigris ($\frac{1}{2}$ p.) dissolved in vinegar and the goods again worked through it for about $\frac{1}{2}$ an hour. This is for 20 parts weight of wool or cloth.

Black marinos are usually mordanted (hot) with about $\frac{1}{10}$ th of their weight of copperas, and then aired for 24 hours; after which they are dyed in a boiling bath made with about $\frac{1}{2}$ their weight of logwood with the addition of about 2% of argol or tartar.

As black is the shade most commonly attempted by amateur dyers, it may be here necessary to call their attention to what is said on mixed fabrics in our article on DYEING; since an inattention to this point will inevitably cause the failure of their efforts.

According to Muspratt, a mixed fabric of silk and woollen may be dyed black, by one process, as follows:—Work the goods an hour in a solution of 8 *oz.* each of tartar and copperas, and wash out; work for 15 minutes in a decoction of 4 *lbs.* of logwood; lift, add 1 *oz.* of bichromate of potash, work for $\frac{1}{2}$ an hour, and dry. And a mixed fabric of cotton, silk, and woollen:—Steep for six hours in a bath made of 2 *lbs.* of sumach; then work for an hour in a solution of 6 *oz.* each of tartar, sul-

phate of copper, and copperas; wash, and work $\frac{1}{2}$ an hour in a decoction of 4 *lbs.* of logwood; lift, add to the bath 1 *oz.* of copperas; work ten minutes, wash, and dry. If a very deep black be required, 1 *lb.* of bark is to be added with the logwood. See DYEING, MORDANTS, &c.

BLACK LEAD (léd). See PLUMBAGO.

BLACK PIGMENTS. *Syn.* PIGMENTA NIGRA, L. The principal black pigments of commerce are obtained by carbonising organic substances (particularly bones), by exposure to a dull red heat, in covered vessels out of contact with the air; or by collecting the soot formed during the combustion of unctuous, resinous, and bituminous matters. Artists and amateurs also prepare, on the small scale, a variety of blacks, many of which are not procurable at the colour-shops. This they effect either by the carbonisation of substances not usually employed for the purpose, or by simply reducing to powder certain mineral productions selected on account of the peculiar shades of colour which they respectively possess. Some of the last might, however, be more appropriately classed with browns. The following list embraces most of these articles:—

Animal-Black. Bone-black.

Beech'-Black. Carbonised beech-wood.

Blue'-Black. Vine-twigs dried and then carefully carbonised, in covered vessels, until of the proper shade. That of the ancients was made of wine-lees. Pit-coal, carefully burnt at a white heat, then quenched in water, dried, and well ground, forms a cheap, good, and durable blue-black, fit for most ordinary purposes. See FRANKFORT-BLACK.

Bone'-Black. *Syn.* IVORY-BLACK (of commerce); CARBO OSSIS, OS USTUM NIGRUM, E'BUR U. N. (yena'le), &c., L.; NOIR D'OS, &c., Fr.; KNOCHENSCHWARTZ, &c., Ger. Carbonised bones reduced to powder. That of commerce is usually the residuum of the distillation of bone-spirit. Inferior to true ivory-black; having a slight, but peculiar reddish tinge, from which the latter is quite free. Besides its use as a pigment, it is extensively employed in making blacking, as a material for the moulds of foundries, as a clarifier and bleacher of liquids, &c. See IVORY-BLACK and ANIMAL CHARCOAL.

Cas'sel-Black; Cologne'-Black. Ivory-black. **Coal'-Black.** See BLUE-BLACK and NEWCASTLE-BLACK.

Composit'ion-Black (-zish'-ün-). The selected portion of the residuum of the process of making prussiate of potash from blood and hoofs.—Used both as a pigment, and to de-colour organic solutions, which it does better than bone-black.

Cork'-Black. Spanish-black.

Flo'rey-Black, FLOREÉ D'INDE. The dried scum of the dyer's wood-bath. A superior blue-black.

Frankfort-Black, NOIR DE FRANCKFORT. From vine-twigs dried, carbonised to a full

black, and then ground very fine. An excellent black pigment; also used by the copper-plate printers to make their ink. See BLUE-BLACK.

Harts'horn-Black. Resembles ivory-black, which is now usually sold for it. It was formerly prepared by carbonising the residuum of the distillation of spirit of hartshorn.

I'vory-Black. *Syn.* CAËBO EB'ORIS, E'BUE US'TUM NI'GRUM, L.; NOIR D'IVOIRE, &c., Fr.; ELFFENBEINSCHWARTZ, KOHLE VON ELFFENBEIN, Ger. From waste fragments and turnings of ivory, by careful exposure in covered crucibles, avoiding excess of heat or over-burning. The whole having been allowed to become quite cold, the crucibles are opened and their contents reduced to fine powder. For the first quality only the richest coloured portion of the charcoal is selected, and this, after being powdered, is ground with water on porphyry, washed on a filter with warm water, and then dried. A very rich and beautiful black. It is brighter than even peach-stone black, and is quite free from the reddish tinge of bone-black. With white-lead it forms a rich pearl-gray. See BONE-BLACK.

Jamaica-Black (-mā'-). Sugar-black.

Lamp-Black. *Syn.* FUL'IGO LUCER'NÆ, F. P'INEA, &c., L.; NOIR DE FUMÉE, &c., Fr.; KIENBUSS, &c., Ger. *Prep.* 1. (On the small scale.) A conical funnel of tin-plate furnished with a small pipe to convey the fumes from the apartment, is suspended over a lamp fed with oil, tallow, coal-tar, or crude naphtha, the wick being large and so arranged as to burn with a full smoky flame. Large spongy, mushroom-like concretions of an exceedingly light, very black, carbonaceous matter, gradually form at the summit of the cone, and must be collected from time to time. The funnel should be united to the smoke-pipe by means of wire, and no solder should be used for the joints of either.

2. (*Commercial.*) On the large scale, lamp-black is now generally made by burning bone-oil (previously freed from its ammonia), or common coal-tar, and receiving the smoke in a suitable chamber. In the patented process of Messrs. Martin and Grafton, the coal-tar is violently agitated with lime-water until the two are well mixed, after which it is allowed to subside, and the lime-water having been drawn off, the tar is washed several times with hot water. After subsidence and decantation, it is put into stills, and rectified. The crude naphtha in the receiver is then put into a long cast-iron tube furnished with numerous large burners, underneath which is a furnace to heat the pipe to nearly the boiling-point. Over each burner is a sort of funnel which goes into a cast-iron pipe or main, which thus receives the smoke from all the burners. From this main the smoke is conveyed by large pipes to a succession of boxes or chambers, and thence into a series of large canvas bags arranged side by side, and connected together at top and

bottom alternately. Fifty to eighty of these 'bags' are employed; the last one being left open to admit of the escape of the smoke, which has thus been made to traverse a space of about 400 yards. As soon as the bags contain any considerable quantity of black, they are removed and emptied. The black deposited in the last bag is the finest and best, and it becomes progressively coarser as it approaches the furnace.

Obs. The state of minute division in which the carbon exists in good lamp-black is such as cannot be given to any other matter, not even by grinding it on porphyry, or by 'elutriation' or 'washing over' with water. On this account it goes a great way in every kind of painting. It may be rendered drier and less oily by gentle calcination in close vessels, when it is called burnt lamp-black, and may then be used as a water-colour; or its greasiness may be removed by the alkali-treatment, noticed under Indian ink. It is the basis of Indian ink, printer's ink, and most black paints.

Russian Lamp-black is the soot produced by burning the chips of resinous deal. It is objectionable chiefly from being liable to take fire spontaneously when left for some time moistened with oil.

Manganese-Black (-nēze'-). Native *binoxide of manganese*. Durable and dries well.

Newcastle-Black. From the richer-looking varieties of pit-coal by grinding, and elutriation. Brown black or, in thin layers, deep brown. It is, perhaps, "the most useful brown the artist can place on his palette; being remarkably clear, not so warm as Vandyke-brown, and serving as a shadow for blues, reds, and yellows, when glazed over them. It seems almost certain that Titian made large use of this material." See BLUE-BLACK (*antè*).

Opor-to-Black. Carbonised wine-lees.

Par'is-Black, NOIR DE PARIS. From turner's bone-dust, treated as for ivory-black. Works well both in oil and water. It is commonly sold for real ivory-black, and for burnt lamp-black.

Peach-stone Black. From the stones or kernels of peaches, cherries, and other similar fruits, treated as for ivory-black. A bright, rich black; works well with oil; with white-lead and oil it makes old gray.

Pit'coal Black. Newcastle-black.

Prus'sian-Black. (prüsl'-än). Composition-black.

Rice-Black. Rice-charcoal. Inferior.

Rus'sian Black. See LAMP-BLACK.

Soot-Black (sōt'-). The soot of coal-fires, ground, and sifted. Used in common paint, and to colour whitewash; with Venetian-red and oil, it makes chocolate-colour; also used to make gray mortar.

Spanish Black. From cork-cuttings carbonised, as bone-black. Resembles Frankfort-black, but works softer.

Sugar-Black (shōōg'-). Carbonised moist sugar. Has little body, but for washing

drawings is equal in mellowness to Indian ink and bistre.

Sun'derland Black. Newcastle-black.

Turn'er's Black. Paris-black.

Vine'-twig Black. Frankfort-black.

Wheat'-Black (hwête'-). Carbonised wheat.

It has a good colour, a full body, and dries hard and quickly with oil.

BLACK'BERRY. The popular name of *ru'bus fructico'sus* (Linn.) or the common 'bramble.' *Fruit* (BLACK'BERRIES; MÛRES DE RONCE, Fr.), antiscorbutic and wholesome, but in excess apt to sicken; twigs, used in dyeing black; root, astringent, formerly used in hooping-cough.

American Blackberry. The *ru'bus villo'sus* (Ait.). Root, astringent and tonic; official in the Ph. U. S.

BLACKING. *Syn.* CIRAGE (des bottes), NOIR (pour les souliers), Fr.; SCHWÄRZE, SCHUHESCHWÄRZE, Ger. An article too well known to require description.

Hist., &c. Blacking, and other polishes for leather, were undoubtedly in common use among the ancients; but the compound to which we now more particularly apply the name is of comparatively modern invention. The latter appears to have been first introduced into England from Paris, during the reign of Chas. II, but was not in common use among the masses of our population much before the middle of the 18th century.

The general and still increasing use of blacking as a polish for boots and shoes by all classes of the inhabitants of civilised countries, has given an extent and importance to its manufacture which a stranger to the subject would scarcely be led to suspect. The princely establishments of some of the firms who compound this sable article, cannot fail to have arrested the attention of the passenger through the streets of this great metropolis; whilst the enormous fortune acquired by one of their late members, and, for the most part, bequeathed by him for purposes of charity and philanthropy, has invested both the donor and his craft with an interest and notoriety which they did not previously possess. At the present time, the consumption of blacking is greater than at any former period; and of this, as of many other articles, England is the principal manufactory for the world, alike distinguished for the extent of her trade and the excellent quality of this product of her industry. In truth, England excels all other nations in the manufacture of common shoe-blackening; and, perhaps, in no other country is an equal attention paid to the cleanliness and appearance of the external clothing of the feet.

Prep. I. LIQUID BLACKING:—

1. Take of bone-black, 16 parts; treacle, 12 parts; oil of vitriol, 3 parts; sperm oil,¹ 2

¹ Sperm oil is commonly regarded as the best for blackening; but pale seal oil is thought by some to be quite as good. The cod-liver oil of the curriers, if clear, is less ex-

parts; gum-arabic, 1 part; strong vinegar, or sour beer, 48 to 50 parts;² (all by weight;) place the bone-black in a capacious wooden, stone-ware, or enamelled iron vessel,³ add the oil, and rub them well together; next gradually add the treacle, and actively and patiently grind or rub the mass, after each addition, until the oil is perfectly killed, and finally for some time afterwards, to ensure complete admixture; then cautiously dilute the vitriol with about three times its bulk of water, and add it, in separate portions, to the former mixture, observing to stir the whole together, as rapidly as possible, on each addition of the acid, and for some minutes after the whole is added, so as to render the mass thoroughly smooth and homogeneous; let it stand, covered over, for two or three days, or longer, stirring it, in the mean time, for 15 or 20 minutes daily; lastly, having dissolved the gum in the vinegar, add the solution gradually to the rest, and stir the whole together briskly for some time, and again daily for 3 or 4 days. It may be further diluted, at will, with a little more vinegar or beer, or with water; but unnecessary or excessive dilution should be avoided, as the richness and quality of the blacking become proportionately reduced. If all the ingredients (except the vitriol) be made hot before admixture, the shining quality of the product will be greatly improved, and the process may be shortened.⁴

2. Ivory-black, 16 parts; treacle, 8 parts; oil of vitriol, 4 parts; (diluted with) water, 2 parts; oil, 2 parts; gum-arabic, 1 part; soft water (for the final dilution, instead of vinegar), 64 parts; mixed, &c., as before. Excellent.

3. As the last; but taking only 6 parts of treacle, 1 part of oil, and omitting the gum-arabic. Good. A commoner article of liquid blacking does not sell.

4. (Bryant and James's INDIA-RUBBER LIQUID BLACKING.—*Patent* dated 1836.) Take of India rubber (in small pieces), 18 oz.; hot rape oil, 9 lbs. (say 1 gal.); dissolve; to the solution add of ivory-black (in very fine powder), 60 lbs.; treacle, 45 lbs.; mix thoroughly; further add of gum-arabic, 1 lb., dissolved in vinegar (No. 24), 20 galls.; reduce the whole to a perfect state of smoothness and admixture by trituration in a paint-mill; throw the compound into a wooden vessel, and add, very gradually, of sulphuric acid, 12 lbs.; continue the stirring for $\frac{1}{2}$ an hour, repeating it daily for 14 days; then add of gum-arabic (in fine

pensive, and probably better than either of them. Common olive oil, and refined rape oil, are, however, those most generally used by the blacking-makers.

² That is, 3 to 3 $\frac{1}{2}$ times the weight of the ivory-black.

³ Metallic vessels must be avoided.

⁴ By taking the 'parts' ordered in this and the other formulæ as so many $\frac{1}{2}$ lbs., lbs., $\frac{1}{2}$ cwt., or cwt., the proportions of each ingredient for any quantity of blacking, from a $\frac{1}{2}$ of a lb., or a $\frac{1}{2}$ pint, up to 2 tons, or nearly 450 galls., will be at once seen; and so on of even larger quantities. See Concluding Remarks (*infra*).

powder), 3 *lbs.*;¹ again mix well, and repeat the stirring for $\frac{1}{2}$ an hour daily for 14 days longer, when the liquid blacking will be ready for use, or for bottling. The quality is very excellent; but this, probably, does not depend on the presence of the India rubber, but on the general correctness of the proportions, and the care and completeness with which they are mixed.

5. (*Without Vitriol.*) Take of ivory-black (in very fine powder), 2 *lbs.*; treacle, 1 $\frac{1}{2}$ *lb.*; sperm oil, $\frac{1}{2}$ pint; mix, as before; then add of gum-arabic, 1 *oz.*; (dissolved in) strong vinegar, $\frac{1}{2}$ pint; mix well; the next day further add of good vinegar, or strong sour beer, 3 to 4 pints (or *q. s.*); stir briskly for a $\frac{1}{4}$ of an hour, and again once a day for a week. Excellent. A cheaper, but inferior article, may be made by the reductions and omissions noticed above.

6. From paste-blackening (see *below*), by reducing it with sufficient vinegar, sour beer, or water, to give it the liquid form.²

II. PASTE BLACKING:—

1. Qualities from good to super-excellent may be made from any of the preceding formulæ, by simply omitting the final dilution with the vinegar, sour beer, or water, therein ordered at the end of the process.

2. (Bryant and James's INDIA-RUBBER PASTE BLACKING.—*Patent* dated 1836.) Of India-rubber oil, ivory-black, treacle, and gum-arabic, the same as for their liquid blackening (see I, 4, *above*), but dissolving the last in only 12 *lbs.* (say 5 quarts), instead of 20 galls. of vinegar; grinding to a smooth paste in a colour-mill, and then adding of oil of vitriol, 12 *lbs.*, as before. The mass is to be stirred daily for a week, when it will be fit for use, or potting.³ Excellent.

3. Ivory-black, 1 *cwt.*; treacle, 28 *lbs.*; rape oil (or other cheap oil), 1 gal.; mix, as before; then add of oil of vitriol, 21 *lbs.*; (diluted with) water, 2 galls.; mix them quickly and thoroughly by forcible stirring with a strong wooden spatula, and as soon as admixture is complete, but whilst still fuming, put the cover on the tub, and leave it till the next day, when (without further stirring) it will be fit for use or sale.⁴ Good ordinary. Used for packets and tins.

4. As the last; but adding with the ivory-

¹ This should be gently rubbed through a sieve, held over the blacking by one person, whilst another stirs the mass assiduously with the spatula.

² It is sometimes convenient to prepare liquid blackening in this way from a stock of 'paste-blackening' already on hand.

³ The final addition of the 3 *lbs.* of powdered gum, ordered in the formula of their liquid blackening, is not mentioned by the patentees; and we, therefore, presume they do not intend it to be made. If made, it should be at the end of the week, and the daily stirring must then be continued for another week. This addition, or omission, enables us to produce two qualities from the same formula.

⁴ The object here is to make the product as spongy and light as possible, so that the purchaser may fancy he has a great deal for his money.

black, &c., 14 to 28 *lbs.* of coal-soot⁵ (sifted), omitting one half of the oil, and diluting with vitriol with an extra gal. of water. Inferius, Chiefly used for *ld.* and $\frac{1}{2}$ *d.* packets.⁶

5. (GERMAN BLACKING.) Ivory-black, 1 part; treacle, $\frac{1}{2}$ part; sweet oil, $\frac{1}{2}$ part; ting as before; then stir in a mixture of hyd. to chloric acid, $\frac{1}{2}$ part; oil of vitriol, $\frac{1}{4}$ part separately diluted with twice its weight clear water before mixing them.⁷ This formed the ordinary paste-blackening of Germany, according to Liebig.

6. (*Without Vitriol.*) As I, 5 (*antè*); but with the omission of the last $\frac{1}{2}$ gal. of 'vinegar.'

Concluding remarks. • To produce a *used* rate article of blacking it is absolutely necessary that the ingredients be of the best quality and used in the proper proportions; and that the order of their admixture, and the general manipulations, be conducted, under ordinary circumstances, in the manner described in the first of the above formulæ. The proportions of the treacle and the oil (the most expensive of the ingredients) should not be stinted; and, indeed, that of the latter may be safely increased in quantity, without materially affecting the polish, and with manifest advantage as far as the softness and durability of the leather to which it is applied, is concerned. The manipulations required in the manufacture of both paste-blackening and liquid blackening, are essentially the same; the difference between the two articles, when the same materials are used, depending entirely on the quantity of liquid added. Thus, as noticed before, by diluting paste-blackening with water, vinegar, or beer-bottoms, it may be converted into liquid blackening of a nearly similar quality; and, by using less fluid matter, the ingredients of liquid blackening will produce paste-blackening. One thing must, however, be observed, and that is, that the ivory-black used for liquid blackening should be reduced to a much finer powder than for paste-blackening; as, if this is not attended to, it is apt to settle at the bottom, and to be with difficulty again diffused through the liquid. Persons who object to the use of blackening containing oil of vitriol, may employ formula I, 5, or II, 6 (*above*). The vitriol, however, greatly contributes to promote the shining properties of the blackening; and in small quantities, or in the proper proportion, is not so injurious to the leather as some persons have represented; as it wholly unites itself to the lime of the bone-phosphate contained in the ivory-black, and is thus neutralised, insoluble sulphate of lime, and an acid phosphate or superphosphate, being formed. It is the latter that gives the acidity to a well-made sample of blackening, and not the sul-

⁵ This is also to give bulk.

⁶ A still more common article is vended in the north of England, and in Scotland, in which the oil is omitted altogether. The sale of such blackings (?) is disreputable, when it is remembered that a really good article may be made for 2*d.* to 2*d.* per *lb.*

buric acid originally added to it. In this way, the larger portion of the ivory-black is reduced to a state of extremely minute division, and with the other ingredients forms a very adhesive paste, which clings to the surface of the leather, and is susceptible of having a high polish by friction when in a hard dry state. This is the reason why

Black should never be employed for rubbing to the exclusion of the necessary proportion of bone-black, as it has no earthy base to absorb or neutralise the acid, which, if left in a free state, would prove very hurtful to the leather. Oil of vitriol is now employed in the manufacture of all the more celebrated and expensive blackings, and that, simply because no other substance is known so efficient, and is little injurious to the leather. In the common blackings of Germany, hydrochloric acid is often used to the entire exclusion of oil of vitriol; but blacking so prepared possesses several disadvantages from which that of England is free. In the best German blackings only a small portion of this acid is used, as may be seen by reference to formula II, 5 (*above*). The addition of white-of-egg, isinglass, and similar articles to blacking, always proves injurious, as they tend to stiffen the leather, and to make it crack, without at all improving its polishing properties. Even gum-arabic, in quantity, is on this account, objectionable. Oil has an opposite tendency, and, as already stated, the quantity commonly used may be increased with advantage. Resin oil should be particularly avoided.

Dr. Ure has recommended the use of a little copperas² in blacking; with the object, we presume, of striking a black with the tan in the leather; but except with new, or nearly new leather, this effect would not occur, whilst its presence, if not objectionable, would otherwise be useless.

The only improvement that has been introduced in the manufacture of blacking since the early days of the celebrated Day & Martin is, a few hours after the conclusion of the mixture of the ingredients, (but before adding the vinegar, if any) to simmer the whole very gently, for about 8 or 10 minutes, observing to stir it assiduously all the time. The fire must then be withdrawn, and the pan covered over, until it is quite cold, when half an hour's lusty stirring will finish the process.³ In this way a degree of maturity and

brilliancy will be imparted to the product, which, without the application of heat, it would take months to acquire, if, indeed, it ever reached it.

As it is generally more convenient to measure than to weigh liquids, it may be useful to remind the reader that, in round numbers,

1 gal. of oil	weighs	9½ lbs.
1 " sour beer	"	10½ "
1 " vinegar	"	10 "
1 " water	"	10 "

We may here further remark that the blackings of different houses vary considerably in some of their properties; as also do those of even the same maker by age. Some blackings dry off rapidly, and give a very brilliant polish with very little labour; whilst others take a little longer to 'dry off,' and somewhat more labour to polish them. The former are best adapted to hasty use, and when a very brilliant surface is desired; the latter when depth of polish, without extreme brilliancy, satisfies the wearer. The first best meets the requirements of fashionable life; the last, those of the middle classes and pedestrians exposed to dirt, mud, and the various vicissitudes of travelling and weather. To the one belong the 'blackings' of Everett, Day & Martin, &c.; to the other, those of Warren, Bryant & James, and most of the smaller manufacturers, with nearly all the paste-blackening of the more respectable shops. Time, however, equalises the qualities of these two classes. Blackings which are crude, moist, and oily, lose these properties, and become drier and more brilliant by age. The practice of several of the first-class West-end boot and shoe makers is never to use a blacking which they have not had in their stock at least a twelvemonth.

Blackening, both liquid and paste, should be stored in a cool and moderately dry cellar; and when in use should be kept corked or otherwise excluded from the air. Exposure or desiccation destroys most of its best qualities.

The present annual value of the blackening consumed in the United Kingdom is estimated at 562,500*l.*, or about 4½*d.* per head for the whole population; while the collective yearly value of that exported is about 35,000*l.*

[See BLACKING BALLS, BONE-BLACK, BOOTS AND SHOES, LEATHER, SULPHURIC ACID, &c.; also *below*.]

Blackening, Automatic. *Syn.* SELF-SHINING BLACKING, SPANISH JAPAN, &c. *Prep.* 1. Gum-arabic, 4 oz.; treacle or coarse moist sugar, 1½ oz.; good black ink, ¼ pint; strong vinegar, 2 oz.; rectified spirit of wine and sweet oil, of each 1 oz.; dissolve the gum in the ink, add the oil, and rub them in a mortar, or shake them together for some time, until they are thoroughly united; then add the vinegar, and lastly, the spirit.

It is longer than necessary to give it the 'simmer,' at the conclusion of which it should be turned out into a wooden tub or vat to cool.

¹ In Scotland, flour-paste soured by keeping, is often substituted for part of the treacle in the common blackings; with the effect, however, of greatly impairing their polishing qualities, and causing the leather to rapidly become stiff, and to crack. Further, such blacking will not keep, often growing mouldy and hard in two or three weeks.

² The proportion recommended by Dr. Ure is ½ oz. to each lb. of bone-black, dissolved in 10 parts of water, and to be added with the vitriol.

³ A spacious enamelled cast-iron boiler, with a concave bottom, should be used for this purpose; in which case the ingredients can be mixed in it, and thus the trouble of removal avoided. If a common copper or cast-iron boiler be employed, the blackening must not be allowed to remain

2. Lamp-black, $\frac{3}{4}$ oz.; indigo (in fine powder), 1 dr.; put them in a mortar, or basin, and rub them with sufficient mucilage (made by dissolving 4 oz. of gum in $\frac{1}{4}$ pint of strong vinegar) to form a thin paste; add very gradually, of sweet oil, 1 oz.; and triturate until their union is complete, adding toward the end the rest of the mucilage; then further add of treacle, $1\frac{1}{2}$ oz.; and afterwards, successively, of strong vinegar, 2 oz.; rectified spirit, 1 oz.; lastly, bottle for use.

3. Mix the whites of 2 eggs with a table-spoonful of spirit of wine, 2 large lumps of sugar (crushed), and sufficient finely powdered ivory-black to give the required colour and thickness, avoiding excess.

Obs. The above are chiefly used for dress boots and shoes. The first two are applied to the leather with the tip of the finger, or a sponge, and then allowed to dry out of the dust. The third is commonly laid on with a sponge or soft brush, and when almost dry or hard may have its polish heightened with a brush or soft rubber, after which it is left for a few hours to harden. It may also be used to revive the faded black leather seats and backs of old chairs. They all possess great brilliancy for a time; but are only adapted to clean, dry weather, or indoor use. They should all be applied to the leather as thinly as possible, as otherwise they soon crack off.

Blacking, Har'ness. Good glue or gelatine, 4 oz.; gum-arabic, 3 oz.; water, $\frac{1}{2}$ pint; dissolve by heat; add of treacle, 6 oz.; ivory-black (in very fine powder), 5 oz.; and gently evaporate, with constant trituration, until of a proper consistence when cold; when nearly cold put it into bottles, and cork them down. For use, the bottle may be warmed a little to thin it, if necessary. Does not resist the wet.

2. Mutton-suet, 2 oz.; bees-wax (pure), 6 oz.; melt, add of sugar candy (in fine powder), 6 oz.; soft soap, 2 oz.; lamp-black, $2\frac{1}{2}$ oz.; indigo (in fine powder), $\frac{1}{2}$ oz.; when thoroughly incorporated, further add of oil of turpentine, $\frac{1}{4}$ pint; and pour it into pots or tins.

3. Bees'-wax, 1 lb.; soft soap, 6 oz.; ivory-black, $\frac{1}{4}$ lb.; Prussian blue, 1 oz.; (ground in) linseed oil, 2 oz.; oil of turpentine, $\frac{1}{2}$ pint; to be mixed, &c., as before.

Obs. The above are used by laying a very little of them on the leather, evenly spreading it over the surface, and then polishing it by gentle friction with a brush, or a soft rubber. The last two are waterproof. Numerous compositions of the class are vended by the sadlers and oilmen, but the mass of them are unchemical mixtures, badly prepared, and cause disappointment to those who use them. Such is not the case with the products of the above formulæ, if we may rely on the statements of those who have employed them for years. The last two are suitable for both harness and carriage leather. See **HEEL BALLS**, &c.

BLADDER. *Syn.* VESICA, L.; VESSIE, Fr.; BLASE, BLATTER, Ger. In *anatomy*, &c., a

thin membranous sac or bag, in an animal, serving as a receptacle for some secreted fluid; *appr.*, the urinary bladder. See CALCULUS, INFLAMMATION, RUPTURE, &c.

Bladders. (In *commerce*.) The better qualities of these articles are prepared by cutting off the fat and loose membranes attached to them, and washing them first in a weak solution of chloride of lime, and afterwards in clear water; they are then blown out and submitted to strong pressure by rolling them under the arm, by which they become considerably larger; they are next blown quite tight, dried, and tied up in dozens. Commoner qualities are merely emptied, the loose fat removed, and then blown out, and strung up to dry.—Used chiefly by druggists and oilmen to tie ~~over~~ pots, bottles, and jars, and to contain pill-masses, hard extracts, and other similar substances; also in surgery, to cover wounds, sore heads, &c.—*Obs.* Bladders should never be purchased unless perfectly dry and air-tight; as, if the reverse be the case, they will neither keep nor prove useful, but will rapidly become rotten and evolve a most offensive odour. If purchased whilst damp, they should be at once hung up in a current of air, so as to dry as soon as possible.

BLAIN* (blâne). A boil; a sore; a pustule.

BLANC (blöng). [Fr.] In *coökery*, a dish which, according to Mrs. Rundell, is formed of grated bacon and suet, of each, 1 lb.; butter, $\frac{1}{2}$ lb.; 2 lemons; 3 or 4 carrots (cut into dice); 3 or 4 onions; and a little water; the whole being simmered for a short time, with or without the addition of a glass of sherry or marsala, before serving.

BLANCH'ING. *Syn.* CANDICA'TIO, DEALBA'TIO, &c., L.; BLANCHIMENT, &c., Fr.; BLEICHEN, &c., Ger. A whitening, or making white; a growing white. In some cases it means decortication. See ALMONDS, BLEACHING, DECOLORATION, &c.

Blanching. In *coökery*, an operation intended to impart whiteness, plumpness, and softness, to joints of meat, poultry, tongues, palates, &c. It is usually performed by putting the articles into cold water, which is then gradually raised to the boiling-point, when they are at once taken out, plunged into cold water, and left there until quite cold. They are subsequently removed and wiped dry, ready for being dressed.

Obs. The operation of blanching meat, although it renders it more sightly according to the notions of fashionable life, at the same time lessens its nutritive qualities, by abstracting a portion of the soluble saline matter which it contains, especially the phosphates, and thus deprives it of one of the principal features which distinguish fresh meat from salted meat. Animal food, before being dressed, may be washed or rinsed in cold water without injury, provided it be quickly done; but it cannot be soaked in water at any temperature much

below the boiling-point without the surface, and the parts near it, being rendered less nutritious. Washing meat when first received from the butcher is, indeed, a necessary act of cleanliness; but soaking it for some time in water is unnecessary, and for the reasons stated, should be avoided.

Strong acetic acid (concentrated vinegar) poured on or rubbed over half lean meat, gradually renders it soft and gelatinous. Ordinary household vinegar has the same effect, but in a less degree. Tough meat thus treated for a short time before dressing it, becomes more tender and digestible, though somewhat less nutritious; whilst the taste and flavour of the vinegar is removed by the heat subsequently employed in dressing it.

BLANCMANGE. (blo-môngzh'). *Syn.* BLANOMANGER (blöng-möng-zhâ), *Fr. Literally*, white food; in *cookery*, a confectioned white jelly. It is commonly prepared by simmering 1 oz. of isinglass, 2 or 3 oz. of lump sugar, and a little flavouring,¹ in about a pint of milk, until the first is dissolved, when the whole is thrown into a jelly-bag, and the strained liquor is allowed to cool and solidify; it is next remelted by a gentle heat, and, when nearly cold, poured into moulds, which have been previously rubbed with a little salad oil and then wiped out again.

Obs. Good gelatine, or strong calves' feet jelly, is often substituted for the isinglass. At other times the jelly is made with about $\frac{1}{2}$ pint of water (instead of milk), when $\frac{1}{2}$ pint of almond-milk, or of cream, is added to the remelted jelly. Sometimes ground rice or arrow-root is employed in lieu of isinglass, when the product is called RICE-BLANCMANGE, or WEST-INDIAN B., as the case may be. **TRANSPARENT BLANCMANGE**² is merely clarified isinglass-jelly, flavoured. See CREAM (Stone), ISINGGLASS, and JELLY.

BLANQUETTE (blang-ket'). [*Fr.*] In *cookery*, a species of white fricasee. It is also the name of a delicate species of white wine, and of a particular sort of pear.

BLASTING. In *civil and military engineering*, the disruption of rocks, &c., by the explosion of gunpowder, or other like material.

BLASTING POWDERS (Melville and Callow's). *Prep.* 1. (POWDER No. 1.) Chlorate of potassa, 2 parts; red sulphuret of arsenic, 1 part; to be separately carefully reduced to powder, and lightly mixed together, scrupulously avoiding the use of iron instruments, percussion, much friction, the slightest contact with acids, or exposure to heat.

2. (POWDER No. 2.) Chlorate of potassa, 5 parts; red sulphuret of arsenic, 2 parts; ferrocyanide of potassium (prussiate of potash), 1 part; as No. 1.

¹ This may be 5 or 6 bitter almonds (grated), or a little aniseed, orange, or lemon peel, &c., at will. Sometimes these are omitted, and a little orange-flower water, rose-water, or essence of vanilla, added to the remelted jelly.

² A misnomer of the confectioners and cooks.

3. (POWDER No. 3.) Chlorate of potassa and ferrocyanide of potassium, equal parts.

Obs. These compounds are not permanently injured by either salt or fresh water, merely requiring to be dried to regain their explosive character. They possess fully eight times the force of ordinary powder. One of their advantages, especially to the underground miner, is the very trifling amount of smoke produced by their explosion. On the other hand, the extreme facility with which they explode by attrition, contact with a strong acid, and a slight elevation of temperature, render them unsuited to most of the purposes of ordinary gunpowder. On this account they should only be prepared in small quantities at a time, and with the utmost caution. Mr. Callow, the inventor of them, lost several of his fingers, and was rendered a cripple for life, by an explosion of the kind referred to, which occurred only a few weeks after the sealing of his patent. A straw, or small strip of wood, only slightly wetted with oil of vitriol, and applied to a small heap of the powder, produces instantaneous explosion. See GUN-COTTON, GUN-POWDER, MINING, &c.

BLEACHING. (blêche'). *Syn.* DEALBA'TIO (-sh'o), INSOLA'TIO,³ &c., L.; BLANCHIMENT, BLANCHISSAGE, *Fr.*; BLEICHEN, *Ger.* The process by which the colour of bodies, natural or acquired, is removed, and by which they are rendered white or colourless. It is more particularly applied to the decolorisation of textile filaments, and of cloths made of them.

Hist. Bleaching is a very ancient art, as passages referring to it in the earlier sacred and profane writers fully testify. It had probably reached a high degree of excellence among the inhabitants of the first Assyrian empire, and was certainly practised in Egypt long before the commencement of written history. We may fairly assume that fine white linen formed part of the "raiment," which, together with "jewels of gold, and jewels of silver," and "precious things," Abraham sent as presents to the beautiful Rebecca and her family,⁴ fully three centuries and a half before the Exodus. Subsequently, in Scripture, we have special mention of "fine linen, white and clean." Herodotus, the earliest Greek historian, tells us, that the Babylonians wore "white cloaks,"⁵ and in Athenæus we read of "shining fine linen," as opposed to that which was "raw" or unbleached.⁶ At this early period, and for many centuries afterwards, the operations of washing, fulling, and bleaching, were not distinctly separated. The common system of washing followed by drying in the sun, adopted by the ancients, is a process which of itself, by frequent repetition, decolorises the raw materials

³ Bleaching by exposure in the sun.

⁴ Gen xxiv, 53: B. C. 1857.

⁵ Herod., i, 195.

⁶ Athen., ix, 77.

of textile fabrics, and thus must inevitably have taught them the art of 'natural bleaching' of a character similar to that practised in Europe up to a comparatively very recent period. And this appears, according to the authority of ancient authors, to have been the case. Washing or steeping in alkaline and ammoniacal lyes, or in milk of lime, followed by exposure in the sun, formed the chief basis of their system; whilst woollens, then as now, were treated with soap and fuller's earth, or with potter's clay, marl, Cimolian earth, or other like mineral. Urine was highly esteemed among them; and we are told that in the time of the emperor Vespasian,¹ and undoubtedly long before it, cloths were sulphured. Indeed, according to Pliny, sulphuring was often had recourse to in ordinary washing, as well as in the bleaching process.²

Bleaching continued to be practised with no essential change of its principles until the discovery of chlorine, to which we shall presently refer. In the last century, Holland obtained the best name for bleaching. The process passed then to Ireland and Scotland, and thence into England. It was even customary to send goods from this country to be bleached in Holland. The first attempt to vie with Holland, was made, in Scotland, in 1749.

The first steps towards the modern or chemical system of bleaching were the investigations of Berthollet on chlorine, in 1784, but which were not communicated to the French Academy until the year 1787. The knowledge of the use of chlorine as a bleacher was soon afterwards brought to this country by the Duke of Gordon, and by Prof. Copeland of Aberdeen, and through them was practically applied by Messrs. Milnes of that place. About the same time, James Watt, a correspondent of Berthollet, successfully introduced its use in the neighbourhood of Glasgow, and then generously laid a statement of the results before the Manchester manufacturers. In enforcing the importance of the new substance and process on these gentlemen, he was ably followed and seconded by Dr. Henry. In 1798, Mr. Chas. Tennant, of Glasgow, obtained a patent for a new bleaching liquor prepared by saturating lime-water with *chlorine*; and another, in 1799, for dry *chloride of lime*, a substance which is still preferred as a bleacher to all other preparations of chlorine. The new or continuous process of bleaching, as it is called, and that which is at present in general use in all the chief bleach-works of Lancashire, was introduced by Mr. David Bentley, of Pendleton, and patented by him in 1828.

Proc. Bleaching is commonly said to be natural, when exposure to light, air, and moisture, forms the leading part of the process; and to be chemical, when chlorine, chloride of lime, sulphurous acid, or other like

substances, are employed. In some cases, as with linen, the two processes are combined. The subject requires to be noticed under separate heads, depending on the material operated on:—

I. BLEACHING of Cotton:—*Cotton* is more easily bleached, and appears to suffer less from the process than most other textile substances. On the old plan it was first (1) thoroughly washed in warm water, to remove the weaver's paste or dressing; then (2) 'bucked' or 'bowked' (boiled) in a weak alkaline lye, or in milk of lime, to remove colouring, fatty, and resinous matters, insoluble in simple water; and after being (3) again well washed, was (4) spread out upon the grass, or bleaching ground, and freely exposed to the joint action of light, air, and moisture (technically called 'crofing'). The operation of 'bucking' in an alkaline lye, washing, and exposure, was repeated as often as necessary, when the goods were (5) 'soured' or immersed in water acidulated with sulphuric acid, after which they (6) received a final thorough washing in clean water, and were (7) dried, finished, and folded for the market. From the length of the exposure upon the bleaching ground, this method is apt to injure the texture of the cloth; and from the number of operations required, is necessarily expensive and tedious. It is therefore now very generally superseded by the system of chemical bleaching briefly described below.

In the CHEMICAL SYSTEM of bleaching, the goods are 'washed' and 'bucked' as on the old plan, then submitted to the action of a weak solution of chloride of lime, and afterwards passed through water soured with hydrochloric or sulphuric acid, when they have only to be thoroughly washed, and to be dried and finished, for the entire completion of the process.

The new or continuous process, before referred to,³ is the method of chemical bleaching at present in the most general use; and, indeed, it has nearly superseded all other methods. In this system the pieces, previously tacked together endwise so as to form a chain, are drawn, by the motion of rollers, in any direction, and any number, of times, through every solution to the action of which it is desired to expose them, and this entirely and completely under the control of the operator.

The following Table exhibits an outline of the several operations in the improved form of the continuous process as practised by Messrs. McNaughten, Barton, & Thom, at Chorley, and in most other large bleach-works:—

1. Preliminary operations:—*a.* The 'pieces'⁴ are separately stamped with the printer's name, a solution of silver, or sometimes coal-tar, being employed for the purpose.

¹ About A. D. 60.

² *Hist. Nat.*, xxxv, 57, &c.

³ See *Hist.* (anté).

⁴ Usually about 30 yards each.

b. They are tacked together endwise either by hand or a machine, so as to form one continuous piece of 300 to 350 yards in length, according to the weight of the cloth.

c. They are singed.¹

d. They are crushed into a rope-like form by drawing them through a smooth aperture,² the surface of which is generally of glass or porcelain—the rope-form being given them to enable the water, and other liquids, to penetrate the goods more easily, and to allow them to be laid in loose coils in the kiers.

2. The pieces are bucked or boiled in milk of lime³ for 12 to 14 hours,⁴ followed by rinsing or cleansing in the washing-machine.

3. They are soured in water acidulated with hydrochloric acid,⁵ and again washed; similar machines being employed for each.

4. They are bucked or boiled for 15 or 16 hours in a solution of resinate of soda,⁶ and then washed as before.

5. They are chemicked by being laid in a wooden, stone, or slate cistern, when a solution of chloride of lime⁷ is pumped over them, so as to run through the 'goods' into a vessel below, from which it is returned on the top, by continued pumping, so that the cloth lies in it for 1 to 2 hours; it is then washed.

6. They are bucked or boiled, for 4 or 5 hours, in a solution of 1 lb. of crystallised carbonate of soda, dissolved in 5 galls. of water, to every 35 lbs. of cloth; and washed.

7. They are again 'chemicked,' as before; and washed.

8. They are soured in very dilute hydrochloric acid;⁸ and then left on 'stillages'⁹ for 5 or 6 hours.

9. They are, finally, thoroughly washed, well squeezed between rollers, dried over steam-heated tin-cylinders, starched or dressed, and finished.

This is the usual process for good calicos. Muslins, and other light goods, are handled rather more carefully; whilst for commoner ones, the sixth and seventh operations are generally omitted. The whole usually occupies 5 days; but by using Mr. Barlow's high-pressure steam kiers, it may be performed in two days. Yarns, &c., may be bleached in a

similar manner by first looping the skeins together.

Obs. According to the most reliable authorities, the strength of cotton-fibre is not impaired by its being boiled for two hours in milk of lime, under ordinary pressure, out of contact with the air; nor, according to the bleachers, even by sixteen hours boiling at the strength of 40 lbs. per 100 galls. It is said that lime is less injurious than 'soda.'

Solution of caustic soda, sp. gr. 1.030, does not injure it, even by boiling under high pressure; but, in practice, soda-ash, or carbonate of soda, is used, and this only in the second bucking, and in the third, if there be one. The strength now never exceeds 25 lbs. of the crystals to the 100 galls., and is usually less.

Experiments have shown that immersion for 8 hours in a solution of chloride of lime containing 3 lbs. to the 100 galls., followed by souring in sulphuric acid of the sp. gr. 1.067, or for 18 hours in acid of 1.035, does not injure it.

By the improved method of previously treating the goods with lime or alkalies, little chloride of lime is required. Indeed, it is said that where 300 lbs. were formerly employed, 30 to 40 lbs. only are now used. At the same time it is right to mention, that though a solution at $\frac{1}{2}$ Twaddle is usually regarded as the best and safest strength, yet in some bleach-works, particularly for inferior and less tender goods, this is greatly increased, even up to 5; the period of immersion being proportionately reduced, as it is not safe to expose the goods long to the action of such powerful solutions. With the higher strengths they are passed rapidly through the liquid with the calender, sufficient time only being allowed to soak them thoroughly; then immediately through the acid or souring, followed by washing as before.

In Scotland and Ireland the washing is generally performed by wash-stocks; whilst in Lancashire, dash-wheels or washing-machines with squeezers, are almost always used for the purpose.

Cotton loses about 1-20th of its weight by bleaching.

II. BLEACHING of Linen:—*Linen* may be bleached in a similar way to 'cotton,' but the process is much more troublesome and tedious, owing to its greater affinity for the colouring matter existing in it in the raw state. Under the old system, several alternate buckings with pearlash or potash and lengthened exposure on the field, with one or two sourings, and a final scrubbing with a strong lather of soft soap, constituted the chief details of the process. In this way a high degree of whiteness, though not an absolutely pure or snow white, was ultimately produced. Grass-bleaching or crofting is still extensively used for linen; but it is more generally employed only for a limited time, and in combination with a

¹ Generally on one side only; but for goods to be subsequently finely printed, on both sides. For very fine printing the nap is sometimes removed by shearing instead of 'singeing,' an ingenious and effective machine being employed for the purpose.

² Such apertures are also used instead of pulleys, in the transfer of the rope from place to place.

³ The common proportions are about 1 lb. of quick-lime slaked and reduced to milk, with 2 galls. of water, for every 14 or 15 lbs. of cloth.

⁴ This is done in a large iron boiler furnished with a perforated false bottom of wood, and technically termed a 'kier.'

⁵ This dilute acid or acidulated water has usually the sp. gr. 1.010, or $\frac{1}{2}$ Twaddle.

⁶ Made with about 17 lbs. of soda-ash and 3 lbs. of resin, with water, 50 galls., to every 20 or 21 lbs. of cloth.

⁷ Technically called 'chemick.' The strength of the solution is usually of the sp. gr. 1.0025, or $\frac{1}{4}$ Twaddle.

⁸ Sp. gr. 1.0125, or $\frac{1}{4}$ Twaddle.

⁹ Low stools or props to keep them from the ground.

modification of the system at present almost universally adopted for cotton goods; whilst, in some cases, crofting is omitted altogether, and the bleaching conducted wholly by the latter process. The following *Tables* exhibit the outlines of the new system as at present practised in Ireland and Scotland:—

a. For plain sheetings:—

1. They are bucked for 12 or 15 hours in a lye made with about 1 lb. of pearlash (or soda-ash) to every 56 lbs. of cloth, and washed.
2. Crofted for about 2 days.
3. Bucked in milk of lime.
4. Turned, and the bucking continued, some fresh lime and water being added; and washed.
5. Soured in dilute sulphuric acid at 2° Twaddle.
6. Bucked with soda-ash for about 10 hours, and washed.
7. Crofted, as before.
8. Bucked again with soda-ash, as before.
9. Crofted for about 3 days.
10. Examined, the white ones taken out, and the others again bucked and crofted.
11. Scalded or simmered in a lye of soda-ash of about only 2-3rds the former strength, and washed.
12. Chemicked, for 2 hours, at $\frac{1}{2}$ ° Twaddle, washed, and scalded.
13. Again chemicked, as before.
14. Soured for 4 hours, as in No. 5; washed, and finished.

This occupies 13 to 15 days, according to the weather.

*b. For shirtings, &c.:—*As the preceding, but with somewhat weaker solutions.

c. For goods to be subsequently printed:—

1. Bucked in milk of lime for 10 or 12 hours.
2. Soured in dilute hydrochloric acid of 2° Tw., for 3 to 5 hours, and washed.
3. Bucked with resinate of soda for about 12 hours.
4. Goods turned, reboiled as before, and washed.
5. Chemicked at $\frac{1}{2}$ ° Tw., for 4 hours.
6. Soured at 2° Tw., for 2 hours, and washed.
7. Bucked with soda-ash for about 10 hours, and washed.
8. Chemicked as in No. 5.
9. Soured, as at No. 6, for 3 hours; washed, and dried.¹

Obs. The chief difficulty in bleaching linen arises from the fact that its colouring matter is insoluble in acid or alkaline solutions until it has been long acted upon by light, air, and moisture, as in the common process of grass-bleaching. Chlorine hastens the operation; but, unfortunately, it can only be employed towards the end of the process; as when earlier used, the colour of the raw cloth becomes set,

and irremovable. To obviate this difficulty Mr. F. M. Jennings, of Cork, has lately introduced the joint use of an alkali and an alkaline hypochlorite (chloride) in the place of the ordinary chloride of lime. He prepares a bath of solution of soda at 5° Twaddle, which he raises by the addition of chloride of soda (or of potash) to 6 or 7°, and in this he steeps the cloth (after the first bucking and souring) for some hours, heat, or constant squeezing between rollers, being had recourse to, to facilitate the action. Souring and washing follow, when the goods are again put into the alkaline and chloride bath, as before; after which they are soured, and bucked again with soda. These last three operations are repeated until the cloth is almost white, when crofting for one half to one fourth the time required by the usual method renders it fit for the final bucking, and finishing. Indeed, it is said that if the process be very carefully managed it renders crofting unnecessary.

Raw linen loses about 1-3rd of its weight in bleaching.

*III. Silk:—*Silk is usually bleached by first steeping it, and then boiling it in solutions of white soap in water, after which it is subjected to repeated rinsings, a little indigo-blue, or archil, being added to the last water to give it a pearly appearance. When required to be very white (as for gloves, stockings, &c.), the goods are cautiously submitted, for 2 or 3 hours, to the action of the fumes of burning sulphur, and then finished by rinsing, as before.

Obs. Boiling or sulphuring is not required for the white silk of China. Raw silk loses from 4 to 5 oz. per lb. by bleaching.

*IV. Wool:—*In bleaching raw wool it is first deprived of the yolk or peculiar natural varnish with which it is covered. For this purpose it is steeped and stirred for about 20 minutes in rather warm water (135°–140° Fahr.), either with or without the addition of 1-4th part of stale urine; after which it is placed in baskets to drain, and soon afterwards thoroughly rinsed in a stream of water, when it is again allowed to drain, and is hung up to dry. The further operations depend on circumstances, wool being sometimes whitened in the fleece, or in the yarn, but still more frequently and extensively, not till woven. When it is intended to send it in the first two forms white to market, it is hung up or spread out, whilst still wet, and sulphured (see *below*); after which it is either at once rinsed for some time in cold water, or is previously treated with a very weak bath of soft soap.

In the case of woollen fabrics the operations of purifying or whitening the wool, beyond the removal of the yolk, are, for the most part, mixed up with the weaving and working of it. The pieces leave the hands of the weaver of a dingy gray colour, loaded with oil, dirt, and dressing. They then pass to the

¹ The strengths of the solutions, when not otherwise stated, are about the same as those given under *Corron (anté)*.

² Patent dated 1859.

fulling-mill, where they are treated with fuller's earth and soap, often preceded with ammonia or stale urine, after each of which they are well washed out or scoured with cold water, and are then ready for the dyer. When it is intended to obtain them very white, or to dye them of a very delicate shade, they are commonly sulphured; after which they are washed or milled in cold water for some hours, a little finely ground indigo being added towards the end, to increase their whiteness; an addition also made when the cloth is sufficiently white without the sulphuring process.

The usual mode of SULPHURING woollen goods is to hang them up on pegs or rails, in the case of fleece-wool, to spread it about, at the upper part of a close, lofty room or chamber, called a Sulphur-stove. In each corner of this room is set a cast-iron pot containing sulphur, which, after the introduction of the goods, is set on fire, when the door at the lower part of the chamber is shut tight and clayed. This is commonly done overnight; and by the morning the bleaching being finished, the goods are removed, washed, and azured.

Sulphuring, unless very skilfully managed, imparts a harsh feel to woollen goods, which is best removed by a very weak bath of soap-and-water (lukewarm); but the action of soap in part reproduces the previous yellowish-white tinge. Milling with cold, or luke-warm water, tinged with indigo, is the best substitute.

Obs. Raw wool loses from 35 to 45% of its weight by scouring, and 1 to 2% more in the subsequent operations of the bleacher; the loss being in direct proportion to the fineness of the staple.

*** The above are the four principal applications of the art of bleaching; but, in technical language, the words bleaching, bleacher, bleachery, bleach-works, &c., when employed alone, are understood to have reference only to cotton and linen. This has arisen from the enormous extent of these manufactures, and from the process of bleaching them forming a business entirely distinct from that of weaving, dyeing, or printing them. The following, with the exception of the first, are of comparatively minor importance and interest:—

V. Materials for Paper:—Old rags for the manufacture of paper, and paper-pulp, are now almost universally bleached with chlorine or chloride of lime; the former being generally used in France, and the latter in England. The process usually consists in (1) boiling in an alkaline lye to remove grease and dirt, (2) washing, (3) pressing, (4) deviling or tearing up the pressed cake into fine shreds or pulp, (5) chemicking, with agitation, for about an hour, in a clear solution of chloride of lime,¹

¹ The 'strength' varies with the colour and quality of the rags. From 2 to 4 lbs. per cwt. of rags is a common proportion; but for dyed and printed rags as much as 7

followed by (6) washing, (7) souring with dilute hydrochloric acid at 1 or 2° Tw., or treatment with a solution of some antichlor, or both, and (8) a final washing and pressing. For the common kinds of paper, the operations included in No. 7 are omitted; but unless the whole of the lime-salt be removed from the pulp, the paper made of it is liable to turn brown and become rotten by age. In some cases rags are bleached before being divided and pulped. Cotton-waste is bleached in a similar way to rags.

In France, the chlorine, in a gaseous form, is passed from the generators into the bleach-cisterns containing the pulp, which in this case must be fitted with close covers.

VI. Printed Paper, as *Books, Engravings, Maps, &c.*—These when stained or discoloured may be whitened by (1) wetting them with pure clean water, (2) plunging them into a dilute solution of chloride of lime, (3) passing them through water soured with hydrochloric acid, and then (4) through pure water until every trace of acid be removed. This process may be further improved by further dipping them into a weak solution of some antichlor, and again washing them, before finally drying them. It is only rare and valuable original works or specimens of art that are worth this treatment, which, owing to the very nature of paper, requires considerable address to manage. In many cases a sufficient degree of renovation may be effected by simply exposing the articles, previously slightly moistened, to the fumes of burning sulphur, followed by passing them through a vessel of pure water.

VII. Straw, Straw-plait, and articles made of them, are, on the large scale, usually bleached by (1) a hot steep or boil in a weak solution of caustic soda, or a stronger one of soda-ash, followed (2) by washing and (3) by exposure to the fumes of burning sulphur. To effect the last, the goods are suspended in a close chamber connected with a small stove, in which brimstone is kept burning. On the small scale, a large chest or box is commonly employed. A piece of brick, or an old box-iron heater, heated to dull redness, is placed at the bottom of an iron crock or earthen pan, a few fragments of roll sulphur thrown on, the lid instantly closed, and the whole left for some hours. Care should be taken to avoid inhaling the fumes, which are very deleterious as well as disagreeable and annoying. Straw goods are now also frequently bleached by the use of a weak solution of chloride of lime, or of water strongly soured with oxalic acid or even oil of vitriol, followed by very careful rinsing in clean water; but here, as in the

or even 8 lbs. per cwt. are often employed. It is better, however, to prolong the process with a weaker solution, than to hasten it by using the chloride in excess. Large rectangular cisterns of wood, or of slate, are commonly employed as the bleach-vessels. Cisterns of wood or brick-work lined with gutta percha or with asphaltum-bitumen, are employed in some paper-mills, and answer admirably.

former case, the natural varnish, dirt, grease, &c., must be first removed by alkalis or soap, to enable the chlorine or acid to act on the fibres.

Concluding remarks. The theory of bleaching, notwithstanding the giant strides of chemistry during the last 20 years, remains still unsettled; and hence the processes employed are still, for the most part, empirical. It appears probable that chlorine acts by uniting with the hydrogen of the water, or of other compounds present, or probably with that of both, and that it is the oxygen thus liberated, and whilst in the nascent state, that is the true operative agent. Hence bleaching by chlorine, or by the hypochlorites, may be regarded as an oxidation of the colouring matter; but whether the chlorine or the oxygen effects this oxidation is of little practical importance—the result being the same—the destruction of the compound, and the removal of the colour that depends on its existence. It is doubtful whether the bleaching power of sulphurous acid is due to it as an oxidising or a deoxidising agent; but the last is probably the case, with a like destruction of the compound constituting the colouring matter. It may, however, be supposed that sulphurous acid acts as an oxidiser, as it appears to do when it decomposes sulphuretted hydrogen; or it may act by simply altering the compound by inserting itself, a view receiving some support from the fact that wool whitened by sulphuring may be restored to nearly its previous colour by merely treating it with soap or alkalis.

The bleaching power of light depends on its actinic or chemical rays, which, like chlorine, appear to act as an oxidising agent.

Chlorates, chromates, chromic acid, manganates, &c., have been proposed as bleaching agents for textile filaments and fabrics, but without success or practical advantage. Immersion in water more or less strongly impregnated with sulphurous acid has, however, been successfully substituted for the common sulphuring process, particularly for silk.

To avoid the injury of the goods by sparks, and by drops of water highly saturated with sulphurous acid falling from the roof, Mr. Thom has invented a method of passing them rapidly through, or keeping them in constant motion in, the sulphuring chamber. His apparatus is constructed on the principle of the washing-machine, the fumes of burning sulphur being used instead of water.

[Further information in connection with bleaching will be found under the heads ACTINISM, BLANCHING, CALICO-PRINTING, CHARCOAL, CHLORIDES (Bleaching), CHROMATES, CHROMIC ACID, HYPOCHLORITES, HYPOCHLOROUS ACID, LIGHT, RINSING, SPOTS and STAINS, SULPHURING, WASHING, &c.; also under BONES, ENGRAVINGS, FAT, FEATHERS, HORN, IVORY, OIL, PAPER,

PRINTED BOOKS, RAGS, SPONGE, STRAW-PLAIT, TALLOW, WAX, &c.¹]

Bleaching Liq'id. Solution of chloride of lime.

Bleaching Pow'd'r. Chloride of lime.

Bleaching Salts. The commercial hypochlorites.

BLEAR'-EYE [blère'-i]. *Syn.* LIPPITU'DO, L.; CHASSIE; LIPPIITUDE; Fr. An exudation of a puriform matter from the margins of the eyelids, which are red, tumid, and painful; and frequently, during the night, glued together by the discharge.

Treatm. Mild astringent collyria, as those of sulphate of zinc or alum (6 or 8 grs. to 1 oz. of water). An ointment formed of 1 part of the ointment of nitrate of mercury (Ph. L.), diluted with 11 parts of sweet washed lard, may be advantageously applied nightly, by means of a camel-hair pencil, the smallest quantity possible only being used. Excess in eating and drinking should be avoided, and some aperient medicine taken.

BLEAK (blèke). *Syn.* BLAÏ, BLEY† (blä). The *cyprinus albus* (Linn.), a small river-fish, the scales of which are used in making artificial pearls (which see).

BLEED'ING (blède'-). In the sense of a flow or loss of blood, see HÆMORRHAGE; in that of bloodletting, see CUPPING, LEECHING, VENESECTION, &c.

BLENDE (blënd). A name applied to several minerals; *appr.*, zinc-blend, or native sulphuret of zinc—the black jack of miners.

BLIGHT (blite). See MILDEW, and PLANTS (Diseases of).

BLIND'NESS (blind'-). *Syn.* ABLEP'SIA, CÆCITAS, &c., L.; AVEUGLEMENT, CÉCITÉ, Fr.; BLINDHEIT, Ger. Deprivation or want of sight.

Blindness may be congenital, or born with a person; or it may arise from accident, external violence, or disease. In the latter it may frequently be relieved by medical and surgical treatment. See AMAUROSIS, CATARACT, EYES, OPHTHALMIA, VISION, &c.

Day Blindness. *Syn.* NIGHT'-SIGHT; NYCTALOP'IA, L. A disease of the eye in which vision is painfully acute or more or less extinct in a strong light, as that of day; but clear and pleasant in the dusk or evening and at night. Its chief causes are excessive exposure of the eyes to the direct influence of very strong or glaring light, or to heat, or both of them together; and is often one of the sequelæ of ophthalmia (which see).

Night Blindness. *Syn.* DAY'-SIGHT; HÆMERALO'PIA, L. An affection of the eye, the reverse of the preceding, in which objects are clearly seen only in broad daylight. In the beginning of the complaint the patient continues to be able to see, though less clearly, for

¹ An accurate description of the apparatus and machinery employed in bleach-works, with numerous engravings, will be found in Ure's "*Dict. of Arts, Manuf. & Mines*," 5th ed., i, 318-351, &c.

a short time after sunset, and even by moonlight, and perhaps distinctly by bright candle-light; but after a short time this power is lost. It most frequently occurs in hot climates, and low latitudes at sea. Its chief causes are fatigue and exposure of the eyes to the glare of the tropical sun, probably coupled with gastric derangement. In some cases it is congenital, and is then generally incurable. The treatment consists in avoiding exciting causes, and endeavouring to restore the tone of the stomach, and the general health, by the usual methods. The eyes at the same time should be topically medicated by the frequent use of cold water, or mild astringent collyria. See OPHTHALMIA (Chronic).

BLISTER. *Syn.* PAF'ULA, PUS'TULA, L.; POSTULE, VESSIE, &c., Fr.; BLASE, BLATTER, Ger. A bladder or vesicle caused by the deposition of serous fluid between the cuticle and the derma or true skin, occasioned by the application of a vesicant, or by a burn, scald, or friction.

Blister. *Syn.* VESICATO'RIMUM, L.; EPISPASTIQUE, VESICATOIRE, Fr.; BLASEN-PFLASTER, B-STOFF, Ger. A substance which vesicates or raises blisters; in *pop. lang.*, a vesicating plaster or similar application.

The use of blisters is very ancient, and appears to date back long prior to the time of Hippocrates. Indeed, their value as cutaneous stimulants and counter-irritants appears to have been recognised by the medical faculty of all nations down to the present time. It is a principle sufficiently established with regard to the living system, that where a morbid action exists, it may often be removed by inducing an action of a different kind, as a state of excitement or irritation, in the same or a neighbouring part. In this way is explained the utility of blisters in local inflammation and spasmodic action, and it is this principle which regulates their application in pneumonia, gastritis, hepatitis, phrenitis, angina, rheumatism, colic, spasmodic affections of the stomach, &c.—diseases in which they are employed with the most marked advantage. "A similar principle exists with respect to pain; exciting one pain often relieves another. Hence blisters frequently give relief in neuralgia, toothache, and other like painful affections. Lastly, blisters, by their operation, communicate a stimulus to the whole system, and raise the vigour of the circulation. Hence, in part, their utility in fevers of the typhoid kind, though in such cases they are used with still more advantage to obviate or remove local inflammation.

Blisters are commonly prepared with cantharides-plaster, or with some other preparation of cantharides; and, in the former case, usually have their surface sprinkled over with powdered Spanish fly; whilst the blistering surface is surrounded with a margin spread with common adhesive plaster, for the purpose of causing them to adhere to the part to which they are applied. In order to prevent the

action of the cantharides upon the mucous membrane of the bladder, or urinary organs, they are also often sprinkled with a little powdered camphor, or better still, are moistened with camphorated ether, which, on its evaporation, leaves a thin layer of camphor on the surface; but care must be taken that the layer be not too thick, as in that case the plaster would not take effect. With a like object, a piece of thin book-muslin or tissue-paper (silver-paper) is frequently placed between the blistering surface of the plaster and the skin; the efficacy of which may be still further heightened by first soaking the muslin or paper in olive or almond oil.

The usual time an ordinary blister of cantharides-plaster is allowed to remain in contact with the skin is from 10 to 12 hours. It is then gently removed. The subsequent treatment depends on the object in view. When it is not wished to maintain a discharge from the blistered surface, the vesicle is cut with the point of a pair of scissors at its most depending part, to let out the fluid which it contains, followed by a dressing of spermaceti or other simple ointment; but when the case requires the blister to be kept open, or to be converted into a perpetual blister, as it is sometimes called, the whole of the detached cuticle is carefully removed with the scissors, and the part is dressed with either the ointment of cantharides or of savine, at first, more or less diluted with lard or simple ointment, with an occasional dressing of resin cerate. According to Mr. Crowther, the blistered surface is best kept clean by daily fomentation with warm water.

Of late years, to obviate the unpleasant effects occasionally arising from the common blister, various compounds having cantharides for their base, as well as fabrics spread with them, have been brought before the public. These are noticed hereafter. See PLASTERS, VESICANTS, &c.

Extemporaneous Blisters. Among the best of these may be mentioned the following:—

1. A piece of lint dipped in the strongest vinegar of cantharides, and immediately after its application to the skin, covered over with a piece of strapping, or preferably a piece of sheet gukta percha or oiled silk, to prevent evaporation. Raises a blister in from 5 to 8 minutes.
2. Concentrated acetic acid, applied in the same way, has a similar effect.

3. (Dr. Darcey.) Into a flat watch-glass pour from 8 to 10 drops of highly concentrated liquor of ammonia; cover the liquid with a small piece of linen of rather less diameter than that of the glass, and at once apply this little apparatus to the previously shaved skin. The whole must be kept in its place by means of moderate pressure with the fingers, until a red ring, about 2 centimètres in breadth, is observed round the glass, when it is certain that vesication is effected. Sometimes scarcely 30 seconds are necessary for

obtaining the result. The apparatus may then be removed, and the blistered part treated in the usual manner; the dressing being according to the object in view.

4. (Trousseau.) Bibulous paper slightly wetted with a little of the ethereal extract of cantharides, and instantly applied to the skin, the whole being covered with a piece of common adhesive plaster to prevent evaporation.

5. Boiling water applied by means of a suitably shaped tube, the adjacent parts being at the same time protected from injury. Instantaneous.

Horse Blister. See VETERINARY MEDICINE. **Perpetual Blister*.** See BLISTER (*anté*).

BLISTERING. *Syn.* VESICANS, VESICATORIUS, L.; EPISPASTIQUE, VÉSICATEUR, VÉSICATEUR, Fr.; BLASENZIEHEND, &c., Ger. In *medicine*, &c., that vesicates or raises blisters when applied to the skin.

Blistering Paper, Plaster, Tis'sue (tish-ū), &c. See PLASTERS, VESICANTS, &c.

BLOATER. See BLOTE.

BLONDE. [Fr.] *Syn.* BLOND'-LACE. Silk-lace. The name is now also applied to cotton-lace edged with silk. For the mode of cleaning it and getting it up, see LACE and MUSLIN.

BLOOD (blūd). *Syn.* SAN'GUIS, L.; SANG, Fr.; BLUT, Ger. The general circulating fluid of animals, and that on which the nourishment and growth of their bodies depend, and from which all the secretions are formed. It is warm and red in vertebrated animals; and, for the most part, cold and white in the invertebrata. In man and all other mammals, and in birds—the two highest classes of the animal kingdom—the blood, though collectively forming but one circulating stream, varies considerably in appearance according to the part or vessels in which it is found. That contained in the left side of the heart, and in the arteries, possesses a very brilliant scarlet colour, and is called arte'rial blood; whilst that found in the right side of the heart, and in the veins, has a darkish purple colour, and is called ve'nous blood. The two, however, differ little from each other in their chemical properties and composition; the most marked point of difference being that venous blood holds carbonic acid in solution, whilst oxygen predominates in the blood of the arteries. The fibrine of venous blood is also soluble in a solution of nitrate of potassa; while that of arterial blood is insoluble in that menstruum.

Comp. Blood consists of a transparent and nearly colourless fluid (plas'ma, se'rum, se'r-albu'men), in which float about a countless multitude of microscopic round red bodies (blood'-discs, b.-cor'puscles, -püslz), to which its colour is due, accompanied by a few colourless globules (white b.-c.) of a somewhat larger size. The red corpuscles are found, on more minute examination, to consist of an envelope containing a solution of hæmatosine.

Prop. These are, for the most part, well

known. It has an alkaline reaction, a saline and rather disagreeable sweetish taste, and when newly drawn evolves a peculiar odour or halitus, which almost immediately disappears. As it cools and on 'epose it coagulates, owing, according to some, to the spontaneous solidification of the fibrine; but more probably, as has been recently shown, to the loss of ammonia, traces of which are always present in newly drawn blood.

Uses, &c. That of bullocks is employed for the clarification of wines and syrups; also in the preparation of adhesive cements, as the vehicle in coarse paint for out-door work, as a manure, as a bleaching powder, to make pure animal charcoal, and for several other purposes. The blood of sheep, pigs, and bullocks, mixed with flour or oatmeal, and seasoned, is eaten by the common people, but it is rather indigestible, and apt to induce disease. Gut-skins stuffed with this mixture form the black puddings of the vulgar.

Bullock's blood, dried by exposure in thin layers to a current of air, at a heat under 125°, and then reduced to powder, is exported in large quantities to the colonies, where it is used, as a 'clarifier,' in the sugar-works. Dried at a temperature ranging between 212° to 220°, then coarsely powdered, and the dusty portion sifted off, it is much used by fraudulent dealers to adulterate grain-musk. See ANIMAL-CHARCOAL, GLOBULINE, HÆMATOSINE, PLASMA, SERUM, STAINS, VISION, &c.

Spitting of Blood. See HÆMOPTYSIS.

Vomiting of Blood. See STOMACH DISEASES.

BLOOD'-ROOT. *Syn.* RED'-ROOT, PUCCOON'; SANGUINA'RIA, L. The *sanguinaria Canadensis* (Linn.), a papaveraceous plant of North America; also its root (SANGUINA'RIA, Ph. U. S.), which is the part used in medicine. Juice, blood-red, used in dyeing. In small doses (3 to 5 grs.), it is stimulant, diaphoretic, and expectorant; in large ones (10 to 20 grs.), narcotic, emetic, and purgative. The powder is sometimes used as an escharotic. See SANGUINARINE.

BLOOD-STONE. A hard compact variety of hæmatite used to form burnishers. The name is also applied by lapidaries to the heliotrope.

BLOOM. In *perfumery*, &c., a name given to several colorific skin-cosmetics, of which the following are examples:—

Bloom of Almonds (ah'-mündz). *Syn.* AL-MOND-BLOOM. **Prop.** Boil 1 oz. of ground Brazil-wood, in 2½ pints of soft water for 30 minutes, adding the juice of two lemons towards the end; strain, and add ½ oz. of isinglass, ¼ oz. of powdered cochineal, 1 oz. of alum, and ½ oz. of borax; boil again for 4 or 5 minutes, and strain through muslin. Glass or earthenware vessels must be used, as metals injure its colour.

Bloom of Roses. **Prop.** 1. Dried red rose leaves, 1½ oz.; boiling water, 1 pint; infuse in glass or earthenware for 2 hours; press out the

liquor, and add the juice of 3 large lemons; the next day filter, or decant the clear portion. Both the above should be kept in a cool place, otherwise they soon spoil. A little spirit of wine (3 or 4 fl. oz. to the pint) is sometimes added to them, to remove this objection. They are greatly inferior to the following:—

2. Carwine, $\frac{1}{2}$ oz.; strong liquor of ammonia (not weaker than 900), 1 oz.; put them into a stoppered bottle; set it in a cool place, and occasionally agitate it for two or three days, to effect a solution; then add of rose-water, 1 pint; and, after admixture, further add of esprit de rose, $\frac{1}{2}$ fl. oz.; pure rectified spirit, 1 fl. oz.; again well agitate, and set the whole aside for a week; lastly, decant the clear portion from the dregs (if any), for use or sale. Very fine. A cheaper article is made by omitting a portion of the carmine, and the whole of the esprit and spirit; and a still inferior one, by substituting $1\frac{1}{2}$ oz. of silver-grain cochineal (in powder) for the carmine, with digestion for a week in the ammonia previously diluted with one half of the water.

BLOTE. To prepare or cure by drying and smoking; now only applied to fish.

BLOTTER. *Syn.* BLOATER. A blotted fish; *appr.*, a herring slightly salted, and only very slightly dried and smoked.

BLOWPIPE (blō'-). *Syn.* CHALUMEAU, Fr.; LÖTHROHR, Ger. An instrument by means of which the flame of a candle or lamp, or a gas-jet, is directed upon any substance placed to receive it, which is thus subjected to an intense heat. The blowpipe is to the artist, and the experimentalist, what the wind-furnace is to the artisan; but it is proportionately more powerful, convenient, and economical.

Beginners are usually unable to maintain a continued stream of air from the jet of this instrument, although the doing so is really a very simple affair. The operation merely depends on a little artifice in using it, which is more difficult to describe than to acquire. The effect intended to be produced is a continual stream of air for many minutes, if necessary, without interruption, even for an instant. This is done by simply applying the tongue to the roof of the mouth, so as to interrupt the communication between the mouth and the passage of the nostrils; by which means the operator is at liberty to breathe through the nose, at the same time that by the muscles of the lips he forces a continued stream of air from the anterior part of the mouth through the blowpipe. When the mouth begins to be empty it is replenished by the lungs in an instant, while the tongue is withdrawn from the roof of the mouth, and replaced again in the same manner as in pronouncing the monosyllable *tut*. In this way the stream of air may be continued for a long time without fatigue, provided the flame be not urged too impetuously; and even should it be so urged no other inconvenience will be

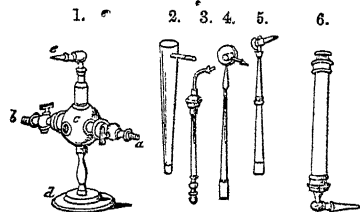

felt than that of slight fatigue of the muscles of the lips.

The hottest portion of the flame produced by the action of the blowpipe is at the tip of the outer white flame, which has also the property of rapidly burning or oxidising substances placed in it which are susceptible of such a change; and it is hence commonly called the **OXIDISING FLAME**. The interior blue flame is, for a like reason, called the **DEOXIDISING or REDUCING FLAME**, as it possesses the property of extracting oxygen from most bodies capable of being so affected.

Substances to be submitted to the action of the blowpipe-flame are placed on a support, which is either a piece of charcoal, or a wire or small spoon of platinum, gold, or silver, as the case may require. Sometimes a plate of cyanite is used. Pine-wood charcoal is preferred for this purpose; and the sides, not the ends of the fibres, are presented to the flame. When a very intense heat is required, the substance operated on should not exceed the size of half a peppercorn.

For producing extreme degrees or heat the flame is blown with a jet of oxygen gas, the instrument being then called an **OXYGEN BLOWPIPE**; or a mixture of oxygen and hydrogen is burned, when it is called an **OXY-HYDROGEN BLOWPIPE**. The heat produced by the last is so great that no substance can stand exposure to it, even the most refractory native compounds being immediately fused. Gold is volatilised, and iron is rapidly consumed the instant it is placed in the flame.

The principal varieties of the blowpipe in general use are figured in the engravings below:—

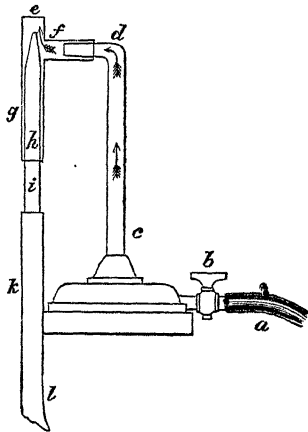

1. Hemming's safety-jet for the oxy-hydrogen blowpipe.
2. Pipe conveying oxygen gas.
3. Pipe conveying hydrogen gas.
4. Ball stuffed with fine wire-gauze.
5. Jet (internal diameter $\frac{1}{80}$ th of an inch).
6. Black's blowpipe.

Beside the above there are several other varieties of the blowpipe occasionally employed; one, in which the air is expelled by the pressure of a column of water, and hence called the **HYDROSTATIC BLOWPIPE**; another, in which the flame is blown with the vapour of boiling alcohol, is named the **SPIRIT-BLOWPIPE**.

Blowpipe, Herepath. For sealing and bend-

ing glass tubes and constructing glass apparatus of various forms, it is convenient to have the blowpipe mounted on a fixed support, and when a flame of considerable power is required, the blast must be supplied by bellows worked with the foot. A very convenient form of blowpipe for these purposes is that invented by Hera-path, and represented in the following figure. *a*

is a flexible tube attached to a stop-cock (*b*), which communicates with a tube (*c d*), bent at right angles at *d*, where a T-shaped tube (*e f g*) slips on by means of the piece *f*. The blowpipe jet (*h i*) passes into the longer arm of the T-piece, and fits somewhat tightly; *k l* is a second piece of flexible tube, terminating in a mouthpiece, or connected with a blowing apparatus. On turning on the gas, it passes in the direction marked by the arrows, and is to be inflamed at *e*. On blowing with the mouth, or by means of a pair of bellows, into the tube *k l*, the ignited gas takes the form of a blowpipe flame of great power, the nature of which is entirely under control by means of the stop-cock *b*, and also by regulating the quantity of air supplied through the tube (*k l*). The T-shaped piece is movable at *f*, so that the jet may be directed to any position. The apparatus may be mounted on a heavy foot, and connected with the gas-supply, by means of the flexible tube, so that it can be placed in any required position on the laboratory table; or it may be permanently fixed on a table specially devoted to the purpose, and having beneath it a pair of bellows worked by a treadle.

BLUB'BER. *Syn.* AD'EPS BALENÆ, L.; GRAISSE DE BALEINE, Fr. The soft fat of whales, and of other large sea-animals, from which the oil (TRAIN' OIL, WHALE' OIL) is obtained by heat.

Sea Blubber. The popular name of several species of marine animals of the genus *medusa*, having a body resembling a large mass of jelly. They are very plentiful in some parts of the

coast of England, and are said to form a rich and cheap manure for pasture and arable land. They are used at the rate of about 1 ton to every 20 or 30 loads of mould, together with a chaldron of lime, per acre. In 3 or 4 months the land is usually found in prime condition. Pilchards, and other fish that swarm upon our coasts, and for which there is not a ready market, may be used in the same way, and are much richer, being, when properly managed, but little inferior to guano.

BLUE (bl'öö). *Syn.* CÆRU'LEUS, L.; BLEU, Fr.; BLAU, Ger. Of the colour of the clear sky, or of any shade of it, whether lighter or darker; *subst.*, a blue colour, blueness (COI'OR CÆRU'LEUS, L.); or a blue colouring material or pigment (CÆRU'LEUM, L.).

BLUE DYE. *Syn.* TEINTE BLEUE, Fr.; BLAU FARBE, Ger. The most permanent blue is that given by indigo, and particularly by what is called the 'indigo-vat.' A variety of shades, of great beauty, and considerable permanence, may also be given by the 'Prussian-blue process.' Cheaper blues are commonly dyed with logwood. Each of these are noticed at length under their respective heads. The following are also employed, and are well adapted for common goods, on the small scale and for domestic use.

1. Give the goods a mordant of alum, or of acetate of alumina ('red liquor'), then rinse them well, and boil them in a bath of logwood, to which a small quantity of blue vitriol has been added; lastly, rinse and dry.

2. Boil the goods for a short time in a bath of logwood; then add to the liquor tartar and verdigris, in the proportion of 1 oz. of each to every lb. of logwood employed; and again boil for a short time.

3. Give the goods a mordant of tartar; lift, add a little chromate of potash; again work for 15 or 20 minutes, and rinse; next boil in a bath of logwood, adding towards the last a few grains more of the chromate; again boil, and finish. The whole quantity of chromate used should not exceed ½ oz. to each lb. of logwood taken for the bath. Very dark.

4. Bilberries, elder-berries, mulberries, privet-berries, and several other like vegetable substances, may be used to die blue, as above, instead of logwood.

Obs. By increasing the proportion of alum or red-liquor the colour verges on purple; and by employing a little acetate of iron or green copperas, the darker shades of blue are produced. Verdigris, blue vitriol, and alkalies, turn it more on the blue; whilst a mordant of tin imparts a violet cast. If much more chromate be used than that ordered the result is a blue-black. See DYEING, INDIGO, LOGWOOD, MORDANTS, PRUSSIAN BLUE, &c.

BLUE PIGMENTS. *Syn.* CÆRU'LEA, &c., L. The preparation of the principal blue pigments of commerce is described under their respective names. In the following list those

for which directions are given are of a miscellaneous and less usual character.

Azure, *Syn.* *Azure Blue*. A name frequently given to smalts. That of the oil-painter is ultramarine, that of the ancients is noticed below. See *AZURE* (p. 165), *ULTRAMARINE*, &c.

Barth's Blue. See *SULPHATE OF INDIGO*.

Berlin' Blue. Prussian blue.

Blue Bice. Native blue carbonate of copper, prepared by grinding and elutriation. That of the shops is generally a factitious compound made from smalts.

Blue Carmine. See *CARMINE* and *SULPHATE OF INDIGO*.

Char'coal-Blue. Carbonised vine-stalks are triturated with an equal weight of salt of tartar or pearlash, the mixture put into a crucible, and heated over the fire until it ceases to swell, the mass being kept well stirred all the time; when cold, it is dissolved in water, and the excess of alkali saturated with dilute sulphuric acid. The liquid becomes blue, and a dark precipitate falls down, which turns of a brilliant blue colour when dried and cautiously heated.

Chi'na-Blue, *Syn.* *Roy'al Smalts*. The crude oxide of cobalt, or zaffre, is ground with an equal weight of potash, and about eight times its weight of felspar, the mixture submitted to fusion in a crucible, and when cold reduced to an impalpable powder. Used to paint pottery, and as a blue pigment.

Cobalt-Blue, *Syn.* *Cobalt'ic Azure*. This is commonly prepared by one or other of the following formulæ:—

1. Zaffre, 1 lb., is dissolved in nitric acid (diluted with an equal weight of water), $\frac{1}{2}$ lb., by digestion for some hours; the solution is evaporated nearly to dryness, and the residuum redissolved in warm water; to this solution, after filtration, a solution of phosphate of soda is added as long as a precipitate forms; this last is collected on a filter, washed with cold water, and mixed, whilst still moist, with 8 times its weight of fresh-precipitated hydrate of alumina; the paste is then dried, and exposed to a cherry-red heat in a crucible, after which the mass is cooled and reduced to a very fine powder.

2. A solution of nitrate of cobalt is precipitated with ammonia-alum, and the precipitate washed, dried, and exposed to a cherry-red heat, as before. The products of the above formulæ are very beautiful and permanent. See *COBALTO-ULTRAMARINE*.

Egyptian Azure, *Alexan'drian Frit*, *Azure of the Ancients*. A mixture of carbonate of soda, 1 lb.; calcined flints, $1\frac{1}{2}$ lb.; copper filings, $\frac{1}{2}$ lb.; (all in fine powder;) fused together in a crucible for 2 or 3 hours, and when cold, reduced to an impalpable powder. A beautiful and unchangeable sky-blue colour. Used in both oil and fresco painting; and as a substitute for smalts, of which, indeed, it is a variety.

Indigo (which see).

Iron-Blue, *Fer'ric Blue*. Ordinary phosphate of iron prepared by precipitating a solution of protosulphate of iron with another of phosphate of soda, the resulting powder being washed, and dried at a gentle heat. A lively sky-blue colour, but without much depth or body.

Blue Lake. See *LAKES* and *SULPHATE OF INDIGO*.

Molybde'num-Blue. From sulphuret of molybdenum, dissolved in nitric acid, and some tin filings and a little muriatic acid added. After digestion for some time, the clear liquid is poured off, and evaporated to dryness. The resulting powder is then mixed with moist hydrate of alumina (as in making cobalt blue), heated to a very dull red, and when it has again become cold, reduced to powder. Used both as a paint and an enamel-colour.

Mountain-Blue. Native carbonate of copper, mixed with more or less earthy matter, reduced to fine powder. That of the shops is often factitious.

Par'is-Blue. Prussian blue.

Pow'der-Blue. Smalts.

Prus'sian Blue (which see).

Queen's Blue. See *STONE-BLUE* (below).

San'der's Blue. Ultramarine-ashes.

Sax'on Blue, *Saxon Azure*. A compound of hydrate of alumina and Prussian blue, prepared as follows:—

1. To sulphate of iron, 1 oz.; and alum, 8 oz.; dissolved in water, 1 gal.; add, simultaneously, separate solutions of prussiate of potash and common pearlash, until they cease to produce a precipitate; after repose collect the deposit, wash it well with water, and dry it.

2. A solution of sulphate of iron is precipitated with another of prussiate of potash, and instantly mixed with the precipitate which has just been obtained by treating a solution of alum with a solution of pearlash; the mixed precipitates being finally treated as before.

Smalts (which see; also *CHINA-BLUE* and *EGYPTIAN AZURE*, above).

Thénard's Blue. See *ULTRAMARINE* (Cobaltic).

Thumb'-Blue, *Cake'-blue*, *Crown'-Blue*, *Fig'-blue*, *Knob'-blue*, *Mech'lenburg-blue* (mèk'-), *Queen's blue*, *Stone-blue*, &c. Names given to the lump-blue used in laundries, which vary according to the quality and the particular form given to it.

Prep. 1. A mixture of powdered starch with sufficient indigo (in impalpable powder) to give the necessary colour, made into a stiff dough with starch-paste, and then formed into lumps or cakes of the desired size and shape, and dried. This forms the ordinary 'washer-woman's blue' of the shops.

2. As the last, but substituting ceruleo-sulphate of potassa or blue carmine¹ for the

¹ See *INDIGO* (Sulphate of).

'powdered indigo' ordered in the last formula. Very fine.

3. As No. 1, but substituting whiting for the powdered starch, and weak size or a decoction of Irish moss for the starch-paste. Inferior.

Uses, &c. Employed by laundresses to impart a faint blue tinge to linen, in order to increase its apparent whiteness. The common forms given to it are that of small balls of about $\frac{1}{2}$ to 1 inch in diameter; the same, but rather larger, and pinched with the thumb and finger in three directions, so as to leave corresponding depressions (THUMB-BLUE); and cakes, which are cut out of the mass, previously rolled into a sheet, by a suitably shaped cutter.

Turnbull's Blue. Ferridcyanide of iron (which see; also TURNBULL'S BLUE).

Blue Verditer. See VERDITER.

Ultramarine' (-rène'), *U.-blue*. See ULTRAMARINE.

BLUSH'ING. *Syn.* RU'BOR, RUBE'DO, L. In *physiology*, &c., the red glow on the cheeks or face occasioned by confusion, bashfulness, surprise, or shame.

Blushing is caused by a sudden increase in the quantity and velocity of the blood in the capillaries, occasioning their turgescence; and, consequently, a heightening of the natural pale-reddish hue of the skin. It is referable to sudden mental emotions of an exciting character, such as surprise, confusion, consciousness of slight, injury, or indignity, and the like. Emotions of a depressing character frequently produce an opposite effect. This is termed pallor; and depends on the rush of blood from the skin and surface of the body upon the internal organs. The first, though often unpleasant, is never dangerous; the last, always so. The cure of the habit of blushing consists in persisting efforts to maintain a sufficient degree of presence of mind and self-confidence to permit of reflection, or a calm view of the exciting circumstance, instead of sinking into a state of temporary mental imbecility and helpless confusion.

BOIL' (boyl). *Syn.* FURUN'GULUS, L.; FURONCLE, Fr.; BEULE, EITERSTOCK, Ger. In *surgery*, a well-known inflammatory tumour, of a superficial and more or less temporary character, which generally terminates by suppuration.

Boils (*furunculæ*) generally attack the healthy and robust during the period of youth and early manhood, and seldom trouble persons who have arrived at the middle age of life.

Treat., &c. When boils begin to appear, and exhibit persistency by daily enlargement and increasing pain, suppuration should be promoted by warm poultices of bread and linseed-meal, to which a little fat or oil may be added, to prevent their getting hard. If poultices are inconvenient, warm and stimulating embro-

cations, or exposure to the vapour of hot water, or the application of stimulating plasters, may be adopted instead. When the tumour is sufficiently 'ripe,' the matter should be evacuated by gentle pressure, and the wound dressed with a little simple ointment spread on a piece of clean lint or linen. The diet may be full and liberal until the maturation of the tumour and the discharge of the matter, when it should be lessened, and the bowels kept gently open by saline purgatives, as Epsom-salt or cream of tartar. When there is a disposition in the constitution to the formation of boils, the bowels should be kept at all times regular, and tonics, as bark or steel, had recourse to, with the frequent use of sea-bathing when possible. An occasional dose of *أبرنيثي* Abernethy-medicines (which see) also often prevents their recurrence. A course of sarsaparilla may be likewise taken with advantage. See ABSCESS, TUMOURS, &c.

BOIL'ERS. See INCrustATION and STEAM.

BOIL'ING. In *cookery*, the operation of dressing food in water at the point of ebullition, or one very closely approaching it. The practice of cooking animal food by boiling, although exceedingly simple, and often most convenient, is neither judicious nor economical when the broth or liquid in which it has been dressed is to be rejected as waste; as in this way, the most nutritious portion of the flesh of animals, consisting of soluble saline and other matter required for the formation of bone, and the nutrition of the muscular tissues, &c., is to a great extent lost. This particularly applies to small pieces so dressed, and to those presenting a large surface to the action of the water in proportion to their weight. Large pieces of meat suffer less in proportion than smaller ones, for the same reason; but even with them the outside should be rejected, as it is both insipid and innutritious compared with the interior portion. To reduce the solvent and deteriorating action of the water to the lowest possible point, the articles to be boiled should not be put into the water until it is in a state of full ebullition, which should be maintained for 5 or 6 minutes afterwards, by which time the surface, and the parts lying immediately beneath it, will have become, to a certain degree, hardened, and will then act as a protective shield to the inner portion of the mass. To induce tenderness, the subsequent operation should be carried on at a mere simmer; the slighter the better. The practice of dressing meat by putting it into cold water, which is then gradually raised to the boiling-point, cannot be too much censured. A $\frac{1}{2}$ of an hour per lb. for dressing young meat, poultry, and small pieces, and 20 minutes per lb. for old, tough, and larger ones, are the usual times allowed by cooks for the purpose. See BOVILLI, FOOD, &c.

BOIL'ING-POINT. See EBULLITION.

BOIS DURCE (bwaish dü-rä-sä). [Fr.] The substance invented in France, and to which

this name is given, is made from sawdust, which, under the influence of a high temperature and the enormous pressure of 600 tons, acquires a degree of hardness very much exceeding that of ordinary wood. It has a very fine grain, and is unaffected by atmospheric variations; but its principal merit is its adaptation to moulding, so that by the most economical processes, forms and impressions are given to it which it would require, in any other way, considerable labour and workmanship.

BOLAS. Sweet light cakes which, according to Mrs. Rundle, are prepared as follows:—Into flour, 2 lbs., pour of warm milk, $\frac{3}{4}$ pint, a small teacupful of yeast, and 6 eggs; make a dough, add of butter, 1 lb. (by degrees), and ~~put~~ in a warm place to rise for an hour; then mix in of powdered sugar, 1 lb.; and make the mass into cakes; put these into cups or tins previously well buttered, and ornament the top with candied orange or lemon peel; lastly bake them. See **CAKES**.

BOLE. *Syn.* BO'LUS, L.; TERRE BOLAIRE, &c., Fr. The name of several argillaceous minerals, varying in colour from white to yellow, red, and brown, which they owe chiefly to iron. See **OCRES** and **RED** and **BROWN** **PIGMENTS**.

BOLOG'NA PHIAL (la-van'-yā). See **PHIALS**.
BO'LUS, [L., Eng.] *Syn.* BOL, Fr. Boluses, in *pharmacy* and *medicine*, are small, roundish masses of medicinal substances, which are taken in the same manner as pills, which they resemble, except in their larger size. Those persons who object to swallowing them in their common state, may wrap them in soft paper, or introduce them into the emptied husks of raisins or grapes.

Boluses (bo'li, L.) are prepared with the same ingredients, and in a similar manner to pills (which see).

BON'-BON (bōng'-bōng). [Fr.] A sugar-plum. See **CONFECTIONERY** and **SUGAR-PLUMS**.

BONE. *Syn.* OS, L., Fr.; BEIN, KNOCHEN, Ger.; BÄN, Sax. The hard substance forming the interior skeleton of animals, or any single part of it.

Comp. According to Berzelius:—

		Human bones.	Ox bones.
Animal matter soluble in boiling water	. . . 32.17	} ... 33.30	
Vascular substance	. . . 1.13		
Triphosphate of calcium, with a little fluoride of calcium	. . . 53.04	... 57.35	
Carbonate of calcium	. . . 11.30	... 3.85	
Phosphate of magnesium	1.16	... 2.05	
Chloride of sodium and other salts	. . . 1.20	... 3.45	
	100	100	

The soluble animal matter is chiefly fat and gelatine.

Uses, &c. The bones of animals are employed for various purposes in the arts, manu-

factures, and domestic economy. Those of good meat form most excellent materials for making soups and gravies, as is well known to every cook. In France, soup is extensively made by subjecting bruised bones to a steam heat of 2 or 3 days' continuance. In England the same is commonly effected in an iron Papin's digester. When the earthy matter of a bone is dissolved out by digesting it in a large quantity of very dilute hydrochloric acid, a lump of gelatine is obtained, which, after being well washed with water, is equal to isinglass for all the purposes of making soups and jellies. The following is the process recommended by Proust for making the best of bones, in hospitals, gaols, and similar establishments:—

The bones, crushed small, are to be boiled for 15 minutes in a kettle of water, and the fat (which is fit for all common purposes) skimmed off, as soon as cold. The bones are then to be ground, and boiled in 8 to 10 times their weight of water (of which that already used must form a part), until half of it is wasted, when a very nutritious jelly will be obtained. Iron vessels should alone be used in this process, as the jelly and soup act upon copper, brass, and the other common metals. The bones of fresh meat are the most productive; those of boiled meat come next, whilst those of roasted meat scarcely afford any jelly. As 'boning' meat before cooking is now a very general practice, a quantity of fresh bones may always be obtained.

Bones are, for the most part, **WROUGHT**, **TURNED**, **BLEACHED**, and **DYED**, in a similar manner to ivory; but with less care, owing to their inexpensive and coarser character. Before being submitted to any of these operations they are, however, first submitted to long boiling, to deprive them of grease.

The bones of living animals may be dyed by mixing madder with their food. The bones of young pigeons may thus be tinged of a rose colour in 24 hours, and of a deep scarlet in 3 days; but the bones of adult animals take a fortnight to acquire even a rose colour. The bones nearest the heart become tinged the soonest. In the same way extract of logwood tinges the bones of young pigeons purple. See **BLEACHING**, **DYEING**, **IVORY**, &c.

BONE'-ASH. Impure triphosphate of calcium, obtained by calcining bones to whiteness, and reducing the ash to fine powder. Used to make pure phosphate of calcium, to form cements, &c.; also sold for burnt hartshorn.

BONE'-DUST. *Syn.* **BONE-MANURE**. Bones (previously boiled for their grease) ground to different degrees of coarseness, in a mill. It is sowed along with the seed in a drill. Wheat thus treated, is said to yield 30 to 50 per cent. more weight in straw and grain than by the common methods. Turnip, and other light soils, it renders more than ordinarily productive. Bone manure is much used in the west of Yorkshire, Holderness, and Lincoln-

shire. The usual quantity per acre is 70 bushels, when used alone; but when mixed with ashes or other common manure, 30 bushels per acre is said to be enough. When coarse, and applied in the same manner as other manures, it has been found to remain upwards of seven years in the ground, the productiveness of which it has increased during the whole time.

BONE'-GLUE. See GELATINE.

BONE'-GREASE. From refuse bones, bruised, boiled in water, and the broth skimmed when cold. *Prod.* $\frac{1}{4}$ th to $\frac{1}{2}$ th of the weight of the dry bones. (Proust.) Used for making soap and candles. See ANIMAL CHARCOAL.

BONE'-PHOSPHATE. See TRIBASIC PHOSPHATE OF LIME.

BONE'-SHAVINGS. *Syn.* BONE'-DUST (Turners'), BONE-TURNINGS. This, by boiling with water, yields a beautiful jelly, which is nearly equal to that produced from hartshorn and ivory shavings, for which it is very frequently sold. Used to make jellies and blanchmanges, to stiffen straw bonnets, &c.

BOOK-BINDING (-bind-). Although a full description of the various operations of this well-known art, or handicraft, does not properly fall within the province of this work, a brief notice of them will probably, in many cases, prove useful to the amateur and the emigrant:—

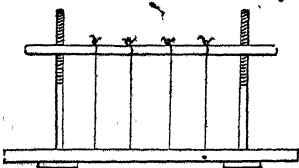

The process of binding books is divided into several distinct operations, which, in large establishments, are usually performed by different persons; such a method being found to produce greater expedition, and better work, than when the whole is done by one person.

The sheets received from the hands of the printer are—

1. *Folded*, which is done correctly by observing the 'marks' or 'signatures' at the bottom of the pages. As the sheets are folded they are laid upon each other in proper order, and are ready to undergo—

2. The operation of *beating*. This is performed by either laying them upon a large stone, and striking them with a heavy smoothed-faced hammer, or by passing them through a rolling-press. The former method is usually adopted in the small way, and the latter on the large scale.

3. The sheets are next *fastened to bands*, which is done by taking them up one by one, and sewing them to pieces of cord, stretched in a little frame screwed or fastened to the counter or table, called the sewing press. (See *engr.*) The number of bands used, is

generally 6 for a folio, 5 for a quarto, and so on proportionally, less than 4 being seldom employed even for small sizes. The ends of the cords being cut off to within about 2 inches of the back, the sheets are ready for—

4. *Glueing*. The back being knocked into shape with a hammer, and the sheets placed in the cutting-press, which is then slightly screwed up, melted glue is thinly and evenly applied. After a short time to permit it to become sufficiently set and hard, the book is removed from the press, and the back properly adjusted with a hammer, when it is again put into the cutting-press, where it is screwed up very tight, and is then ready for—

5. *Cutting*. The instrument employed for this purpose is of a peculiar shape, and called a plough or plough-knife, which consists of a stout flat knife, double-edged at the 'cutting point,' firmly set in a kind of frame, in which it may be adjusted by screws.

6. *Attaching the boards*. The bands are now scraped out fine at the ends, and fastened to the pasteboard intended to form the covers, which is then properly adjusted, and further shaped, if necessary, with a large pair of shears. The edges now undergo the operation of—

7. *Sprinkling, gilding, or other adornment*. The first is performed with a stiff brush made of hog's bristles, dipped in the colour; the brush being held in the one hand, and the hairs moved with the other, so as to scatter the colour in minute drops equally over the surface.

8. The *external covering* of leather, fancy cloth, or paper, is now applied, having been previously soaked in paste, to make it properly adhere. One or more of the blank leaves of the book are next *manufactured* just the inside of the cover, to *manufacture* of; that are turned over, where *ANHYDRIDE*hed; or for choice work, *IDE*. er' for—

9. *RATE*. [Eng., Fr. *te*. Ordinary gold-leaf *AXSAURE SAUZE*, Ge^{of} white of egg; the patten hydrogen of boracic pressure with heated brass radical. The bor design or letters on their sur^{gesting} the hole is then glazed over with white the acid, and polished.

The succession of the above operations sometimes slightly varies with the workmen, and with the nature of the binding. The examination of a bound book during their perusal will, however, render the whole quite familiar to the reader.

There are several varieties of binding, of which only the following deserve notice here:—

BOARDS. A book rather loosely done up, without cutting the edges, and covered with coloured paper or cloth, is said to be in 'boards.'

CLOTH, CLOTH-BINDING. This is the style of binding in which the majority of works are now issued. It admits of great neatness and even beauty, is cheap, and when well executed is very durable.—The prepared cloth (hard-

glazed or varnished calico), cut by a pattern to the proper size, is passed rapidly between the engraved cylinders of a rolling-press, by which the design is given to it. Paste is now applied to each piece of cloth, which is then placed over the volume previously prepared to receive it. In many cases the covers are prepared separately before being embossed, and are afterwards fastened in the finished state to the book by means of a piece of canvas or calico previously affixed to its back for the purpose, when all that is required is to paste the ends of it to the inside of the boards, with the last blank leaf over it. Books in cloth are seldom cut at the edges, unless they are otherwise highly finished.

HALF-BINDING. Books forwarded in boards, and finished with leather backs and corners, are said to be 'half-bound.'

LEATHER-BINDING. A book is only said to be 'bound,' or 'fully bound,' when both its back and sides are wholly covered with one piece of leather.—The leather is wetted by immersion in water, wrung or squeezed, stretched on a smooth board, cut to the proper size, pared thin on the edges, and covered with paste. It is then applied to the book (previously forwarded in boards, and cut), drawn tightly over it, turned down on the inside, rubbed smooth with a folding-stick, and otherwise adjusted; after which it is placed in some suitable situation, at a distance from a fire, to dry.

Rough calf requires to be damped on the grain side with a sponge and water before pasting and covering.

Russia-leather is well soaked in water for an hour, taken out, pressed and rubbed; after which the paste is pressed into the flesh side before covering in a similar manner.

Morocco is first pasted on a board, with the 'bong'. [Fr.] A book, after being pasted, left to dry for a quarter of an hour; after which it is covered with a piece of woollen cloth. [Fr.; BEIN, KNOCRain.]

Roan is either soaked in water or left to soak when pasted. [Fr.] animals, or an

SCHOOL-BINDING. Applied to school-books strongly sewed up 'done up' in sheep-skin, which was either left of a plain brown, or sprinkled or marbled with copperas-water. Similar works of a cheaper class, are now often 'done up' in canvas, brown-holland, and even coarse and strong coloured glazed calico.

Concluding remarks. Numerous patents for improvements in binding books, several of which possess very great merit and usefulness, have been obtained during the last 30 years. Among these, one known as 'Hancock's Patent Binding,' from its extreme novelty, simplicity, durability, and inexpensiveness, deserves a passing notice here. By Mr. Wm. Hancock's method the sheets are folded in double leaves, and being properly placed together and adjusted (by setting them vertically, with the

edges forming the back of the book downwards, in a concave mould so formed that whilst giving shape it may leave the whole breadth, and nearly the whole length exposed), and firmly secured by a few turns of packthread, the book is subjected to the action of a press, and a strong and quick-drying solution of India rubber is smeared over the back with the finger, when the whole is left for 3 or 4 hours, or longer, to dry. The operation is repeated, as often as necessary, after which fillets of cloth are cemented on with the same varnish, and the book is ready to have the boards attached. The sheets of books that cannot be folded in 'double leaves' may be strongly stitched through, separately, before adjusting them in the mould. In this way, several of the usual operations of binding are dispensed with. We most willingly bear testimony to the strength and durability of this method, as well as to the great convenience it affords in allowing the books to open perfectly flat upon a table, or to be distorted in any possible manner, without injury to their backs. It is, undoubtedly, the best way of binding books for travellers. The Editor of the last edition of this work once had a large trunk of books, among which was a massive volume bound on Hancock's plan. All the rest were nearly torn to pieces by a few months' journey, but this one remained uninjured even after five years, during which time it accompanied him in his travels, extending, collectively, to upwards of 23,000 miles. See GILDING, MARBLING, SPRINKLES, STAINS, &c.

BOOTS AND SHOES. The cleaning of boots and shoes forms no unimportant part of the domestic duties of a large establishment; as on it being properly performed depend both their appearance and durability. A votary of St. Crispin, in whom we place considerable reliance, assures us, that to effect this object in the best style, all that is necessary is to employ very little blacking (merely enough to moisten the surface of the leather), and to brush it off whilst still damp. Never make the surface wet, nor allow the blacking to dry before applying the polishing brush. For this purpose, a portion only of the boot or shoe should be attended to at a time. The dirt is, of course, to be carefully brushed off before applying the blacking. When it is desired to restore the shape of a boot or shoe, as well as to clean it, boot trees may be used. Of the brushes, we are told that there should be at least three—one (dirt-brush) with bristles stiff, but not wiry nor scratchy, to remove mud and dirt; another (blacking-brush), with fine, flexible hair, and plenty of it, for applying the blacking; and a third (polishing-brush), covered with long, fine, springy, and slightly stiff hair, for giving the polish. The employment of inferior or worn-out brushes, is said to be false economy, and proves particularly destructive to the lighter classes of leather.

The occasional use of a little oil or grease to the uppers of boots and shoes, increases their

softness and durability, as well as the 'depth,' but not the brilliancy of the polish, from common blacking. For this purpose some good tallow or 'dubbing' may be used; the absorption being aided by a very gentle heat. The soles or bottoms of new boots and shoes may be thoroughly saturated with similar substances, by which means their durability will be fully doubled. The common practice among the shoemakers is to moisten the surface of the leather with a wet sponge before applying the oil or grease; by which (they say) its pores are opened and its absorbent powers increased.

Patent-leather boots and shoes are best cleaned with a little sweet oil or milk, (preferably the first,) the dirt having been previously removed in the usual way.

India-rubber goloshes and overshoes may be cleaned with a sponge or brush, and water, care being taken not to wet the linings. The same applies to gutta percha. See BLACKING, LEATHER, WATERPROOFING, &c.

The reasons why boots and shoes so commonly cause corns, and fatigue, and give pain in wear, are explained in our article on the FEET (which see).

BOOT-POWDER. French chalk reduced to powder by scraping or grating. *Used* to facilitate the 'getting on' of new or tight boots, a little of it being rubbed on the insides of the backs, heels, and insteps.

BOOT-TOP LIQUID. *Syn.* BOOT-TOP COMPOSITION. There are numerous articles of this class extant, but, with few exceptions, they are most unchemical mixtures, not infrequently containing ingredients which are either unnecessary, or opposed to the action of the rest. The following are examples:—

Prep. a. WHITE-TOPI.—1. Oxalic acid and white vitriol, of each, 1 oz.; water, 1½ pint; dissolve.—It is applied with a sponge, the leather having been previously washed with water; after a short time it is washed off with water, when the boot-tops are either dried in a current of air, or by a gentle heat; they are lastly either polished with a brush, so as to appear like new leather, or they are left rough, as the case may require.

2. Sour milk, 1 quart; butter of antimony, cream of tartar, tartaric acid, and burnt alum, of each, 2 oz.; mix.

3. Sour milk (skimmed), 3 pints; cream of tartar, 2 oz.; alum and oxalic acid, of each, 1 oz.

4. Alum, cream of tartar, magnesia, and oxalic acid, of each, 1 oz.; salt of sorrel and sugar of lead, of each, ½ oz.; water, 1 quart. The preceding are for white tops.

b. BROWN-TOP.—Alum, annatto, and oxalic acid, of each, 1 oz.; isinglass and sugar of lead, of each ½ oz.; salt of sorrel, ¼ oz.; water, 1 quart; boil for 10 minutes.

BORACIC ACID (rās'-). H_2BO_3 . *Syn.* BO'RIC ACID, SEDATIVE SALT†, S. S. OF VITRIOL†; ACIDUM BORACICUM (rās'-), L.;

ACIDE BORACIQUE, A. BORIQUE, Fr.; BORAXSAURE, &c., Ger. The pure acid is obtained from common borax. That of commerce is extracted from the boracic acid lagoons of Tuscany.

Prep. 1. Borax, 1 part; boiling water, 4 parts; dissolve, and add sulphuric acid until the solution acquires a distinctly acid reaction, for which purpose about ½ the weight of the borax will be required. As the solution cools, crystals of BORACIC ACID will be deposited. These may be purified by placing them on a filter, and washing them with a little very cold water, followed by re-solution in boiling water, and recrystallisation. Nearly pure.

2. As the last, but substituting hydrochloric acid for the sulphuric acid, there orderd Very nearly pure.

3. By exposing the product of the first crystallisation of either of the preceding formulæ to heat in a platinum crucible, and redissolving and recrystallising the residuum. Chemically pure. *Used* in analysis.

Prop., &c. Odourless; bitter-tasted; dissolves in 25 times its weight of cold water, and in 3 times its weight of boiling water; very soluble in alcohol, which then burns with a bright green flame; reddens litmus; browns turmeric-paper; (Properties characteristic of this substance; when strongly heated it forms a brittle glass (VITRIFIED BORACIC ACID) on cooling. The crystallised acid contains 3 atoms, or 43.5%, of water. Its salts are called BO'RATES.

Uses. Boracic acid was once administered internally, in large doses, as an anodyne, antispasmodic, and sedative, but is now scarcely ever employed as a medicine. The crude acid is used in the manufacture of borax; the pure acid, in the manufacture of certain chemicals.

BORACIC ANHYDRIDE. See BORIC ANHYDRIDE.

BO'RATE. [Eng., Fr.] *Syn.* BO'RAS, L.; BORAXSAURE SALZE, Ger. A salt in which the hydrogen of boracic acid is replaced by a basic radical. The borates may be formed by either digesting the hydrate of the base in a solution of the acid, with the assistance of heat, or from a solution of borax and a soluble salt of the base, by double decomposition. They are all decomposed by the stronger acids.

Tests. The borates may be tested by digesting them in a slight excess of oil of vitriol, evaporating the resulting solution to dryness, powdering the residuum, and dissolving it in alcohol; the resulting solution possesses the property of burning with a green flame if the sample examined was a borate, or contained a notable quantity of one. See BORACIC ACID.

BO'RAX. [Eng., Fr., Ger., L., B. P.] $2NaBO_3 \cdot B_2O_3$. *Syn.* BIBO'RATE OF SODA, BO'RATE OF S*, SUBBO'RATE OF S†, GOLD SOLDER††, REFINED TINC††; SODA-BI-BO'RAS, S. BO'RAS, L.; CHYSSOCOLLE, &c., Fr.; BORAXSAURES NATRON, &c., Ger. Commercial baborate of soda. Borax is obtained

either by purifying native borate of soda (TINC'AL, TINC'AB), or by saturating crude boracic acid with the alkali. It is never prepared on the small scale unless for chemical analysis.

Prop. Crystals, six-sided prisms, which contain 10 equiv. of water, and effloresce in dry air; soluble in 20 parts of cold, and in 6 parts of boiling water; solution has an alkaline reaction on test-paper; by heat it loses its water of crystallisation, and at a higher temperature fuses to a glass-like substance (see below).

Pur. This may be ascertained by determining the quantity of sulphuric acid required to neutralise a given weight of the sample under examination, as indicated by litmus paper. Common salt and alum are frequently mixed with borax to lower the value. The first may be detected by a solution in hot water giving a curdy-white precipitate with nitrate of silver, soluble in ammonia; the last, by water of ammonia, giving a bulky-white pulverulent precipitate. The former must be distinguished from the white pulverulent precipitate of borate of silver, which is thrown down from pure borax.

Uses, &c. Borax is extensively employed as a flux for metals, for soldering, and in medicine. Internally, it is diuretic, sedative, emmenagogue, and refrigerant, in doses of 15 to 40 grs.; externally, made into a gargle for sore throat, and in powder as a detergent in aphthæ, and ulcerations of the mouth. Dissolved in rose-water, it is used as a cosmetic; and mixed with about 8 times its weight of lard, forms a useful ointment in piles and sore nipples.

Borax, Glass of. Borax dried at a gentle heat, and then melted by increasing the heat until it forms a vitreous mass on being cooled. Used in soldering, and as a flux, particularly in blowpipe experiments.

BO'RIC ACID. See BORACIC ACID.

BORIC ANHYDRIDE. B_2O_3 . *Syn.* ANHYDROUS BORACIC ACID, BORACIC ANHYDRIDE, BORIC OXIDE. The only known oxide of boron. It can be produced by burning boron in oxygen, in the air, or in nitrous oxide, but is most easily and economically prepared by strongly heating boracic acid so as to deprive it of water. It is a brittle vitreous solid, not volatilised by heat except in the presence of water. Dissolves in water, forming boracic acid. Its alcoholic solution burns with a green flame, like that of boracic acid.

BORON. B. The base of boracic acid. It was discovered by Homberg in 1702; but, from attracting little notice, was soon forgotten. It was rediscovered almost simultaneously, by Sir H. Davy, and by Gay-Lussac and Thénard, in 1807-8.

Prep. Boron is prepared by a process similar to that employed to obtain silicium:—Potassium and perfectly dry boracic acid, or, preferably, boro-fluoride of potassium, inti-

mately mixed together, are placed in a glass adapter-tube, and submitted to a low red heat. When cold, the loose cork that fastened its mouth is removed, and hot water poured in, in successive portions, until the whole matter is detached and all its soluble portion dissolved; the liquid is next allowed to settle, and the precipitate washed first with a solution of sal-ammoniac, and afterwards with alcohol; the residuum (boron) is lastly dried in a capsule, and put into a well-stoppered phial.

Prop., &c. A solid, tasteless, and inodorous powder, of a dark grayish-brown colour. With sulphur it unites at high temperatures, forming sulphurets (sulphides of boron); and when placed in chlorine gas it spontaneously inflames, and a gaseous chloride of boron is formed. The compounds of boron with simple bodies are termed BO'RIDES (-îdz) or BO'RURETS*.

Obs. Among the most remarkable of the recent discoveries in chemistry, are those of M.M. Wohler and Deville, relative to silica and boron. Each of these substances is now proved to exist in three very different states, analogous to the three known states of carbon, namely, charcoal, graphite, and diamond. The last of these states is, of course, the most interesting. Crystallised boron possesses a hardness, brightness, and refractive power, comparable to those of the diamond; it burns in chlorine, without residue, and with circumstances resembling those of the combustion of diamond in oxygen; it is not acted on by any of the acids, and appears to be the least alterable of all the simple bodies. Its powder is already used in the arts, instead of diamond-dust; and it seems not improbable that, when obtained by the chemist in crystals of a larger size, it may rival even the diamond as a gem.

Boron, Terflu'oride of. See FLUOBORIC ACID.

BOTTLES (bôt'îz). See GLASS, INFANCY, LACTATION, PHIALS, PHOSPHORUS, &c.

BOTT'LING (bôt'l'îng). See CORES, MALT LIQUORS, WINE, &c.

BOUGIE (bôv'-zhê). [Fr.] *Syn.* CÉRÉUS, CÉRÉOLUS,¹ CANDE'LA PROBATO'RIA*, L. In surgery, a long slender instrument, originally of wax,² introduced into the urethra, œsophagus, or rectum, in stricture and other diseases of those organs.

Prep. 1. (Prof. Pickel's.) Amber (melted), 1 part; boiled oil, 3 parts; mix, cool a little, and further add of oil of turpentine, 1 part; spread the mixture, at 3 successive intervals, upon loose spun-silk cord or web; dry in a heat of 150° Fahr., and repeat the process until the instrument has acquired the proper size; lastly, polish it, first with pumice-stone, and afterwards with tripoli and oil. This is the original receipt of the once celebrated French professor Pickel, and is still generally

¹ Properly, a 'little bougie.'

² Hence the name.

to be dreaded from those made of the uncoloured material when of good quality.

BOUILLI (bōōl'ye). [Fr.] A name frequently applied by cooks to dishes of boiled or stewed meat, as a refinement on its plain English synonyms. Thus, *beef bouilli*, *beef in bouilli*, &c., mean stewed or boiled beef, &c. As, however, the name is à la français, so must be the 'accompaniments,' which generally consist of herbs and vegetable seasoning in greater quantity and variety than is usually deemed essential for an humble dish of English boiled or stewed meat.

BOUQUET' (bōō-kā'). [Fr.] A nosegay. In perfumery, highly scented spirits (*esprits*) adapted for the handkerchief are commonly called *bouquets*. The following are examples:—

Bouquet de la Reine. *Prep.* 1. • Essence of bergamot, 1 dr.; English oil of lavender, 25 drops; oil of cloves, aromatic vinegar, and essence of musk, of each, 10 drops; alcohol, 1 fl. oz.; mix.

2. Oils of begamot and lavender, of each, 30 drops; neroli, 15 drops; oils of verbena and cloves, of each, 5 drops; essences of musk, ambergris, and jasmin, of each, $\frac{1}{2}$ dr.; rectified spirit of wine (strongest, scentless), 2 fl. oz.; mix. A much-esteemed perfume.

BRA'GRAS. Tar, black resin, and the dregs of strained resin, melted together.

BRAIN (brāne). *Syn.* **BRAINS**†; CER'E-BRUM, L.; CERVEAU, Fr.; GEHIRN, HIERN, Ger. The soft whitish mass of nerve-matter contained in the skull of animals, and, in man, supposed to be the seat of the soul and the mind.

Brains. (In *cookery*.) There appears to be scarcely anything which is at all eatable, that the ingenuity and taste of the modern cook does not appropriate to his purposes, and clothe with delectability, or transform into something execrable. We observe that our chef de cuisine—no unimportant personage—has taxed every viscera and brought together every novelty, and dainty to humour and excite the appetite. Animals which were guiltless of brains whilst living, are found by him to possess excellent ones when dead, from which he prepares a variety of miniature dishes, which are truly novel and inviting. Let frugal housewives for the future carefully value their brains, and apply them to useful purposes in a double sense. When cleaned, washed, blanched, and flavoured with the necessary seasoning, they may be formed into a variety of hors-d'œuvres, creditable to any table. Mrs. Rundell tells us, that “beat up with a little white pepper and salt, a sage-leaf or two

3. (Piderit's.) Olive oil, 1 part; wax, 6 parts; as before.

4. (Bell's.) Lead-plaster, 11 parts; yellow wax, 4 parts; olive oil, 1 part.

5. (St. B. Hosp.) Wax, 12 parts; Chio turpentine, 4 parts; red sulphide of mercury, 1 part.

6. CAOUTCHOUC BOUGIES:— In France, where ether is comparatively inexpensive, these are made by applying an ethereal solution of India rubber to the silk or foil prepared as before. In England, naphtha was, until recently, employed instead of ether; but it furnishes a very inferior product. Now bisulphuretted carbon, or generally used as the solvent. Sometimes pieces of India rubber, previously boiled in ether, or that have had their edges softened in moistening them with a little ether, saturate sulphuretted carbon, are wound round the 'cylinders' or 'foils' and kept in their place handy by means of tape applied over them. The end stores, wards carefully smoothed off and collectable.

7. GUTTA induce BOUGIES:—These are formed of *various*, Br. (previously softened by immersion in names of water), by rolling it between skillful, and strength of glass or marble. When gutta is obtained, as the best (uncoloured) a bougie distillation, an admirable instruments. And a slight delicate injection, of moderate size, and a slight of COGNAC is mixed with glycerine, or gum-wax of the is passed through the whole length of the of a healthy person without officially color and of a slightest pain. Gutta-percha is kept in water, and hence, even a flexible and hence, called (aw bougies) are still more in the unrequited called, induced, and may remain in the unrequited, ag time without causing irritation. ed. "or common" tant advantage in such matters. "e," or spoilt will cannot, however, be too careful to about 0.947 made of coloured gutta-percha, with the 'ordinary' nately, rapidly become very brittle, and Those originally manu- factured in India, and were coloured black, and were of spirit to 1, breaking whilst in use; a disaster from which it is several serious and even fatal cases of fatalities, there is no such danger.

(scalded and finely chopped), and the yolk of an egg, and fried, they make excellent cakes, fritters, &c."

BRAN. *Syn.* FUR/FUR, L.; BRAN, SON, Fr.; KLEIB, Ger. The inner husk or proper coat of the cereal grains, sifted from the flour; appr., that of wheat. *Comp.* 100 parts of bran contain albuminoid bodies, 13.80; oil, 5.56; starch, fibre, &c., 61.67; ash, 6.11; water, 12.85.

Uses, &c. The bran of wheat, diffused through hot water, is largely employed by the calico-printers to remove the colouring matter from those parts of their goods which are not mordanted. A handful mixed with a pail of warm water forms an excellent emollient foot-bath. Infused in hot water (bran-tea), and sweetened, it forms a popular demulcent, much used in coughs and hoarseness, and which, taken in quantity, proves gently laxative. It also forms an excellent manure, and, from containing the ammoniaco-magnesian phosphate, is especially adapted as a 'dressing' for potatoes. It is frequently mixed with flour, and made into bread (bran-bread), which is eaten by the poorer orders for economy, and by the higher classes because it is recommended by the faculty as being more wholesome than white wheaten-bread.

BRANDY. *Syn.* SPIRITUS GAL'LICUS, S. VINI GAL'LICI (-is; B. P.). A'QUA VITÆ*, L.; EAU-DE-VIE, Fr.; BRANNTWEIN, COGNAC, Ger.; BRANDYWINE†. A well-known spirituous liquor obtained by the distillation of the wine of grapes. The name is also often, though improperly, given to the spirit distilled from other liquors, and particularly from the fermented juice of fruits; but in this case, usually with some qualifying epithet.

When first distilled, brandy, like other spirituous liquors, is colourless (WHITE BRANDY), and continues so if kept in glass or stoneware; but if stored in new oak casks, as is, usually the case, it gradually acquires a yellowish tint from the wood (PALE BRANDY). The deep colour that this spirit frequently possesses when it reaches the consumer, is imparted to it by the addition of a little burnt sugar (caramel). Catechu, or terra japonica, in powder or solution, is also sometimes added to give a roughness to the spirit. The original intention was merely to imitate the appearance acquired by brandy from great age, when kept in wood; but in process of time the thing has come to be overdone. The natural colour which the spirit receives from the cask, however long it may be kept in it, never exceeds a light amber tint, about equal to that of pale Jamaica rum. Nothing, however, will now please the public taste but a spirit of lively and full 'brandy-colour,' as it is called. The consequence is, that more colouring is commonly added than is compatible with a rich appearance or a very fine flavour.

The brandies most esteemed in England are imported from France, and are those of Cognac

and Armagnac, the preference being generally given to the former. The brandies of Rochelle and Bordeaux come next in quality, while those obtained from Portugal, Spain, and Italy, are very inferior.

The constituents of pure brandy are alcohol and water, together with small quantities of a volatile oil, acetic acid, acetic ether, æthanolic ether, colouring matter, and tannin. It is from the presence of the two ethers that the spirit derives its characteristic smell and flavour. The amount of absolute alcohol in brandy varies from 45 to 55 per cent. When first imported, it is generally 1 or 2 over-proof, but its strength decreases by age, and by the time it is taken from the bonded store for sale, it is seldom stronger than 3 or 4 under proof. Pure brandies of the best quality, even when new, seldom exceed proof, and are generally a little below it. The reason of this is that they are but slightly rectified, as redistillation tends to injure the ethereal oils, upon which the flavour of the brandy depends.

The quality and flavour of the brandy imported from France vary, and often considerably from that which is drunk at the best tables on the Continent; this principally arises from it being prepared, or, as it is technically termed, 'made up,' for the London market, which means lowering it by the addition of plain spirit, colouring, &c. This is done to any extent desired, the prices of the substance and the quantity added being set out in the invoice so added are regular. Foreign brandy is sold in England varies fixed in proof to 33 under proof. In large quantities, and from bond, the strength, of course the spirit; a fine old brandy being, perhaps, 17 u. p., while one of the last year's vint. See a common quality, may be as strong as 20 to 25 u. p. These matters a See GLASS, &c. experienced brandy dealers (PROBATORS, &c. in France there are). See CORKS, &c. brandy, which are known

of their qualities, so [Fr.] *Syn.* CÉREUS, "Eau-de-vie supérieure" PROBATO'RIA*, L. In pale white wines by ski instrument, originally remarkable for its relief to the urethra, vesophthalmia forms the finest varieture and other diseases both 'white' and 'f' drinker, being seldom arel's.) Amber (melted), deepest tint, though for arts; mix, cool a little, exceeds a pale amber; of turpentine, 1 part; thus coloured, it is fit 3 successive intervals, brandy' by the uninitiated cord or web; dry in a "Eau-de-vie ordinaire" and repeat the process is distilled from inferiorias acquired the proper wines; average sp. gr. first with pumice-stone, to 27 u. p.). It forms tripoli and oil. This is of the taverns and hotp the once celebrated 'made up' with plain sel, and is still generally very large portion of the little bongie. Of each of the above name.

ther increased in number by their admixture, and by the addition to them of plain spirit.

"*Eau-de-vie de marc.*" From the lees of sour, damaged, and inferior red wines, the marc or cake of grapes, &c., distilled by a quick fire, to drive over as much essential oil and flavouring matter as possible. Coarse flavoured and inferior. Used chiefly to mix with other brandy, or to flavour plain spirit.

"*Eau-de-vie seconde.*" The weak spirit that passes over, after the receiver has been changed. Very weak and inferior.

"*Eau-de-vie à preuve d'Hollande.*" Sp. gr. .941 to .942 (18 to 20 u. p.). The common strength at which brandy is retailed in France, and that at which it stands the 'proof' or 'bead.'

"*Eau-de-vie à preuve d'huile.*" Sp. gr. .9185 (about 23° Baumé, or 1½ o. p.); pure olive oil just sinks in it. It is the strongest brandy kept for retail sale in France.

"*Eau-de-vie forte.*" From common brandy distilled at a low temperature. It answers to our spirit of wine. Sp. gr. .839 (38° Baumé, or 55° o. p.).

"*Esprit de vin*" is brandy or spirit, carefully rectified to .861 (28° Baumé, or 42 o. p. and upwards).

Pur., &c. The method of determining the strength of brandy is explained under 'ALCOHOMETRY.' Of the large quantity of this liquor consumed in England, we can assure the reader, that a small fraction only escapes adulteration. Pure French brandy is indeed an article quite unattainable by the small consumer. The brandy of our shops and taverns is not only systematically 'lowered' a little (with spirit of wine or British brandy) by the wholesale dealer, but it undergoes a like process, but to a much greater extent, at the hands of the retailer. The only method to obtain perfectly pure brandy is either to take it direct from the bond store, or to buy it of some respectable party, and to pay a price with no inducement to dishonesty. When this is done, British brandy had better be purchased, by which money will be more advantageously employed, and a more wholesome article obtained. It is obtained, as already noticed, is comparatively with water, malt brandy, and delicate by which its original flavour is preserved and unaltered. This specially colored brandy is best detected by the addition of water, and is very uncommon, and hence, by the retailers, is to reduce the strength of a large quantity of water. In consequence their liquor suffers from want of vigour, and its deficiency in strength is so apparent, that they soon resort to either abandoning the ordinary, or resorting to others of a different character to disguise it. The method most commonly adopted. An equal quantity of water is immediately introduced, followed by sundry powerful varieties, such as pepper, grains of paradise, &c., to give it a

pungency and 'make-believe strength' that "passes muster" with the petty consumer. This fraud may be detected by gently evaporating a little of the suspected liquor in a spoon or glass capsule, when the acrid matter, colouring, and sugar, will be left behind, and may be readily detected by their flavour, sweetness, glutinosity, &c. A little perfectly pure brandy evaporated in a similar manner, (on a watch-glass, for instance,) merely leaves a trifling discoloration on the surface of the glass. *Genuine French brandy* always reddens blue litmus paper, from containing a little acetic acid; the old coloured varieties are also blackened by a solution of a persalt of iron. Sometimes brandy is contaminated with a small quantity of 'lead' or 'copper,' derived from the apparatus or utensils with which it has been prepared or measured. 'Sugar of lead' has also sometimes been used by the ignorant dealer to clarify it. The presence of these highly deleterious substances may be detected in the following manner:—

1. COPPER:—*a.* A small piece of clean polished iron or steel immersed in the suspected liquid for a short time (with agitation) becomes coated with a film of *metallic copper*, when that metal is present. To facilitate the precipitation of the metal, the sample under examination may be slightly acidulated with a few drops of pure acetic acid. Minute traces of copper may sometimes be detected on the surface of the iron with a lens, which would be passed over unnoticed by the naked eye.

b. (Böttger.) A little of the brandy is to be agitated with a few drops of pure olive oil. The latter will acquire a green colour if copper be present.

2. LEAD:—*a.* Sulphuretted hydrogen and hydrosulphuret of ammonia produce a *black precipitate* or *discoloration* in brandy containing lead.—*b.* A solution of sulphate of soda (*Glauber-salts*), or water soured with sulphuric acid, produces a heavy white precipitate, which turns *black* when moistened with hydrosulphuret of ammonia.

Concluding remarks. In the 'trade,' the addition of water ('*liquor*') to spirit is technically called '*reducing*,' whilst absolute adulteration is known under the questionable name '*improving*.' Both of these operations have now been so long practised with impunity as to form the leading qualifications demanded in a cellarman.

The following formulae for '*reducing*' brandy are those of two large wholesale dealers, who consider themselves much more honest than their brethren in the same line:

1. *Cognac brandy* (10 u. p.), 20 galls.; *British brandy* (17 u. p.), 5 galls.; *water*, 4 galls. Strength of mixture, 25 u. p.

2. To 72 galls. of *full-flavoured French brandy* (5 u. p.) are added 10 galls. of *spirit of wine* (58 o. p.); 25 galls. of *water*, and 1 pint of *good colouring*. The whole is then well 'rummaged up,' and allowed to stand for two

days, when it is fit for use. Strength of mixture, 22 u. p.

A liqueur, sold in London under the name of "brandy improver," or "brandy essence," consists of a thin sugar syrup, flavoured with acetic ether and essence of cayenne, and coloured with burnt sugar. It is said to heighten the true Cognac flavour, and restore lost alcoholic strength.

Brandy, British. *Syn.* MALT BRANDY, &c. For a long time this liquor was distilled from spoiled wine and the dregs of wine, both British and foreign, mixed with beer-bottoms, spoiled raisins, and similar substances. Malt and molasses spirit were afterwards employed, as at the present day, for the purpose; but it was long considered as "an unpardonable and wicked misuse of these articles." Modern experience, however, has proved that pure malt spirit is, in this country, the most convenient, if not the best kind, to form the basis of an imitation brandy.

Prep. 1. To 12 galls. of *malt spirit* (finest and flavourless), at proof, add, of *water*, 5 galls.; *crude red tartar* or *wine-stone*, $\frac{3}{4}$ lb. (previously dissolved in 1 gal. of *boiling water*); *acetic ether*, 6 fl. oz.; *French wine-vinegar*, 2 quarts; *French plums* (bruised), 5 lbs.; *sherry wine-bottoms*, $\frac{1}{2}$ gal.; mix in a sherry or French brandy cask, and let them stand for about a month, frequently 'rummaging up' the liquor with a stick; next draw over 15 galls. of the mixture from a still furnished with an agitator. Put the 'rectified spirit' into a clean, fresh-emptied Cognac-brandy cask, and add of *tincture of catechu*, 1 pint; oak shavings, 1 lb.; and *spirit colouring*, $\frac{1}{2}$ pint; agitate occasionally for a few days, and then let it repose for a week, when it will be fit for use. *Prod.*, 15 galls. of BRANDY, 17 u. p. Age greatly improves it.

2. *Malt spirit* (as before), 99 galls.; *red tartar* (dissolved), 7 lbs.; *acetic ether*, $\frac{3}{4}$ gall.; *wine-vinegar*, 5 galls.; *bruised raisins* or *French plums*, 14 lbs.; *bitter-almond cake* (bruised and steeped for twenty-four hours in twice its weight of water, which must be used with it), $\frac{1}{2}$ lb.; *water*, q. s.; macerate as before, and draw over, with a quick fire, 120 galls. To the distilled spirit add a few lbs. of *oak shavings*; 2 lbs. of *powdered catechu* (made into a paste with hot water), and *spirit colouring*, q. s.; and 'finish' as in the last. *Prod.*, 120 galls. of spirit, fully 17 u. p. Equal in quality to the last.

3. *Clean spirit* (17 u. p.), 100 galls.; *nitrous ether*, 2 quarts; *cassia buds* (ground) 4 oz.; *bitter-almond meal*, 5 oz.; *orris-root* (sliced), 6 oz.; *powdered cloves*, 1 oz.; *capsicum*, $\frac{1}{2}$ oz.; *good vinegar*, 3 galls.; *brandy colouring*, 3 pints; *powdered catechu*, 2 lbs.; *full-flavoured Jamaica rum*, 2 galls. Mix in an empty Cognac 'piece,' and macerate for a fortnight, with occasional stirring. *Prod.*, 106 galls., at 21 or 22 u. p.

4. *Malt spirit* (17 u. p.), 100 galls.; *catechu*,

2 lbs.; *tincture of vanilla*, $\frac{1}{2}$ pint; *burnt-sugar colouring*, 1 quart; *good rum*, 3 galls.; *acetic* or *nitrous ether*, 2 quarts. Mix as the last.

5. *Clean spirit* (17 u. p.), 89 galls.; *high-flavoured Cognac*, 10 galls.; *oil of cassia*, 2 drs.; *oil of bitter almonds*, 3 drs.; *powdered catechu*, 1 lb.; *cream of tartar*, (dissolved), $\frac{1}{4}$ lb.; *Beaufoy's concentrated acetic acid*, $\frac{1}{2}$ gal.; *sugar colouring*, 2 to 3 pints; *good rum*, 1 gal. When the above mixtures are distilled, the French brandy, colouring, and catechu, should be added to the distilled spirit.

6. To *plain spirit* (coloured), at 17 u. p., add a little *tincture of catechu*, and a sufficient quantity of *eau-de-vie de marc*, or of the *oil distilled from wine-lees*, to flavour it.

Obs. The oil referred to in the last formula is obtained by distillation from the lees of wine, either dried and made up into cakes, or in their wet state, mixed with about 7 or 8 times their weight of water. This oil should be kept dissolved in alcohol, as it is otherwise apt to lose its flavour. Brandy from any part of the world may be very closely imitated, by distilling the oil from the lees of the wines produced in that particular district. Where black tea is cheap, as in the United States of America, it is very commonly employed to impart the roughness of brandy to the coloured spirit, and the subsequent addition of a little 'flavouring' greatly improves it. A really good article of cider-spirit thus treated forms a passable 'mock brandy.' In conclusion, we may remark that, as the strength and quality of ingredients frequently vary, and success depends greatly on skill in manipulation, much must be left to the experience, judgment, and discretion of the operator. In all cases he must recollect that a certain degree of 'age' is absolutely necessary to give a high character to any spirit. Indeed, to age in the one case, and its absence in the other, may be referred the reasons why French brandy and British brandy, apart from mere shades of flavour, so materially differ.

The production of a flavoured British spirit closely resembling French brandy is a subject well worthy of the attention of the ingenious chemist, rectifier, and cellarman, as a matter of profit; and of the amateur, as affording an interesting field for useful and amusing experiment.

Brandy, Caraway. A species of cordial commonly prepared as follows:—1. *Caraway-seeds* (bruised), 4 oz.; *lump sugar*, 2 lbs.; *British brandy*, 1 gal.; macerate a fortnight, occasionally shaking the bottle.—2. *Sugar*, 1 lb.; *caraway-seeds* (bruised), 1 oz.; 3 *bitter almonds* (grated); *spirit colouring*, 1 oz.; *plain spirit* or *gin* (22 u. p.), $\frac{1}{2}$ gal.; as before. Some persons omit the colouring.

Brandy, Cherry. *Prep. 1.* Brandy and cherries (crushed), of each, 1 gal.; let them lie together for 3 days, then express the liquor, and add 2 lbs. of lump sugar; in a week, or two, decant the clear portion for use.

2. To the last add 1 quart of raspberry juice, and $\frac{1}{2}$ a pint of orange-flower water. Both the above are excellent.

3. Treacle, 1 cwt.; spirit (45 u. p.), 41 galls.; bitter almonds (bruised), 1 lb. (or more or less to taste); cloves, 1 oz.; cassia, 2 oz.; macerate a month, frequently stirring. This is the article now commonly vended in the shops and at stalls for cherry brandy.

Obs. Equal part of fully ripe Morello cherries and black cherries produce the richest cordial. Some persons prick each cherry separately with a needle instead of crushing them; in which case they retain them in the liquor, and serve up a few of them in each glass. The plan named in the first formula is, however, that usually adopted. On the small scale, the fruit is commonly bruised between the fingers. A portion only (if any) of the stones in the cherries should be crushed, to impart a nutty flavour. See LIQUETTERS.

Brandy, Cider. From *cider* and *perry*; also from the *marc* of apples and *pear*s fermented. It is very largely manufactured in the United States of America and Canada, where it may be purchased for about 2s. 1d. a gallon. See BRITISH BRANDY (above).

Brandy, Dant'zic. From *rye*, ground with the *root* of *calamus aromaticus*. It has a mixed flavour of orris and cinnamon.

Brandy, Guern'sey. Beet-root spirit flavoured.

Brandy, Lem'on. Prep. 1. Fresh lemons (sliced), 1 dozen; brandy, 1 gal.; macerate for a week, press out the liquor, and add of lump sugar, 1 lb.

2. Proof spirit, 7 galls.; essence of lemon, 3 drs.; sugar, 5 lbs.; tartaric acid, 1 oz.; (dissolved in) water, 2 galls.; turmeric powder or spirit-colouring, a dessert-spoonful; as before. Sometimes milk is added to the above, in the proportion of 1 quart (boiling hot) to every gallon.

Brandy, Malt. See BRITISH BRANDY.

Brandy, Or'ange. As lemon brandy, but employing oranges.

Brandy, Pale. This article has been already referred to. (See p. 248.) That of the gin-shops and publicans is generally a spurious article, made by mixing together about equal parts of good brown French brandy, clean spirit of wine, and soft water, and allowing the whole to stand until the next day to 'fine down.' If the first is 9 u. p., and the second, 58 o. p., the product will be 17 u. p. Any deficiency of strength is made up by adding a little more spirit of wine.

Brandy, Pat'ent. The article so much be-puffed under this name, by certain houses, is merely very clean malt-spirit mixed with about 1-7th of its bulk (or less) of strong-flavoured Cognac, and a little colouring.

Brandy, Peach. From *peaches*, by fermentation and distillation. Much used in the United States, where peaches are very plentiful, and consequently cheap. A cordial spirit under the same name is prepared as follows:—

1. From *peaches*, sliced and steeped in twice their weight of British brandy or malt-spirit, as in making cherry brandy.

2. Bitter almonds (bruised), 3 oz.; proof spirit (pale), 10 galls.; water, 3 galls.; sugar, 5 or 6 lbs.; orange-flower water, $\frac{1}{2}$ a pint; macerate for 14 days. Add brandy-colouring, if required darker.

Brandy, Rais'in (râ'zn). See SPIRIT (Raisin).

Brandy, Rasp'berry (râ'z'-). From rasp-berries, as directed under CHERRY BRANDY. Sometimes a little cinnamon and cloves are added. The only addition, however, that really improves the flavour or bouquet, is a little orange-flower water, a very little essence of vanilla, or a single drop of essence of ambergris.

Brandy, White. See BRANDY (p. 248) and PALE BRANDY (above).

BRASS. *Syn.* *Æs*, *Æ'* RIS METAL'LUM, L.; AIRAIN, LATON, CUIVRE JAUNE, Fr.; ERZ, MESSING, Ger.; BRÆS, Sax. A well-known alloy of copper and zinc.

Prep. Brass is now generally manufactured by plunging copper, in slips, into zinc melted in the usual manner. The former metal rapidly combines with the fluid mass, and the addition is continued until an alloy somewhat difficult of fusion is formed, when the remainder of the copper is at once added. The brass thus obtained is broken into pieces, and remelted under charcoal, and a proper addition of either zinc or copper made, to bring it up to the colour and quality desired. It is next poured into moulds of granite. Before being submitted to the rolling-press for reduction to thin plates, it undergoes the operation of annealing.

The proportions of the metals forming this alloy are varied according to the desired colour, and the purposes to which it is to be applied. The following formulæ are founded chiefly on analyses of standard brasses and yellow metals, made expressly for this work. Small fractions are omitted; the nearest whole numbers being generally taken:—

a. FINE BRASS:—1. Copper, 2 parts; zinc, 1 part; either combined, as explained above, or the two metals separately melted, suddenly poured together, and united by vigorous stirring.

2. Copper, 7 parts; zinc, 3 parts. Bright yellow; malleable.

3. Fine copper, 4 parts; zinc, 1 part. Deeper coloured than the last; an excellent and very useful alloy.

b. MALLEABLE BRASS:—1. Copper, 33 parts; zinc, 25 parts; as before.

2. Copper, 3 parts; zinc, 2 parts. These alloys are malleable whilst hot.

c. RED BRASS. This name is commonly applied to all those alloys which do not contain more than 18 to 20% of zinc. In the deeper-coloured foreign varieties (RED TOM'BACK) the per-centage of copper occasionally amounts to 88, 90, or even 92%.

d. **YELLOW BRASS.** See **FINE BRASS** (above):

e. **BUTTON-BRASS**.—1. *Copper*, 8 parts; *zinc*, 5 parts. This is the 'PLATIN' of the Birmingham makers.

2. *Yellow brass*, 16 parts; *zinc*, 2 parts; *tin*, 1 part. Paler than the last.

3. *Copper*, 25 parts; *zinc*, 20 parts; *lead*, 3 parts; *tin*, 2 parts. Pale; used for common buttons.

f. For **FINE CASTINGS**.—1. As *fine brass*, according to the colour desired. (See above.)

2. *Copper*, 62 parts; *zinc*, 35 parts; *lead*, 2 parts; *tin*, 1 part.

3. *Copper*, 60 parts; *zinc*, 36 parts; *tin*, 4 parts. Both the last two are rather pale and brittle.

4. *Copper*, 90 parts; *zinc*, 7 parts; *tin*, 2 parts; *lead*, 1 part. Rich deep colour.

5. *Copper*, 91 parts; *zinc*, 5 parts; *tin*, 3 parts; *lead*, 1 part; as the last.

g. For **GILDING**.—1. As *fine brass* (above).

2. *Copper*, 64 parts; *zinc*, 32 parts; *lead*, 3 parts; *tin*, 1 part.

3. *Copper*, 82 parts; *zinc*, 18 parts; *tin*, 3 parts; *lead*, 1 part.

h. For **SOLDER**.—1. *Fine brass*, 12 parts; *zinc*, 6 parts; *tin*, 1 part; melted together.

2. *Brass*, 2 parts; *zinc*, 1 part; as before.

3. *Brass*, 3 parts; *zinc*, 1 part. Very strong. Used for soldering tubes and other like purposes requiring great strength. The above alloys form the 'HARD SOLDER' of the braziers. For certain purposes a little silver is added to them, when the compound receives the name of 'SILVER-SOLDER.'

i. For **TURNING**.—1. *Fine brass*, 98 parts; *lead*, 2 parts; melted together.

2. *Copper*, 61 parts; *zinc*, 36 parts; *lead*, 3 parts.

3. *Copper*, 65 parts; *zinc*, 33 parts; *lead*, 2 parts.

j. For **WIRE**.—1. *Copper*, 72 parts; *zinc*, 28 parts; the resulting alloy being subsequently properly annealed.

2. *Copper*, 64 parts; *zinc*, 34 parts; as before.

3. To the last add of *lead*, 2 parts.

Anal. This may be briefly described as follows:—

a. 100 grs. of the alloy is digested in nitric acid. The insoluble portion is peroxide of tin, every 74 grs. of which, when washed and dried, contain 58 grs. of metallic tin.

b. Sulphuric acid is added to the nitric solution as long as a white precipitate falls; after a time the precipitate is collected on a filter, washed with a mixture of water and alcohol, and ignited in a porcelain crucible. Every 152 grs. of the residuum represents 104 grs. of metallic lead.

c. The liquid filtered from the precipitate of sulphate of lead is treated with a stream of sulphuretted hydrogen; the precipitate is collected on a filter, washed with water mixed with a little sulphuretted hydrogen, dried, and

digested in pure nitric acid until the sulphur which separates acquires its natural full yellow colour; the resulting solution is next diluted with water, and reprecipitated with potassa, the whole being boiled until the precipitated oxide of copper becomes of a deep brown or black; it is then collected on a filter, washed, dried, ignited in a platinum crucible, and weighed therein immediately after it becomes cold. Every 40 grs. of oxide of copper thus obtained represents 32 grs. of pure copper.

d. The liquid poured from the precipitate of sulphide of copper is boiled for about a minute, when it is precipitated with a solution of carbonate of sodium; the whole is then boiled for a few minutes, and the precipitated oxide of zinc collected, washed, dried, and ignited. Every 40 grs. of this oxide contains 32 grs. of metallic zinc.

Concluding remarks. In the adoption of his formula the operator should be entirely led by the object he has in view. The larger the proportion of copper, the deeper will be the colour, and the greater the density, and, within certain limits, the toughness of the alloy. Zinc lessens the specific gravity and colour. Tin gives it hardness and grain; whilst lead toughens it, and renders it fitter for turning. These facts are known to every experienced brass-founder. See **ALLOYS, COPPER, MOSAIC GOLD, PRINCE'S METAL, TOMBAK, &c.**

BRASS-COLOUR. *Syn.* **BRASS-PIGMENT, B-BRONZE.** *Prep.* 1. Grind copper filings, or the precipitated powder of copper, with a little red ochre. Red-coloured.

2. *Gold-coloured brass, or Dutch leaf*, reduced to a very fine powder. Yellow or gold coloured.

Obs. Before application these powders are mixed up with pale varnish, no more being worked up at once than is wanted for immediate use. They are also applied by dusting them over any surface previously covered with varnish to make them adhere.

BRASS-PASTE. *Prep.* 1. *Soft soap*, 2 oz.; *rotten-stone*, 4 oz.; beaten to a paste.

2. *Rotten-stone* made into a paste with sweet oil.

3. *Rotten-stone*, 4 oz.; *oxalic acid* (in fine powder), 1 oz.; *sweet oil*, 1½ oz.; turpentine, q. s. to make a paste.

Obs. The above are used to clean brass-work, when neither varnished nor lacquered. The first and last are best applied with a little water; the second, with a little spirit of turpentine or sweet oil. Both require friction with soft leather. See **BRASS-WORK, PASTES, &c.**

BRASS-STAIN. *Prep.* 1. Sheet-brass (cut into small pieces), is exposed to a strong heat for 2 or 3 days, then powdered, and again further exposed in a like manner for several days; the whole is then reduced to fine powder, and exposed, a third time, to heat, testing it occasionally, to see if it be sufficiently burnt.

When a little of it, fused with glass, makes the latter swell and froth up, the process is complete. It imparts to glass a green tint, passing into turquoise.

2. Equal parts of plate-brass and sulphur are stratified together in a crucible, and calcined, until they become friable; the whole is then reduced to powder, and exposed to heat as before. This imparts a calcedony red or yellow tinge to glass by fusion; the precise shade of colour being modified by the mode of using it.

Obs. The common practice in the glass-houses is to conduct the calcination by exposing the metal, placed on tiles, in the leer or annealing arch of the furnace; a plan both convenient and economical.

BRASS-WORK. Articles of brass and copper, when not varnished or lacquered, may be cleaned and polished with sweet oil and tripoli, rotten-stone, or powdered bath-brick, applied with friction, on flannel, and 'finished off' with leather; due care being taken to ensure the absence of anything gritty, which would scratch and disfigure the surface of the metal. A strong solution of oxalic acid in water gives brass a fine colour. Vitriol and spirits of salts make brass and copper very bright, but the polish thus obtained soon tarnishes, and the articles consequently require more frequent cleaning. A strong lye of roche alum and water also improves the appearance of brass. In all cases where acids or saline matter has been used, the metal should be at once well rinsed in clean water, and then wiped dry, and finally dry polished with soft leather.

BRASS INLAID-WORK may be cleaned with tripoli and linseed oil, applied by a rubber of felt or leather; the whole being afterwards thoroughly rubbed off, and then finished with clean soft leather. The ornaments of a French clock, and similar articles, are said to be best cleaned with bread-crumbs, carefully rubbed, so as not to injure the wood-work. **OR-MOLU CANDLESTICKS, LAMPS, and BRANCHES,** may be cleaned with soap and water. **LACQUERED and GILDED ARTICLES** are spoiled by frequent rubbing, and by acids and alkaline leys.

A fine colour may be given to **BRASS ORNAMENTS**, when not gilt or lacquered, with a little sal-ammoniac, in fine powder, moistened with soft water. The articles must be afterwards rubbed dry with bran and whiting. Another plan is to wash the brass-work with a strong lye of roche alum (1 oz. to water 1 pint), and after rinsing it in clean water and drying it, to finish it off with fine tripoli. These processes give to brass the brilliancy of gold. See **BRASS-PASTE**.

BRASSING. *Syn.* **BRASS-COATING.** 1. Copper-plates and copper-rods may be covered with a superficial coating of brass by simply exposing them, in a heated state, to the fumes given off by melted zinc at a high temperature. The coated plates and rods are rolled into

thin sheets or drawn into wire. The spurious gold wire of Lyons is said to be made in this way.

2. Vessels of copper may be coated with brass, internally, by filling them with water strongly soured with hydrochloric acid, adding some amalgam of zinc and cream of tartar, and then boiling the whole for a short time. This plan may be usefully applied in certain cases to copper boilers in laboratories, and to other purposes.

3. By the electrotype (which *see*).

BRAWN. A boar or its flesh. When young, the horny parts feel moderately tender. If the rind is hard, it is old. (Mrs. Rundell.) Also, in cookery, the flesh of the boar, or of swine, collared so as to squeeze out as much of the fat as possible, boiled, and pickled.

Mock Brawn. *Prep.* (Mrs. Rundell.) Take the head and belly-piece of a young porker, well saltpetred; split the head and boil it; take out the bones and cut it to pieces; then take 4 ox-feet, boiled tender, and cut them in thin pieces; lay them in the belly-piece with the head cut small; roll it up tight with sheet tin, and boil it 4 or 5 hours. When it comes out set it up on one end, put a trencher on it (within the tin), press it down with a heavy weight, and let it stand all night. The next morning take it out of the tin and bind it with a fillet, put it in cold salt-and-water, and it will be fit for use; it will keep a long time, if fresh salt-and-water are put into it about once every four days.

BRAZIL-WOOD (-zéle-). *Syn.* **BRAZIL-T; LIG'NUM BRAZILIEN'SE, L.; BOIS DE BRÉSIL, Fr.** A dye-stuff furnished by several species of trees of the genus *caesalpinia*, and much used in dyeing various shades of red. The usual practice is to boil it for some hours in hard spring-water, and to keep the resulting decoction for some time, or until it undergoes a species of fermentation; as it is thus found to yield more permanent and beautiful colours than when employed fresh. The following are examples of its application:—

a. For **COTTON**:—

1. The goods are first boiled in a bath of sumach, next worked through a weak mordant of solution of tin, and then run through the Brazil bath lukewarm. This gives a bright red.

2. The goods are alumed, rinsed, next mordanted with solution of tin, rinsed again, and then turned through the Brazil dye bath. This gives a rose colour.

b. For **LINEN**:—This, for the most part, is similar to that adopted for *Cotton*.

c. For **SILK**:—The goods, after being alumed in the same way as wool, but at a lower temperature, are rinsed, and passed through the Brazil-wood bath lukewarm.

d. For **WOOL**:—The goods are first steeped or boiled in a weak mordant of alum and tartar, for 1 hour, and then allowed to lie in the cold liquor for 2 or 3 days, with frequent

moving about; they are lastly boiled in the Brazil-wood bath for about $\frac{1}{2}$ an hour.

Obs. The shades of colour given with Brazil-wood may be modified by varying the strength of the bath, the mordant, &c. The addition of a little alum turns it on the purple. A little alkali added to the bath, or passing the goods, after being dyed, through water holding a little alkali in solution, produces what is called false crimson. A deep crimson is obtained by adding a little logwood to the Brazil-wood bath. 1 lb. of Brazil-wood, $\frac{1}{2}$ oz. of alum, and 2 oz. of tartar, are sufficient to dye from 20 to 28 lbs. of cotton, according to the depth of shade required. See DYEING, RED DYES, &c.

BRAZIL'INE (-zêl'-in). *Syn.* BREZE'LINE, SAPAN'INE. The colouring matter of Brazil-wood. It forms small orange-coloured needles, soluble in both water and alcohol. Alkalies turn it violet; acids, yellow.

BRA'ZING. The operation of uniting pieces of copper, brass, iron, &c., by means of hard solder.

Proc. The edges, after being filed or scraped quite clean, are covered with a mixture of hard solder and powdered borax, made into a paste with water. The whole is then allowed to dry, and is afterwards exposed, in a clear fire, to a heat sufficient to melt the solder. See AUTOGENOUS, SOLDERING, SOLDERS, &c.

BREAD (brêd). *Syn.* PA'NIS, L.; PAIN, Fr.; BRÖD, Ger.; BRÖD, Dut.; BRÖD, Dan., Swed.; BREOD, Sax. Loaves or cakes made from ground corn, and constituting the staple article of food of all civilised nations.

This important article of food is made of the flour of different cereal grains, but only those that contain gluten admit of conversion into light or spongy bread. In this respect wheat-flour is superior to all others. When this flour is made into a paste or dough with water, and the dough, previous to baking, is left for some time in a moderately warm place, a state of fermentation comes on, owing to the sugar of the flour gradually undergoing the process of conversion into alcohol, in every respect similar to that which takes place during the fermentation of wine and beer. In this process a large quantity of carbonic acid gas is liberated, and the toughness of the dough preventing its escape, the whole mass becomes puffed up and spongy, and a light porous paste is formed, the porosity of which is still further increased by the heat of the oven. The natural process of fermenting the dough just described is, however, tedious and uncertain, whilst the dough has a tendency to run into the acetous fermentation, and to acquire a sour and disagreeable taste, by which it is rendered less nutritious, and less easy of digestion. This has led to the use of a ferment, which produces a similar condition more speedily, and with greater certainty. Leaven or dough was originally employed for this

purpose, and the bread so made was hence called LEAVENED BREAD. At the present time barm or yeast is almost universally used for this purpose. All that is essential to make a loaf of bread, is to add a proper quantity of yeast to the dough, and to allow it to remain for a short time in a warm place, and as soon as it rises or becomes spongy, to subject it to the process of baking.

In preparing his dough, the modern baker takes a part of the water needed for the batch, and having rendered it tepid or lukewarm (80° to 90° Fahr.) by the addition of boiling water, dissolves his salt in it, and adds the yeast, together with a portion of the flour. With these he forms a thin dough, which he sets aside in a moderately warm place provided for the purpose, and technically called the 'kneading trough,' 'prover,' or 'tryer,' where it soon begins to ferment and swell up. This process is called 'setting the sponge,' and according to the proportion the water in it bears to the whole quantity that is to be used, it receives the name of 'whole,' 'half,' or 'quarter sponge.' Here, the sponge heaves and swells, and ultimately the surface bursts and subsides, and if not checked, swells again and again in a similar manner, and would continue to do so, until the whole of the 'saccharine matter' was destroyed, and the dough had become sour. The baker is careful, however, to stop it before it has communicated a sourness to the mass. After the first, or at the furthest, after the second or third 'dropping of the sponge,' he adds the remaining quantity of flour, water, and salt, necessary to form the 'batch,' and then kneads the whole until it becomes sufficiently tough and elastic to bear the pressure of the hand without adhering to it. The 'dough' is now left to itself for a few hours, during which the fermentation still goes on. The inflated mass is then again kneaded, cut into pieces, weighed, and shaped into loaves. In an hour, or two, these unbaked loaves swell up to nearly double their former size, and are then placed in the oven, and baked. During this operation they continue for a time to increase in size, in consequence of the dilation of the pent-up gas by the heat. At length the fermentation is checked, and the dough becomes too solid to admit of further alteration.

Such are the principles and practice of the art of baking. The operations are precisely the same on both the small and the large scale, and therefore need not be separately described.

Adult. The adulteration of both flour and bread is carried to a fearful extent, more especially in London. The bakers' flour is very often made of the worst kinds of damaged foreign wheat; and other cereal grains, and particularly beans, are mixed with them in grinding them into flour. In this capital no fewer than six distinct kinds of wheaten flour are brought into the market—*fine flour*,

seconds, middlings, fine middlings, coarse middlings, and twenty-penny flour.

Among the principal substances which have been proved to have been used to adulterate wheat-flour and bread are the following:—

*Alum.	*Plaster of Paris.
*Ammonia (Sesquicarbonate).	*Potash (Carbonate and bicarbonate).
**Beans.	**Potatoes.
*Bone dust.	**Rice.
*Chalk.	**Soda (Carbonate and sesquicarbonate).
Clay.	*Starch (Potato).
Copper (Sulphate).	**Water (in excess).
Lime (Sulphate from the soda water makers).	Zinc (Sulphate).
*Magnesia (Carbonate).	

Of these substances, those marked thus (*) are very frequently used; and those marked thus (**), almost universally so.

According to Mr. Accum, the smallest quantity of alum that can be employed with effect to produce white, light, and porous bread, from the inferior kinds of flour commonly used by the bakers, is from 3 to 4 oz. to a sack of flour weighing 280 lbs. But Dr. P. Markham states, that the ordinary bread of the London baker is made of one sack or 5 bushels of flour; 8 oz. of alum; 4 lbs. of salt; $\frac{1}{2}$ gal. of yeast; and about 3 galls. of water. Our own analyses, extending to many hundred samples of London bread, as well as those of other chemists, show that even this large quantity of alum is often very much exceeded by the bakers.

Alkaline substances, as the carbonates of ammonia, soda, and potash, are often employed to realise the important consideration of producing light and porous bread from spoiled, or, as it is technically called, sour flour. The first salt becomes temporarily converted into a gaseous state during the operation of baking, causing the dough to swell up in minute bubbles, which thus render it light and porous; the salt itself being at the same time, for the most part, volatilised. Alum is added, not only with a like intention, but also to enable the dough to carry more water. There are several instances of convictions on record of millers and bakers having used gypsum, chalk, and pipeclay, in the manufacture of their goods. A gentleman lately writing from the North of England, says that he found in one sample of flour, which he recently examined, upwards of 16 $\frac{1}{2}$ of gypsum; and in another, 12 $\frac{1}{2}$ of the same earth.

A few years since it was discovered that some of the bakers in France and Belgium added blue vitriol to their dough to make it take more water, in the same way as the English baker uses alum. 1 oz. of this sulphate was dissolved in a quart of water, and a wine-glassful of this solution added to the

water necessary to make about 50 4-lb. loaves. This enormous crime was soon detected, and deservedly caused the ruin of its heartless perpetrators.

Exam. The principal adulterants above referred to are fortunately easy of detection. The following are the simple and most approved methods for this purpose:—

1. ALUM:—*a.* (Robine and Parisot.) About $\frac{1}{4}$ lb. of the suspected bread (somewhat stale or dry) is reduced to crumbs, macerated for 2 or 3 hours in cold water, and then squeezed through a clean piece of white linen. The liquid is next evaporated to dryness at a steam-heat, the residuum redissolved in a little hot water, and the solution filtered. Liquor of ammonia or a solution of sal-ammoniac, and a solution of chloride of barium, added to the filtered liquid, give a white precipitate when ALUM is present.

When nearly the whole of the alum has suffered decomposition in the loaf, as is frequently the case, the following process is required:—

b. (M. Kuhlman.) 4 or 5 oz. of bread are reduced to ash, which is powdered and treated with nitric acid, the mixture evaporated to dryness, and about 1 oz. of hot water added. A little caustic potassa is added to the last solution (unfiltered), the whole boiled a few minutes, and passed through a filter. The filtrate is next tested with a solution of sal-ammoniac, and the whole again boiled for 2 or 3 minutes. If a precipitate forms it is alumina; every 50 grs. of which are equivalent to 332 grs. of crystallised alum.

c. The suspected sample is wetted with a weak solution of logwood, or, preferably, of cochineal. Pure bread is only slightly stained by this solution; bread containing alum strikes a lavender, lilac, or purple colour, according to the quantity of the adulterant present. If it acquires a pearl-gray, or bluish tint, some alkali (potash, soda, or ammonia) is present.

2. COPPER:—*a.* Moisten the suspected bread with a few drops of a solution of ferrocyanide of potassium. It will assume a pinkish-brown colour if copper be present.

b. A little of the bread may be steeped in hot water, or better still in water spured with a little nitric acid, and the clear liquor squeezed or poured off, and tested with ferrocyanide of potassium, as before.

3. MAGNESIA:—Bread adulterated with magnesia, on digestion in hot water acidulated with sulphuric acid, furnishes a liquid which gives a white precipitate when tested with a solution of either carbonate of potassa or of carbonate of soda, especially on boiling.

4. SODA; POTASSA:—Hot water after digestion on the ashes or charcoal turns turmeric paper brown. The liquid may be evaporated to dryness, redissolved in distilled water, slightly acidulated with hydrochloric acid, and tested with bichloride of platinum. If a yellow crystalline precipitate forms, either as

once or after some hours, it is potash; otherwise, the alkali present is soda.

5. CHALK, WHITING, BURN'T BONES, PLASTER OF PARIS, and similar substances, are easily detected by calcining a little of the flour or bread in a clean open vessel, when the amount of ash left will indicate the quantity of adulteration. The quantity of the ash left by genuine bread or flour is very trifling indeed, about $\frac{2}{10}$.

Concluding remarks. A number of processes are used by cooks and confectioners to make the different varieties of fancy bread, cakes, puddings, &c., which vary according to the peculiar characteristic it is desired to communicate to them; but none of these articles properly belong to the trade of the common baker. Thus, some kinds of cakes and pastes are made to eat 'short,' as it is called, or are rendered less tenacious, and a species of brittleness imparted to them, by the addition of starch, rice-flour, or sugar. In pastry a similar effect and peculiar lightness is produced by butter or lard, whilst in some articles, white-of-egg, gum-water, isinglass, and other adhesive substances, are added to produce an exceedingly light and porous mass.

The different varieties of bread made in England vary, in their quality, chiefly according to the flour of which they are formed. The best WHITE BREAD is made from the purest wheat-flour; ordinary WHEATEN BREAD, of flour containing a little of the finest bran; SECONDS, from flour containing a still larger proportion of bran; and common HOUSEHOLD-BREAD, from flour produced by grinding the whole substance of the grain, without any separation of the bran. The last variety is undoubtedly the most wholesome and nutritious, although that least frequently used. SYMNEL-BREAD, MANCHET or ROLL-BREAD, and FRENCH BREAD, are varieties made of the purest flour, from the finest wheat, a little milk being usually added for rolls, and butter and eggs for choicer purposes. Several other minor kinds of bread are also made, varied by the addition of sundry trifles, as sugar, currants, and other palatable ingredients. The SCOTCH SHORT-BREAD is made from a very thick dough, to which butter, sugar, orange-peel, and spices, are added, according to the taste of the maker.

In the manufacture of white bread from damaged or inferior flour, a large quantity of alum is employed by the fraudulent baker, as already noticed; but with the 'best flour' no alum is required. The utmost beauty, sponginess, and sweetness may be given to bread without the addition of one particle of alum, provided the best materials alone enter into its composition. As such materials are seldom employed by the bakers, the usual practice is to introduce 4 or 5 oz. of alum to every sack of flour, or about 1 oz. to each bushel; and very frequently fully double this quantity of alum is employed. But even this enormous

quantity is often not the whole of the alum present in common bread; for the miller, in order to cheat the baker, puts in the 'doctor,' in the shape of 4 to 6 oz. of alum to the sack, whilst the baker, unconscious of this victimisation, subsequently uses a double dose of alum in order to cheat his customers.¹ The method of detecting this pernicious adulteration has been already explained. The proper quantity of salt is 4 lbs., and never more than 5 lbs., to the sack, or 1 lb. per bushel. One sack of the best flour, with 4 or 5 lbs. of salt, yields about 360 lbs. of good bread; and a sack of seconds, 345 to 350 lbs. of bread; each being moderately baked. If the loaves are well-baked or over-baked, the product will be from 345 to 350 lbs. only; but if they are slack-baked or under-baked, from 370 lbs. to 385 lbs. of crumbling bread may be obtained from 1 sack of good white flour.

The attention of chemists has, at various times, been directed in search of some method to rectify or lessen the effects of bad harvesting and improper storage on grain, so that a damaged or inferior article might be rendered serviceable, and available for human food. Prof. E. Davy recommends the addition of $\frac{1}{4}$ oz. of carbonate of magnesia to about every 3 lbs. of sour, melted, heated, and similarly damaged flour. This substance materially improves the quality of the bread, "even when made from the worst new seconds flour;" whilst it is said to be perfectly harmless; and the bread so prepared, for temporary use, is certainly unobjectionable. What effects would arise from the daily consumption of such bread for several months has not been determined; but it is doubtful whether it would prove salutary. Indeed there are sufficient reasons for condemning the adoption of such bread in the general diet of a people for any very lengthened period.² Our own experiments in bread-making, extending over a long period of years, lead us to prefer carbonate or bicarbonate of soda, for the purpose. Theoretically, the corresponding salts of potassa would be preferable. A mixture of equal parts of the bicarbonates of potassa and of soda, will, perhaps, ultimately be found to be more useful than either substance used separately.

In times of scarcity and famine various substances, besides the flour of the cereals, have been made into bread, or have been mixed with it, in order to lessen the quantity of the former required by the people. For this purpose, almost every amylaceous vegetable at once plentiful and cheap, has, in its turn, been eagerly appropriated. Acorns, beech-mast, the leguminous seeds, numerous

¹ The common excuse of the bakers for using alum is, that without it the bread is not sufficiently white to please their customers, and that the batches are not easily parted into loaves after baking; but Liebig has shown that clear lime-water, which is perfectly harmless, will effect the same object if substituted for the sulphuric water used to make the dough.

² See GORTRE, MAGNESIA, &c.

starchy bulbous roots, and similar substances, have been employed, either in the form of meal, or made into an emulsion or jelly, which has been used instead of water to form the flour of bread-corn into a dough. At such times bran, the most nutritious and valuable portion of the grain, although usually rejected as worthless, has been retained in the flour, and has even been added to it in excess. Birkenmayer, a brewer of Constance, during a period of scarcity, succeeded in manufacturing bread from the farinaceous residue of beer (brewer's grains). 10 lbs. of this substance, rubbed to a paste, with $\frac{1}{2}$ lb. of yeast, 5 lbs. of ordinary meal, and a handful of salt, produces 14 lbs. of **BLACK BREAD**, which is said to be "both savoury and nourishing." The nutritious quality of brewers' grains is shown by their extensive employment at the present day as food for pigs and cattle, and particularly for milch cows. In like manner Iceland, Caragheen, and other mosses, have been made into bread, either alone, or mixed with flour meal. They are used, in the first case, in a state of meal, in the same way as flour; the second case, 7 lbs. of moss are directed to be boiled in 10 or 12 galls. of water, and resulting glutinous liquid or jelly to be employed to make 70 lbs. of flour into dough, which is then fermented and baked in the usual way. It is said that flour thus produces 7 double its weight of good household-bread. A simpler plan is to mix 1 lb. of lichen with 3 or 4 lbs. of flour; the bitterness the lichen having been first extracted by boiling it in cold water. Bread so prepared of late been highly recommended for the sick and dyspeptic. The modern baker is the habit of mixing large quantities of potatoes with his bread, whenever he can purchase them at paying prices. Mealy potatoes are selected, and are carefully mashed or pressed, and the dry flour is worked into this or dough, which is then mixed with the water in the usual manner. For inferior bread, equal weights of potato pulp and dry flour are often used. Bread so prepared eats well, and is deficient in sponginess, and in the fine yellowish-white tint which forms one of the characteristics of pure wheaten bread. Of late, rice boiled with water to a pulp, has got into very extensive use among bakers. A 'sponge' is made with a portion of the jelly thickened with some flour; the whole process is conducted in the ordinary manner, except that the fermentation is generally more slowly conducted and allowed to proceed for a longer period. Flour so treated yields fully 50% more bread than when merely mixed up with yeast and water. This substitutes the process of Messrs. Moriaud, Martin, and Journet, of Paris, which was adopted, a few years since, at Marylebone Workhouse. The experiment succeeded, but the result to the public has been, that the London bakers have adopted the plan, and

now very generally surcharge their bread with such an excess of water that, in many cases, it only possesses two thirds the amount of nourishment which it did before the publication of the system just referred to. Unfortunately, the cupidity of dishonest tradesmen appears to be continually impelling them to avail themselves of the exertions of philanthropists and the discoveries of science, in order to increase their profits, regardless alike of the quality of their commodities and the health of their customers. Bread containing an excess of water rapidly becomes sour and mouldy, and is apt to disorder the digestive functions of those who eat it.

From the experiments of Dr. Colquhoun, it appears that the starch of flour is partially converted into sugar during the process of fermenting and baking the dough, and thus contributes to the sweetness of the bread. He proposes to add to the flour, arrow-root, the farina of potatoes, and similar amylaceous substances, made into a jelly with hot water, for this purpose. Dr. Percival has recommended the addition of salep with the same intention. 1 oz. of salep, dissolved in 1 quart of water; 2 lbs. of flour; 80 grs. of salt; and 2 ozs. of yeast, gave 3 lbs. 2 oz. of good bread. The same weight of materials, without the salep, gave only 2 $\frac{1}{2}$ lbs. If too much salep is added, it gives its peculiar flavour to the bread.

In reference to the above substitutions, and to the relative quantity of bread produced from any given weight of flour, the reader should remember that the mere increase of the weight or bulk of the product does not carry with it a corresponding increase of the nutritive elements contained in the flour. These remain the same in all cases; and just in proportion as the product, in bread, is greater, will be the decrease in the value of such bread as food. So also with potatoes, rice, and other farinaceous and pulpy substances used as substitutes for wheat-flour. Their poverty in nitrogenous matter, or flesh-formers, is so great, that the greatly increased quantity required as food, to support the body, apart from mere inconvenience, more than compensates for their apparent low price. Thus, good wheaten bread at 2d. per lb., is more than twice as cheap as potatoes at 1d.; for, assuming 2 lbs. of the first as a day's food, 10 lbs. of the last will be required for the same purpose; and even this large quantity will scarcely effect the desired object. Liebig has demonstrated, that, regard being had to the nutritive power of wheat, it is, under all ordinary circumstances, the cheapest article of food provided by nature for man.

In the preceding article we have not entered into particulars respecting oven management, because, on the large scale, it is thoroughly understood by every practical baker. For the instruction of the busy housewife, we may state that the oven should always

be sufficiently heated before the bread is put into it, in order that the gas contained in the cells of the 'sponge' may be expanded as rapidly as possible by the heat, and the resulting light mass quickly rendered sufficiently solid to prevent its subsequent collapse. The heat should also be maintained at nearly the same temperature during the whole of the time the bread is submitted to its action. In general, with ordinary kitchen ovens properly heated, 30 minutes' baking is sufficient for one-pound loaves and cakes; and 15 minutes in addition for every pound after the first, for larger ones. Thus, a 1 lb. loaf requires $\frac{1}{2}$ hour; a 2 lb. loaf $\frac{3}{4}$ hour; and a 4 lb. loaf, 1 $\frac{1}{2}$ hour.

It is the common ambition of the English baker to give that peculiar tint to the crust of his bread in the process of baking which is so highly esteemed by connoisseurs, and so successfully produced by the Viennese and Parisians. It has been long known at Vienna, that if the hearth of an oven be cleaned with a moistened wisp of straw, the crust of bread baked in it immediately afterwards, presents a beautiful yellow tint. It was thence inferred that this peculiarity depends on the vapour, which being condensed on the roof of the oven, falls back on the bread. At Paris, in order to secure, with certainty so desirable an appearance, the hearth of the oven is generally laid so as to form an inclined plane, with a rise of about 11 inches in 3 feet; and the arched roof is built lower at the end nearest the door, as compared with the further extremity. When the oven is charged, the entrance is closed with a wet bundle of straw. By this arrangement the steam is driven down on the bread, and a golden-yellow crust is given to it, as if it had been previously covered with the yolk of an egg.

Pure wheaten bread is one of the most wholesome articles of food, and has been justly termed the 'staff of life.' When well fermented and baked, it is very easy of digestion. It should never be eaten until it has stood at least 24 hours after being taken out of the oven. When newer, bread is apt to disagree with the stomach, frequently producing indigestion, biliousness, diarrhoea, dyspepsia, and other like ailments. Bread prepared from meal containing the whole of the bran is the most nutritious and digestible, and should alone be given to children and growing persons, and eaten by the dyspeptic and delicate. See ALBUROMETER, ALUM, FLOUR, WHEAT, &c.

Bread, Aerated. For a full description of the method of preparing this article, see Watts' 'Dic. of Chemistry.'

Bread, American. From American barreled flour. "14 lbs. of American flour will make 21 $\frac{1}{2}$ lbs. of bread; whereas the best sort of English flour produces only 18 $\frac{1}{2}$ lbs. of bread." (Mrs. Rundell.) This arises from the superior quality of the wheat used in its production; and also from its being kiln-dried before

grinding, by which much water is off.

Bread, Bee. The matter collected to form the bottom of the hive. It is a mixture of resin and wax. Its fum formerly thought to be anti-asthmatic.

Bread, Bran. 1. From the whole meal out sifting out any of the bran.

2. By adding about 3 oz. of bran to of ordinary flour.

Bread, Extemporaneous. See UNFERMENTED BREAD.

Bread, French. *Prep.* 1. From fine the best white bread. For the better and for those intended for rolls and small bread, the sponge and dough is covered with milk and water, and, occasionally a very little butter is added. "When, or small fancy loaves have lain in a quantity about a quarter of an hour, turn them over the other side for about a quarter of longer. Then take them out and cover with a knife, which will make them spongy, and of a fine yellow; whereas takes off this fine colour, and renders it less inviting."

2. FRENCH SOUP-BREAD. From the usual but employing fully double the usual of salt. It is baked in thin loaves, so nearly all crust, by which means it is more soluble in hot soup.

Bread, Hick's Patent. This is bread baked in an oven so arranged that the vapours arising during the process are condensed in a suitable receiver. The liquor is a crude, weak spirit, produced by the fermentation of the dough, and of little commercial value; indeed, insufficient to pay for the expenses attending its distillation. Besides which, the bread prepared under this patent was rejected by the vulgar, who refused to go to the shops of the neighbouring bakers to profess to sell their bread with it.

Bread, Household. This name is given to bread made with flour fit only the coarser portion of the bran removed; and to bread prepared from a mixture of flour and potatoes. The are examples:—

1. (Rev. Mr. Haggett.) Remove the bran from flour, 14 lbs.; boil the 1 gal. of water until reduced to one gallon, strain, cool, and knead in the flour, and yeast as for other bread. Very good.

2. Flour, 7 lbs.; mealy potatoes (dried), 3 lbs.; as before. Objections to reasons already given.

Bread, Leavened. (Léven.) Using instead of yeast, and in the same way 1 lb. to each bushel of flour is sufficient. The more leaven used, the better the bread made with it will be; and the sweeter the leaven, the less taste. Leaven, except among the sailors, is now superseded by yeast.

Bread, London White (lūn'-). The common proportions of the London bakers are—Flour, 1 sack; common salt, $4\frac{1}{2}$ lbs.; alum, 5 oz.; yeast, 4 pints; warm water for the sponge (about) 3 galls. The process has been already noticed.

Bread, Paris White. The following has been handed to us as the plan commonly adopted by the Paris bakers for their best white bread:—On 80 lbs. of the dough (before the yeast was added) from yesterday's baking, as much luke-warm water is poured as will be required to make 320 lbs. of flour into a rather thin dough; as soon as this has risen, 80 lbs. are taken out and reserved in a warm place as leaven for the next day's baking; 1 lb. of dry yeast, dissolved in warm water, is then added to the remaining portion, and the whole lightly kneaded; as soon as it has sufficiently risen, it is made into loaves, and shortly afterwards baked; the loaves being placed in the oven without touching each other, so that they may become crusty all round.

Bread, Unfermented. *Syn.* EXTENSIORE¹ NE-
OUS BREAD. *Prep.* 1. From Jones's patent flour. Very wholesome and excellent; indeed, when skillfully made and baked, almost equal to French bread.

2. From Sewell's patent flour. Slightly inferior to the last.

3. To each lb. of flour, add, separately, $1\frac{1}{2}$ dr. of bicarbonate of soda, and 1 dr. of tartaric acid (both perfectly dry, and in very fine powder); rub them well together with the hands until thoroughly incorporated; then form the whole into a dough with water, as quickly as possible, and at once bake in a quick oven. About 8 or 9 oz. of water are required for every lb. of flour. Answers well when expertly managed.

4. Flour, 1 lb.; bicarbonate of soda, 1 dr.; mix; make a dough with water, q. s., to which 1 dr. of hydrochloric acid (commercial) has been added, and further proceed as before.

5. Whiting's PATENT BREAD:—This closely resembles the last. The proportions are—Flour, 7 lbs.; carbonate of soda and hydrochloric acid, of each, 1 oz.; water, $2\frac{1}{2}$ pints. This method was suggested by Dr. Henry, in 1797, and was patented by Dr. Whiting in 1836. If the proportions be not observed, or the mixture be not perfect, the quality of the bread suffers. The action of the acid on the soda forms common salt in the loaf.

6. AMMONIACAL BREAD:—Carbonate of ammonia, $\frac{3}{4}$ to 1 oz.; cold water, q. s.; dissolve, add of flour, 7 lbs.; and make a dough, which must be formed into loaves and baked immediately, as before.—*Obs.* To ensure success the carbonate should be recent, and free from bicarbonate, the presence of which is known by its being white and powdery, and of inferior pungency. If any of the last salt be present, the bread will have a yellowish colour, and a slightly alkaline or urinous flavour. The process answers best for small loaves, cakes, and fancy bread. By employing

pure carbonate of ammonia instead of the commercial sesquicarbonate, the process succeeds admirably, and the resulting bread is most wholesome. A late writer recommends the use of bicarbonate of ammonia, but evidently does so in ignorance, as in practice it is inapplicable, as we have verified by numerous carefully conducted experiments.

7. It has been at various times proposed to knead the dough with water highly charged with carbonic acid, on which Dr. Ure observes, that "the resulting bread will be somewhat spongy." We have repeatedly endeavoured to make bread in this way, but never could succeed in producing a light spongy loaf. The quantity of gas in the water is much too trifling for the purpose, and the greater part of it escapes in the process of making the dough, even though all the materials be well cooled, and the operation conducted in a cold place. The only way of obviating the difficulty is to conduct the kneading in a trough under considerable atmospheric pressure, and at a very low temperature, by means of machinery, as is done by Dr. Daughlish, whose method is now protected by letters patent. This method is not, however, adapted either to domestic use or the small scale.¹

Obs. Unfermented bread has been strongly recommended as being more wholesome, and generally better adapted to bilious and dyspeptic patients, than fermented bread. It must, however, be confessed, that the unfermented bread commonly met with, has a slight 'raw-grain' taste, which is very disagreeable to some persons. But this taste is not necessarily present, being chiefly dependent on bad manipulation, the use of inferior flour, and insufficient baking. The process of fermentation doubtless modifies the condition of the starch and gluten of the dough, and renders them easier of digestion. This species of bread is sadly adulterated with a variety of indescribable drosses. See BISCUITS, BREAD (*anté*), FLOUR, GINGERBREAD, &c.

BREAKFAST (brék'-). *Syn.* JENTACULUM, L.; DÉJEÛNER, DÉJEÛNÉ, FR.; FRÜHSTÜCK, Ger. The first meal of the day; or the food served at it.

The morning meal—the 'early bit' of the Germans—is, perhaps, the most important one of the day. According to Erasmus Wilson, it is usually "taken at eight or nine." The proper time for the purpose must, however, depend upon that at which the party rises. About an hour, to an hour and a half, after leaving the bed, will generally be found the most appropriate time for breakfast, and appears to be the one pointed out by nature, and the most conducive to health. By that time the powers of the system have fully recovered from the inactivity of sleep, and the functions of the stomach and other viscera have again come into full play. The appetite

¹ For a full description of Daughlish's process, see Watts' 'Dic. of Chemistry.'

is excited and seeks appeasing, and both instinct and reason direct us to the social board. If abstinence be now prolonged, the physical and mental energies, unsupported by the supply of food which indirectly gives them birth, gradually lessen, and incipient exhaustion ensues. The fluids of the stomach and the smaller intestines begin to act upon the coats of those viscera, instead of on the food, and an unpleasant feeling of hunger, or a loss of appetite comes on, with all its depressing consequences. When breakfast cannot be taken within a reasonable period after rising, the gap should be filled up by chewing a crust, a biscuit, or the like. A raw egg or two, sucked from the shell, or broken into a tea-cup and drank, will be found most valuable for this purpose. Raw milk, cheese, salted food, and other indigestible matter, should be particularly avoided at this early period of the day.

The articles of food to be chosen for the breakfast-table must depend entirely on the state of the health, the occupations, &c., of those assembled round it. Coffee appears to be, by common consent, the favourite beverage. For the delicate, the bilious, and the young, it should neither be taken too strong, nor very weak, and should be softened down with milk or cream, and well sweetened with sugar. Tea is more apt to affect the nerves and stomach than pure unchicoried coffee. Green tea, taken thus early in the day, often acts as an absolute poison, though a slow one. We have seen severe fits of vomiting and exhaustion follow its use.

The solid food for breakfast should be easy of digestion, and nutritious. Females, children, and persons leading a sedentary life, should confine themselves to a sufficient quantity of good meal-bread with only a moderate quantity of butter, to which an egg, or a small rasher of mild bacon, may be advantageously added. Parties engaged in active occupations may extend their exploits somewhat farther, and add to this bill of fare a little ham or cold meat. When an undue time will elapse before the luncheon or dinner, and particularly during the colder season of the year, the broiled leg of a fowl, an underdressed mutton chop, or a little tender beef-steak, will be found, by the parties last referred to, most useful; nay, in many cases, invaluable. But excess must be particularly avoided. The object is to take enough food to maintain the system in full energy and vigour, and particularly to avoid offending the stomach by overloading it; a misfortune easily effected at the breakfast table. Old commercial travellers—men wise in the mysteries of life and its enjoyments—are scrupulously careful to make a good, but not a heavy breakfast, before commencing the arduous duties of the day. See *DEJEUNER, MEALS, &c.*

Breakfast Powder. *Syn.* RYE-COFFEE, DILLINIUS'S C., HUNT'S ECONOMICAL

BREAKFAST POWDER, &c. Rye, roasted along with a little fat, after the manner of coffee. It was once sold at 2s. 6d. the lb., and was formerly extensively used as a substitute for foreign coffee, of which it is one of the cheapest and best. Since the reduction of duty on coffee it has nearly fallen into disuse, unless it be by the grocers to adulterate that article.

BREAST (Sore). See NIPPLES.

BREATH (Fetid). Scarcely anything is more disagreeable or disgusting than a stinking breath. Various means have been proposed to remove this annoyance, depending principally on the administration of *aromatics*, which by their odour smother it for a time; but these require continual repetition, and are liable to interfere with the functions of digestion. The real cause of stinking breath may generally be traced to a diseased stomach, or to decayed teeth. When the former is the case, mild aperients should be administered; and if these do not succeed, an emetic may be given, followed by an occasional dose of the *Abernethy-medicines*. When rotten teeth are the cause, they should be thoroughly cleansed, and then 'stopped,' or if this is impracticable, they should be removed. When this is impossible or inconvenient, the evil may usually be lessened by keeping them scrupulously clean. Dirty teeth also often cause the breath to smell; and hence the use of the tooth-brush should be a daily habit. Occasionally rinsing out the mouth with a little clean water to which a few drops of solution of chloride of lime, or of chloride of soda, has been added, is often an effective method. As a tooth-powder, fresh-burnt charcoal, and particularly area-nut charcoal, is without comparison the best. Lozenges, such as the following, have been strongly recommended to sweeten and purify the breath:—*Gum-catechu*, 2 oz.; *white sugar*, 5 oz.; *orris powder*, 1 oz.; *neroli*, 5 or 6 drops; make them into a paste with *mucilage*, and divide the mass into very small lozenges. 20 or 30 drops of *oil of cloves* may be substituted for the *orris* and *neroli*, at will. One or two may be sucked at pleasure. See *CACHOU AROMATISÉ, PASTILS, &c.*

BREWING. The art of making beer.

The only ingredients allowed by law to enter into the composition of beer are malt, sugar, hops or any substitute for hops, and water, together with a little yeast.

The apparatus and utensils required, under the common system, in brewing beer, are—

1. A copper or boiler capable of holding fully two thirds of the quantity proposed to be brewed; with a gauge-stick to determine the number of gallons of fluid at any given depth therein; and a wooden cover to place over it before the boiling commences, or when not in use. A copper capable of holding not less than 140 galls. is a convenient size for brewing a quarter of malt, and is commonly known as a one-quarter copper.

2. A mash-tub or mash-tun capable of containing one third more than the copper.

3. One or more tuns or vessels, to ferment the beer in.

4. Three or four shallow coolers, to reduce the wort as rapidly as possible to a proper temperature for fermentation.

5. One or two copper or wooden bowls, for bailing, &c.

6. A thermometer with a scale reaching from below 32° to a few degrees above the boiling-point of water (say to 225° or 230° Fahr.).

7. A saccharometer, for taking the density of worts and beer.

8. A suitable number of casks (clean and sweet), to contain the beer.

9. One or more large funnels or tunners.

10. Two or more clean pails.

11. A hand-pump of a size proportionate to the brewing.

12. A mill, for crushing the malt. Brewers, for sale, are restricted by law to the use of mills with plain metal rollers.

These articles will vary in value from £10, upwards to many hundreds, or even thousands, according to the extent of the brewing; but the whole of them necessary for a private family may be bought for less than the former amount, as the mill, pump, &c., may then be dispensed with, and the rest may be of the simplest and least expensive character possible. By proper care they will last for 30 or 40 years, and still continue in a useful state.

Preliminary proceedings :—

The malt is chosen according to the intended character of the brewing—pale, amber, roasted, or any mixture of them, as the occasion may require. It is bruised or crushed in a mill (malt-mill) before employing it in brewing, that it may be the more readily acted on by the water. It should not be ground too small, as it would then make the wort thick, and cause it to run with difficulty from the mash-tun. The crushed malt may advantageously lie for a few days in a cool situation, by which it will attract a considerable quantity of moisture from the air, and be the more easily exhausted by the water used in mashing. Pale malt may be used coarser than amber or brown malt. A bushel of good malt should measure 1½ bushel when ground; and a quarter should yield between 9½ and 10 bushels, the quantity slightly varying according to the degree of bruising it has undergone. On the large scale, malt is ground in crushing-mills furnished with plain iron rollers; on the small scale, by wooden rollers or mills worked by hand. For private brewing, the malt is generally bought ready crushed or ground, for convenience sake.

The hops, after being taken from the 'pockets' or 'bag,' are crumbled with the hands ready to be thrown into the copper. For general purposes those grown in Kent, and of the present season, are preferred. For the finer sorts of ale, East-Kent hops are com-

monly used; and when it is intended to keep the liquor for a long time, those known by the names of Country's, Alton's, or Farnham hops, are employed.

The quantity of hops required by a given measure of malt varies from 2 lbs. to 22 lbs. per quarter, according to the strength or gravity of the wort, the character of the beer intended to be brewed, and the climate which the beer may have to sustain. Export beer requires, as a rule, an exceptionally large amount of hops to enable it to bear without injury the heat of the country to which it is shipped. The following are the usual proportions:—

	Hops.	Malt.
Table beer	2lbs.	1 qr.
Mild ale or porter	4 „	1 „
Brown stout	5 „	1 „
Scotch ale (best)	5 „	1 „
Strong ale (ordinary) . . .	5½ „	1 „
„ (keeping)	8 „	1 „
Bitter ale.	10 to 14 „	1 „
East India ale (export) 12 „	22 „	1 „

When a strong, coarse hop is used, a less quantity suffices for the same strength brewed, but the flavour is always inferior.

The water, which should be clear, and free from all traces of decomposing animal and vegetable matter, must be provided in abundance. Of late years hard water has been preferred by many brewers, on the ground that beer brewed with it is self-fining, and hence requires no artificial clarification either in the vat or cask. The water at Burton-on-Trent, a place celebrated for its ales, is of this class.

The yeast must be sweet and good; and all the vessels and utensils perfectly sweet and clean. If the latter be neglected, even the most skilful brewing will prove a failure.

Process of brewing :—

1. **MASHING:—**The ground or bruised malt placed in the mash-tun is macerated for some time in hot water, and the infusion (wort) drawn off from a hole in the bottom, over which a strainer or false bottom is placed, to prevent the malt passing out along with the liquor. During the process of mashing a peculiar principle contained in the malt, called diastase, reacts upon the starch with which it is associated, and converts it into grape-sugar. The more completely this conversion is effected, the richer will be the resulting wort in sugar or saccharine, and the stronger and more alcoholic the beer produced by its fermentation. It is, therefore, a desideratum with the brewer to mash at the temperature which most fully promotes this important object. The best temperature for this purpose ranges between 150° and 170° Fahr. When more than one mash is made, the first should be something lower than the first-named temperature; the second may be from 175° to 185°; and the third as high as 200° F. If the first mashing has been rightly conducted, the whole of the starch should be con-

verted into sugar, and the action of the second and third mashings is merely to wash out any of the remaining saccharine matter still adhering to the crushed grains.

In practice, as soon as the water in the copper acquires the temperature of 170°, 45 galls. are run into the mash-tun, and 1 quarter of crushed malt gradually added to it. The whole is now thoroughly mixed with the mash liquor, by means of oars, or machinery, the agitation (mashing) being continued for 30 or 40 minutes, when 36 galls. more water from the copper are added, and the whole again well agitated, as before. The mash-tun is now closely covered up, and the mash allowed to repose for about two hours, in order that the 'diastase' may exert its saccharifying power upon the unconverted starch of the malt. At the end of this time the tap is set, and the wort run into the 'underback.' It generally amounts to about 50 galls. The second mash is then made with about 60 galls. of water, at 185° F., and the whole process repeated as before. After an hour, the liquor is drawn off, and the malt drained ready for the third mash. This time, only 35 galls. of water are added at 200° F., and the whole is seldom allowed to stand longer than half an hour. It is then run off, and the malt allowed to drain as dry as possible.

In some cases, the worts of the first and second mashings only are used for strong beer; that of the third mashing being kept for table beer, or as liquor to mash a fresh quantity of malt.

Pale malt and mixtures of malt and raw grain should be mashed for a longer time, and at a somewhat lower temperature than brown or high-dried malt.

Instead of making second and third mashings as above described, it has long been the practice in Scotland, and is now becoming common in England, to sprinkle the surface of the grains in the mash-tun with water, at or about the temperature of 180° F., by means of a simple revolving instrument termed a 'sparger,' and to let the liquor drain through the goods and run off by the tap with the last portions of the first wort. By this means the whole surface of the grain is continuously and regularly sprinkled with hot water.

When sugar is used, it may be either mixed with the malt in the mash-tun, at the time of mashing, or put into the underback, just before setting the taps, and the hot wort run upon it. The proportions of malt and sugar vary, according to the quality of the latter, but, on an average, from 170 lbs. to 200 lbs. of good raw sugar may be taken as the equivalent of a quarter of malt.

2. **BOILING**.—The wort is next transferred from the underback to the copper, and heated to the boiling-point as soon as possible, the object of this expedition being to prevent the formation of acid in the wort, by exposure to the air, before undergoing the changes which take

place in the copper. As soon as the boiling of the wort commences the hops are added, and the boiling is continued for about 2 or 2½ hours. A longer boiling is highly objectionable, owing to the extraction of a heavy, resinous bitter from the hop, and the danger of losing the volatile oil upon which the aroma depends. For mild beers the worts are seldom boiled so long; for strong keeping ales, sometimes a little longer. The boiling is known to be completed when the liquor 'clears,' as it is called, and albuminous flocks sink to the bottom of the copper.

The hops, strained from each wort, are returned into the copper with the following one.

The average loss by evaporation in the process of boiling varies from $\frac{1}{4}$ th to $\frac{1}{2}$ th of the original bulk of the wort. The gravity increases at the same time in about the ratio of 5 to 4; so that, if the gravity be, at first, say 32 lbs. per barrel, it will at the end of the operation have risen to about 40 lbs.

3. **COOLING**.—The wort, under the common system, is 'run off' from the copper into the 'hop-back,' through a strainer which keeps back the hops. It is then pumped into large square shallow vessels called 'coolers,' where it is freely exposed to a current of air to reduce its temperature as quickly as possible, in order to avoid acidity or 'souring.' In 6 or 7 hours, or sooner, the temperature should fall to about 60° Fahr. In warm weather the depth of the liquor in the coolers should not exceed 3 or 4 inches; and in cold weather, not more than 5 or 6 inches. As soon as the temperature has fallen to about 60° the liquor is 'tunned' and 'yeasted.'

The loss by evaporation and condensation in the coolers, varies from 13 to 18 galls. per quarter.

4. **FERMENTATION**.—The cooled wort is next run into the fermenting tuns or vessels (gyle-tuns). In small brewings these may be casks, with one of their heads removed; but under any form they must not be more than $\frac{2}{3}$ ds filled. The yeast, previously mixed with a little wort, and kept until the whole has begun to ferment (technically termed 'lobb'), is now added, and after agitation, the vessel is covered up, and kept so, until the fermentation is well established. By this time the temperature has risen from 9° to 15°.

The quantity of yeast employed, and the temperature of the wort when it is added, differs in different breweries and for different kinds of beer. It seldom exceeds 2 lbs. per barrel, unless the weather is unusually cold, or the yeast old or stale, when a larger proportion is required. The Scotch brewers generally take only 1 gal. of yeast to fully 4 hhd. of wort.

In England, the temperature at which the yeast is added, varies from 55° to 65° Fahr. In Scotland, the common temperature is 51° to 52°. In cold weather, the heat may be 5° or 6° higher than in mild and warm weather.

and a little more yeast may also be advantageously employed. In cold weather, ale is commonly tunned at 60°, porter at 64°, and weaker beers at 65° or 70° Fahr. In warm weather, strong beer should be 4° or 5°, and other beers 7° or 8° cooler than the 'heats' just mentioned. On the small scale, 1 to 1½ pint of yeast may be used to every barrel of strong-beer wort, and ¾ pint to every barrel of mild-beer wort.

The commencement of the fermentation is indicated by a line of small bubbles forming round the sides of the tun, and in a short time extending over the whole surface. A 'crusty head' soon forms, and then a 'fine rocky head,' followed by a 'light frothy' one. At length the 'head' assumes a yeasty appearance, the colour becomes yellowish-brown, and a vinous odour is developed. As soon as this last head begins to fall, the tun is skimmed every 2 or 3 hours, until no more yeast is formed. The object of this is, not only to check the violence of the fermentation, but also to remove a peculiar bitterness, with which the first portion of the yeast is impregnated. The beer is then put into casks, or 'cleansed,' as it is called. A minute attention to every stage of this process is necessary to secure a fine flavour and a brilliant beverage.

It may be regarded, as a rule, that the lower the temperature, and the slower, more regular, and less interrupted the process of fermentation, the better will be the quality of the brewing, and the less likely to change by age. A little more yeast is required in winter than in summer. When the fermentation becomes slack in the 'gyle-tun,' a little more 'lobb' is generally added, and the whole is well 'roused up.' On the contrary, if the temperature rises considerably, or the fermentation becomes too brisk, the wort is cooled a little and skimmed, or at once cleansed.

5. CLEANSING:—This consists in running the beer from the gyle-tun into casks, or other vessels, set sloping, so that the yeast, as it forms, may work off the one side of the top, and fall into a vessel placed below to receive it. In small brewings, the beer is often at once transferred from the gyle-tun to the 'store-casks,' which are sloped a little until the fermentation is over, when they are skimmed, filled, and bunged.

The process of cleansing is generally commenced as soon as the 'saccharine' in the fermenting wort falls to about 10 lbs. per barrel, a degree of attenuation which it usually reaches in about 48 hours. Some brewers add a little wheat-flour or bean-flour (about ¼ lb. per barrel) to the beer in the gyle-tun, shortly before cleansing, to quicken the discharge of yeast; but it is not clearly ascertained whether such a plan is advantageous, or the contrary.

6. STORING:—As soon as the fermentation is concluded, which generally takes from 6 to 8 days, or longer, the clear liquor is pumped into the store-casks or vats, which are then

closely bunged, and deposited in a cool cellar, if not already there, to mature. The preference, which at present exists in most parts of the United Kingdom, is for mild, freshly-brewed malt liquors; the good old or mature-vatted beer, being now seldom met with. This, of course, is a source of increased profit to the brewer, as it enables him to turn over his capital more rapidly, and saves the risk and expense attendant on long storage.

7. RIPENING:—After a period varying from one to twelve months, or longer, according to the nature of the brewing, and the condition of the cellar, the liquor will have become fine, and sufficiently mature for use. During this period the casks, &c., should be occasionally examined to see that there is no leakage, and to open the vent-holes, should any ooziings appear at the joints. As equable a temperature as possible should be maintained in the cellar, by ventilation, on the one hand, and the employment of artificial heat on the other, as circumstances and seasonal changes may render necessary.

8. FINING or CLARIFYING:—Beer which has been badly brewed or badly stored, or which from other causes may be thick or muddy, requires clarifying by artificial means. For a barrel about 1 to 1½ pint of brewer's finings (isinglass or fish-gelatine dissolved in sour beer) is put into a bucket, and some of the beer being gradually added, the whole is violently agitated with a whisk until a frothy head is formed. The mixture is then thrown into the cask of beer, and well 'rummaged up,' after which the bung is replaced, and the liquor allowed to repose for a week or ten days.

Sometimes the above method is found to fail with weak and bad-conditioned beer. When such is the case, the addition of a tea-spoonful of sulphuric acid, or a table-spoonful of powdered catechu (previously dissolved in ½ a pint of boiling water), followed by agitation for a quarter of an hour, will generally cause the 'finings' to clarify the liquor; 2 or 3 oz. of tincture of catechu (mixed with a little water) may be used in the same way. A handful of hops, previously boiled for five minutes in a little of the beer, and then added to the barrel, and the whole allowed to stand for a few days, before proceeding to clarify it, will generally have a similar effect, and cause the 'finings' to act with certainty. It is the absence of the proper quantity of astringent matter in beer that usually renders them ineffective.

Gen. commentary. The preceding is a concise account of all the essential operations of the system of brewing at present practised in this country. On the large scale, extensive and costly apparatus and machinery are employed for the purpose. On the small scale, various modifications, of a minor character, or the several processes herein detailed, are frequently adopted, according to the circum-

stances or ingenuity of the operator. The principles and practice of brewing beer are, however, essentially the same under all the conditions here referred to. In Scotland, only one mash is made, and that at a temperature of about 180° Fahr., with one third of the quantity of the water required for the brewing. The 'mash-tun' is then covered up for about half an hour, when the wort is drawn off, and the operation of 'sparging' begun. This operation is continued until the density of the mixed worts becomes adapted to produce the quality of the ale then under process of manufacture. The 'gyle-tun' (fermenting-tun) is set at from 50° to 60° Fahr., the fermentation being continued slowly for fifteen to twenty days; and the ale is not 'cleansed' before the degree of attenuation falls to about $\frac{1}{2}$ lb. per day, and not more than one fourth of the original gravity of the wort remains. Scotch ale is justly celebrated for its superior quality. Its usual original gravity is from 34 to 45 lbs. per barrel.

In Bavaria, a country remarkable for the excellence of its beer, the wort is made to ferment at a low temperature, until all the substances which favour acetification have been rendered insoluble, and have separated from the liquor. The fermentation is conducted in wide, open, shallow vessels, which afford free and unlimited access to atmospheric oxygen; and this in a situation where the temperature does not exceed 45° to 60° Fahr. A separation of the nitrogenous constituents thus takes place simultaneously on the surface, and within the whole body of the liquid. The clearing of the fluid is the sign by which it is known that these matters have separated. The fermentation usually occupies three or four weeks, and is conducted during the cooler portion of the year only, and in a situation removed as much as possible from the influence of atmospherical changes of temperature. The sedimentary yeast (unterhefe), and not the surface yeast (oberhefe), of the Bavarian fermenting backs, is employed.

The beers of England and France, as well as most of those of Germany, become gradually souf by contact with the air. This defect, as observed by Liebig, does not belong to the beers of Bavaria, which may be preserved, at pleasure, in half-full casks, as well as in full ones, without suffering any material alteration. This precious quality must be ascribed to the peculiar process employed for fermenting the wort, called by the German chemists 'untergährung,' or fermentation from below; and which "has solved one of the finest theoretical problems that had long taxed the ingenuity and patience of both the scientific and practical brewer." (Liebig.)

In the ordinary fermentation of grape-juice and worts, these liquids do not furnish a quantity of alcohol equivalent to the sugar which they contain; and this because a certain portion of the sugar serves for the oxidation of

the gluten, and is not transformed like the rest. But wherever the liquor has arrived at the second period of transformation, the product in alcohol ought to be equivalent to the quantity of sugar present, as actually happens in all fermentations (sedimentary) which are not accompanied by a formation, but a disappearance of the yeast. According to Dr. Ure, worts furnish, in the Bavarian breweries, from 10 $\frac{1}{2}$ to 20 $\frac{1}{2}$ more alcohol than they do by the ordinary process of fermentation (obergährung), or that excited by the use of 'oberhefe' or top-yeast.

East-India Ale or Pale Ale, for exportation, is brewed from worts of a sp. gr. of from 1.060 to 1.070. For the best varieties, 15 to 16 lbs. of the finest East Kent hops are used to every quarter of pale malt. The pale ale or bitter beer of the publicans is commonly a very weak liquor (mere table beer), highly bittered with the hop, and too often with quassia, wormwood, and other still more objectionable substances. The process now adopted by the great brewers of pale ale at Burton-on Trent, combines all the most admirable points of both the Bavarian and Scotch systems of brewing.

Berlin White ale or Pale beer is brewed from wheat-malt mixed with about $\frac{1}{4}$ th part of barley-malt, the 'wort' being boiled with hops, $\frac{1}{2}$ lb. to the bushel, and slightly fermented with 'top-yeast,' at a rather higher temperature.

The desire of evading the duty led to the discovery of its being only necessary to employ $\frac{1}{4}$ rd, or less, of the grain, in the form of malt; this portion being sufficient to convert into sugar, in the process of mashing, the starch of the unmalted grain forming the other part. This plan answers well when the wort is merely intended for the production of 'grain spirit;' but beer so made is insipid and inferior in quality to that brewed wholly of malt. Inferior kinds of beer have also been made from other ingredients than barley-malt, among which may be named the grain of the cheaper cereals, bran, potatoes, turnips, beet-root, carrots, parsnips, pea-shells, and other vegetable substances rich in starch and sugar, all of which will produce beer by being mashed with water in the common way, with about 5 $\frac{1}{2}$ or 10 $\frac{1}{2}$ of barley-malt.

One quarter of the best barley-malt yields, by skilful mashing, fully 84 lbs. of 'saccharine,' or soluble sweet extractive matter. This concentrated within the compass of one barrel (36 galls.), gives a sp. gr. of 1.234. In the process of mashing about $\frac{1}{4}$ ths of this quantity of saccharine (or 48 lbs.) is generally carried off in the first wort; $\frac{1}{4}$ ths (or 24 lbs.) in the second wort; and $\frac{1}{4}$ th (or 12 lbs.) in the third wort; the strengths of the worts being to each other respectively as 4, 2, 1. The average gravity obtained by the common brewers from malt of current quality, ranges from 80 to 81 lbs. Sugar may be used as a partial sub.

stitute for malt, with, in most cases, some degree of saving to the brewer, and without injury to the quality of the beer. The kind of sugar to be used will depend on the quality of the beer to be brewed, but it should be remembered, that a bad sugar will not, any more than bad malt, yield a sound palatable beer. From 170 lbs. to 200 lbs. of good raw sugar may be taken as the average equivalent of a quarter of malt.

When the process of mashing has been properly conducted, the wort, after leaving the cooler, should not be turned blue by tincture of iodine, or by iodide of potassium added, along with a little acid. If it turns blue some of the starch has escaped conversion into sugar, and is dissolved in the liquor.

By multiplying the decimal part of the number representing the specific gravity of a wort by 360 (the weight in pounds of a barrel of pure water), we obtain the quantity of saccharine, per barrel, corresponding to the given sp. gr.; and by dividing the joint weight of saccharine and water, per barrel, by 360, we obtain the specific gravity. Thus—

Suppose a sample of wort to have a specific gravity of 1·055, then—

Decimal of sp. gr. $\cdot 055 \times 360 = 19\cdot8$ lbs. per barrel.

Again, a barrel of wort weighs 379·8 lbs., that is, 360 lbs., for the weight of a barrel of water, and 19·8 lbs. for the weight of saccharine in the water, then—

$297\cdot8 \div 360 = 1\cdot055$ specific gravity.

It is usually stated in works on brewing that certain temperatures must be reached by each variety of beer, during the progress of the fermentation, in order for the liquor to acquire its characteristic flavour. Thus, it is stated, that—mild beer begins to acquire flavour when the heat of fermentation arrives at 75° Fahr., increases at 80°, and is highest at 90°, but sometimes even reaches 100°. Old ale is said to obtain its best flavour at a temperature not exceeding 75°; and porter at 70° Fahr.

In order to reach these temperatures, the worts are directed to be set at from 10° to 15° lower, the rise being due to the heat generated during the fermentation. That these statements refer principally to the old methods of brewing is shown by the fact, that some of the brewers of Bavaria, Scotland, and Burton-on-Trent, produce rich and high-flavoured liquors at temperatures vastly below those above enumerated. Still, however, the fact must not be concealed, that since the introduction of the new German system of brewing into England, the general character of its beers, as they reach the consumer, are inferior in strength and flavour to those of a former period. We may now seek almost in vain for the fine, vinous, high-flavoured, invigorating old beers brewed in our early days by the common publicans and tavern-keepers, of whom the larger majority were their own brewers. Under the new system of chemical brewing, as worked

by those huge monopolists, the ‘great brewers,’ the only object appears to be to obtain the largest quantity possible of saccharine out of the quarter of malt, and to convert this into the largest possible quantity of beer, with little regard to flavour or quality, but an excessive one for their own profits. In due course this liquor is forced on their helpless tenants, the publicans, who, in their turn, ‘reduce’ and ‘doctor’ the liquor, until, by the time it reaches the consumer, its insipidity and low strength would have led even a brewer’s drayman of the last century to cast it into the kennel.

The best times for brewing are the spring and autumn; as at those periods of the year the temperature of the air is such as to permit of the easy cooling of worts sufficiently low, without having recourse to artificial refrigeration, or to the use of machinery for the purpose. Old ale cannot be conveniently brewed in summer.

Beers are classed by the brewers into—

Small beers—made from worts not exceeding the sp. gr. 1·025, or 9 lbs. per barrel.

Middlings—made from worts of the sp. gr. 1·030 to 1·050, and averaging about 14 lbs. per barrel.

Strong beers—made from worts of the sp. gr. 1·040 to 1·080, extending from about 35 lbs. per barrel upwards.

The densities of the worts employed for different kinds of beer vary considerably, as will be seen by the following table:—

TABLE of the Densities of Beers.

Description.	Pounds per barrel.	Specific gravity.
Burton ale, Class 1	40 to 43	1·111 to 1·120
“ “ 2	35 “ 40	1·097 “ 1·111
“ “ 3	28 “ 33	1·077 “ 1·092
Ordinary ale	25 “ 27	1·070 “ 1·075
Common “	21	1·058
Scotch ale, Class 1	40 to 44	1·111 to 1·122
“ “ 2	33 “ 40	1·092 “ 1·111
Porter (ordinary)	18	1·050
“ (good)	18 to 21	1·050 to 1·058
“ (double)	20 “ 22	1·055 “ 1·060
Brown stout	23	1·064
“ (best)	26	1·072
Table beer	12 to 14	1·033 to 1·039
Small “ (com.)	6	1·017

EXPORTATION OF BEER:—When beer is exported from any part of the United Kingdom, either as merchandise or ships’ stores, the brewer or exporter of such beer is allowed a certain drawback of duty. The amount is

proportional to the quantity of malt or sugar, inferred to have been used in the brewing of the beer. Thus, if the original specific gravity of the worts from which the beer was brewed were not less than 1.040, a drawback is granted of 4s. 3d. per barrel. This is equivalent to a return of the duty on $1\frac{1}{2}$ bushels of malt, with an allowance of 3d. for licence duty, now charged in lieu of the abolished hop duty. For every additional 5 degrees of specific gravity, from 1.040° to 1.125° inclusive, a further sum of 6d. per barrel is allowed.

[For further information connected with the above subject, the reader is referred to the separate articles—**ALE**, **BEEF**, **DEXTRINE**, **DIASTASE**, **FERMENTATION**, **MALT LIQUORS**, **PORTER**, **SACCHAROMETER**, **SPECIFIC GRAVITY**, **WORT**, **YEAST**, &c.]

Brewing Utensils. The cleansing and preservation of brewing utensils, beer casks, &c., has frequently engaged the attention of practical men and brewers' chemists. To preserve them sweet they should always be thoroughly cleaned before setting them aside. Contact with soap, or any greasy material, should be carefully avoided. A scrubbing-brush and scalding-hot water are generally sufficient to clean them. Great care should be taken to remove every particle of yeast or fur on the sides and bottom; and after being well-drained, they should be stowed away in some clean and cold situation, properly exposed to the fresh air. Should they become tainted or mouldy, a strong lye of pearl-ash, common salt, or quicklime, may be spread over them, scalding hot, with a broom or scrubbing-brush. Washing them with oil of vitriol diluted with about 7 or 8 times its bulk of water, is another excellent and very effective method. Fresh-burnt charcoal has also been employed for the same purpose. In each case the vessels must be subsequently thoroughly washed out with clean water, as before. Steam, assisted by the action of a chain, has been successfully applied to clean casks in several breweries. Bisulphite of lime has, within the last few years, been highly recommended for sweetening and cleaning vats, casks, &c. It is also said to prevent beer from developing acidity. See **CASKS**, **VATS**, &c.

BRICKS. Brick-making scarcely comes within the province of this work. In connection with hygiene, however, we may call the reader's attention to the superior advantages of both hollow and waterproof bricks; the first, for ventilation and lightness; the last, for preserving the dryness and integrity of our homes under all the vicissitudes of climate, season, and weather, either on damp soils or dry ones. Workman's "Patent Waterproof Bricks" received a strong commendatory notice from the Commissioners of the 'Great International Exhibition' of 1851.

BRINE (for Meat). *Prep.* 1. A nearly saturated solution of common salt, 1 lb.; and saltpetre, 1 oz.; in soft water.

2. To the last, add of sugar or treacle, $\frac{1}{2}$ lb. Bay-salt is recommended when the meat is to be kept for a very long period. See **PICKLING**, &c.

Brine, Red-Cabbage. Red-cabbage leaves steeped in a strong solution of common salt. *Used* as a test for acids and alkalies.

Brine, Violet. From the petals of the blue violet, as the last. *Used* as a test for acids.

BRIOCHE PASTE (bre-ôsh'). In *cookery*, a species of paste, or crust, prepared of eggs and flour, fermented with yeast, to which a little salt, a large quantity of sugar, and about $\frac{1}{2}$ lb. as much butter as the weight of the flour used, are afterwards added, and well worked in. *Used* as an addition to soup, and as a casing for lobsters, patties, eggs, &c.

BRISKNESS. The natural briskness and sparkling of fermented liquors depends on the gradual evolution of carbonic acid gas within the body of the fluid, by the process of fermentation. See **MALT LIQUORS**, **PORTER**, **WINES**, &c.

BRISTLES (briz'ls). The stiff hair of swine, &c. They are commonly stiffened by immersion for a short time in alum-water; and are dyed by steeping them for a short time in any of the common dyes used for cotton or wool.

BRITANNIA METAL (-y'ä). *Syn.* **TUTANIA**. A superior species of pewter, used for teapots, spoons, &c.

Prep. 1. Plate-brass, bismuth, antimony, and tin, equal parts, melted together, and the resulting alloy added at discretion to melted tin, until it acquires the proper degree of colour and hardness.

2. To the first alloy, prepared as in No. 1, add $\frac{1}{4}$ th of its weight of metallic arsenic, before mixing it with the melted tin.

3. Antimony, 1 part; brass, 4 parts; tin, 5 or 6 parts; melted together. See **ALLOYS**, **QUEEN'S METAL**, **PEWTER**, &c.

BRITISH GUM. See **GUMS**.

BRITISH WINES. See **WINES**.

BROCCOLI [Eng., L., Ger.] *Syn.* **BROCOLI**, Fr.; **BROCCOLO**, It. A well-known subvariety of cauliflower. The qualities, and the mode of dressing broccoli, are similar to those of cabbages, noticed elsewhere. See **VEGETABLES** (Culinary), &c.

BROMA. *Prep.* 1. Pure cocoa, 1 lb.; sugar and sago-meal, of each, 4 oz.; mix. British arrow-root (*i.e.* carefully prepared potato-starch) is often substituted for the sago.

2. As the last, but using fine wheat-flour, in lieu of sago-meal. Made into a beverage in a similar way to cocoa.

BROMIDE (-mid). *Syn.* **BROMURET***, **HYDROBROMATE***; **BROMIDUM**, **BROMURETUM**, **HYDROBROMAS**, L.; **BROMIDE**, **BROMURE**, Fr. A chemical compound of bromine with another radical.

Prop., &c. The soluble bromides give white precipitates with nitrate of silver, acetate of lead, and protonitrate of mercury.

merison. Used for binding screws, holders, and other small articles of copper and brass.

10. Sulphate of iron and sulphate of copper, of each, 1 oz.; water, 1 pint; dissolve; wash the surface of the articles with it; let them dry; then apply a solution of verdigris, 2 oz.; dissolved in strong vinegar, $\frac{1}{4}$ pint; when dry, polish them with a soft brush, and either some plumbago or colcothar. Used for tin castings.

11. The articles (properly cleaned) are either immersed in, or washed over, with a solution of sulphate of copper or of verdigris. In a short time they acquire a coating of pure metallic copper, and are then washed. This only answers with iron and steel goods. It is admirably suited for iron castings.

12. An antique appearance may be given to silver by either exposing it to the fumes of hydrosulphate of ammonia, or immersing it for a very short time in a solution of hydrosulphate of ammonia, or in dilute nitric acid.

Surface Bronzing. A term commonly applied to the process of imparting a bronze-like or metallic appearance to the prominent portions of the surfaces of figures made of paper, wood, plaster of Paris, &c. It is effected by first giving them a coat of oil-varnish or size, and when this is nearly dry, applying, with a 'dabber' of cotton, or a camel-hair pencil, any of the ordinary metallic bronze-powders before referred to. Sometimes the powder is placed in a little bag of muslin, and dusted over the surface. The articles should be afterwards varnished.

Paper is bronzed by mixing the bronze-powders up with a little weak gum-water, and burnishing the surface when dry and hard.

BROOM. The common name of the plant *spartium scoparium*.

Broom Ashes. From broom-stalks burnt. Formerly used as a diuretic in dropsy.

Broom, Salt of. Obtained by dissolving broom ashes in water, and filtering and evaporating the solution. It consists principally of carbonate of potassa. It was formerly used in dropsy, and as an antacid, &c.

BROSSE DE CORAIL. [Fr.] The root of lucerne (*medicago sativa*), cleaned, dried, and hammered at the end. Used as a tooth-brush.

BROTH. *Syn.* Jus (coctis carnibus), Jus-culUM, L.; Bouillon, Jus, Fr.; Fleisch-brühe, Ger. In *cooking*, the liquor in which flesh has been boiled. Broth is distinguished from soup by its inferior strength and quantity of seasoning, &c. It contains much of the nutriment of the meat. See **BOILING**, **SOUP**, &c.

BROWN DYE. Every shade of brown may be produced, almost at will, by mixtures of reds and yellows with blues and blacks, or directly, by simple dyes. The following are examples:—

a. For **COTTON**:—

1. Give the goods a mixed mordant of acetate of alumina and acetate of iron, followed

by a bath of madder or of madder and fustic. Excess of acetate of alumina turns it on the **AMARANTH TINT**; the acetate of iron darkens it.

2. First 'gall' the goods, then turn them for a short time through the black bath; next give them a mordant of sulphate of copper, then pass them through a decoction of fustic, afterwards through a bath of madder, and again through the solution of sulphate of copper; drain, dry, rinse well, and finish with a boil in soap and water. This gives a **CHESTNUT-BROWN**.

3. First give the goods a mordant of alum, then a bath of madder, and next a bath of fustic to which a little green copperas has been added. This gives a **CINNAMON-BROWN**.

b. For **LINEN**:—This varies little from that commonly employed for cotton.

c. For **SILK**:—

1. One of the above mordants is followed by a bath made by mixing equal parts of the decoctions of logwood, fustic, and Brazil-wood. The shade may be varied by altering the proportions of the decoctions; Brazil-wood reddening, logwood darkening, and fustic yellowing, the tint.

2. Annotta, 4 oz.; and pearlash, 1 lb.; are dissolved in boiling water, q. s.; the silk is passed through it for two hours, then taken out, and squeezed dry; it is next passed through a mordant of alum, and then through a bath of Brazil-wood, followed by another of logwood to which a little green copperas has been added.

d. For **WOOL**:—

1. Boil the cloth in a mixed mordant of alum, common salt, and water, then dye it in a bath of logwood to which a little green copperas has been added. 2 oz. of alum, and 1 oz. of salt, are required for every lb. of wool.

2. Boil the goods in a mordant of alum and sulphate of iron, then pass them through a bath of madder. The more copperas the darker will be the dye. Good proportions are 2 parts of alum and 3 of copperas.

3. Give a mordant of alum and tartar, then pass the goods through a madder bath; next run them through a bath of galls and sumach or logwood to which a little acetate or sulphate of iron has been added.

4. Mordant the cloth as last, dye in a madder bath, remove the cloth, add a little acetate or sulphate of iron, and again pass it through the bath, as long as necessary.

5. Give the cloth a light blue ground with indigo, and then a mordant of alum; rinse, and lastly run it through a bath of madder.

6. A mordant of alum and tartar, followed by, first a bath of madder, and afterwards a bath of weld or fustic to which a little iron-liquor has been previously added. In this way every shade, from **MORDANT** and **CINNAMON** to **DARK CHESTNUT**, may be produced.

7. Boil fustic-chips, 1 lb., for 2 hours; pass

the cloth through the bath for 1 hour; take it out and drain; add of green copperas, $1\frac{1}{2}$ oz.; good madder, 4 oz.; boil for a short time, and again pass the cloth through the bath, until it acquires the proper tint. BRONZE-BROWNS, and every similar shade, may be thus given by varying the proportions.

e. The following are called SUBSTANTIVE or DIRECT BROWNS:—

1. *Decoction of oak-bark.* It dyes wool of a fast brown of various shades, according to the quantity employed. A mordant of alum brightens it.

2. *Infusion or decoction of walnut-peels.* Dyes wool and silk a brown, which is brightened by alum.

3. *Horse-chestnut-peels.* A mordant of chloride of tin turns it on the BRONZE; and sugar of lead, on the REDDISH-BROWN.

4. *Catechu or Terra Japonica.* For cottons. Blue vitriol turns it on the BRONZE, and green copperas darkens it, when applied as mordants. Acetate of alumina as a mordant brightens it. The French colour, CARMELETTE, is given with 1 lb. of catechu, 4 oz. of verdigris, and 5 oz. of sal-ammoniac.

5. *Sulphate or chloride of manganese.* Dissolved in water with a little tartaric acid, it gives the bronze tint called SOLITAIRE. The stuff, after being passed through the solution, is turned through a weak lye of potash, and afterwards through another of chloride of lime, to heighten and fix it.

6. *Prussiate of copper.* This gives a fine BRONZE or YELLOWISH-BROWN to silk. A mordant of blue vitriol is commonly first given, followed by a bath of prussiate of potash.

BROWN PIGMENTS. The principal and most useful of these are—*umber, terra di Sienna* (both burnt and raw), *Spanish brown*, and some of the *ochres*. Brown, of almost any shade, may be made by the admixture of blacks with reds and yellows, or with greens, in different proportions. See BISTRE, NEW-CASTLE-BLACK, OCHRES, SEPIA, &c.

Spanish Brown. See OCHRES.

BROWN PINK. See YELLOW PIGMENTS.

BROWN'ING. In *cookery*, a fluid preparation used to colour and flavour gravies, soups, &c.

Prep. 1. Sugar, 4 oz.; and butter, 1 oz.; are melted in a frying-pan or ladle with about a tablespoonful of water, and the heat is continued until the whole has turned of a deep brown; the heat is then lowered a little, and some port wine (about 1 pint) is gradually poured in; the pan is now removed from the fire, and the mixture well stirred until the roasted sugar is entirely dissolved; it is then put into a bottle, and $\frac{1}{2}$ oz. each, of bruised pimento and black pepper, 5 or 6 shalots (cut small), a little mace and finely grated lemon-peel, and $\frac{1}{2}$ pint of mushroom catsup, added. The bottle is shaken daily for a week, and the clear liquid, after 5 or 6 days' repose, decanted

¹ Under BLACK PIGMENTS.

into another bottle. Rich-flavoured, but expensive.

2. As the last, but using strong beer, or water, instead of wine. A glassful of spirit may be added after bottling it.

3. Sugar-colouring 1 pint; salt, $\frac{1}{2}$ lb.; mushroom-catsup, $\frac{1}{2}$ pint; spice, q. s. Excellent for all ordinary purposes.

4. Lump sugar (powdered), $2\frac{1}{2}$ lbs.; salad oil, $\frac{1}{2}$ lb.; heat as before; then add, of port wine, 1 quart; Cape wine, 3 quarts; shalots, 6 oz.; mixed spice, 4 oz.; black pepper, 3 oz.; mace, 1 oz.; salt, 1 lb.; lemon juice, 1 pint; catsup, 1 quart; mix well.

5. Good spirit-colouring or sugar-colouring and mushroom-catsup, of each, 1 gal.; Jamaica pepper, black pepper, and shalots, of each, 4 oz.; cloves, cassia, and mace, bruised, of each $\frac{3}{4}$ oz.; boil in a covered vessel for 5 minutes; digest for 14 days, and strain.

6. Colouring, 3 pints; mushroom-catsup, 1 pint; common salt, $\frac{1}{4}$ lb.; Chili vinegar, (strongest)— $\frac{1}{2}$ pint; spice, q. s. Half a pint of British brandy or rum may be added.

Obs. The above are excellent additions to gravies, soups, &c.; and of themselves form most admirable sauces for fish, meat, and game.

Browning (for Gun-Barrels). *Prep.* The following are current formulae:—

1. Blue vitriol, 4 oz.; tincture of muriate of iron, 2 oz.; water, 1 quart; dissolve, and add aquafortis and sweet spirit of nitre, of each, 1 oz.

2. Blue vitriol and sweet spirit of nitre, of each, 1 oz.; aquafortis, $\frac{1}{2}$ oz.; water, 1 pint; as last.

3. Butter of antimony and sweet oil, equal parts; well shaken together. To be applied to the iron previously warmed.

Obs. The above fluids are rubbed on the barrel (previously well polished and cleaned off with whiting to remove the oil), and allowed to remain on for some hours, or until the next day, when they are rubbed off with a stiff brush. The process may be repeated, if necessary. The barrel is next washed in water in which a little pearlsh or soda has been dissolved, and afterwards well rinsed in clean water; it is then polished, either with the burnisher, or with a brush and bees' wax. Sometimes a coat of tough shellac varnish is applied.

BRUCEA* (-sh'ä). False cusparia (which *see*).

BRUCIA. $C_{22}H_{29}N_3O_4 \cdot 4$ Aq. [Eng., Fr.] *Syn.* BRUCINE; BRUCINA, L. An alkaloid discovered, by Pelletier and Caventou, in the bark of *brucia antidysenterica*, and afterwards associated with strychnia, in *nux vomica*.

Prep. Ground nux vomica, or the bark of *brucia antidysenterica*, is boiled in dilute sulphuric acid, and the resulting decoction mixed with hydrate of lime (in excess); the crude precipitate thus obtained is boiled in alcohol (sp. gr. .850), and the tincture filtered whilst

hot. A mixture of crude strychnia and brucia is deposited as the fluid cools, and the remainder is obtained by evaporation. This is powdered and digested in cold alcohol, which dissolves out the brucia; the solution furnishes crystals on spontaneous evaporation. It may be further purified by re-crystallisation from alcohol.

Prop. Soluble in 850 parts of cold, and about 500 parts of hot water; freely soluble in alcohol; added to the dilute acids until they are neutralised, it forms crystallisable salts, easily obtained by evaporation.

Tests. It is distinguished from strychnia, which in many respects it resembles, by its ready solubility in both dilute and absolute alcohol, and its insolubility in ether. With nitric acid it strikes a fine red colour, which is removed by sulphuretted hydrogen and sulphurous acid. Iodic acid, chloric acid, and chlorine, also turn it red.

BRUISE (brōoze), *Syn.* CONTUSIO, CONTUSUM, L.; CONTUSION, MEUTEISSURE, Fr.; BRAUSCHE, QUETSCHUNG, &c., Ger. A contusion; but in popular language applied chiefly to cases in which there is an extravasation of blood owing to the rupture of the minute vessels, with consequent discoloration or tumefaction of the part.

Treatm. In common cases, sufficiently serious, bruises may be rubbed with a little opodeldoc or soap-liniment; or, if the inflammation be considerable, they may be bathed with a little weak goulard water, or with vinegar and water. In more severe cases leeches may be applied. See CONTUSION.

BRUNS'WICK BLACK. See VARNISHES.

BRUNS'WICK GREEN. See GREEN PIGMENTS.

BRYONIN (-nĭn). A peculiar bitter principle extracted from the root of white bryonia (*bryonia dioica*, Jacq.). It is obtained from the dry extract of the expressed juice, by solution in alcohol, filtration, and cautious evaporation.

Prop., &c. A yellowish-white mass. It is a drastic purgative; and, in large doses, poisonous. It enters into the composition of several quack medicines.

BUBBLE-AND-SQUEAK. In *cooking*, a species of olla podrida variously prepared, as the materials and fancy of the maker dictate.

Prep. (Rundell.) Take slices of cold meat, fry them quickly until brown, and put them into a dish to keep them hot. Then clean the pan from the fat; put in it greens and carrots (previously boiled and chopped small); add a little butter, pepper, and salt; make them very hot, and put them round the beef with a little gravy. Cold boiled pork is a better material for bubble and squeak than beef. In either case the slices should be very thin and lightly fried.

BUBBLE FEVER†. See PEMPHIGUS.

BU'CHU (-kū). The plant *diosma crenata* (which see).

BUCK'THORN. *Syn.* RHAM'NUS, L. The *ram'nus catharticus* (Linn.). Berries* (BAC'Œ RHAM'NI, L.), cat'artic; juice of the berries (SUC'CUS R., L.) is official in the B. P. See RHAMNINE, SYRUPS, &c.

BUCK'WHEAT. See WHEAT.

BUG. *Syn.* CIMEX, L.; PUNAISÉ, Fr.; WANZE, Ger. A name popularly and very loosely applied to a vast number of insects that infest houses and plants; in *zoology*, hemipterous insects of the genus 'cimex,' of which there are many hundred species; *appr.*, the bed-bug.

Bug. *Syn.* BED'-BUG, HOUSE'-B., WALL-B., WALL'-LOUSE*, &c.; CIMEX DOMESTICUS, C. LECTULARIUS (Linn.), L.; PUNAISE, Fr.; BETTWANZE, HAUSWANZE, Ger. An insect too well known in all the larger towns of Europe and America, and in the huts of squalid poverty everywhere, to require a description here. It is almost the only species of the bug-kind that has undeveloped wings. Its introduction to England is believed to have occurred soon after the great Fire of London (A.D. 1666). Human blood appears to be its favourite food; but it will also eat grain, seed, flour, dried paste, size, soft deal, beech, osier, &c. Cedar, mahogany, and the odorous and harder woods, are usually avoided by this insect. Aromatics, perfumes, and strong odours generally, are unfavorable to its propagation.

Extern., &c. Various means have been adopted to prevent the accession, and to destroy or drive away, these enemies of "tired nature's sweet restorer, balmy sleep." Among the most certain of these is thorough cleanliness, and ventilation. The furniture brokers put articles infested with these insects into a room with doors and windows fitting quite close, and subject them to the fumes of burning sulphur or chlorine gas. In the small way, poisonous washes are commonly resorted to. For this purpose nothing is more effective than chloride of lime or chloride of zinc; the latter being preferable to the other on account of its being comparatively scentless.

The following mixtures are in common use, or have been recommended for this purpose:—

1. Corrosive sublimate (in powder) and hydrochloric acid, of each, 1 oz.; hot water, $\frac{3}{4}$ pint; agitate them together until the first is completely dissolved. It is applied with a paint-brush, observing to rub it well into the cracks and joints. This is the common 'bug wash' of the shops. It is a deadly poison!

2. As the last, but substituting 2 oz. of sal-ammoniac for the hydrochloric acid.

3. Oil of turpentine, 1 pint; camphor, 2 oz.; dissolve. Very cleanly and effective.

4. Tobacco-water, made by steeping 2 oz. of good shag in 1 pint of warm water, for a few hours.

5. Crude pyroligneous acid.

6. Coal-tar naphtha. This, as well as No. 3 (*above*) should never be used by candle-light, as it is excessively inflammable. When the

smell of the common naphtha is objectionable, benzol or benzine may be used instead. The celebrated nostrum vended under the name of "Insecticide" is said to be nothing but benzol.

7. Sulphurated potash (in powder), 6 oz.; soft soap, $\frac{1}{2}$ lb.; oil of turpentine, $\frac{1}{2}$ pint, or q. s. to make a species of soft ointment. The odour of the last three (Nos. 5, 6, 7) is rather persistent and disagreeable; but they are very effective.

8. Strong mercurial ointment, soft soap, and oil of turpentine, equal parts, triturated together. Rather greasy and dirty.

9. Scotch or Welsh snuff, mixed with twice its weight of soft soap.

10. Sulphur, or squills, in impalpable powder, blown into the cracks or joints, or scattered in a fine cloud, by means of a hollow ball or balloon of vulcanised India rubber filled with it and furnished with a small wooden jet or mouth-piece, or in any other convenient manner. Very cleanly and effective. Dumont's 'Patent Vermin Killer,' as well as the whole host of imitations of it, is of this kind.

Obs. Out of the above list there is ample room for selection. The common practice is to take the bedstead, or other piece of furniture, to pieces, before applying them.

These pests exist only in dirty houses. A careful housewife or servant will soon completely destroy them. The surest method of destruction is to catch them individually when they attack the person in bed. When their bite is felt, instantly rise and light a candle and capture them. This may be troublesome, but if there be not a great number a few nights will finish them. When there is a large number, and they have gained a lodgment in the timbers, take the bed in pieces, and fill in all the apertures and joints with a mixture of soft soap and Scotch snuff. A piece of wicker-work, called a BUG-TRAP, placed at the head of the bed, forms a receptacle for them, and then they may be daily caught till no more are left. Oil-painting a wall is a sure means of excluding and destroying them. It has been asserted that these insects are so fond of narrow-leaved dittany or pepperwort (*lepidium rudemale*), that if a bunch of it be suspended near their haunts, they will settle in it, and may be thus easily captured. It is said to be commonly used as a bug-trap in some of our rural districts. Water, poured boiling from the spout of a kettle into the cracks and joints, is a cleanly and certain remedy, which we have often seen employed; so also is a jet of steam; they are both destructive to all insects, and will be found particularly so to beetles.

The proper time for attacking these pests is early in March, or shortly before they are revived from their dormant state by the warm weather. See INSECTS.

Harvest Bug. See ACARI.

BUGLE (bu'gl). An elongated cylindrical glass bead. See BEAD.

BUNION (-yün). A species of corn or swelling on the ball of the great toe, resulting from pressure, and irritation by friction. The treatment recommended for corns applies also to bunions; but in consequence of the greater extension of the disease, the cure is more tedious. A bunion may often be effectually stopped and removed by poulticing it, and, at the proper time, carefully opening it with a lancet. See CORNS.

BUN. A well-known kind of light, sweet cake.

Prep. 1. **BATH-BUNS**.—As 6, but adding a little candied lemon and orange peel, and putting a little grated peel and a few caraway comfits on the top of each.

2. **CROSS-BUNS**.—Flour, 2 $\frac{1}{2}$ lbs.; sifted sugar, $\frac{1}{2}$ lb.; coriander seeds, cassia, and mace, of each (powdered), q. s.; make a paste with butter, $\frac{1}{2}$ lb.; (dissolved in) hot milk, $\frac{1}{2}$ pint; work with three table-spoonfuls of yeast; set it before the fire for an hour to rise, then make it into buns, and set them before the fire on a tin for half an hour; lastly, brush them over with warm milk, and bake them to a nice brown in a moderate oven.

3. **MADREIRA-BUNS**.—Butter, 8 oz.; 2 eggs; flour, 1 lb.; powdered sugar, 6 oz.; half a nutmeg (grated); powdered ginger and caraway seeds, of each, $\frac{1}{2}$ teaspoonful; work well together, then add as much milk as required, and ferment; lastly, bake on tins in a quick oven.

4. **PLAIN BUNS**.—Flour, 2 lbs.; butter, $\frac{1}{2}$ lb.; sugar, 6 oz.; a little salt, caraway, and ginger; make a paste with yeast, 4 spoonfuls, and warm milk, q. s.; as before.

5. **PENNY-BUNS**.—To the last add of currants, well washed, $\frac{1}{2}$ lb.; and water, stained by steeping a little saffron in it, q. s. to give a light yellow tinge to them.

6. **RICH BUNS**.—Fine flour, 3 lbs.; sugar, 1 lb.; butter, 2 lbs. (melted, and beat with); rose water, 4 oz.; currants, 1 lb.; yeast, $\frac{1}{2}$ pint; as before.

Obs. The great secret in producing good buns is, the use of sweet yeast and the best currants only, and thoroughly washing these last in a sieve or colander, to remove grit, before adding them to the dough.

BURGLARIES. The common precautions of locks and bolts, alarum-bells and fire-arms, are frequently found useless in preserving houses from burglars; but a light in the upper part of the house, or a small dog on the ground-floor, with the means of running into a place of safety from its enemies, has been seldom known to fail. A combination of the two would undoubtedly be doubly effective. The bark of the dog, and the fear of detection by the approach of the light, would deter the majority of rogues of common pluck and feeling. A dog out of doors, and consequently accessible, however large and fierce, is easily pacified or silenced by men of the class referred to.

BURNS¹ and Scalds.² *Treatm.* When the injury is superficial and slight, a little creosote may be applied to the part. If a scald, the vesicle should be first pierced with a needle, or what is better, snipped with a pair of scissors, and the water which it contains should be then gently squeezed out. When creosote is not procurable, a liniment formed of equal parts of soft soap, basilicon ointment, oil of turpentine, and water, may be used instead. When the part feels very hot and painful, a poultice may be applied, on the surface of which a few drops of creosote, or of the liniment, should be spread with a knife. This treatment will generally succeed in allaying the pain. It may be followed by a dressing of spermaceti ointment, or any other like simple emollient or unctuous preparation. Creosote, contrary to what is commonly asserted, produces scarcely any smarting or pain; whilst it rapidly removes the burning sensation, and the charred surface soon assumes a dry scabby appearance, which, by dressing with simple ointment, soon comes off and leaves the part beneath in a sound and healthy state. If a poultice be applied it is best to keep it on until the next day. Plunging the part into very cold water immediately after the receipt of an injury of this kind, will frequently prevent any further remedy being required. In all cases cooling laxatives should be administered; and the diet should be rather low until the inflammatory symptoms subside.

BURNING-GLASS. See LENS.

BUTEA FRONDOSA, Roxb. (Ind. Ph.) Syn. **BENGAL KINO TREE. *Habitat.*** Common all over India.—*Official part.* The inspissated juice obtained from the stem by incision (*Butea Gummi, Kino Bengalensis, Bengal kino*). It occurs in the form of irregular shining fragments, seldom as large as a pea; more or less mixed with adherent pieces of grayish bark; of an intense ruby colour and astringent taste; soluble, but not freely so, in water and in alcohol. Its astringency is due to the presence of tannic and gallic acids.—*Prop. & Uses.* Similar to those of kino, for which it has been found an efficient substitute.—*Prep.* Same as those of kino.

BUTTER. [Eng., Ger.] Syn. BUTYRUM, L.; BEURRE, Fr.; BUTER, BUTERA, Sax. The fatty matter obtained from cream by churning it.

Manuf. The process of making butter by the common operation of churning is extremely simple, and is well known. The chief objects to attend to, are maintaining a proper temperature, and a certain degree of exposure to the air. Extreme cleanliness must also be observed; the churn and other utensils being frequently scalded out with water. When the butter is 'come,' it should be put into a fresh-scalded pan, or tub, which has been standing

in cold water, cold water poured on it, and after it has acquired some hardness, it should be well beaten with a flat board until not the least taste of the buttermilk remains, and the water, which must be often changed, becomes quite colourless and tasteless. A little salt may then be worked into it; after which it may be weighed and made into 'forms,' which should then be thrown into cold water contained in an earthen pan provided with a cover. In this way nice and cool butter may be obtained in the hottest weather.

At *Dumbarton*, the newly separated butter is put into a clean vessel, and a corn sickle is drawn several times crosswise through it, to extract any hairs that may adhere to it. This operation is performed in very cold spring water, and is followed by thoroughly washing it therein. 10 oz. of salt are now added to every stone-weight of the butter, and well mixed in.

In *Devonshire*, the milk is generally scalded in copper pans over a charcoal or wood fire, and the cream collected as soon as it rises, or, and more frequently, when the whole has got cold. It is then, churned in the usual way. On the small scale, the butter is commonly obtained from this cream by patiently working it with the hand in a shallow pan or tub. Without care the cream is apt to absorb some of the fumes from the charcoal, which impart a peculiar taste to the butter. This is the reason why some of the Devonshire butter has a slight smoky flavour. It may be removed by thorough washing in cold water. Of late years, in the large dairy-farms of Devonshire, covered flues, with openings to receive the bottoms of the pans, have superseded open fires, by which the danger of contamination from the fumes is removed.

Choice. Fresh butter has a pleasant odour and is of an equal colour throughout its substance. If it smells sour, the buttermilk has not been well washed out; and if it is streaked or veiny, it is probably mixed with stale butter or lard. A good way to try butter is to thrust a knife into it, which should not smell rancid and unpleasant when withdrawn. Rancid and stale butter, when eaten in quantity, is capable of producing dangerous symptoms.

Pur. The cheaper kinds of butter are frequently adulterated with common wheat-flour, oatmeal, pea-fibur, lard, &c., as well as with a large quantity of salt and water. The trick is concocted between the Irish factors and the London dealers. The higher priced article is seldom mixed with anything beyond an excess of salt and water, notwithstanding the assertions of alchemists to the contrary. The presence of lard may be detected by the flavour and paleness of the colour. A little of the sample adulterated with the other substances named, if melted in a glass tube or phial, will separate into strata, which are very marked when cold.

¹ BURN, s. sing.; AMBUS'TIO, L.; BRÜLURE, Fr.; BRAND, BRANDMAHL, Ger.

² See SCALDS (under S).

Preservation. 1. Melt the butter in a stone-ware or a well-glazed earthen pan set in a water bath at a heat not exceeding 180° Fahr., and keep it heated, skimming it from time to time, until it becomes quite transparent; then pour off the clear portion into another vessel, and cool it as quickly as possible, by placing the vessel in very cold water or ice. This is the method employed by the Tartars who supply the Constantinople market. In this state it may be preserved perfectly fresh for 6 or 9 months, if kept in a close vessel and a cool place. This is the plan so strongly recommended by M. Thénard. Mr. Eaton states that butter melted by the Tartarian method, and then salted by curs, will keep good and fine-tasted for two years.

2. Saltpetre and white sugar, of each, 1 oz.; best Spanish great-salt (or Cheshire large-grained salt), 2 oz.; all in very fine powder; mix thoroughly, and add 1 oz. of this mixture to every lb. of butter, and thoroughly incorporate them together. The butter thus prepared is then to be tightly pressed into clean glazed earthenware vessels (or well-seasoned casks), so as to leave no vacuities. This plan is recommended by Dr. Anderson, who declares that "butter so prepared will keep in a cool place for years; and will bear a voyage to the East Indies, if packed (stowed) so as not to melt." It does not taste well before it has stood for three or four weeks, after which it acquires a rich marrow-like flavour, which no other butter ever possesses. A good method to preserve the butter from the air, is to fill the pots to within an inch of the top, then to lay on it some coarse-grained salt to the depth of a $\frac{1}{4}$ to $\frac{1}{2}$ an inch, and lastly to cover each pot with a slate, plate, or other flat article. The salt by long keeping runs to briffe, which forms an air-tight layer on the top of the butter, and may at any time be very easily removed by turning the pot on one side.

3. Fresh butter, 21 lbs.; salt, 1 lb.; saltpetre, 1 oz. These are the common proportions for the best salt butter of the shops.

4. Fresh butter, 18 lbs.; salt, 1 lb.; saltpetre, $1\frac{1}{2}$ oz.; honey or fine brown sugar, 2 oz. Superior to No. 3.

Concl. remarks. It may be useful to know that rancid butter may be restored, or, in all cases greatly improved, by melting it in a water bath with some fresh-burnt and coarsely powdered animal charcoal (which has been thoroughly freed from dust by sifting), and straining it through clean flannel. A better and less troublesome method is to well wash the butter first with some good new milk, and next with cold spring water. Butyric acid, on the presence of which rancidity depends, is freely soluble in fresh milk.

The turnip-flavour, arising from the cows being fed on turnips or cabbages, is said to be removed by one or other of the following methods:—1. When the milk is strained into the pans, put to every 6 galls., 1 gal. of boiling

water.—2. Dissolve 1 oz. of nitre in a pint of spring water, and put a $\frac{1}{2}$ pint of the solution to every 15 galls. of milk.—3. Keep back a $\frac{1}{2}$ pint of the sour cream when you churn, and put it into a well-scalded pot, into which you are to gather the next cream; stir that well, and do so with every fresh addition. Each of these methods come on good authority, but we are bound to say, that our own experience does not confirm their constant success. We have found that the addition of a handful of salt to the water used to wash the butter, is as good a plan as any.

Butter, Ancho'vy. From anchovies (boned and beaten to a paste), 1 part; butter, 2 parts; spice, q. s.

Butter, Clar'ified. Fresh butter melted in a water bath, allowed to settle, and the clear portion poured into an earthenware basin or pot, set in cold water, so as to cool it as quickly as possible, without allowing it to crystallise. It keeps a long time without becoming rancid. See BUTTER, No. 1 (*anté*).

Butter, Hon'ey. Fine Narbonne-honey, 2 to 4 oz.; mixed with good butter, 1 lb. Used as a delicacy for children, and by the sick and aged.

Butter, Lem'on. See ORANGE BUTTER.

Butter, Melt'ed. This well-known sauce may be prepared of excellent quality as follows:—Beat up about 1 oz. of fine flour with 4 oz. of butter, in the cold, until they are evenly and thoroughly mixed, then add 4 or 5 table-spoonfuls of hot milk, put the whole into a small saucepan, and continue shaking it, all in one direction, until it simmers very gently; lastly, remove it from the fire, and pour it into the butter-boats for use. These last should be filled with hot water, and then emptied and wiped dry, before putting the melted butter into them. See SAUCES.

Butter, Or'ange. *Prep.* 1. From 6 eggs, 2 oz. of powdered sugar, and 4 oz. of butter, well beaten together with a little orange-flower water. Sometimes 1 or 2 oz. of blanched almonds, or of almond-paste, is added.

2. Butter, 1 lb.; syrup of orange peel, 4 oz. Both are eaten as a delicacy. LEMON-BUTTER is made in a similar manner.

Butter of Antimony†.* Trichloride of antimony.

Butter of Caca'o. See CO'COA, and CO'COA-NUT OIL.

Butter of Nut'megs. Collected from the surface of the water in the still, after the distillation of the essential oil of nutmegs.

Butter of Ro'ses. Obtained by distilling damask roses. It separates slowly from the water in the receiver. It has little smell, and is hence used to dilute the odour of musk, ambergris, and civet.

Butter of Wax. Prepared by distilling bees'-wax. A factitious kind is also made.

Butter of Zinc†.* Chloride of zinc.

BUTTER-MILK. The liquid that remains after the butter is separated from the cream.

Qual., &c. Butter-milk left from the

churning of sweet cream is not only very delicious, but exceedingly wholesome and nutritious. It is eaten with fruit, puddings, and cakes, and is said to possess the property of allaying the nervous irritability induced by excessive tea-drinking. It is an admirable beverage in rickets, diabetes, and many stomach affections. An American physician has recently asserted that it induces longevity. See MILK.

BUTTONS. See BRASS, GILDING, &c.

BUTYRATE. [Eng., Fr.] *Syn.* BUTYRAS, L. A salt in which the hydrogen of butyric acid is replaced by a basic radical.

Butyrate of Barium. *Prep.* Saponify butter with a boiling solution of caustic alkali, and decompose the resulting soap by adding a solution of tartaric acid; filter and distil; neutralise the distillate with hydrate of barium, and evaporate; the first crystals that form are caprate of barium; the next, caproate of barium; and the last, butyrate of barium. This salt is very soluble in water, and hence is easily separated from the others.—*Use.* Chiefly for making butyric acid.

BUTYRIC (-tŭr') *Syn.* BUTYRICUS, L.; BUTYRIQUE, Fr. Of or from butter.

BUTYRIC ACID. $\text{HC}_4\text{H}_7\text{O}_2$. *Syn.* ACIDUM BUTYRICUM, L.; ACIDE BUTYRIQUE, Fr.; BUTTERSÄURE, Ger. An oily acid, first obtained by Chevreul, from butter.

Prep. From butyrate of barium or magnesium, by adding sulphuric acid in quantity not quite sufficient to decompose the whole of the salt; the clear liquid filtered, and distilled, yields butyric acid, from which the water may be removed by digestion with chloride of calcium.

Prop. A thin colourless liquid, of pungent rancid odour, and sour taste, miscible with water and alcohol. It boils and distils unchanged at 327° Fahr. Sp. gr. .963. See ETHERS.

BUTYRIN (-in). [Eng., Fr.] An oily substance existing in butter, and of which it forms the characteristic portion. It was discovered by Chevreul.

Prep. Keep clarified butter in a porcelain vessel, at a heat of 66°, for some days; carefully collect the oily portion which separates, mix it with an equal weight of alcohol of the sp. gr. .796, and agitate it frequently for 24 hours; after repose pour off the clear portion, and evaporate it; treat the oily residuum with a little carbonate of magnesium, to remove free acid, and wash off the butyrate of magnesium, thus formed, with water; lastly, heat the remaining fatty matter in alcohol, filter, and evaporate, by a gentle heat; the residuum is butyrin.

BUXINE (-in). An alkaline substance, detected by M. Faure, in *buxus semper-virens*, or the common box-tree.

CABBAGE. *Syn.* BRASSICA, L.; CHOU, Fr.; KOHL, Ger. This common esculent, and

all its numerous varieties, are merely cultivated specimens of the wild sea-cabbage of our coasts (*brassica oleracea*, Linn.), one of an extensive and valuable genus of plants belonging to the *nat. ord.* Cruciferae. After the potato, the cabbage is doubtless more extensively used by the masses of the people, than any other fresh vegetable. When young, and properly dressed, it forms an agreeable and wholesome addition to animal food, the grossness of which, it is said, it tends to correct. It should be eaten only when fresh gathered and fresh cooked; and the unconsumed portion, as well as the water in which it has been boiled, should be at once thrown away. Persons troubled with a weak digestion, or who have a tendency to flatulence, diarrhoea, or worms, would do well to avoid them. Their use is particularly serviceable in scurvy, and in numerous skin diseases.

It has been asserted that cabbages, cauliflowers, broccoli, celery, and several other culinary vegetables, may be preserved in a fresh state for some time, by cutting them so that they may have about two inches of stem left below the leaves, scooping out the pith as far down as a small knife will reach, and then suspending them perpendicularly by means of a cord, in an inverted position, in some cool situation, and daily filling up the bottom part of the stem with clean cold water. In this way it is stated that a supply of green vegetables may be readily obtained during a severe winter, and on ship-board. Other methods, including those usually adopted with the same object, are noticed under VEGETABLES (Culinary).

Cabbages, broccoli, &c., are dressed by simply throwing them into boiling water, and simmering them until tender. A few minutes is sufficient for this purpose. A pinch of salt of tartar, or of carbonate of soda, is commonly added to the water, to preserve the green colour of the vegetables.

CACHOU AROMATISÉ (kashoo aromätészä) [Fr.] A mouth-lozenge intended to sweeten and perfume the breath. Preparations of this description are much used by smokers and bacchanals. The form under which they are generally prepared for sale, is that of 1½ to 2 gr. pills, neatly silvered. Originally they were composed chiefly of catechu and sugar, flavoured and perfumed with the stronger aromatics; but at the present day the catechu, from which they derive their name, is not unfrequently omitted. Their preparation is described elsewhere. See BREATH, LOZENGES, PASTILS, &c.

CADMIUM. Cd. [Eng., L.] *Syn.* KLAPROTHIUM. A metal discovered by Stromeyer and Hermann, in the ores of zinc.

Prep. 1. (Stromeyer.) The cadmo-zincic ore is dissolved in an excess of dilute sulphuric or hydrochloric acid, by heat; a stream of sulphuretted hydrogen is passed through the solution, the resulting precipitate (sul-

phide of cadmium) dissolved in nitric acid, and the solution evaporated to dryness; the residuum is dissolved in water, the solution precipitated with carbonate of ammonium in excess, and the precipitate (carbonate of cadmium) collected, mixed with charcoal, and heated to redness in a crucible apparatus so arranged as to condense the fumes; the cadmium sublimes.

2. (Wollaston.) A solution of the ore obtained as above is placed in a platinum capsule, and a piece of metallic zinc is plunged into it. In a short time the cadmium is precipitated, and attaches itself to the sides of the capsule, when it is collected, washed, and dried.

3. (Herapath.) When zinc is obtained by distilling its ores, *per descensum*, the first portion of the metallic fumes evolved burn with a brownish flame, and deposit oxide of cadmium, which is subsequently reduced by distillation with charcoal. Thousands of pounds of cadmium are yearly wasted at the zinc works which might be easily collected in a similar manner.

Prop., &c. Resembles tin in most of its physical properties, being white, soft, and malleable. Sp. gr. 8.61. Stromeyer gives its melting-point as 442° Fahr., but Dr. Wood, an American chemist, states that the metal requires for its fusion nearly the same heat as lead, and gives it as about 600° Fahr. It volatilises at a somewhat higher temperature, giving off orange-coloured, suffocating fumes, which, when inhaled too freely, leave a disagreeable, sweetish, styptic sensation upon the lips, and a persistent brassy taste in the mouth, with constriction of the throat, heaviness in the head, and nausea. The alloys of cadmium are said to be brittle, by almost all who have treated of them, but Wood found that many were extremely tenacious, as, for instance, the combination of 2 parts of silver and 1 part of cadmium, which is perfectly malleable and very strong. The amalgam of equal parts of cadmium and mercury is also highly malleable. Like bismuth, cadmium has the property of promoting fusibility in certain alloys; thus, a remarkable fusible metal may be formed by melting together cadmium 1 to 2 parts, lead 2 parts, and tin 4 parts.

Tests. Its ores and salts are recognised as follows:—1. Mixed with carbonate of sodium, and exposed on a charcoal support to the reducing flame of the blowpipe, the charcoal becomes almost instantly covered with a reddish-yellow incrustation of oxide of cadmium, commonly forming a circle or zone.—2. Caustic soda and potassa give a white precipitate (hydrated oxide) in solutions containing cadmium, insoluble in excess of the precipitant.—3. Ammonia gives a similar white precipitate, freely soluble in excess.—4. The alkaline carbonates give white precipitates (carbonate of cadmium), insoluble in excess.—5. Sulphuretted hydrogen, and sulphhydrate of ammonium, give a bright yellow precipitate (sulphide of cad-

mium), which is insoluble in dilute acid, alkalies, sulphides, and cyanide of potassium, but readily soluble in both hydrochloric acid and nitric acid, especially with heat.—6. The salts of cadmium are readily distinguished from those of arsenic, by the precipitated sulphide being insoluble in ammonia, and soluble in hydrochloric acid, and being capable of sustaining a white heat without subliming.

Cadmium, Carbonate of. CdCO_3 . *Syn.* CADMIUM CARBONAS, L. From a solution of sulphate or chloride of cadmium, and an alkaline carbonate; the precipitate being collected, washed, and dried by a gentle heat. A white powder.

Cadmium, Chloride of. CdCl_2 . *Syn.* HYDROCHLORATE OF CADMIUM, MU'RIATE OF CADMIUM; CADMIUM CHLORIDUM, CADMIUM HYDROCHLORAS, L. *Prep.* 1. (Pure.) By dissolving carbonate or oxide of cadmium in hydrochloric acid, and crystallising by gentle evaporation. Prismatic crystals; very soluble in water.

2. (Turber.) By exposing the product of the last process to heat. Amorphous.

3. From crude cadmium or its oxide, and hydrochloric acid, as last.

Cadmium, Iodide of. CdI_2 . *Syn.* HYDRIODATE OF CADMIUM; CADMIUM IODIDUM, C. HYDRIODAS, L.

Prep. (Crookes.) Cadmium in filings 1 part, pure iodine 2 parts, are to be placed together in a capacious flask, with alcohol, sufficient to cover them. Action commences at once, attended with considerable evolution of heat; when it ceases, heat the mixture till it is colourless; then filter from a few grains of cadmium which will remain undissolved, evaporate and crystallise.

Uses. In photography this salt has lately been employed with great success for iodizing collodion. Being very stable, it is not decomposed, and the collodion iodized with it preserves its sensitiveness undiminished during many months. (See COLLODION.) In medicine it is used occasionally as a substitute for iodide of lead.

Cadmium, Oxide of. CdO . *Syn.* PROTOXIDE OF CADMIUM; CADMIUM OXYDUM, L. *Prep.* 1. (Hydrated.) From sulphate or chloride of cadmium, and a solution of caustic alkali; observing to well wash and dry the precipitate. A white powder, freely soluble in acids.

2. (Anhydrous.) By igniting the hydrated oxide, or the carbonate or nitrate of cadmium. That from the first two has a pale brown colour; that from the nitrate has a dark brown tint and a semi-crystalline appearance. The former has been proposed to be used as a pigment.

Cadmium, Sulphate of. CdSO_4 . *Syn.* CADMIUM SULPHAS, CADMIUM SULPHURICUM, KLAPROTHIUM SULPHURIUM, L. *Prep.* 1. From carbonate or oxide of cadmium and dilute sulphuric acid, as the chloride.

2. (Cottetereau.) Oxide of cadmium, 1 oz.; sulphuric acid, q. s.; dissolve, evaporate, and crystallise.

3. (Pereira.) Sulphuric acid, 6½ parts; water, 15 parts; mix; add cadmium, 7 parts; dissolve, evaporate to dryness, redissolve in water, filter, and evaporate by a gentle heat, so that crystals may form.

Prop., &c. Efflorescent, rectangular, prismatic crystals; very soluble in water; tastes astringent. It is about 4 times as strong as sulphate of zinc, and is used in similar cases. *Dose.* 3 to 10 grs. *Externally* (¼ to 3 or 4 grs. to water, 1 oz.); in specks of the eye, opacity of the cornea, chronic ophthalmia, &c. As an ointment, 10 to 12 grs. to lard, 1 oz.

Cadmium Sulphide of CdS. *Syn.* CADMIUM YELLOW. This occurs native as GREENOCKITE. It may be prepared artificially, either by fusing its elements together, or by passing a stream of sulphuretted hydrogen through a solution of the chloride, nitrate, or sulphate. When prepared artificially, it is of a bright yellow or orange colour, and is of great value to the artist. It has been used in making fireworks. See FIRES, Coloured.

Cadmium Yellow. See SULPHIDE OF CADMIUM (*above*) and YELLOW PIGMENTS.

CÆSALPINA (GUILLANDINA) BONDUCCELLA. (Ind. Ph.) *Habitat.* Tropical portions of both hemispheres.—*Official part.* The seeds (*Bonducella Semina, Bonduc seeds*); of a somewhat irregular sub-spherical or ovoid form, usually from ⅝ to ¾ of an inch in diameter, smooth, hard, and lead-coloured, and contain an amylaceous white nucleus, having a bitter taste. They contain a fixed oil, resin, and a bitter principle.—*Properties.* Tonic and antiperiodic.—*Therapeutic uses.* In intermittent fevers; also in debility, and other cases requiring tonics.—*Dose.* 10 to 15 grains twice daily.

COMPOUND POWDER OF BONDUC (*Pulvis Bonducellæ compositus*). Take of bonduc seeds, deprived of their shells and powdered, 1 oz.; black pepper, powdered, 1 oz. Mix thoroughly, and keep in a well-stoppered bottle.—*Dose.* 15 to 30 grs., three times a day.

CÆSIUM. [Eng., L.] Cæ. A metal belonging to the alkaline group, discovered by Bunsen in the mineral water of Durckheim by means of SPECTRUM ANALYSIS (which see), and so named by him from *cæsius*, grayish-blue, the colour of its characteristic ray.

CAFFEIC ACID. *Syn.* CHLOROGENIC ACID. A white powder, discovered by Runge in coffee, in which it exists in combination with potassium (caffeate of potassium), and caffeine, and is then very soluble in alcohol. Pfaff states that the aroma of coffee is dependent on the volatilisation, or, rather, the decomposition of this acid.

CAFFEINE. $C_8H_{10}N_4O_2$. *Syn.* CAFFE'INE, THE'INE, GUARANINE. A peculiar nitrogenised principle, discovered by Robiquet in coffee. It is, moreover, the essential principle of tea, of Paraguay tea, and of Guarana, infusions of which are used as beverages in different parts of the world. The proportion of caffeine to

the pound was found by Liebig to be as stated below in the six descriptions of coffee named:—

Martinique	32 grains.
Alexandrian	22 "
Java	22 "
Mocha	20 "
Cayenne	19 "
St. Dominique	16 "

In Hyson tea it exists in the proportion of from 2·5 to 3·4 per cent.; and in gunpowder tea from 2·2 to 4·1. In Paraguay tea, or *maté* as it is called in Brazil, and in Guarana, it exists in the proportion of 1·3 per cent.

Prep. 1. Coarsely powdered raw or unroasted coffee, is boiled in water, and subacetate of lead added to the filtered decoction to throw down the extractive and colouring matter; the excess of lead is next precipitated with sulphuretted hydrogen, and the liquid filtered, and evaporated by a gentle heat; the residuum is dissolved in boiling water, the solution agitated with freshly burnt animal charcoal, filtered, evaporated, and crystallised. By redissolving the product in hot alcohol, it may be obtained in white, shining, silky filaments, as the solution cools.

2. (H. J. Versman.) Quick-lime, 2 lbs.; water, q. s. to form a hydrate; raw coffee (bruised), 10 lbs.; mix, put it into a displacement apparatus, and cause alcohol of 80° to percolate through the mixture, until the fluid obtained no longer contains caffeine; the mass in the percolator is then roughly ground to powder, mixed with a fresh quantity of quick-lime, and the process of percolation repeated with fresh alcohol, as before. The spirit is next distilled from the mixed tinctures in a retort, and the residuum washed with a little warm water to remove the oil; the evaporation is then gently conducted until a crystalline mass is obtained, which is further freed from adhering oil by pressure between folds of blotting paper. It is purified by redissolving it in boiling water or hot alcohol, &c., as before.

3. (A. Vogel.) An extract of powdered coffee is made with commercial benzol,* this being distilled off, leaves an oil and caffeine behind; the oil is then removed by a little ether or by hot water, from which latter liquid the alkaloid crystallises on cooling.

4. From a hot infusion of tea-leaves by treatment with subacetate of lead and sulphuretted hydrogen, as in process 1 (*above*).

Prop., &c. Soluble in 100 parts of cold water; freely soluble in hot water and in water acidulated with an acid; slightly soluble in cold alcohol; it fuses at 352° Fahr., tastes slightly bitter, and possesses feeble basic properties. With the sulphuric and hydrochloric acids it forms crystallisable compounds. The salts of caffeine may be made by dissolving it, to saturation, in the dilute acid, and evaporating the solution by a very gentle heat.

It forms splendid double salts with bichloride of platinum and terchloride of gold.

Uses. Caffeine has been recommended in those pains that affect only one side of the head (hemiparesis); in doses of 1 to 3 grs. Its physiological action is very trifling, notwithstanding all that has been said to the contrary. Mr. Cooley took 20 grs. daily, of pure caffeine, for above a month, without experiencing any other effect than a very slight elevation of spirits after each dose, similar to that produced by a small quantity of spirits of sal-volatile. It has been used lately with doubtful success as an antidote to the poisonous effects of opium. See COFFEE, TEA, &c.

CAFFEONE. A brown, aromatic oil, formed during the roasting of coffee.

CAJUPUT OIL. See OILS (Volatile).

CAKES. A species of fancy bread or trifle familiar to every one.

Before proceeding to the actual operation of cake-making, the various materials which are to enter into their composition undergo a certain amount of preparation. For this purpose every article is got ready about an hour previously to its being wanted, and is placed before the fire, or upon a stove, that it may become gently heated. Without these precautions it is impossible to produce good cakes. The flour is thoroughly dried, and warmed. The currants are nicely washed in a hair sieve, wiped dry in a cloth, and then set before the fire. Before use, they are dusted over with a little flour. The sugar is rubbed to a fine powder, and passed through a sieve. The eggs are well beaten in a basin, and strained. The butter is melted by being placed in a basin set in hot water, and is afterwards well beaten up with a little warm milk. The lemon peel is cut very thin, and beaten in a mortar to a paste or powder, with lump sugar; or for common purposes, it is grated. The caraways, ginger, and other flavouring ingredients, are preferred in the form of fine powder, or are made into an essence, by digesting them in spirit of wine; the first is the most common method. The milk and water is made lukewarm. When all these things are ready and have stood a sufficient time, they are put into a pan, one after another, in the proper order, and well beaten together, by which the lightness of the cakes is considerably increased.

In plum cakes, as well as in some other varieties, a little yeast may be added after the butter, and the mass allowed to rise a little, and then again well kneaded, by which not only less butter and eggs may be used, but the products will be both lighter and more wholesome. Good stale bread, well soaked in hot milk or water, and then beaten to a paste, and passed through a fine sieve, forms an excellent thing to mix up the ingredients with, and produces a very light and nutritious cake. Cakes "wetted up" with milk are richer, but do not keep so well as those without it; they get stale sooner, and

when in that state are far from agreeable to the palate. A kind of flour prepared from maize or Indian corn has been recently introduced to the notice of cooks, but it is better adapted for puddings than for cakes. See CORN-FLOUR.

Cakes are preferably baked on flat tins or in little "tin shapes," which should be first well buttered.

Cakes should be kept for store in tin canisters; wooden boxes, unless very well seasoned, are apt to give them an unpleasant taste. Brown-paper linings and wrappers should be avoided for the same reason. See BISCUITS, BREAD, BUN, ICING, STAINS, &c.

Cakes, Almond. *Prep.* 1. From sweet almonds (blanched and beaten to a smooth paste), flour and powdered sugar, of each, $\frac{1}{2}$ lb.; 7 eggs, and the outside peel of 4 lemons (shredded small). The almonds, sugar, lemon peel, and eggs, are beaten together, until as white as sponge paste; the flour next worked in, and the paste put into buttered moulds, and baked in a slack oven, with 8 or 10 thicknesses of white paper under them and one or two over them.

2. Almonds, 1 lb.; sugar, $\frac{1}{2}$ lb.; rose water or orange-flower water, $\frac{1}{4}$ pint; flour, $\frac{1}{2}$ lb.; 3 eggs; as above. Some persons ice these cakes.

Cakes, Banbury. *Prep.* From butter and dough fermented for white bread, of each, 1 lb., as in making puff paste, then rolled out very thin, and cut it into oval or triangular pieces, or other shapes. On these are placed a mixture of currants and moist sugar, equal parts, wetted with a little wine or brandy, and the paste being closed up, they are placed on a tin with the closed side downwards, and baked. A little powdered sugar, flavoured with candied peel (grated), or essence of lemon, is sifted over them as soon as they come out of the oven. In the common cakes of the shops, the brandy is omitted, and lard is used for butter, and less of it.

Cakes, Bath. *Prep.* From butter, $\frac{1}{2}$ lb., flour, 1 lb., 5 eggs, and a cupful of yeast; when risen, add powdered sugar, 4 oz., and caraways, 1 oz. Bake them on tins.

Cakes, Cheese. *Prep.* 1. Curdle some warm new milk with rennet, drain the curd in a linen bag, and add $\frac{1}{4}$ of its weight, each, of sugar and butter, 6 eggs, some grated nutmeg, and a little orange flower or rose water.

2. (*Almond Cheese Cakes.*) To the above add as much blanched almonds, beaten to a smooth paste, as there is butter, and an equal weight of macaroni.

3. (*Lemon Cheese Cakes.*) To the first form add lemon peel (grated fine), or essence of lemon, q. s.

Cakes, Di'et. *Syn.* DIET BREAD. *Prep.* 1. Dissolve sugar, 1 lb., in milk, $\frac{1}{2}$ pint; add 6 eggs, and whisk the mixture to a full froth, then cautiously stir in flour, 1 lb., beat it for $\frac{1}{2}$ hour, and immediately bake it in a quick

oven. It may be baked whole or divided into small cakes.

2. From fine flour and powdered sugar, equal parts; 6 eggs; and the juice and rind (grated) of 1 lemon.

Cakes, Drop. *Prep.* Eggs, 1 dozen; rose-water, 1 table-spoonful; powdered sugar, $\frac{1}{2}$ lb.; fine flour $\frac{1}{2}$ lb.; and caraways, $\frac{1}{2}$ oz. Drop it on wafer paper, and bake as before.

Cakes, Gin'ger. *Prep.* Sugar, 1 lb.; powdered ginger, 4 oz.; flour, 2 lbs.; water, 1 pint; butter, $\frac{1}{2}$ lb.; candied orange peel, 8 caps (grated).

Cakes, Lem'on. *Prep.* Flour and sugar, 6 $\frac{1}{2}$ each, 1 lb.; eggs, 1 dozen; grated peel and juice of 4 lemons; whisk the eggs to a bright froth, then gradually add the rest.

Cakes, Marl'borough. *Prep.* Beat 8 eggs and 1 lb. of pounded sugar $\frac{1}{2}$ hour; then add fine flour, 1 lb.; and caraway seeds, 2 oz.

Cakes, Plain. *Prep.* 1. From flour, 4 lbs.; currants, 2 lb.; butter, $\frac{1}{2}$ lbs.; caraway seeds, $\frac{1}{2}$ oz.; candied lemon peel (grated), 1 oz.; yeast, $\frac{1}{2}$ pint; milk, q. s. Let it rise well before baking.

2. Baker's dough, 2 lbs.; currants, 1 lb.; butter, $\frac{1}{2}$ lb.; 3 eggs; milk (hot), $\frac{1}{2}$ pint.

3. (Rundell.) Baker's dough, 4 lbs.; butter and moist sugar, of each, $\frac{1}{2}$ lb.; caraway seeds, a small handful. Well work it together, pull it into pieces the size of a golden pippin, and work it together again. This must be done three times, or it will be in lumps, and heavy when baked.

4. (*Rich.*) Equal weights of flour, butter, sultana raisins, eggs, currants, and brown sugar, mixed up with milk, and seasoned with candied peel, nutmeg, &c., and baked in a quick oven. This resembles "pound cake."

Cakes, Plum. *Prep.* 1. (*Good.*) From butter, $\frac{1}{2}$ lb.; dry flour, 3 lbs.; Lisbon sugar, 8 oz.; plums and currants, of each, $\frac{1}{2}$ lb.; and some pimento, finely powdered; to be "wetted up" with 3 spoonfuls of yeast, and a Winchester pint of new milk (warmed); bake on a floured tin half an hour.

2. (*Excellent.*) From fresh butter, sifted sugar, flour, and currants, of each, 1 lb.; 18 eggs; powdered spices, 2 oz. (viz., cloves, mace, cinnamon, nutmeg, and allspice); sliced almonds, 4 oz.; raisins (stoned and chopped), $\frac{1}{2}$ lb.; and a large glass of brandy; bake in a hot oven. When sufficiently baked, let the oven cool, and afterwards put in the cake and allow it to remain for several hours to dry. (Rundell.)

3. (*Rich.*) Take fresh butter and sugar, of each, 1 lb.; flour, $1\frac{1}{2}$ lb.; currants, 2 lbs.; a glass of brandy; sweetmeats and peels, 1 lb.; sweet almonds, 2 oz.; 10 eggs; allspice and cinnamon, of each, $\frac{1}{2}$ oz.; bake in a tin hop in a hot oven for 3 hours, and put 12 sheets of paper under it to keep it from burning. (Mackenzie.)

Cakes, Port'ugal. *Prep.* From flour, powdered sugar, and fresh butter, of each, 1 lb.;

10 eggs; currants, $\frac{1}{2}$ lb.; and a little white wine; bake in small tins only half filled.

Cakes, Pound. *Prep.* 1. As plum cake; but using 1 lb. each of all the ingredients, except the spices.

2. Using equal parts of sugar, flour, currants, and sultana raisins, and half that quantity each of butter, brandy, and candied peel, with spices as required.

Cakes, Queen. *Prep.* From about 1 lb. each of dried flour, sifted sugar, washed currants, and butter, with 8 eggs; the whole beaten for an hour, made into a batter, and baked in little tins, teacups, or saucers, only half filled. A little fine sugar is frequently sifted over them. Nutmeg, mace, and cinnamon are also sometimes added.

Cakes, Rat'ifa. *Prep.* Beat $\frac{1}{2}$ lb. of sweet, and 1 oz. of bitter almonds, in fine orange, rose, or ratifa water; mix in $\frac{1}{2}$ lb. of pounded sugar; add the whites of 4 eggs (well beaten); set it over a moderate fire in a preserving-pan; stir it one way until it is pretty hot, and when a little cool, form it into small rolls, and cut it into thin cakes; shake some flour lightly on them, give each a light tap, put them on sugar papers, sift a little sugar on them, and put them into a very slack oven.

Cakes, Rout. *Prep.* From flour, 2 lbs.; butter, sugar, and currants, of each, 1 lb.; 3 eggs; $\frac{1}{2}$ pint of milk; 2 glasses of white wine; and 1 glass of brandy; drop them on a tin plate, and bake them.

Cakes, Savoy. *Prep.* From flour and sifted sugar, of each, 1 lb.; 10 eggs; and the rind of a lemon (grated); form a batter by degrees, put it into moulds, and bake in a slack oven.

Cake, Seed. *Prep.* 1. (*Plain.*) From flour, $\frac{1}{2}$ peck; sugar, $\frac{1}{2}$ lb.; allspice, $\frac{1}{2}$ oz.; melted butter, $\frac{1}{2}$ lb.; a little ginger; milk, $\frac{1}{2}$ pint; yeast, $\frac{1}{2}$ pint; add seeds or currants; and bake an hour and a half.

2. (*Good.*) To the preceding add of butter and sugar, of each, $\frac{1}{2}$ lb., and wet it up with milk previously mixed with 6 eggs.

3. (*Rich.*) Take of flour, $1\frac{1}{2}$ lb.; butter and sugar, of each, $\frac{1}{2}$ lb.; 8 eggs; 2 oz. of caraway seeds, 1 grated nutmeg, and its weight in cinnamon. Bake 2 hours in a quick oven.

4. (*Scotch.*) Nine eggs; sugar and butter, of each, $\frac{1}{2}$ lb.; mix well together, then add a little cinnamon, nutmeg, and cloves; $\frac{1}{2}$ oz. of caraway seeds; $\frac{1}{2}$ lb. of candied citron; $\frac{1}{2}$ lb. of candied orange peel; $\frac{1}{2}$ lb. of blanched almonds (pounded fine); flour, 3 lbs.; and brandy, $\frac{1}{2}$ pint.

Cakes, Shrewsbury. *Prep.* From flour, 3 lbs.; sugar, 1 lb.; a little cinnamon and nutmeg; 3 eggs; a little rose water; and melted butter enough to make it into a dough.

Cakes, So'da. *Prep.* 1. From flour, 1 lb.; bicarbonate of soda, $\frac{1}{2}$ oz.; sugar and butter, of each, $\frac{1}{2}$ lb.; make a paste with milk, and add candied orange, lemon, or citron peel, or the fresh peels grated, q. s. to flavour.

2. To flour, 1 lb.; sugar and butter, of each,

2 oz.; candied peel, $\frac{1}{2}$ oz.; sesquicarbonate of soda, 3 lbs.; milk, q. s.

Obs. An equal weight of carbonate of magnesia, used instead of the soda, also makes good cakes. Both are suitable to delicate stomachs, especially in dyspepsia, with acidity.

Cakes, Sponge. *Prep.* From 8 eggs; lump sugar, $\frac{3}{4}$ lb.; flour, $\frac{1}{2}$ lb.; water, $\frac{1}{2}$ pint; the yellow peel of a lemon; mix as follows:—Put the lemon peel into the water; when about to make the cake, put the sugar into a saucepan, pour the water and peel on it, and let it stand by the fire to get hot. Break the eggs into a deep earthen vessel that has been made quite hot; remove from the heat, whisk for a few minutes; make the sugar and water boil up, and pour it very gradually boiling-hot over the eggs; continue to whisk them briskly until they become thick and white; add the flour (quite warm), stir it lightly in, put the paste into tins lined with white paper, and bake them immediately in a moderately hot oven.

Cakes, Tea. *Syn.* BENTON CAKES. *Prep.* From flour, 1 lb.; butter, 4 oz.; and milk, q. s.; bake on a hot hearth or slow oven plate.

2. To the last, add 2 table-spoonfuls of yeast.

Cakes, Tip'sy. *Prep.* Small sponge cakes steeped in brandy, and then covered with grated almonds and candied peel; or almonds (cut into spikes) are stuck in them. They are commonly piled on a dish, surrounded with a custard, and covered with preserves drained as dry as possible.

Cakes, Wigg. *Prep.* From $\frac{1}{2}$ pint of warm milk; $\frac{1}{4}$ lb. of fine flour; and 2 or 3 spoonfuls of light yeast. Afterwards work in 4 oz. each of sugar and butter; make it into cakes, or wiggs, with as little flour as possible, add a few caraway seeds, and bake them quickly.

Cakes. (In medicine.) Cakes have been used as a form of administering medicinal substances to children, but have not been extensively employed in this country for the purpose, unless by quacks, and in domestic practice. In preparing them, the active ingredients are added in such proportions to the common materials of a sweet cake, that one or two, as the case may be, are sufficient for a dose. See GINGERBREAD, WORM-CAKE, &c.

CALAMINE. See ZINC (Carbonate of).

CALCINATION. The operation of burning or roasting any solid body to expel its more volatile parts, as the conversion of chalk into lime by the expulsion of carbonic anhydride. The roasting of the ores in the first stage of the Welsh process of copper smelting and in the Silesian mode of extracting zinc is technically termed CALCINATION.

The method of conducting the process of calcination depends on the nature of the body operated on. Many substances, for delicate experiments, are calcined over a spirit lamp in a platinum spoon or crucible; others, in iron vessels or earthen crucibles, placed in a com-

mon furnace. When the action of the air proves injurious, as in the manufacture of charcoal, the process is performed in close vessels or chambers. In some cases the fuel is mixed with the articles, and they are both burnt together, as in the manufacture of lime, the roasting of ores, &c. The process of drying salts, or driving off their water of crystallisation by heat, is also frequently called CALCINATION; thus we have calcined copperas, alum, &c.

CALCI'NER. A reverberatory furnace used for the calcination of metallic ores, particularly those of COPPER and ZINC (which see).

CALCIUM. [Eng., L.] Ca. The metal of which LIME is an oxide. Though it is a chemical curiosity when isolated, it is one of the most abundant substances in nature, forming a very large portion of the crust of the earth. It occurs in combination with fluorine as fluor-spar; with oxygen and carbonic acid as chalk, limestone, and marble; and with oxygen and sulphuric acid as gypsum. The metal was first obtained from lime by Sir H. Davy, in 1808; but little was known of its properties until Dr. Matthiessen formed it by the electrolytic decomposition of the chloride of calcium.

Prep. 1. By the action of a powerful voltaic current upon a paste of pure lime in contact with mercury, as in the original method of preparing barium.

2. By the electrolysis of chloride of calcium in a state of fusion.

3. (Caron.) Fused chloride of calcium in powder, 300 parts; distilled zinc, finely granulated, 400 parts; sodium, in small pieces, 100 parts; the whole placed in a crucible and heated to redness in an ordinary furnace. The action is very feeble at first, but after some time zinc flames arise. The heat must now be moderated, to prevent the volatilisation of the zinc, but at the same time it must be maintained as high as possible. When the crucible has remained in this state for about a quarter of an hour it may be withdrawn. On cooling, a metallic button will be found at the bottom. This alloy of zinc and calcium, which generally contains from 10 to 15% of the latter metal, must be placed in a coke crucible and heated until the whole of the zinc is driven off. The alloy should be in pieces as large as possible. When proper precautions have been observed, a button of CALCIUM is obtained, only contaminated with the foreign metals contained in the zinc.

Prop. &c. The metal belongs to the group which includes BARIUM, STRONTIUM, and MAGNESIUM; it is of a light yellow colour; is rather harder than lead, and very malleable. It melts at a red heat. It tarnishes in a day or two, even in dry air, and in contact with moist air it breaks up like ordinary lime. Its sp. gr. is 1.55.

Tests. Salts of calcium in solution produce a white precipitate with carbonate of

ammonium; it becomes far less voluminous on heating the solution, and dissolves very readily in hydrochloric acid. Sulphuric acid, when added to concentrated solutions, gives an immediate white precipitate; if the solution is not concentrated, the precipitate may separate gradually, in minute crystals; and if it is very dilute, no precipitation will take place, because sulphate of lime is soluble in about 500 times its weight of water. With neutral solutions, even when very dilute, oxalate of ammonium gives a copious white precipitate, soluble in most dilute acids.

Calcium, Bromide of. CaBr_2 . *Syn.* CAL'CI' BROM'DUM , L. *Prep.* (Magendie.) To a solution of bromide of iron add hydrate of calcium in slight excess; filter, evaporate to dryness, redissolve in water, and again filter, and evaporate.

Calcium, Chloride of. CaCl_2 . *Syn.* CAL'CI' CHLOR'DUM (B. P.). *Prep.* Hydrochloric acid and water, of each, 10 fl. oz.; chalk, 5 oz.; evaporate the solution until the salt becomes solid, and dry the residue at about 400°F .

It is obtained in solution as a residuum in making several preparations of ammonia, as the liquor and carbonate, and in making carbonic acid by the action of hydrochloric acid on marble. The residuum is concentrated and set aside to crystallise, or evaporated to dryness.

Prop., Uses, &c. This salt crystallises in colourless, striated, hexagonal prisms, terminated by very acute points. It is very soluble in alcohol and water, the latter even at 32° dissolving more than its own weight, and at 60° three or four times its weight of this salt. When heated, the crystals undergo watery fusion. When dissolved in water, they produce great cold; and hence are frequently employed as an ingredient in FREEZING MIXTURES. These crystals contain nearly half their weight of water. They are very deliquescent, passing readily into the liquid state, and forming what used to be called oleum calcis, or oil of lime. The anhydrous chloride is hard and friable; slightly translucent; totally and readily soluble in water, and, like the crystallised salt, very deliquescent. In the laboratory chloride of calcium, either fused or merely dried, is continually used for drying gases and for absorbing the water from ethereal and oily liquids in organic analysis. The unfused is now generally preferred for this purpose, as it is more porous than the fused. The salt is also used in the rectification of alcohol, and to form a bath for heating stone-ware stills and other apparatus liable to be cracked on the sand bath. As a chemical reagent, it is employed chiefly in detecting certain organic acids. As a medicine, it has been given in some scrofulous and glandular diseases. *Dose.* 10 to 20 grs. See SOLUTIONS.

Calcium, Fluoride of. CaF_2 . *Syn.* $\text{HYDROFLUORATE OF LIME}$. This occurs native as the mineral called fluor-spar. It is found in beautiful crystals in the lead mines of Alston

Moor and Derbyshire, and in the concretionary crystalline masses known as Blue John or Derbyshire spar at Castleton. It may be prepared by the action of hydrofluoric acid upon lime, as directed under FLUORIDE OF BARIUM.

Calcium, Iodide of. CaI_2 . *Syn.* $\text{HYDRIODATE OF LIME}$; CAL'CI' IODI'DUM , CALCIS HYDRIODAS, L. *Prep.* 1. (Magendie.) From a solution of protiodide of iron and hydrate of calcium, as directed under iodide of barium.

2. Dissolve lime or carbonate of lime in hydriodic acid.

Prop., Uses, &c. It is a deliquescent salt, easily soluble in water, and has a bitterish taste. It has been used in scrofulous affections, internally, in doses ranging from $\frac{1}{4}$ to 2 grs., thrice daily, and externally in ointments containing 2 drs. or less to the oz.

Calcium, Oxide of. See LIME.

Calcium, Phosphide of. *Syn.* $\text{PHOSPHURET OF LIME}$; $\text{CAL'CI' PHOSPHURE'TUM}$, C. PHOSPHI'DUM , L. *Prep.* By passing the vapour of phosphorus over lime (in small fragments) heated to redness in a porcelain tube. A brownish substance, supposed to be a mere mechanical mixture of phosphide and phosphate of calcium. Thrown into water, it suffers instant decomposition, and phosphuretted hydrogen gas escapes.

Calcium, Sulphides of. Calcium forms with sulphur at least three different compounds:—

1. **Calcium, Protosulphide of.** CaS . *Prep.*

—*a.* From sulphate of lime, exposed at a high temperature to a stream of hydrogen gas.—*b.* From dried gypsum, 25 parts; lampblack or finely powdered charcoal, 4 parts; calcined together at a strong heat in a covered crucible.

2. **Calcium, Bisulphide of.** CaS_2 . *Prep.* From sulphur and quick-lime, equal parts; water, q. s.; slake the lime, add the sulphur, and boil until a solution is obtained, which on cooling deposits crystals.

3. **Calcium, Pentasulphide of.** CaS_5 . *Prep.* As the last, but increasing the quantity of sulphur, and continuing the boiling for a longer period. Little is known about it.

4. **Calcium, Commercial Sulphuret of.** *Syn.* $\text{COMMERCIAL SULPHIDE OF CALCIUM}$. *Prep.*

—*a.* As 1, *b* (above).

b. Sulphur, 1 part; hydrate of lime, 3 parts; water, $2\frac{1}{2}$ pints; boil it until it solidifies on cooling, then pour it out on a cold marble slab, and when solid break it into pieces and preserve it in a well-corked bottle.

c. (Guibourt.) Quick-lime, 7 parts; sulphur, 4 parts; mix, and heat the compound for about 2 hours in a covered crucible.

d. (Cottureau.) Quick-lime, 2 parts; sulphur, 1 part; water, 5 parts; as 4, *b* (above).

Obs. The precise composition of the last three preparations is uncertain. They are acrid, caustic, stimulant, and diaphoretic. *Dose.* 1 to 3 grs. Sulphide of calcium has been used as a *depilatory* by applying it made into a paste with water, and washing it off in

about $\frac{1}{2}$ of an hour. Made into an embrocation, it has been strongly recommended in gout, scabies, &c. Its solution yields pure sulphur on the addition of hydrochloric acid.

CALCULATIONS (Useful). 1. *To find the Value of a Dozen Articles.* Take the price in pence as shillings, and if there are any farthings in the price, add threepence for each. Thus 2s. 8d., or 32 pence per yard, is £1 12s. per dozen.

2. *To find the Value of One Hundred Articles.* For every farthing take as many pence and twice as many shillings. Thus, $1\frac{1}{4}$ d. each, is—5d., and 10s.=10s. 5d. per hundred.

3. *To find the Value of a Pound at any price per Ounce.* Take the price in farthings as shillings, and divide by three. Thus, $5\frac{1}{4}$ d. per ounce, is 21 farthings; taken as shillings, $21 \div 3 = 7$ s. per pound.

4. *To find the Value of an Ounce at any price per Pound.* Take the shillings as farthings, and multiply by three. Thus, at 6s.— $6 \times 3 = 18$ farthings, or $4\frac{1}{2}$ d. per ounce.

Obs. By reversing Nos. 1 and 2, the price of a single article or pound may be found from the price per dozen or hundred. For several other calculations, useful in domestic economy, chemistry, &c., see BREWING, DECIMALS, EQUIVALENTS, MEASURES, PER-CENTAGE, WEIGHTS.

CALCULUS. *Syn.* STONE. In medicine, a hard concretion formed within the animal body by the deposition of matters which usually remain in solution. The concretions most commonly formed are those formed in the kidneys or bladder, and termed *urinary calculi*, and those formed in the gall-bladder or biliary ducts, which are called *biliary calculi*. Both of these give rise to very painful symptoms, and may even threaten life.

CAL'NDAR. *Syn.* CALENDAR'RIUM, L.; CALEN'DER, Fr. A table of all the days of the year, arranged in the order of days and weeks, to which are generally added certain astronomical indications and dates of great civil and religious events. The most remarkable calendars are the *Hebrew calendar*, the *calendar of the Greeks*, the *Roman*, or *Julian calendar*, the *Gregorian calendar* (now adopted by all Christian peoples except the Greeks and Russians), and the *French Republican calendar*, which, having remained in force about thirteen years, was abolished by Napoleon I on the 1st of January, 1806.

Calendar, Perpetual. A table which furnishes the general indications necessary to construct a calendar for any year, and to resolve, without error, many difficulties connected with the verification of dates.

CAL'NDERING. The process of finishing by pressure the surface of linen or cotton goods. It is usually performed by passing the fabric between cylinders pressed together with great force. It is necessary that one of the cylinders, at least, shall be of a material combining considerable hardness with a slight de-

gree of elasticity; for this purpose the paper cylinder is used. It is made by forcibly compressing a number of circular discs of thick pasteboard, each with a square hole in the centre, upon an iron axis, so as to form a solid cylinder, which is turned perfectly smooth and true in a lathe. The paper cylinder usually works against a hollow roller of copper or iron, heated by steam or metallic heaters. Before the final rolling in the calendaring machine the fabric is lightly smoothed by passing over warm cylinders. Cotton goods are starched, and a fictitious appearance of stoutness is sometimes given to them by employing starch thickened with plaster of Paris, porcelain clay, or a mixture of these. Watering is a beautiful effect produced by means of a hot cylinder with a pattern raised upon it. Glazing is produced by combined rubbing and pressure, the rollers being made to move with unequal velocities, so that one side of the fabric is rubbed as well as pressed by the roller whose surface moves with the greater speed. A copper cylinder is preferred for glazing, and is made so hot that if the machine stops it burns the goods. The old method of glazing consisted in burnishing the surface of the fabric with a polished flint.

CALICO. See COTTON.

CALICO PRINTING. The art of producing figured patterns upon calico, by means of dyes and mordants topically applied by wooden blocks, copper-plates, or engraved cylinders. The goods are either directly printed in colour, or receive their patterns by being run through a colouring matter or mordant, when the dye is only produced upon that portion of the ground previously prepared for it. Of late this system of dyeing has been extended to silks and woollens.

The mordants are thickened with some glutinous substance, as flour, starch, or gum, to render them adhesive and to prevent their spreading.

The following are the principal styles of calico-printing, each requiring a different method of manipulation:—

In the *madder*, *fast colour*, or *chintz style*, the mordants are applied to the white cloth, and the colours are brought out in the dye bath. This is the method commonly followed for "permanent prints."

In the *padding* or *plauage style*, the whole cloth is passed through a bath of some particular mordant, and different mordants are afterwards printed on it before submitting it to the dye bath. By this means the colour of the ground and pattern is varied. Like the last, it is much used for gown pieces, &c.

In the *reserve* or *resist-paste style*, white or coloured figures are produced, by covering those parts with a composition which resists the general dye afterwards applied to form the ground of the pattern. In this style the dye bath is indigo, or some other substantive colour.

The *discharge*, or *rongeant style*, is the reverse of the preceding; it exhibits bright figures on a dark ground, which are produced by printing with acidulous or discharge mordants after the cloth has been passed through the colouring bath.

Steam-colour printing, consists in printing the calico with a mixture of dye extracts and mordants, and afterwards exposing it to the action of steam.

Spirit-colour printing, is a method by which brilliant colours are produced by a mixture of dye extracts and solution of tin, called by the dyers "spirits of tin."

Pigment printing, consists in applying such colours as ultramarine, magenta, or aniline purple, to the cloth, and fixing them by such agents as casein, albumen, or solution of India rubber. This style of printing has been developed to a great extent since the introduction of the splendid mauves and purples obtained from aniline.

For further information on this subject, the reader is referred to Ure's 'Dictionary of Arts, Manufactures, and Mines,' and O'Neill's 'Dictionary of Calico Printing and Dyeing,' where he will find the several processes of calico printing fully treated on, and most ably and accurately described. To enter largely into the subject in this work might amuse the reader, but would be of no practical value; as calico printing is an art only practised on the large scale, and by men who obtain their whole knowledge of it in the laboratories and printing rooms of the factories.

CALOMEL. See MERCURY (Chlorides of).

CALOTROPIS PROCE'RA.

CALOTROPIS GIGANT'EA. } (Ind.Ph.) Syn.

MUDAR.—*Habitat*. One or other of these species, everywhere in India.—*Official part*. The root-bark, dried (*Calotropis cortex*). Small, flat or arched pieces, brownish externally, yellow-grayish internally, peculiar smell, and mucilaginous, nauseous, acrid taste. Its activity appears to reside in a peculiar extractive matter named *mudarine*.—*Properties*. Alterative tonic; diaphoretic, and, in large doses, emetic.—*Therapeutic uses*. In leprosy, constitutional syphilis, mercurial cachexia, syphilitic and idiopathic ulcerations, in dysentery, diarrhoea, and chronic rheumatism, it has been used with alleged benefit.

Powder of Mudar. (*Pulvis Calotropis*.) Take of the roots of mudar, collected in the months of April and May from sandy soils, a sufficiency; carefully remove, by washing, all particles of sand and dirt, and dry in the open air, without exposure to the sun, until the milky juice contained in it becomes so far inspissated that it ceases to flow on incisions being made in it. The bark is then to be carefully removed, dried and reduced to powder. Preserve in well-corked bottles.—*Dose*. As an alterative tonic, 3 grains, gradually increased to 10 grains or more, thrice daily. As an emetic, from $\frac{1}{2}$ to 1 drachm.

CALOTYPE. See PHOTOGRAPHY.

CALUM'BA. Syn. CALUMBÆ RADIX, B. P. CALUM'BA-ROOT; KALUMB, Hind. The root of a plant of Eastern Africa, extensively used in medicine as a stomachic and mild tonic. *Dose*. 10 to 20 grains, three or four times a day. The botanical name of this plant is *Jateorhiza palmata*, or *Cocculus palmatus*. See CALUMBINE (*below*); also INFUSIONS and TINCTURES.

CALUM'BA WOOD. This wood, which is used as a tonic by the Cingalese, is not the produce of the true calumba plant, but of *Menispermum fenestratum*. It contains the alkaloid BERBERINE (which see).

CALOM'BINE. Syn. CALOM'BINE, CALUM'BINA. A bitter substance discovered by Wittstock in calumba root.

Prep. 1. Digest calumba root (in coarse powder) in water acidulated with acetic acid; express, filter, boil to one half, again filter, add carbonate of calcium, in slight excess, and evaporate to dryness in a water bath; reduce the residuum to powder, and digest it in boiling alcohol; the latter will deposit crystals of CALUMBINE on cooling.

2. (Wittstock.) Evaporate tincture of calumba root (made with rectified spirit) to dryness; dissolve the residuum in water, and agitate the solution with an equal bulk of ether; after repose for a short time, decant the ethereal portion, distil off most of the ether, and set the liquid aside to crystallise.

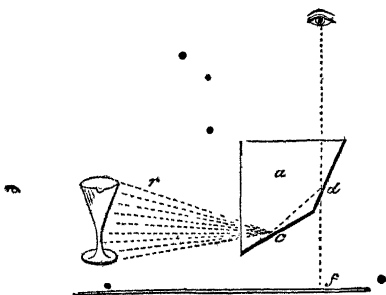

Prop, &c. Impure calumbine occurs as a yellow-brown mass; when pure, it forms rhombic prismatic crystals or delicate white needles; it is only slightly soluble in alcohol, ether, and water; 40 parts of boiling rectified spirit take up only 1 part of calumbine. Its best solvent is acetic acid; it is also soluble in acidulated and alkalisied water. Neither nut-galls nor metallic salts affect its solution. Concentrated sulphuric acid dissolves it, and assumes first a yellow, and then a red colour. Its properties indicate that weak vinegar or sour wine would be the best menstruum for extracting the medicinal virtues of calumba root. *Dose*. 1 to 3 grs. twice a day as a tonic and stomachic, in dyspepsia, debilitated stomach, bilious vomiting, &c.; and in the later periods of dysentery and diarrhoea.

CALX. This term was formerly applied to the residuum of the combustion of any substance; or to any substance which had been exposed to a strong heat. See CALCINATION, LIME, &c.

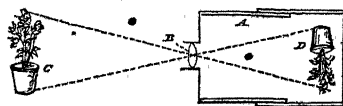

CAMBOGE'. See GAMBOGE.

CAM'ERA LU'CIDA. [L. and Eng.] When a ray of light (*r*) falls upon a quadrangular glass prism (*a*), it is bent by two reflections (at *c* and *d*), and thrown upwards where it may be received by the eye, to which it will appear described on the table or sheet of paper (*f*), glazed to receive it. The point of a pencil used to trace any object on the paper can also be seen, and, by its means the picture can be

easily copied. When the prism is mounted on a stand, and a thin brass plate with a small hole through it for the eyepiece adjusted thereto, it forms the *CAMERA LUCIDA* of the opticians. The image may be magnified or lessened by placing a lens, so as either to intercept the rays before they strike the prism, or before they reach the eye. An ingenious person will readily be able to set up this instrument, than which a more useful one cannot exist.

CAMERA OBSCURA. [L. and Eng.] An optical instrument for producing upon a screen the image of a field of view more or less extensive. It was invented by Baptista Porta in the 16th century. The principles and construction of the camera obscura may be thus described:—A convex lens (*B*), is placed in a hole admitting the light into a darkened box or chamber (*A*), which, falling on a white ground (*D*), produces an inverted picture of every object within its range. The image thus formed may be restored to its natural position, by allowing the rays of light to pass through two lenses instead of one, or by receiving the rays on a mirror placed at an angle of 45° , when the image will be thrown on the floor in its original position. The picture may be viewed through an oblong aperture cut in the box, or the experiment may be performed in a darkened room, by placing the lens in a hole in the shutter, and allowing the image to fall on the wall, or on a sheet of white paper stretched to receive it.

In the simplest form, when intended for taking views or portraits, the image is thrown upon a mirror placed at an angle of 45° , and resting on the bottom of the box, by which means it is thrown upwards against a plate of glass, also placed at a similar angle. On this is laid a piece of semi-transparent tracing paper, on which the object is distinctly seen painted, and may be traced out with a pencil. When

the camera is used in photography, slides are provided to retain the sensitive paper in the proper position in the box or dark chamber to receive the image, and the whole apparatus is adjusted with screws, and slides of the most delicate description. Achromatic glasses are also employed. See *PHOTOGRAPHY*.

CAMP'HINE. The name given by the trade to rectified oil of turpentine when sold for burning in lamps, in order that purchasers may not be aware of the inflammable character of the liquid. Since the introduction of the hydro-carbon oils from coal, shale, and petroleum, camphine has been little used for burning. To rectify the turpentine, it is passed in vapour through a solution of caustic potash, soda, or lime; or through sulphuric acid.

CAMP'HOR. $C_{10}H_{16}O$. *Syn.* CAM'PHIRE, LAU'REL CAM'PHOR; CAMPHO'RA, B. P. A crystalline substance found in many plants; though only obtained in large quantities from two, namely, *Camphora officinarum* and *Dryobalanops aromatica*. The first, commonly known as the laurel camphor tree of China and Japan, yields the camphor of commerce; the latter, the Sumatra or Borneo camphor, and the peculiar fluid known as liquid camphor.

It is found that several of the essential oils, by carefully distilling off about one third their volume, yield a species of camphor. By collecting this, and redistilling the remainder of the oil 2 or 3 times, a further quantity of camphor may be obtained. Oil of rosemary, treated in this way, yields about 10% of camphor; oil of sweet marjoram the same; oil of sage yields 13%; oil of lavender, 25%. By keeping the oils loosely corked, and in a cool place, they produce a larger portion of this camphor. Aniseed camphor is the congealable portion of oil of aniseed, separated from the liquid oil, which it resembles in odour and flavour.

Camphor, Am'ber. See *PYRETINE* (Crystallised).

Camphor, Com'mercial (Crude). The produce of the laurel camphor tree, brought to Europe chiefly from China and the island of Formosa, in the form of grayish grains, aggregated into crumbling cakes.—*Prep.* The Chinese and Japanese extract the camphor by cutting the wood into small pieces, and boiling it with water in iron vessels, which are covered with large earthen capitals or domes, lined with rice straw. As the water boils, the camphor is volatilised along with the steam, and condenses on the straw.

Camphor, Commercial (Refined). *Syn.* WHITE CAMPHOR; CAMPHO'RA, B. P. *Prep.* 100 parts of crude camphor are mixed with 2 parts each of quick-lime and animal charcoal, both in powder, and the mixture is placed in a thin, globular, glass vessel, sunk in a sand bath. The heat is then cautiously applied, and the vessel gradually and carefully raised out of the sand as the sublimation goes on. When the process is complete, the

subliming vessel is removed and allowed to cool.

Obs. The whole process of refining camphor requires great care and experience to ensure its success. If conducted too slowly, or at a heat under 375° Fahr., the product is found to be flaky, and consequently unsaleable, without remelting or subliming. An improvement on the common method, is simply to sublime the above mixture in any convenient vessel furnished with a large and well-cooled receiver, and to remelt the product in close vessels under pressure, and to cool the liquid mass as rapidly as possible.

Prop., &c. A white, semi-crystalline solid, very volatile at common temperatures; freely soluble in alcohol, ether, bisulphuret of carbon, benzole, oils, and acetic acid, and sufficiently so in water (about $1\frac{1}{2}$ gr. to 1 oz.), to impart its characteristic smell and taste; 100 parts of alcohol (sp. gr. .806) dissolve 120 parts of camphor; concentrated acetic acid dissolves twice its weight of camphor, average sp. gr. .990. It fuses at 347° , boils at 400° Fahr., and when set fire to, burns with a bright flame. It evaporates slowly at ordinary temperatures, and crystallises on the inside of bottles. While floating on water it undergoes a curious rotatory movement.

Uses, &c. Camphor is sedative, narcotic, anodyne, diaphoretic, and anaphrodisiac. *Dose.* 2 to 10 grs. in the form of pill or bolus, or made into an emulsion with yolk of egg, mucilage, or almonds. In overdoses it is poisonous. The best antidote is opium or wine, preceded by an emetic. It is also used externally in ointments, liniments, and embrocations.

Camphor is frequently put into wardrobes and clothes-trunks, to keep away insects; it is used to make the white stars and fire of the pyrotechnist; and by the varnish-makers, to increase the solubility of copal and other gums. Mixed with six times its weight of clay, and distilled, it suffers decomposition, and yields a yellow, aromatic, volatile oil, smelling strongly of thyme and rosemary, which is much used by the wholesale druggists and perfumers to adulterate some of the more costly essential oils, and by the fancy soap-makers to scent their soaps.

Camphor may be beaten in a mortar for some time, without being reduced to powder, but if it be first broken with the pestle, and then sprinkled with a few drops of rectified spirit of wine, it may be readily pulverised. By adding water to an alcoholic or ethereal solution of camphor, this drug is precipitated under the form of an impalpable powder of exquisite whiteness.

Tests. Pure camphor is entirely soluble in rectified spirit, oils, and strong acetic acid; a fragment placed on a heated spoon or in a warm situation, will wholly disappear, and the evolved fumes will be highly fragrant (camphoraceous), and be free from an acid or terebinthinate odour. In an alcoholic solution of

natural camphor, ammonia gives but a slight precipitate, which is dissolved on shaking the mixture; a similar solution of artificial camphor under the like treatment gives a flocculent precipitate, which remains undissolved. See FACTITIOUS CAMPHOR (*below*).

Camphor, Factitious. *Syn.* HYDROCHLORATE OF TURPENTINE, HYDROCHLORATE OF CAMPHENE, ARTIFICIAL CAMPHOR. Prepared by passing dry hydrochloric acid gas into pure oil of turpentine, cooled by a freezing mixture or pounded ice. After a time a white, crystalline mass is formed, which must be drained, and dried by pressure between folds of bibulous paper. It may be purified by solution in alcohol.

Prop., &c. It has a camphoraceous taste and odour; burns with a greenish, sooty flame, and when blown out evolves a terebinthinate odour; heated a little above the boiling-point of water, slight fumes of hydrochloric acid gas are perceptible. See CAMPHENE.

Camphor, Hydrochlorate of. *Syn.* MU'RIATE OF CAMPHOR; CAMPHORÆ HYDROCHLORAS, L. By passing hydrochloric acid gas over camphor, in small fragments, until it ceases to be absorbed.

Camphor, Liquid. *Syn.* CAMPHOR OIL; O'LEUM CAMPHORÆ, L. A pale yellowish, limpid fluid, which exudes from *Dryobalanops aromatica*, a tree growing in Sumatra and Borneo, when deep incisions are made in the trunk. It is supposed that the crystalline SUMATRA CAMPHOR (see *below*) is deposited from this fluid. The liquid camphor has somewhat the odour of CAJUPUT OIL, and might, no doubt, be beneficially employed for the same purpose. It is sometimes imported into Europe.

Camphor, Nitrate of. *Syn.* CAMPHOR OIL; O'LEUM CAMPHORÆ FACTITIUM, L. Prepared by dissolving camphor in nitric acid, in the cold.

Camphor, Sulphite of. From camphor and sulphurous acid gas, as hydrochlorate of camphor.

Camphor, Sumatran. *Syn.* BORNEO CAMPHOR, HARD C., DRAGON'S BRAIN PERFUME. Obtained from *Dryobalanops aromatica*, being found in natural fissures or crevices of the wood. It resembles ordinary camphor in most properties, but its odour is not of so diffusible a nature. This kind is not seen in European commerce.

CAMPHOR CAKES. See BALLS (Camphor).
CAMPHORIC ACID. $H_2C_{10}H_{14}O_4$. *Syn.* ACIDUM CAMPHORICUM, L. *Prep.* From camphor, 1 part; and nitric acid (sp. gr. 1.33), 4 parts; distilled together in a glass retort, with a gradually increasing heat, until vapours cease to be evolved; the camphor that has volatilised is then added to that in the retort, along with 4 or 5 parts more of nitric acid, and the process repeated again and again, until 20 parts of acid have been consumed, when crude camphoric acid crystallises out of the remaining liquor on cooling. The crystals

are purified by washing with cold distilled water, solution in boiling water, and evaporating the solution until a pellicle forms; crystals of pure camphoric acid are formed as the liquid cools.

Prop., &c. Small, colourless, lamellar or acicular crystals; acid; bitter; fusible at 158° Fahr.; sparingly soluble in water; soluble in alcohol; alcoholic solution not precipitated by water, which distinguishes camphoric acid from benzoic acid. Its salts are called CAMPHORATES. The soluble camphorates may be made by digesting the carbonate or hydrate of the metal in a hot solution of the acid, and the insoluble camphorates by double decomposition. By distillation, camphoric acid yields a colourless, crystalline, neutral substance, which has been improperly called anhydrous camphoric acid.

CAMWOOD. This dye-stuff resembles Brazil-wood in its properties, and is used in a similar manner.

CANADA BALSAM. *Syn.* BAL'SAMUM CANADENSE, TEREBINTHINA CANADENSIS, L. A thick, viscid oleo-resin obtained from the *Abies balsamea* (Lindley), a tree of common growth in Canada and the State of Maine. It is much employed as a medium for mounting microscopic objects. When pure, it is perfectly transparent, has an agreeable odour (not terebinthinate), and is wholly soluble in rectified oil of turpentine, with which it forms a beautiful glassy and colourless varnish, much used for preparing a semi-transparent copying paper.

Canada Balsam, Factitious. *Syn.* BALSAMUM CANADENSE FACTITIUM, L. *Prep.* 1. Yellow resin, 3 lbs.; oil of turpentine, 1 gal.; dissolve, and add essence of lemon, 2 drs.; oil of rosemary, 1½ dr.

2. To the last add of nut oil, 1 pint. Both are sold in the shops for Canada balsam.

CAN'DIES. See CANDYING.

CAN'DLES. Candle-making, once a rude and noisome trade, is now a first-class chemical manufacture, and as it is generally carried on in large works under the superintendence of men trained in the laboratory, a detailed account of the numerous processes included in it would be out of place here. We will, however, briefly describe the principal kinds of candles now in use, and give a few particulars respecting their manufacture. Candles are either dipped, moulded, or rolled. The cheaper sorts of tallow candles are formed by the first process, and wax candles by the last; all the other kinds are moulded. The moulds are tubes of pewter, well polished on the inside, eight or more being fitted into a frame, the upper part of which forms a trough to receive the melted candle material. When in the moulds the candles are inverted; in other words, the bottom of each mould corresponds to the top of the candle. The wick passes through a small hole at the lower extremity of the tube, and is held in the axis by a little

bar placed across the top. At the factories of Price's Patent Candle Company the frames of moulds are ranged close together in long benches, and are filled with hot candle material from cars running along little railways above them. When quite cold the candles are withdrawn. The plan of pulling them out one by one with the aid of a bodkin has been superseded at the factories above mentioned, by the ingenious device of blowing them out with compressed air.

The wicks of ordinary tallow candles are made of the rovings of Turkey skein-cotton, 4 or more of which, according to the intended thickness of the wick, are wound on a reel, from which they are again run off, and cut into the proper lengths. Of late years the wicks of the best candles have been made in such a way that they do not require snuffing. This object is effected by causing the wick to bend over, and its end to fall outside the flame, where it is exposed to the oxygen of the air. This bending over is variously brought about.—1. By twisting the wick with one strand shorter than the rest, which, being slightly stretched during the moulding of the candle, contracts again and bends the wick when the fat melts. 2. By plaiting the cotton into a flat wick, which naturally takes the required curve. Such a wick is generally dipped in a solution of borax, which preserves it from being acted upon by the flame except at its extreme point at the edge of the flame. A very fine wire is sometimes included in the plaited wick. 3. In Palmer's patent two-wicked candles, which were formerly much used in lamps, the wicks are saturated with subnitrate of bismuth ground up with oil; they are then twisted tightly round a wire, which is withdrawn after the candle is moulded. In burning, the ends gradually untwist and stand out of the flame on either side. Other devices are said to be employed.

Candles, Composite. Mould candles formed of a mixture of the hard fatty acid obtained from palm oil and the stearine of cocoa-nut oil. They were introduced in 1840. Other compositions are occasionally used, such as a mixture of spermaceti and hard white tallow, to which a little bleached resin is added.

Candles, Medicated. These have been proposed as a convenient means of diffusing the active principles of certain volatile substances through the atmosphere, and for complete and partial fumigations. They are seldom employed in England.

Candles, Mercurial. From the red sulphide or the gray oxide of mercury mixed with wax, and a wick of cotton inserted therein. Recommended by Mr. Colles for partial mercurial fumigation. They are burnt under a glass funnel with a curved neck, the upper orifice of which is directed to the diseased part.

Candles, Paraffin. From the beautiful translucent substance paraffin (which see). These candles surpass all others in elegance,

and are entirely free from odour and greasiness. The light produced by 98 lbs. of paraffin candles is equal to that of 120 lbs. of spermaceti, or 138 lbs. of wax, or 144 lbs. of stearic, or 155 lbs. of the best composite candles (Letheby). They are sometimes delicately tinted with red, mauve, violet, crimson, and rose colour. The Belmontine Candles of Price's Patent Candle Company are formed of the paraffin of Rangoon tar.

Candles, Spermaceti. From spermaceti (which see). These are very delicate in appearance, but rather expensive. They burn well, but as the melting-point of spermaceti is low, 120° Fahr., they will not bear carrying about in the hand without guttering. They are generally adulterated with stearic acid or hard white tallow.

Candles, Stearic. Under this head we may place the various sorts of candles moulded from the hard fatty acids of both animal and vegetable origin. The principal sources whence British manufacturers derive their acids are tallow, palm oil, and cocoa-nut oil. The processes employed for separating them are generally described under Stearic Acid. Candles formed of the fatty acids can now be prepared so as to imitate and almost rival those of wax and spermaceti; and they are quite as cheap as the nearly obsolete mould candles formed of common tallow. They are extremely hard; they do not grease the hands, and they burn away brightly and steadily, without giving off any offensive odour. Uncoloured, they are snowy white, but a yellow tint is frequently given them by gamboge.

Candles, Tallow. From ordinary tallow or from tallow which has been freed from much of its oleic acid by pressure. These have so unpleasant an odour and are so apt to gutter, that they will probably ultimately disappear from use. They are, however, sold at so low a price, that among the lower classes they must long retain their hold. For dip candles the wicks are immersed in melted tallow, and after rubbing with the hands, are placed straight and allowed to harden, after which they are arranged upon the "broaches" ready for dipping. For mould candles, the last operation is omitted. Great care is taken to select a cotton that yields the least possible quantity of ash after burning.

In the process of "dipping," the "dipping cistern" being filled with tallow of a proper temperature from the boiler, one of the broaches covered with wicks is placed upon the end of the "dipping beam," and pressed down gently into the melted fat; it is then withdrawn, the bottoms of the candles just touched against a board placed on one side of the cistern for the purpose, and the frame removed to the rack. This operation is repeated until the candles acquire a sufficient size, when they are finally cooled, sorted, weighed, and strung in pounds for sale.

The mould candles once in common use were

made of the finer kinds of tallow, only a mixture of 3 parts of sheep, with 1 part of ox suet, being preferred. See WAX.

CANDLESTICKS. Metallic, earthenware, and porcelain candlesticks, snuffers, and snuffer-stands, are recommended to be cleaned by pouring boiling hot water on them (previously placed in an earthen pan), and, after wiping them quite dry with a cloth, to clean them with a piece of wash leather; those made of silver, or of plated copper, may be finally polished with a little plate powder; those of white metal, with a little whiting or fine chalk, and those of brass, with a little rotten-stone or one of the polishing pastes. For articles of this kind, made of bronze and papier maché, the water should be used only hot enough to melt the tallow, and they should be only gently dabbed or rubbed off with a very soft cloth or leather. The common practice of placing candlesticks before the fire to melt off the grease is injudicious, as the solder or japan about them is almost certain to be injured. Hence the common annoyance of damaged or "crippled" candlesticks in houses where there are careless servants.

CANDYING. When the object is simply to form a confection or sweetmeat, imbued with the aroma, flavour, or medicinal property of any substance, candies are generally prepared by simply boiling lump sugar with a sufficient quantity of the infusion, decoction, tincture, expressed juice, or sometimes even the powder of the particular article, until a portion taken out and cooled becomes quite solid, when it is either poured out on a marble slab, or into tin, marble, or paper moulds, dusted with powdered lump sugar.

When the object is to preserve the form and character of the vegetable in the candy, the substance is boiled in water until soft, and then suspended in concentrated syrup (in the cold), until they become transparent; after which they are either dried in a current of warm air, or in a stove, at a heat not exceeding 120° Fahr. The syrup must be kept fully saturated with sugar by reboiling it once or twice during the process.

Another method occasionally employed by confectioners for almonds and the like is to put the substances into a syrup boiled until it forms a small thread between the opening fingers, and to stir the whole until it is nearly set. See SUGAR BOILING.

The following are the principal candied articles kept at the shops:—

Candied Almonds. From blanched almonds, roasted and halved.

Candied Angelica. *Prep.* 1. From the root. Boil the fresh roots (after slicing them and removing the pith) in water, to deprive them of part of their bitterness and aroma; then drain them and put them into syrup, boiled to a full candy height, and boiling hot; let them remain until nearly cold, when they may be taken out and carefully dried.

2. From the stems. From the tender stems, stalks, and midribs of the leaves, as last. Used as a sweetmeat and dessert. It is said to be cordial, stomachic, tonic, and aphrodisiac.

Candied Apricots. From the fruit, scarcely ripe, either whole or cut into quarters, immersed in the syrup (hot), without any further preparation.

Candied Citrons. From the peels.

Candied Erin'go. From the roots, slit and washed.

Candied Gin'ger. From the roots of green ginger.

Candied Horehound. From a strong decoction or infusion of the root, and lump sugar, 1 pint to 8 or 10 lbs. may be used. Boil the mixture to a candy height, and pour it whilst warm into moulds or small paper cases well dusted with finely powdered lump sugar; or pour it on a dusted slab and cut it into squares.

Candied Lem'on Peel. As Candied Citron.

Candied Orange Flowers. From the flowers deprived of their cups, stamina, and pistils (2 oz. to each lb. of sugar), as Candied Almonds, but poured out on a slab.

Candied Orange Peel. From the peel of the Seville orange, or common orange, as Candied Citron.

Candied Sugar. See SUGAR BOILING.

The following are articles of a more special character.

Candy, Car'away. 1. From caraway seeds (in fine powder), $\frac{1}{2}$ oz.; sugar, 1 lb.

2. Oil of caraway, 1 dr.; sugar, 1 lb.

Candy, Diges'tive. *Syn.* LIVE-LONG CANDY. *Prep.* 1. Rhubarb and bicarbonate of soda, of each, 1 dr.; ginger, $\frac{1}{2}$ dr.; cinnamon, 20 grs.; (all in fine powder;) heavy magnesia, 1 oz.; powdered sugar, 2 oz.; mucilage of tragacanth, q. s. to form a lozenge mass; to be divided into small squares of 18 or 20 grs. each.

2. As the last, but adding finely powdered caraways, 1 dr.; oil of caraway, 15 drops; and sugar, 1 oz. Both are used as heartburn and digestive lozenges.

Candy, Gin'ger. *Prep.* 1. From ginger (in coarse powder), 3 oz.; boiling water, $1\frac{1}{2}$ pint; macerate in a warm place for 2 hours, strain, add lump and moist sugar, of each 5 lbs., and boil to a candy.

2. Ginger (in very fine powder), 1 oz.; powdered sugar, 2 lbs.; syrup, q. s. to make a paste. Stomachic and carminative.

For various sweetmeats which might come under the head of CANDY, see CONFECTIONS, DROPS.

CANNON METAL. See GUN METAL.

CANTHARIDES. *Syn.* SPANISH FLIES, BLISTERING F., LYTT'Æ; CANTHAR'IS, B. P. The *Cantharis vesicatoria* of Latreille, commonly known as the *Spanish fly*, is an insect of the order *Coleoptera*; it abounds in the south of France, Spain, and Italy; and has

spread into Germany and the south of Russia. When alive it exudes a strong fetid and penetrating odour.

Pur., &c. These insects should be preserved in well-closed bottles or tin canisters. The addition of a few drops of oil of cloves, or of strong acetic acid, or even a few cloves in substance, will preserve them unchanged for a length of time in closed vessels. The best proof of their goodness is the smell. The powder is constantly adulterated. The plan of the wholesale druggists is to sort out the most worthless flies for powdering, and to compensate for their deficiency of vesicating power, by adding 1 lb. of euphorbium to every 12 or 13 lbs. of flies. When a superior article is required, liquorice powder is added (4 or 5 lbs. to every 14 lbs.), along with about 1 lb. of euphorbium, and sufficient blue black or charcoal to turn the yellow of the liquorice to a greenish colour. The best mode of detecting this adulteration is by the microscope.

Ant. An emetic of sulphate of zinc, followed by the stomach-pump, if necessary. The vomiting may be promoted by copiously drinking warm bland diluents, such as broth, linseed tea, milk, &c. Friction on the spine, with volatile liniment and laudanum, and the subsequent administration of draughts containing musk, opium, and camphorated emulsion, have been strongly recommended.

Tests. By the microscope, very minute particles may be discovered in the stomach and intestines, on a post-mortem examination. Orfila thus found particles of cantharides in a body that had been interred nine months.

Uses, &c. Spanish flies are used externally, to raise blisters, and internally, as a stimulant and diuretic, generally in the form of tincture. In excess they produce strangury, bloody urine, satyriasis, delirium, convulsions, and death. See TINCTURES, VESICANTS, &c.

CANTHARIDIN. $C_5H_{10}O_2$ Isomeric with picrotoxin. This substance is found in, and is the vesicating principle of, the Spanish fly, Chinese blistering fly, and other coleopterous insects. *Prep.* Pulverised cantharides are allowed to remain in contact for 24 hours with twice their weight of chloroform, in a displacement apparatus. The chloroform is then drained off, and finally displaced by alcohol, and the solution is left to evaporate. The cantharidin crystallises out, saturated with green oil. In order to purify the cantharidin it is laid on bibulous paper, which absorbs the greater part of the oil, and then crystallised out of a mixture of alcohol and chloroform (Procter).

Prop. Prismatic crystals, melts at $200^{\circ} C.$, volatilises in white fumes, which strongly irritate the eyes, nose, and throat, and condenses in rectangular prisms. Cantharidin is insoluble in water, but soluble in alcohol, ether, chloroform, acetic acid, and in the fixed and volatile oils. Its solution in any of the liquids above mentioned possesses vesicating proper-

ties, which, however, is not exhibited by solid cantharidin.

CAOUTCHOUC. *Syn.* INDIA RUBBER, ELASTIC GUM. India rubber is the concrete juice of the *Ficus elastica*, *Siphonia elastica*, the *Urceola elastica*, and many other tropical plants. The fresh milky juice is spread over moulds of unbaked clay, and is then exposed to the heat and smoke of a fire, or torches, to dry it, whence it derives its dark colour. Successive coats of juice are laid on, and the operation of drying repeated, until the bottles acquire sufficient thickness. When it has become thoroughly hard and dry, the clay is beaten out. In this form it is commonly imported.

Prop., &c. The general properties of India rubber, as well as its numerous applications, are well known. The fresh juice has a cream-like appearance and consistence, is coagulated by heat, and is miscible with water, alcohol, and wood naphtha; sp. gr. 1.012 to 1.041; it yields from 18% to 45% of solid caoutchouc, either by heat or evaporation. By excluding it from the air, it may be preserved unchanged for a considerable period.

Solid caoutchouc has a sp. gr. ranging between .919 and .941; it melts at 248° Fahr. into a viscid mass, which does not again harden on cooling; it is unaltered by chlorine, hydrochloric acid, sulphurous acid, fluosilicic acid, ammonia, caustic alkaline lyes (even when boiling), and most similar substances; nitric acid and sulphuric acid act on it only by long contact when concentrated. Some specimens of caoutchouc are harder than gutta percha itself, and equally inelastic, whilst others never perfectly solidify, but remain in a condition resembling that of birdlime or printers' varnish.

The best solvents of caoutchouc are rectified sulphuric ether (which has been washed with water to remove alcohol and acidity), chloroform, bisulphide of carbon, a mixture of bisulphide of carbon and absolute alcohol (94 of the first to 6 or 7 of the last), and caoutchoucine. All these liquids dissolve India rubber rapidly in the cold, and leave it unaltered on evaporation. The first two, are, however, too expensive to be generally employed. The others have a disagreeable odour, but are much cheaper than the rest, and possess the advantage of leaving the film of caoutchouc in a firmer and stronger condition than other solvents. Pyrogenous oil of turpentine is another cheap and good solvent. Benzol, rectified mineral or coal-tar naphtha, crude petroleum, and oil of turpentine, dissolve India rubber by long digestion and trituration, (with heat,) otherwise they merely form with it a glutinous jelly that dries very slowly and imperfectly, leaving it much reduced in hardness and elasticity. The fats and fixed oils also readily dissolve caoutchouc (with heat), forming permanently glutinous solutions or pastes; so also do most of the volatile oils, but the solutions with the majority of them dry with difficulty.

One of the most remarkable properties of India rubber is the great amount of heat which is disengaged during its condensation by pressure or in the exercise of its elasticity. During the process of kneading the raw caoutchouc in the "masticators," the cold water thrown in to reduce the temperature soon becomes boiling hot. When no water is added, a temperature so high is often reached as to occasion the melting of the rubber. This is particularly the case during the process of "dry kneading" with quick-lime. A tube 2½ inches in diameter, impactly secured, was subjected to a force of 200 tons. The result was a compression amounting to 1-10th; great heat was evolved, and the excessive elasticity of the substance caused a flywheel weighing five tons to recoil with alarming violence. Mr. Brockedon states that he succeeded in raising the temperature of an ounce of water 2° in about fifteen minutes by collecting the heat evolved by the extension of a small thread of caoutchouc. He refers this effect to the change in specific gravity, and contends that the heat thus produced is not due to friction, because the same amount of friction is occasioned in the contraction as in the extension of the substance, and the result of this contraction is to reduce the caoutchouc thus acted upon to its original temperature.

The edges and surfaces of India rubber are readily and perfectly joined by mere contact and intense pressure. On the small scale, the edges may be moistened with ether, naphtha, oil of turpentine, or some other solvent, or by long boiling in water, and immediately pressed tight together, and held in contact for some time.

Elastic tubes are readily formed of India rubber, by cutting it into uniform slips of proper thickness, and winding them round rods of polished glass or metal, so that the edges are in close contact or "overlapping." A piece of tape is then wound round outside it, and the whole boiled in water for 2 or 3 hours, after which time the edges will be found to be sufficiently adherent. A better plan is to immerse the "rubber" in a mixture formed of bisulphide of carbon, 95 parts, and rectified spirit, 5 parts, until it swells into a pasty mass, which may then be moulded into any desired form, or passed through the die of a tubing machine. For chemical purposes, brewing, &c., vulcanized India-rubber tubing has now taken the place formerly occupied by the unprepared material.

The once celebrated "Mackintoshes" are made by spreading two or more coats of a paste made of caoutchouc and rectified coal-tar naphtha over the surface of the stuff or cloth, and when it has become partially dry, pressing two such surfaces evenly together by passing the goods between a pair of cylinders or rollers. The articles are then placed in a stove room for the composition to harden, and to remove the odour of the naphtha. Of

late years, vulcanized or mineralized rubber (coloured) has been used for this purpose, and being spread on the outside of the stuff instead of the inside, forms an ornamental and thoroughly waterproof material.

India-rubber thread is prepared by stretching it (previously cut into coarse filaments) to 5 or 6 times its length in boiling water or hot air, in which state it is allowed to cool slowly. This process is repeated again and again, until it reaches 16,000 or 17,000 times its original length, when it is glazed by agitating it with powdered sulphur, or French chalk. This thread is readily joined or "pieced," as it is called, by paring the ends obliquely with a pair of scissors or a knife, and then pressing the clean ends strongly together with the fingers. When the coarse filaments from the cutting machine are simply stretched with the moistened thumb and finger in the act of "reeling" to about 8 or 9 times their length, they are said to be "inelasticated," and are ready to be made into elastic braces, elastic web, and other like elastic tissues and fabrics, in the braiding machine.

Caoutchouc, Vulcanized. *Syn.* VULCANIZED INDIA RUBBER, MINERALIZED I. R., SULPHURETTED I. R. The discovery of the singular action of sulphur and the mineral sulphides on caoutchouc was made by Mr. Charles Goodyear, of New York, in 1842, at which date the manufacture of vulcanized India rubber may be said to have commenced. In 1843 Mr. Thomas Hancock patented a process for vulcanized India rubber in these countries, founded on that of Mr. Goodyear. A sheet of caoutchouc immersed in melted sulphur absorbs a portion of it, and at the same time undergoes important changes in many of its leading characteristics. So prepared, it is no longer affected by changes of temperature; it is neither hardened by cold nor softened by any heat insufficient to destroy it. It loses its solubility in the solvents of ordinary caoutchouc, whilst its elasticity is greatly augmented, and has become permanent.

The same effect is produced when sulphur is kneaded into caoutchouc in a masticator, or by means of powerful rollers, as well as when common solvents (naphtha, spirit of turpentine, &c.) are charged with a sufficient amount of sulphur, in solution, to become a compound solvent of the rubber. In these cases articles may be made of any required form before heating them for the change of condition, technically termed "vulcanization." It is necessary, however, for this purpose, that the form should be carefully maintained both before and during the exposure to the heat.

"A vulcanized solid sphere of $2\frac{1}{2}$ inches in diameter, when forced between two rollers $\frac{1}{4}$ inch apart, was found to maintain its form uninjured. In fact, it is the exclusive property of vulcanized caoutchouc to be able to retain any form impressed upon it, and to return to that form on the removal of any dis-

turbing force which has been brought to act upon it." (Brockedon.)

Caoutchouc combines with from 12% to 15% of sulphur; the quantity of sulphur added to the naphtha paste should not, therefore, exceed 10% or 12% of its weight.

The temperatures for vulcanization by the common method range from 320° to 330°; and the period required is one hour or more, according to the temperature. A much lower temperature is, however, sufficient, if the duration of the exposure is much extended, or the compound mass is softened with any of the common solvents of India rubber.

The process of sulphuring, or mineralization, is differently conducted in different manufactories. Under Mr. Burke's patent, oxysulphide or amorphous sulphide of antimony (formed by decomposing a solution of crude antimony in a lye of potash or soda, with hydrochloric acid) is employed. This powder he combines with either India rubber or gutta percha, or mixtures of them, by kneading in a "masticator" for 2 or 3 hours, and after strong compression in a mould whilst still warm, he exposes the mass to a steam heat ranging from 250° to 280° Fahr. The block, so prepared, is afterwards cut into sheets, &c. The advantages possessed by the product are, that it possesses no unpleasant odour, nor does the sulphur effloresce on its surface, as in ordinary vulcanized India rubber.

Under Mr. Christopher Nickel's patent (1849) 1 part of sulphur is kneaded with 6 parts of caoutchouc, and then pressed into moulds, as before. He also vulcanizes rubber by exposing it in a cylinder heated in a steam jacket to the fumes of sulphur or to sulphuretted gases, given off from a retort connected with the apparatus. The rubber thus prepared he next subjects to hydraulic pressure in moulds, at a temperature ranging between 220° and 250° Fahr.

Small articles or sheets of India rubber may be extemporaneously vulcanized at common temperatures by simple immersion, for a minute or two, in a mixture of bisulphide of carbon, 97½ parts, and protochloride of sulphur, 2½ parts; after which they must be well washed first in weak alkaline lye, and next in pure water. Mr. Parkes employs 100 instead of 97½ parts of the bisulphide. This method is termed "cold sulphuring."

An excellent method of vulcanization, recommended by Mr. Parkes, particularly applicable to small articles, consists in immersing them for about 3 hours in a close vessel containing a solution of polysulphide of potassium at 25° Baumé (sp. gr. 1.197), and of the temperature of 240° Fahr. It is afterwards washed in an alkaline lye, then in pure water, and dried.

Among the many applications of vulcanized India rubber those connected with its elasticity and its enormous contractile power when extended are particularly striking. Under

Mr. E. Smith's patent, "torsion springs" for roller blinds, door springs, clock springs, carriage springs, &c., are made of it. Mr. Hodges, in another patent, has availed himself of the same property as a new mechanical power. Short lengths of caoutchouc, which he terms "vulcanized power purchases," are successively drawn down from or lifted to a fixed bearing, and attached to any weight which it is required to raise; when a sufficient number of these power purchases are fixed to the weight, their combined elastic force lifts it from the ground. Thus, 10 purchases of the elastic strength each of 50 lbs. raise 500 lbs. Each purchase is 6 inches long, and contains about $1\frac{1}{2}$ oz. of vulcanized caoutchouc. These 10 purchases, if stretched to the limit of their elasticity (not of their cohesive strength), will lift a weight exceeding 650 lbs.

The same principle has been applied to relieve and equalise the strain on ships' cables, especially where several boats are towing one vessel; and as a projectile force. A number of power purchases, attached to the barrel of a gun constructed to project harpoons, will exert a power, if suddenly relieved, proportioned to their aggregate forces. By similar contrivances balls may be projected 200 yards or more, and a charge of No. 4 shot can be thrown 120 yards. A bow, in which the string alone is elastic (the reverse of the usual form), has been contrived which throws a 30-inch arrow 170 yards.

The last great improvement in the manufacture of caoutchouc is the discovery that by continuing the process of vulcanization for a longer time at an increased heat and under pressure, a hard black substance is obtained, which can be turned in a lathe like ebony. This substance has already been applied to an extraordinary number of uses. See VULCANITE.

An exceedingly useful combination of cork and India rubber has lately been introduced. See KAMPTULION.

Caoutchouc, Factitious. See CONSOLIDATED OIL.

CAOUTCHOUCIN. An extremely light fluid obtained by distilling India rubber.

Prep. (Barnard's patent process.) A highly volatile fluid, discovered by Mr. Barnard. India rubber or caoutchouc, as imported, cut into small lumps, containing about 2 cubic inches each, is thrown into a cast-iron still, connected with a well-cooled worm-tub (any flat vessel with a large evaporating surface will do, the entire top of which can be removed for the purpose of cleaning it out); and heat is applied in the usual way, until the thermometer ranges to about 600° Fahr., when nothing is left in the still but dirt and charcoal. The dark-coloured fetid oil which has distilled over is next rectified along with $\frac{1}{3}$ rd its weight of water, once or oftener; and at each rectification becomes brighter and paler, until at about sp. gr. .680

it is colourless, and slightly volatile. The product is then shaken up with nitro-hydrochloric acid, or chlorine, in the proportion of a $\frac{1}{4}$ of a pint of the acid to 1 gallon of the liquid. To enable the dirt to be the more easily removed from the bottom of the still, common solder, to the depth of about $\frac{1}{2}$ an inch, is trown in.—*Prod. Soc.*

Prop., &c. Mixed with alcohol, caoutchouc dissolves gums and resins, especially copal and India rubber, at the common temperature of the atmosphere, and it speedily evaporates, leaving them again in the solid state. It mixes with the oils in all proportions. It has been used in the manufacture of varnishes, and for liquefying oil paints, instead of turpentine. It is very volatile, and requires to be kept in close vessels. According to the researches of Himly, Gregory, and Bouchardat, the caoutchouc of Barnard consists of several liquids, some of which have the composition of olefiant gas, and others that of oil of turpentine.

CA'PERS. The flower buds of various species of *Capparis*, particularly *C. spinosa*, caper tree, preserved in vinegar. They are chiefly imported from Spain, Italy, and the South of France, where the caper tree is largely cultivated for the purpose. The flower-buds are picked daily, and thrown into a cask of strong pickling vinegar, until it becomes full, when it is sold to the dealers by the collector. The former sort them into different sizes by means of copper sieves, in a similar way to that adopted for lead shot and gunpowder. In this way they are divided into *nonpareilles*, *capuchins*, *capotes*, *seconds*, and *thirds*, of which the former, or smallest, are regarded as the best; but much depends upon the quality of the vinegar.

The lively green colour of capers, so much valued by the ignorant, arises chiefly from the presence of copper derived from the sieves used in sorting them. In many cases, copper coin, as sous and halfpence, are added for the purpose. Thus the eye is gratified at the sacrifice of the stomach, and an insidious poison introduced into the system, simply to give an unnatural appearance to a condiment which tastes better without it. See COPPER.

CAPILLAI'RE. [Fr.] Simple syrup, or a concentrated solution of sugar in water, flavoured with orange-flower water, or some other similar aromatic. The name was originally given to a mucilaginous syrup, prepared by adding to an infusion of maiden-hair (*Adiantum capillus Veneris*) some sugar and orange-flower water.

CAP'NOMOR. See KAPNOMOR.

CAP'RIC ACID. $\text{HC}_{10}\text{H}_{19}\text{O}_2$. Syn. BUTYRIC ACID; ACIDUM CAPRICUM, L. An acid discovered by Chevreul, and obtained by decomposing caprate of barium with dilute sulphuric acid, or primarily by the saponification of butter or cocoa-nut oil, when it appears combined with butyric, caproic and caprylic acids. It is

also procured by acting upon oleic acid or oil of rue with nitric acid. ⁶

Obs. When butter is saponified with caustic potassa or soda, and the resulting soap decomposed by adding an acid, in excess, and distilling the mixture, the four acids above named pass over into the receiver, in combination with water. The mixed acids may be separated by saturating them collectively with baryta, and by taking advantage of the unequal solubility of the newly formed barium salts. The less soluble portion (equal to about $\frac{1}{10}$ th of the dry mass) contains capric and caprylic acid; the larger and more soluble portion, butyric and caproic acid. On the same plan, the two groups are resolved into their separate acids. These acids are deprived of their uncombined water by means of chloride of calcium. It is advisable to employ the term *rutic acid*, as the older term is easily confounded with caproic and caprylic.

Prop. Capric or rutic acid crystallises in fine needles, which fuse at 86° Fahr., giving out an odour resembling that of a goat. It is sparingly soluble in boiling water.

Prep. (Miller.) Castor oil is saponified by means of potassa or soda, and afterwards an excess of the hydrated alkali is added, amounting to one half the oil used. The mass is heated in a retort, and an oily liquid covered with water distils over. This oily liquid, which is the octylic alcohol, is rectified several times with potassa until the residue is no longer coloured brown.—*Prop.* A colourless liquid, of powerful aromatic odour; insoluble in water, but dissolving readily in acetic acid, ether, and alcohol. Its boiling-point is 356° Fahr., its sp. gr. .823. The caprylate of ethyl, erroneously termed caprylic ether, is a colourless liquid, with an agreeable odour of pineapples.

CAP'SICINE is the name given to an alkaloid obtained from the *capsicum* or Cayenne pepper. It has a burning taste, and when quite pure crystallises. It forms crystallisable salts with acetic, nitric, and sulphuric acids.

CAP'SICUM. [L. and Eng.] *Syn.* CHILI, RED PEPPER. A gen. of plants belonging to the natural order *Solanaceæ*, species of which yield the fruits which are used to form *Cayenne pepper* and *Chili vinegar*. The official *capsicum*, of B. P. is the fruit of the species *C. fastigiatum*. See PEPPERS, TINCTURES, VINEGARS.

CAP'SULES. This term is now commonly applied to small egg-shaped or spherical vessels, in which medicines are placed, for the purpose of covering their nauseous taste, at the time of swallowing them. They are commonly made of gelatin, mixtures of sugar and gelatine, or animal membrane.

Capsules, Gelatin. *Prep.* 1. By dipping the bulbous extremity of an oiled metallic rod into a strong solution of gelatin. When the rod is withdrawn, it is rotated, in order to diffuse the fluid jelly equally over its surface. As

soon as the gelatinous film has partially hardened, it is removed from the mould and placed on pins, furnished with suitable heads, and fixed on a cork table. When sufficiently dry, the capsules are placed upright in little cells, made in the table to receive them, and the liquid with which they are to be filled is then introduced by means of a small glass tube. They are next closed by dropping some of the melted gelatin on the orifice of each. Six parts of gelatin, and one part of sugar, are now the common proportions.

2. (Simoni.) Oval balls of wax, of the requisite size, are prepared by pouring wax into a wooden mould, consisting of two parts, and arranged for the reception of a row of these balls. These are afterwards stuck on iron needles, affixed to rods of convenient size, in rows. The balls are now uniformly coated all at once by dipping in the usual manner, then removed from the needles, and are next placed with the needle holes downwards, on a gently heated plate, when the wax flows out, and a round capsule is left behind.

Capsules, Gelatin and Sugar. *Prep.* (Giraud.) Gelatin, 6 parts; solution of gum and simple syrup, of each, 1 part; water, 5 parts; melt in a water bath, remove the scum, and proceed as before.

Capsules, Gluten. These, which form the subject of a French patent, are said to be formed of the gluten of wheat flour, a substance which is insoluble, although softened, by water. We have placed these capsules for twenty-four hours in warm water, and found them, at the expiration of that time, still unbroken, the enclosed medicine being completely enveloped. The mode of preparation is kept secret.

Capsules, Membranous. *Syn.* ORGANIC CAPSULES. From gut-skin moistened and stretched over an oiled bulb of glass or metal, and filled in the common way. These have been patented, but they do not appear to be an improvement on the common capsule of gelatin.

Obs. The common capsules usually hold about 10 or 12 grs. of balsam of copaiba. Those of the shops, in nine cases out of ten, are filled with adulterated copaiba, and at least 4-5ths of them are filled with train oil or linseed oil, to which a few drops only of the balsam are added.

Balsam of copaiba (*capivi*) and oil of cubebs, or a mixture of them, castor oil and cod-liver oil, are the substances most usually administered in this way. *Bacca copaiifera facitima* are official in the Ph. Castr. Ruth. Ratier has proposed to grease them and administer them per anum. Ricord has strongly recommended capsules of copaiba, coated with extract of rhatany, as much superior to the common ones of copaiba alone, in the treatment of gleet and gonorrhoea. They may be easily prepared by either of the following methods:

1. By immersing, for an instant, the com-

mon capsule in a mixture of extract of rhatany (newly prepared from the root), 3 parts; syrup of moist sugar, 1 part; mucilage of gum Arabic, 1 part; melted together in a water bath.

2. By forming the bodies of the capsules with the above mixture or composition, instead of with gelatin, and then following the same manipulations as for the manufacture of the common gelatin capsules.

These capsules are said to sit well upon the stomach, the tone of which they contribute to improve, and to act with greater certainty than those made of copaiba and gelatin alone.

CARAMEL. A dark-brown product obtained by heating sugar. It is formed during the roasting of all materials containing sugar, such as coffee and malt. It is much used for colouring soups, wines, spirits, and other liquids.

Caramel, Crude. *Syn.* SPIRIT COLOURING, BURN'T SUGAR. *Prep.* From cane sugar, by heating it to from 410° to 428° Fahr., as long as aqueous vapour is formed; dissolving the product in water, and concentrating the solution by evaporation.

Caramel, Pure. *Prep.* 1. (Graham.) Crude caramel, obtained as above, is placed on a parchment-paper dialyser. The undecomposed sugar and certain intermediate compounds diffuse out with considerable facility, and what ultimately remains on the dialyser possesses five times the colouring power of the original crude caramel, weight for weight. See DIALYSIS.

2. (Peligot.) Add strong alcohol to a filtered aqueous solution of crude caramel until it ceases to produce a precipitate; collect the precipitate, which is caramel, on a filter, wash with alcohol, and dry. Graham recommends that the product should be dissolved and precipitated four or five times, or till the mass thrown down, from being plastic at first, becomes pulverulent.

3. (J. J. Pohl.) Cane sugar is heated in a spacious metallic vessel by means of an oil bath to 410° or 419° Fahr. as long as aqueous vapours escape, the mass being occasionally stirred with a spatula. The mass is then finely powdered and digested with alcohol for two or three hours; the digestion is repeated until the fluid no longer tastes bitter.

Prop. A solution containing 10% of purified caramel is gummy, and forms a tremulous jelly on standing. Evaporated *in vacuo*, it dries up into a black shining mass soluble in water; but if the solution be evaporated to dryness by the heat of a water bath, the whole matter is rendered insoluble in hot or cold water. A very small proportion of caramel suffices to give a rich sepia tint to water.

CARAT. A weight of 4 grains used in weighing diamonds, which are spoken of as of so many carats weight. Among assayers, a carat is a weight of 12 grains; but more

commonly a proportional weight or term, representing the number of parts of pure gold in 24 parts of the alloy; pure gold being spoken of as of 24 carats fine. It is commonly the 24th part of the "assay pound," and is nominally subdivided into 4 assay grains, and these again into quarters. See ASSAYING.

CARAWAY. *Syn.* CARAWAY SEED; *SE-MENA CARUI*, L.; *CARUI*, B. P. The fruit of the *Carum Carui* (Linn.), an umbelliferous plant, common in England and other parts of Europe. These fruits, commonly called "seeds," form an agreeable and useful aromatic and carminative, and are especially esteemed in the flatulent colic of children. They are also largely employed as an adjuvant or corrective in various official preparations; and as a flavoring ingredient in cakes, biscuits, cordials, confectionery, &c. See ESSENCES.

CARBAZOTIC ACID. See PICRIC ACID.

CARBOLIC ACID. $H. C_6H_7O$. *Syn.* PHENYLIC ACID, PHENIC ACID, PHENOL, PHENYLIC ALCOHOL, HYDRATE OF PHENYLE, HYDRATED OXIDE OF PHENYLE. A powerful antiseptic substance obtained from coal-tar oil.

Prep. Crude, heavy coal oil is agitated with milk of lime, allowed to stand, and the aqueous portion separated from the undissolved oil and decomposed by hydrochloric acid. The oily liquid obtained is purified by distillation.

1. Crude coal oil is distilled in a retort furnished with a thermometer, and the portion which passes over when the heat ranges between 300° and 400° Fahr., is collected apart, and mixed with a hot saturated solution of caustic potassa; after standing for some time, a semi-crystalline pasty mass forms, from which the supernatant liquid is decanted; the pasty mass is now agitated with a small quantity of water until dissolved; the solution thus formed separates into two portions, the denser of which contains carbolate of potassa; this being separated by decantation, is decomposed by hydrochloric acid. The solution of carbolic acid which rises to the surface is digested with chloride of calcium, to remove water, and purified by distillation; the distillate, by refrigeration, furnishes crystals of the acid, which must be drained, dried, and preserved from the air.

2. From salicylic acid. Mix intimately together equal weights of salicylic acid and powdered glass; introduce the mixture into a good German retort, and heat on a sand bath, gradually raising the heat till it becomes red hot at the bottom. The vapour is condensed in any convenient receiver. If the materials are perfectly dry, it solidifies to a mass of crystals as soon as it condenses, but if there be a trace of water present it remains liquid. The slower it distills over, the lighter will be the colour, while if a high temperature be employed it comes over nearly black. It may be rendered colourless and anhydrous by rectification over quick-lime.

Of late years the manufacture of carbolic

acid has increased to a great extent, and is generally found in a pale yellow clear solution, instead of as a dark hazy liquid. The pure anhydrous acid is in long, colourless, prismatic crystals, often, however, on keeping turning a beautiful pink, rose, or crimson, and which rapidly deliquesce in moist air, becoming converted into a colourless refractive liquid, having a faint odour of roses and tar. Carbolic acid is poisonous, and is a powerful antiseptic.

Uses. The extraordinary antiseptic properties of carbolic acid have long been known, but its extended use has been delayed, owing to the difficulty experienced in obtaining it in considerable quantities. It is now, however, principally owing to the labours of Dr. F. Crace Calvert, produced on a large scale, and this chemist has proposed its application to many valuable purposes. As a medical agent, it seems to have all the useful properties of creosote in an exalted degree, with some peculiar actions of its own, and is being applied with marked success in the Manchester Royal Infirmary and similar institutions, in cases of chronic diarrhoea, obstinate vomiting (even after creosote has failed), and as a disinfecting wash for ill-conditioned ulcers and gangrenous sores. It has also been applied successfully in cases of foot-rot, a disease which annually carries off large numbers of sheep. It has been employed for the preservation of gelatin solutions and preparations of size made with starch, flour, and similar materials, and of skins and other animal substances. It appears to act strongly as an antiferment, and Dr. Calvert states that it is one of the most powerful preventives of putrefaction with which he is acquainted. Commercial creosote is frequently nothing more than hydrated carbolic acid.

CARBON. *C.* *Syn.* CARBONIUM, CARBO, L.; CHARBON, Fr.; KOHLENSTOFF, Ger. An elementary or simple non-metallic solid body, very widely diffused through nature. Its purest and rarest form is that of the diamond. Nearly pure, it occurs very abundantly in the forms of graphite and anthracite. In combination with oxygen, as carbonic acid, it exists in the atmosphere and in the waters of most springs, also in limestone, marble, chalk, and dolomite. Combined with hydrogen, it enters largely into coal, peat, and lignite. It is an essential constituent of organic matter, and hence it has been termed the "organic element." Charcoal, lamp-black, and coke, are more or less pure forms of carbon. By strongly igniting lamp-black in a covered crucible, the element is obtained sufficiently pure for most chemical purposes.

It is best obtained purest by burning a jet of pure olefiant gas in an atmosphere of pure chloride, collecting the amorphous carbon deposited, and igniting *in vacuo* at a red heat.

Forms several chlorides, sulphides, &c., of which the following are the chief:—

Carbon, Protochloride of. Obtained from

the sesquichloride by subliming it repeatedly through a tube filled with fragments of glass heated to redness. A transparent colourless liquid, with aromatic odour.

Carbon, Sesquichloride of. C_2Cl_6 . Obtained by exposing Dutch liquid with chlorine, in a glass vessel, to the direct rays of the sun, taking care to renew the chlorine as long as it is absorbed. The liquid is ultimately converted into the sesquichloride of carbon, which is a white, crystalline, volatile substance.

Carbon, Oxychloride of. $COCl_2$. *Syn.* CHLOROCARBONIC ACID, PHOSGENE GAS, CHLORIDE OF CARBONYL. Equal measures of carbonic oxide and chlorine are exposed to the direct rays of the sun; they combine, and become condensed to half their volume. It is a colourless, suffocating gas, which is immediately decomposed by water into carbonic and hydrochloric acids.

Carbon, Sulphide of. CS_2 . *Syn.* BISULPHIDE OF CARBON, CARBON DISULPHIDE, SULPHURET OF CARBON. Bisulphide of iron (iron pyrites), 5 parts, and fresh dry charcoal, 1 part, are heated together in a stoneware retort, furnished with a glass tube, having the end bent, and passing nearly to the bottom of a bottle or receiver filled with pounded ice. The bisulphide of carbon collects at the bottom of the receiver, and is then purified from adhering moisture and sulphur by distilling it, at a low temperature, from fused chloride of calcium.

By passing the vapour of sulphur over fragments of charcoal, heated to bright redness in a porcelain tube, and collecting the product as before.

Prop., Uses, &c. A colourless, pungent, fetid liquid, having the sp. gr. 1.27. It is exceedingly volatile, boiling at 118.5° Fahr., and has never been frozen. It is highly inflammable, burning with a pale-blue flame, and giving off sulphurous and carbonic acid gases. It freely dissolves sulphur, phosphorus, and several other substances, and by spontaneous evaporation deposits the first in beautiful crystals. The solution of phosphorus is much used in electrotyping objects, which are coated with a conducting film by its means. Its refractive power is remarkably high, and on this account it is employed to fill hollow lenses for spectroscopes and other optical instruments. It produces intense cold by its evaporation. A spirit thermometer, having its bulb covered with cotton, if dipped into this fluid and suspended in the air, rapidly sinks from 60° to 0° , and if put into the receiver of an air-pump it will fall to -81° Fahr. A mixture of sulphide of carbon and solid carbonic anhydride forms almost the most powerful frigorific agent known. Sulphide of carbon is now prepared on the large scale, and extensively employed as a solvent.

It is stated that the odour of sulphide of carbon can be readily removed by allowing it to stand over mercury or corrosive sublimate for some time, and then redistilling.

CARBONATE, a salt in which the hydrogen

of (hypothetical) carbonic acid (H_2CO_3) is replaced by a metal or other basic radical.

Prep., &c. The processes by which the commercial carbonates and many others are prepared are described under the respective bases. Most of the earthy carbonates are found abundantly in nature. In general, the salts of this class may be formed by adding an alkaline carbonate to a salt of the metal in solution by double decomposition.

Prop. The carbonates of the alkalis are soluble in water; those of the other bases are for the most part insoluble, except the water is highly charged with carbonic acid. From most of them carbonic anhydride or anhydrous carbonic acid can be easily expelled by heat.

Tests. The carbonates are easily distinguished by the following reactions:—They dissolve with effervescence in hydrochloric acid, and in most other acids; in some cases a gentle heat is required to promote the disengagement of the gas.—The gas evolved in the last, passed into lime water and baryta water, occasions white precipitates, which redissolve in acids with effervescence, and after the solution has been boiled are not reprecipitated by liquor of ammonia.—Chloride of calcium and chloride of barium give white precipitates in solutions of the neutral alkaline carbonates, but in solutions of the alkaline bicarbonates only after ebullition; and the precipitates are readily soluble with effervescence in acetic acid.

Estim. The quantity of the metal in an alkaline or earthy carbonate may be easily determined by the ordinary volumetric methods of alkalimetry (which see), and the quantity of carbonic acid, by the method of Fresenius and Will (see ALKALIMETRY). The apparatus figured below, or preferably that shown in the article on ALKALIMETRY, may be used instead of the more complicated contrivance of the German chemists.

- (a.) Flask containing the sample of carbonate for examination, stopped by a closely fitting cork, through which passes the bent tube (c).
- (b.) A small tube, sufficiently long to maintain a slanting position without falling, filled with sulphuric or hydrochloric acid.
- (c.) A bent tube, connecting the flask with (d).
- (d.) Horizontal tube, filled with small fragments of fused or dried chloride of calcium, with a fine orifice at the extremity (e).

With the apparatus above, which is that

commonly used, a weighed sample of the carbonate to be examined is placed in the flask (a) along with a little water, and the small tube (b), filled with either sulphuric or hydrochloric acid, is carefully introduced. The cork, with its chloride of calcium tube (d), is then fitted to the flask, and the whole apparatus very accurately weighed.

On inclining the apparatus the acid escapes over the side of the small tube, and mixing with the liquor in the flask, expels the carbonic acid of the carbonate, which is then dried by passing over the chloride of calcium. After effervescence has ceased, heat should be applied to the bottom of the flask, until it be filled with steam, to expel the carbonic gas it contains. The loss of weight gives the weight of the carbonic acid gas that was contained in the sample. The quantity of carbonic acid in the carbonates of the metals that do not contain water, may be determined by heating them to redness in a platina crucible.

CARBONIC ACID. H_2CO_3 . True carbonic acid has not yet been obtained in any satisfactory condition, although the solution of carbonic anhydride (often called carbonic acid), or anhydrous carbonic acid, is generally regarded as such. It forms with bases an important series of salts, called the carbonates, by double decomposition.

CARBONIC ANHYDRIDE. CO_2 . *Syn.* CARBONIC ACID, CARBON DIOXIDE, FIXED AIR, CHOKE DAMP; ACIDE CARBONIQUE, Fr.; KOHLEN SAURE, Ger. A compound formed by the chemical union of carbon and oxygen.

Hist. Van Helmont recognised carbonic acid as a peculiar gas. Dr. Black, in 1757, proved that it was a constituent of limestone, and gave it the name of fixed air; he also showed that the causticity of alkalies depended on its absence. Bergmann first described it as an acid, applying to it the term aerial acid. Lavoisier, in 1776, established its true nature, and gave it the name it now bears. Faraday, in 1823, by pressure at an extremely low temperature, reduced carbonic acid to a liquid, and a few years later Thilorier and Brunel obtained it in the solid form.

Nat. hist. Carbonic acid is a constituent of the atmosphere, its presence being essential to the existence of vegetable life on the globe. It issues from the earth in many situations, as the Grotto del Cane in Italy, the Valley of Poison in Java, and near the Lake of Laach in Germany. It gives to many mineral springs their sparkling brilliancy, and is held in solution by all natural waters. Combined with the bases, lime and magnesia especially, it exists in large quantities in the crust of the earth. It is the chief product of combustion, and one of the products of fermentation. It is always being exhaled by animals in the process of respiration, and in smaller quantities by plants at night or in the shade. It forms the terrible "choke-damp" or "after damp" of the coal mines. It is the gas dis-

engaged during the effervescence of soda water and other aerated drinks, and the cause of the freshness of newly drawn beer.

Prep. Hydrochloric acid, 1 part, diluted with water, 4 or 5 parts, is poured upon fragments of white marble, previously placed in a suitable generating apparatus.¹

Carbonic acid is rapidly evolved, and may be collected, with some loss, over water in the pneumatic trough. If required dry, the gas must be passed over fragments of fused chloride of calcium, placed in a large tube, or through a small quantity of concentrated sulphuric acid, and collected by displacement or over mercury.

From oil of vitriol, 1 part; water, 6 parts; and chalk or whiting, $1\frac{1}{2}$ part; mixed in a suitable vessel, applying agitation.

Prop. Under ordinary conditions, carbonic acid is a colourless, non-inflammable, irrespirable gas, possessing a slightly pungent odour, and an acidulous taste. Water absorbs its own volume of this gas, and by pressure may be made to take up enormous quantities, forming carbonated or aerated water. Its sp. gr. is 1.520, hence it may be poured from one vessel to another like water. By a pressure of thirty atmospheres at 32° Fahr., it is liquefied, the pressure required decreasing as the temperature gets lower. At -94° Fahr. it solidifies into a vitreous transparent mass.

Carbonic acid, even when greatly diluted with air, cannot be inhaled without insensibility following. An atmosphere containing more than its natural quantity of the gas (1 part in 2500 parts, by measure) acts upon the system as a narcotic poison, hence the danger of overcrowded rooms. It is a non-supporter of combustion, at once extinguishing a lighted candle, gas-jet, or even a piece of burning phosphorus, when these are placed in a jar of the gas.

Tests. It feebly reddens litmus paper, extinguishes the flame of a burning taper, and forms a white precipitate in aqueous solutions of lime and baryta, which is soluble in acetic acid. By the last test, a very small quantity of this gas may be easily detected in the atmosphere of rooms, &c. A lighted candle is generally used to test an atmosphere suspected to contain carbonic acid; but it is found that air that will support combustion will contain sufficient of this gas to cause insensibility.

Ant., &c. The patient should be immediately removed into the open air, and placed on his back with the head slightly raised. Cold water should be dashed over the body, hot water or mustard poultices applied to the feet, and ammonia (carefully) to the nostrils. Brandy and water and other stimulants may be administered. Continued friction on the surface of the body is also very useful. If the

patient has ceased to breathe, artificial respiration should be attempted. This may be done by gently pressing down the ribs, and forcing up the diaphragm, and then suddenly withdrawing the pressure. The inhalation of air, mixed with very little chlorine gas, has also been recommended. Wells, cellars, or other underground apartments, containing carbonic acid in poisonous quantities, may be freed from this gas by pumping it out, in the same way as water, observing to allow the suction hose to fully reach the floor or bottom of the place. Fresh slaked lime or milk of lime, copiously thrown in, will have a like effect, by absorbing the gas. Free ventilation, whenever it can be established, is, however, not only the cheapest, but the most efficient remedy. See ASPHYXIA.

CARBONIC OXIDE. *CO.* *Syn.* PROTOXIDE OF CARBON, CARBON MONOXIDE, GASEOUS OXIDE OF CARBON; OXYDUM CARBONICUM, L. A gaseous compound of carbon and oxygen, containing less oxygen than is contained in carbonic acid.

Prep. 1. From carbonic acid gas passed over fragments of charcoal, heated to redness in a tube of porcelain or iron.

2. From crystallised oxalic acid, gently heated with 5 or 6 times its weight of strong sulphuric acid in a glass retort.

3. From ferrocyanide of potassium in fine powder, and 8 or 10 times its weight of concentrated sulphuric acid, heated together in a glass retort.

Obs. All the processes except the last give a mixture of carbonic acid and oxide. It is therefore necessary to pass the gas through a caustic alkaline solution or milk of lime, to deprive it of carbonic acid. It may then be passed over dried chloride of calcium, to deprive it of moisture. It may be collected either over mercury or water, as the latter absorbs very little of this gas.

Prop. Carbonic oxide is colourless, inodorous, neutral, inflammable, and irrespirable. It is extremely poisonous, $1\frac{1}{2}$ mixed with air being sufficient to cause dangerous drowsiness. The deaths produced by the combustion of charcoal in close rooms are now attributed to this gas. The *antidotes*, &c., are the same as for poisoning from inhaling carbonic acid.

• **CARBURETTED HYDROGEN.** See HYDROGEN.

• **CARDAMOM.** *Syn.* CARDAMUM; CARDAMOMUM, B. P. The seed or fruit of the *Elettaria Cardamomum* forms the official cardamom. It is warm, pungent, carminative, and stomachic, and is largely used as a condiment in the East, and in Europe as an adjunct in other medicines. Several kinds of cardamoms used medicinally and as spices are produced by the genus *Amomum*, belonging to the natural order *Zingiberaceæ*, the Ginger family.

CARMINATIVES. Medicines that allay flatulency and spasmodic pains. Among the

¹ A large flask, provided with a bent glass tube for conveying the gas, and a tube-funnel for introducing the acid, is the most convenient form of apparatus. A tubulated retort may be used, but the generating flask or bottle is to be preferred.

principal carminatives are ANISEED, CARAWAY SEED, CARDAMOMS, CASSIA, CINNAMON, GINGER, PEPPERMINT, and the PEPPERS. To these may be added ARDENT SPIRITS, and most of the AROMATIC ESSENCES and TINCTURES. See MIXTURES, PATENT MEDICINES, &c.

CAR'MINE, *Syn.* CARMINE RED, VEGETABLE SCARLET; CARMINUM, L. A beautiful red pigment prepared from the cochineal insect.

Prep. The preparation of carmine is little understood, but success in its manufacture depends less on any mystery connected with the process than on the employment of the purest water and the best materials, and the exercise of moderate care, dexterity, and patience. The following forms will produce carmine of the richest hues down to ordinary and common, according to the skill possessed by the manipulator.

1. (*Madame Cenet's process.*) Cochineal (in powder), 2 lbs., is boiled in pure river water, 15 galls., for 2 hours, when refined saltpetre (bruised), 3 oz., is added to the decoction, and the whole boiled for 3 or 4 minutes longer; salt of sorrel, 4 oz., is next added, and the boiling again renewed for 10 or 12 minutes; the heat is now removed, and the liquid allowed to settle for about 4 hours, after which time it is decanted with a syphon, into shallow plate-like vessels, and set aside for three weeks. At the end of this time the film of mould which has formed on the surface is dexterously and carefully removed, without breaking it or disturbing the liquid beneath it. The remaining fluid is next very carefully removed with a syphon, and the adhering moisture, as far as possible, drained off, or sucked up with a pipette. The residuum, which is the carmine, is dried in the shade, and possesses extraordinary lustre and beauty.

2. (*Alcon or Langlois process.*) Powdered cochineal, 1 lb., is boiled in river water, 4 galls., for 10 minutes, when carbonate of soda, $\frac{1}{2}$ oz., dissolved in water, 1 pint, is added, and the whole again boiled for $\frac{1}{2}$ hour longer; when the decoction is cold, alum (in fine powder), $\frac{3}{4}$ oz., is thrown in, and the liquid agitated rapidly until it is entirely dissolved; after 20 minutes' repose, it is decanted into another vessel, and clarified by heating it with the whites of 2 eggs; the perfectly clear liquid is then allowed to repose for 40 minutes or longer, when it is decanted, and the carmine which it has deposited is collected, drained on a filter, and dried on shallow plates covered with silver paper. The product by either of the above processes varies from 9 $\frac{1}{2}$ to 10 $\frac{1}{2}$ on the weight of the cochineal employed in them.

3. (*China or Spirit process.*) Cochineal, 1 lb., is boiled for 15 minutes, in water, 3 galls., powdered alum, 1 dr., is next added, and the whole again boiled for 5 or 6 minutes; when the liquid has become cold, the clear portion is decanted, and again heated, and solution of

tin (spirits of tin), cautiously dropped in until all the carmine is precipitated; it is collected, drained, and dried, as before. *Prod.* 1 $\frac{1}{2}$ oz.

3. (*French process.*) From cochineal (in powder), 1 lb., boiled for 15 minutes, in water, 3 galls.; cream of tartar (in powder), 1 oz., is then added, the boiling further continued for 10 minutes, and powdered alum, 1 $\frac{1}{2}$ oz., thrown in; after another 2 minutes' boil, the heat is withdrawn, and in 5 or 6 minutes more, the clear portion is decanted into porcelain vessels, which are set aside until the carmine falls down.

4. (*German process.*) Powdered cochineal, 1 lb., water, 4 galls.; boil 15 minutes, add powdered alum, 1 oz.; boil 3 minutes longer, remove the heat, allow the liquor to settle for 5 minutes, pour off the clear portion into porcelain or earthenware vessels, and set them aside for 3 or 4 days. The carmine is found deposited on the bottom of the vessel, and must be now carefully drained and dried, as before. The decanted liquor yields more carmine by standing in fresh vessels. *Product.* About 1 $\frac{1}{2}$ oz.; besides $\frac{1}{2}$ oz., or more, of an inferior quality obtained as a second deposit.

5. (*English process.*) From cochineal, 1 lb., and carbonate of potash, $\frac{1}{2}$ oz., boiled in water, 7 galls., for 15 minutes; the vessel is then removed from the fire, and powdered alum, 1 oz., added; the liquor is then well agitated and allowed to settle for about 15 minutes longer; the clear liquid is next decanted into a clean copper, and isinglass, $\frac{1}{2}$ oz., dissolved in water, 1 pint (and strained), added; as soon as a coagulum forms upon the surface, the heat is removed, and the liquid is strongly agitated with a bone or silver spatula, after which it is allowed to repose for 20 or 30 minutes. The deposited carmine must be drained and dried, as before.

Obs. The best black cochineal is generally used for the preparation of carmine. For ordinary qualities, spirits of tin (bichloride) is added to the decoction as a precipitant, and the liquid being put into suitable vessels (wash-hand basins answer very well), a deposit of carmine slowly takes place. Neither exposure to solar light nor artificial heat is advisable during the drying, but the latter must nevertheless be effected with all possible expedition. Hence, the finer shades of carmine can only be successfully made during certain states of weather; as in very hot weather the liquid rapidly sours or ferments, and the deposit is more or less dissolved; whilst in dull, damp weather, it is difficult to dry the precipitate sufficiently, which is then apt to become mouldy, and to lose colour. The researches of Pelletier and Caventou tend to show that the solution of tin used as a precipitant, should be at the maximum of oxidation or chlorination, to produce the richest shades of carmine. That first deposited is, in all cases, the most beautiful, and the quality gradually deteriorates as the process proceeds. 6 or 7 drs. only of carmine

of the very finest quality can hence be obtained from 1 lb. of cochineal.

Prop., &c. Pure carmine is a very light, lustrous, scarlet powder, entirely soluble in ammonia, a test by which its purity is readily determined. Mr. Warren De la Rue says the pure colouring principle of cochineal is carminic acid. By digesting ammonia on carmine, until all the colour is taken up, filtering and adding acetic acid and alcohol, till the whole is precipitated; and lastly, carefully washing the precipitate with spirit of wine, at proof, and drying in the shade, carmine of the richest and most lustrous hue, may be obtained even from samples of inferior quality.

Uses, &c. As a pigment in velvet and miniature painting, and for tinting artificial flowers, and as rouge for the complexion. The powdered cochineal (carmine grounds), from which the coloured liquor (liquid rouge, carmine liquor), has been decanted, is used by the paper stainers, and both are used in the preparation of carminated lake.

Blue Carmine. See INDIGO.

Liquid Carmine. *Syn.* FLUID CARMINE, LIQUID ROUGE, CARMINE INK. *Prep.* 1. A solution of carmine in ammonia water, or spirits of hartshorn. Very rich and beautiful.

2. The residual liquor of the process of making carmine. Inferior. The first is used in velvet and miniature painting, and for tinting artificial flowers; the second for common purposes, as a stain or wash.

Purple Carmine. See MUREXIDE.

CARMINIC ACID. $C_{14}H_{14}O_8$. *Prep.* (W. De la Rue.) The powdered insect, after treatment with ether to remove the fat, is digested in water. The decoction of cochineal is precipitated by adding a solution of acetate of lead, and the impure carminate of lead thus formed, after being washed with water, is suspended in water, and decomposed by a stream of sulphuretted hydrogen; the whole process is repeated with the decanted solution, so obtained; the second solution is then evaporated to dryness (*in vacuo* over sulphuric acid), dissolved in absolute alcohol, digested on some washed crude carminate of lead (to separate a little phosphoric acid), and, lastly, mixed with ether (to precipitate some nitrogenised matter); the residuum obtained by careful evaporation (*in vacuo*) is pure carminic acid.

Prop., &c. A purple-brown mass, yielding a rich-red powder; it is freely soluble in water and alcohol; slightly soluble in ether; and without decomposition in oil of vitriol; it is feebly acid; its salts are termed carminates, only two or three of which have been examined. According to Mr. De la Rue, this acid constitutes the pure colouring matter of cochineal.

CAROTINE. $C_{18}H_{24}O$. A crystalline, copper-red substance, obtained from the root of the *Daucus carota (sativa)* or garden carrot. It is tasteless; odourless; neutral; fusible; inflammable; insoluble in ether and water;

slightly soluble in alcohol; and very soluble in the mixed and volatile oils.

CARPETS. Considerations of cleanliness and economy demand a few words on carpets and hearth-rugs. We are assured by an experienced person, that before proceeding to sweep a carpet, a few handfuls of waste tea-leaves should be sprinkled over it (say some five or six minutes before). A stiff hair broom or hair brush only should be employed, unless the carpet be very dirty, when a whisk or carpet-broom may be used first, followed by another made of hair, to take off the loose dust. The frequent use of a stiff "carpet-broom" (those made of cane or birch are here alluded to), soon wears off the beauty of the best carpet. An ordinary clothes-brush, or a clean one, resembling the dirt brush used for shoes, is best adapted for superior carpets. When carpets are very dirty, they should be cleaned by shaking and beating. "If you must have a carpet, take it up two or three times a year, instead of once. A dirty carpet literally infects the room: if you consider the enormous quantity of organic matter from the feet of people coming in, which must saturate it, this is by no means surprising." (Miss Nightingale.) In laying down carpets, it is very advisable, at first, to cover the floor beneath them with large sheets of thick paper, so as to prevent dust from rising between the boards. Old druggist, sacking, matting, or any similar substance, will effect the same purpose, and will, moreover, materially increase the durability of the carpet, by preserving it from the contact of the hard floor.

BRUSSELS CARPETS may be cleaned with ox-gall (1 pint to a pailful of water), and a scrubbing-brush and floor-cloth; afterwards rinsing them in fresh water applied in the same way. They should be previously perfectly freed from dust by beating, and should be nailed down before commencing the above operations. Great care should be taken to rub them as dry as possible with a clean dry floor-cloth. A small portion only should be done at a time, and a dry windy day selected for the purpose. A carpet treated in this manner will be greatly refreshed in colour, particularly the greens.

KIDDERMINSTER CARPETS will scarcely bear the above treatment without becoming so soft as to get speedily dirty again. This may in some measure be prevented, by brushing them over with a hot weak solution of size in water, to which a little alum has been added. Curd soap, dissolved in hot water, may be used instead of ox-gall, but it is more likely to injure the colours, if produced by false dyes. When there are spots of grease on the carpeting, they may be covered with curd soap, dissolved in boiling water, and rubbed with a brush until the stains are removed, when they must be cleaned with warm water as before. The addition of a little gall to the soap renders

it more efficacious. Some persons employ a mixture of soap, fuller's earth, and turpentine, for the same purpose. Benzol rapidly removes the grease stains, and may be advantageously substituted for preparations of soap.

CARRAGEEN. *Syn.* I'RISH MOSS; CHON'DRUS, L. The *Chondrus crispus* of botanists, a well-known alga or seaweed. It contains a large proportion of a peculiar jelly, called carrageen-in or pect'in. This may be purified by agitation with dilute alcohol and filtration. The jelly forms an agreeable article of diet. It is used to a limited extent for thickening colours in calico printing. In *medicine*, carrageen is used in the form of a jelly and decoction as a demulcent, and is often prescribed in pulmonary complaints. See FIXATURE, PASTE, SYRUP.

CAR'ROT. *Syn.* CARO'TA, L. The seed is carminative and diuretic; the expressed juice of the root is anthelmintic. Scraped raw carrot is sometimes employed as a stimulant application to sore nipples; the boiled root as a poultice to sores and tumours. It's an article of food, unless young and well dressed, carrots are rather indigestible.

CAR'THAMIN. $C_{14}H_{16}O_7$. *Syn.* PURE ROUGE, SAFFLOWER CARMINE, SAFFLOWER LAKE. The red colouring matter of *Carthamus tinctorius* or safflower, formerly much used as a dye, particularly in the form of pink saucers for dyeing stockings.

Prep. 1. Safflower, exhausted by washing it with water (or with water acidulated with acetic acid), is dried, coarsely pulverised, and the powder digested in a weak solution of carbonate of sodium; pieces of clean white cotton or calico are then immersed in the solution, and acetic acid gradually added in slight excess; the cotton is next washed, dried, and digested in a fresh quantity of dilute solution of carbonate of sodium, and agitation employed until the whole of the colour is again dissolved; the new solution is filtered and slightly super-saturated with citric acid (or acetic acid); the carthamin, which falls down in rich carmine-red flocks, is lastly washed with cold distilled water, and dried.

2. Washed safflower (dried and powdered), any quantity; aqueous solution of carbonate of sodium (containing 15% of carbonate), q. s. to form a thick paste; after some hours press out the red liquor, nearly neutralise it with acetic acid, put in cotton as before, and add acetic acid in slight excess; the next day remove the cotton and wash it in water holding in solution 5% of carbonate of sodium, until the colour is dissolved out, after which precipitate with citric acid, as before.

Prop., &c. An amorphous, brilliant, greenish powder; nearly insoluble in water, soluble in alcohol, forming a gorgeous purple solution, and in weak alkaline lyes, giving an equally beautiful red one.

CARTHAMUS. *Syn.* SAFFLOWER. In botany, a genus of composite plants, the most

important species of which is *Carthamus tinctorius*, the safflower.* The florets of this yield a beautiful pink dye (see *above*), and are sometimes used to adulterate hay saffron. The "cake saffron" of the shops consists entirely of safflower and mucilage. The fruits, commonly called "seeds," yield by expression the useful oil known in India as Kosum oil.

CARUM (PTYCHOTIS) AJOWAN. *Ind. Ph. Syn.* AJWAIN or OMUM PLANT. *Habitat.* Tropical Africa? Much cultivated in India. — *Official part.* The fruit (*Fructus Ptychotis, Ajwain fruit*). Occurs in the form of minute umbelliferous fruits, which, examined with a lens, are seen to be covered with prominent tubercles, extremely aromatic, evolving, when rubbed, a strong odour resembling that of common thyme. Taste somewhat bitter, and very pungent. Its virtues reside in a volatile oil.—*Properties.* Valuable stimulant, carminative, and antispasmodic.—*Therapeutic uses.* In flatulence, flatulent colic, atonic dyspepsia, and diarrhoea, it is a remedy of much value.

OIL OF AJWAIN, or OMUM (*Oleum Ptychotis*). The oil obtained by distillation from the fruit. Recently prepared, colourless, but soon acquires a yellowish tinge. It has the odour of the fruit, and an acrid burning taste. Sp. gr. about 0.88.—*Dose.* 1 to 3 drops on sugar or in emulsion.

AJWAIN, or OMUM WATER (*Aqua Ptychotis*). Take of ajwain fruit, bruised, 20 oz.; water, 2 galls. Distil a gallon.—*Dose.* 1 to 2 fluid ounces. A valuable carminative; also useful in disguising the taste of disagreeable drugs, especially castor oil, and obviating their tendency to cause nausea and griping.

CARYOPHYLLIN. $C_{10}H_{16}O$. *Syn.* CLOVE CAMPHOR, CLOVE RESIN. A crystalline substance, isomeric with ordinary camphor, which deposits from oil of cloves in needles.

CARYOPHYLLUS. See CLOVE.

CASCARIL'LA. *Syn.* CASCARILLE CORTEX (B. P.), L. The bark of *Croton eleutheria* or the seaside balsam, a tree growing in the Bahamas and Jamaica. It is an aromatic bitter, stomachic, and tonic.—*Dose.* 10 grs. to 30 grs., in the form of powder, infusion, or tincture; in diarrhoea, dysentery, dyspepsia, low fevers, intermittents, &c.

CASCARIL'LINE. *Syn.* CASCARIL'LINE. *Prep.* (Duval.) Cascarilla is exhausted with cold water, by percolation, precipitated with acetate of lead, and the filtrate treated with sulphuretted hydrogen; the filtered liquid, after agitation with animal charcoal and filtration, is gently evaporated to dryness. The powder is redissolved in boiling alcohol and crystallised by very slow or by spontaneous evaporation. It has a bitter taste, and a reaction; its aqueous solution is unaffected by the ferric salts and tincture of galls.—*Dose.* 1 to 3 grs.; in dyspepsia, &c.

CASE-HARDENING. *Syn.* STEEL SUB-RACING. The operation of giving a surface of

steel to iron goods. Tools, fire-irons, fenders, keys, &c., are usually case-hardened.

Process. 1. The goods (finished in every respect but polishing) are put into an iron box, and covered with animal or vegetable charcoal, and "cemented" at a red heat, for a period varying with the size and description of the articles operated on; these, when taken out, are hardened by plunging into water, or oil, if they are of a delicate nature.

2. (Moxon.) Cow's horn or hoof is baked or thoroughly dried, and pulverised; to this is added an equal quantity of bay salt, and the whole is made into a paste with stale chamber-lye, or white wine vinegar; the iron is covered with this mixture, and bedded in it, in loam, or inclosed in an iron box. In this form it is laid on the hearth of the forge to dry and harden, then it is put into the fire, and blown till the lump has a blood-red heat (no higher). It is hardened as before.

3. Coat the goods with a paste made of a concentrated solution of prussiate of potash and loam; then expose them to a strong red heat, and when it has fallen to a dull red, plunge the whole into cold water.

4. The goods, previously polished and finished, are heated to a bright red and rubbed or sprinkled over with prussiate of potash. As soon as the prussiate appears to be decomposed and dissipated, the articles are plunged into cold water.

Obs. The process of case-hardening has been well conducted when the surface of the metal proves sufficiently hard to resist a file. The last two plans are a great improvement upon the common method. By the topical application of prussiate of potash (ferrocyanide of potassium) any part of a piece of iron may be case-hardened, without interfering with the rest.

Case-Hardening Powders. *Syn.* CASE-HARDENING COMPOSITIONS. 1. Prussiate of potash, dried and powdered.

2. Prussiate of potash, 3 parts; sal-ammoniac, 1 part; mix.

3. Sal-ammoniac and bone-dust, of each, 2 parts; prussiate of potash, 1 part. (See above.)

CA'SEIN. *Syn.* CA'SEUM, CA'SEIN, LACT-ALBUMEN, ALBUMEN OF MILK. The nitrogenous principle of milk. Cheese made from skimmed milk and well pressed, is nearly pure caseine. (Liebig.)

Prep. 1. The curd obtained by adding dilute sulphuric acid to milk is well washed and dissolved in carbonate of soda. It is allowed to stand for 24 hours, to let the oil rise to the surface, and when this is properly skimmed off, the caseine is precipitated by an acid. The process is repeated a second time, and the coagulum digested with alcohol and ether, and dried. With all these precautions the caseine still contains some saline matter which cannot be removed.

2. Milk is coagulated by hydrochloric acid,

and the curd then well washed with dilute acid, and finally with pure water. The curd so prepared is dissolved by digestion at 110° Fahr., with a large quantity of water; the solution, after filtration, is coagulated with carbonate of ammonia; the coagulum is washed with water, ether, and alcohol, and finally dried.

Prop., &c. Coagulated caseine is readily dissolved by the alkalies and alkaline carbonates. The most remarkable property of caseine is its coagulation by certain animal membranes, as in the process of cheese-making, with rennet. See LACTARIN.

CASKS. The care and management of casks is an important affair in a large establishment. It is found that they last longest when stored either in a dry situation, or in one uniformly very moist. Continual variations from the one to the other speedily rot them. As soon as casks are emptied they should be bunged down quite air-tight, with as much care as if they were full, by which means they will be preserved both sweet and sound. Should any of the hoops become loose, they should be immediately driven up tight, which will at once prevent the liability of their being lost or misplaced, as well as the casks fouling or becoming musty from the admission of air. For this purpose, those out of use should be occasionally hauled over and examined.

Numerous plans are adopted for **CLEANING** and **PURIFYING** CASKS, among which are the following:—

1. Wash them well out with oil of vitriol, diluted with an equal weight of water.

2. Wash them first with a little chloride of lime and warm water, and then with water soured with oil of vitriol.

3. Match them with sulphur, or with sulphur mixed with a little saltpetre.

4. Unhead them and whitewash them with fresh milk of lime, made pretty strong. This plan is commonly followed for brewers' vats.

5. Remove the heads, and char the insides of the staves by the aid of a fire of shavings, kindled within them.

6. A simpler, safer, and more effectual method of charring them than the last, is to wash the dry casks out with strong oil of vitriol (sp. gr. 1.854). This not only purifies the surface of the staves, but penetrates into all the cracks, some of which might escape the action of the fire.

7. Steam has lately been applied to the insides of casks, with great advantage. High-pressure steam is driven in at the bung-hole, at the same time that the cask is violently agitated (a heavy chain having been previously put into it), until all the dirt and bad smell is removed.

8. A lye of pearlash or soda, mixed with milk of lime, as well as strong hot brine, and other similar liquors, have been adopted by some persons, and are highly spoken of.

9. The coopers boil the staves for gin casks

in a strong lye of alum before placing them together, to prevent their colouring the spirit, but washing with oil of vitriol is a better plan.

10. Some persons fill musty casks with water, and add 3 or 4 lbs. of coarsely powdered fresh burnt charcoal, and agitate well for a few days.

Obs. In all the above processes the greatest care must be taken to scald, or soak and well rinse out the casks after the treatment described. See BREWING UTENSILS, MATCHES, &c.

CAS'SAREEP. The expressed juice of the sweet cassava, concentrated by heat and flavoured with aromatics. It is used in the West Indies as a condiment. (See *below*.)

CAS'SAVA. A poisonous shrub cultivated in the West Indies, and in many parts of South America, for the sake of the starchy matter contained in its roots. It belongs to the natural order *Euphorbiaceæ*, and is known to botanists under the names *Manihot utilisima* (Pohl), *Janipha manihot* (Humboldt), and *Jatropha manihot* (Linn.), the former being that now generally adopted. The name "bitter cassava" is commonly given to it in the West Indies, to distinguish it from another species of the same genus, *Manihot aipi* (Pohl), which, from having no poisonous properties, is named the "sweet cassava." The roots of both species yield the starch, but those of the poisonous plant are the richer.

The roots, after being well washed and scraped, are rasped or grated, and the pulp thus formed is subjected to strong pressure, to expel the poisonous juice which it contains. The compressed pulp is next thoroughly dried over the fire, being constantly stirred the whole time, by which any remaining portion of the noxious juice is either volatilised or decomposed. It now forms CASSAVA MEAL. When it is further prepared by grinding, it forms FINE CASSAVA MEAL, or CASSAVA FLOUR. When the compressed pulp is baked on a hot plate, it forms CASSAVA BREAD, or CASSAVA CAKES, the flavour of which greatly resembles that of Scotch oat-cakes. See TAPIOCA.

CAS'SIA. In *botany*, a genus of the natural order *Leguminosæ*, including several important medicinal plants. The "purging cassia," *Cassia fistula* (Linn.), produces pods containing a soft, blackish pulp. (See *below*, also SENNA.)

Cassia Pulp. *Syn.* CASSIA PRÆPARATA, CASSIA PULPA (B. P.). *L. Prep.* The cassia (pods or fruit), broken lengthwise, are macerated in sufficient distilled water to cover them, for six hours, constantly stirring; and the purified pulp strained through a hair sieve, and evaporated to the consistence of a confection in a water bath.—*Dose.* As a mild laxative, 1 to 2 drs.; as a purgative, $\frac{1}{2}$ oz. to 1½ oz.

CAS'SOLETTES (Scented). See PASTILLES and PERFUMERY.

CAS'TOR. *Syn.* CASTORÆUM, L. (B. P.). "The follicles of the prepuce of the *Castor fiber* or *beaver*, filled with a peculiar secretion." (Ph. L.) "A peculiar secretion from the præputial follicles." (Ph. E. and D.) It is often sophisticated; a fraud readily detected by the "absence of the membranous partition in the interior of the bags, as well as by the altered smell and taste." (Ure.) Russian castor, which is very rare, may be distinguished by a tincture of 1-16th part in alcohol, being of the colour of deep sherry, while that with American castor is of the colour of London porter. (Pereira.)—*Dose.* 1 to 2 drs. or more, in powder or made into pills; in nervous and spasmodic affections, especially in hysteria, epilepsy, and other like diseases of females.

CAS'TORIN. *Syn.* CASTORINÆ, CASTOREUM CAMPHOR. When castor is cut into small pieces and boiled in about 6 times its weight of alcohol, crystalline substance (*castorin*) is deposited by the filtered tincture in cooling. By re-solution in alcohol, it may be obtained under the form of colourless, prismatic, acicular crystals.

Obs. Genuine Russian castor, although the most expensive, must be employed in the above process, as scarcely any castorin can be obtained from the American variety.

Prop., &c. Castorin has the odour of castor, and a coppery taste; it is inflammable, and is soluble both in ether and hot alcohol.

CAS'TOR OIL. See OILS.

CASTS. In preparing casts and moulds with gelatin, wax, fusible metal, and similar substances, it is important to use them at the lowest temperature compatible with fluidity; as when only a few degrees hotter, the water which adheres to the things from which the casts are taken, is converted into vapour, and produces bubbles. Fusible metal may be allowed to cool in a teacup until just ready to set at the edges, and then poured into the moulds. In this way beautiful casts from moulds of wood, or of other similar substances, may be procured. When taking impressions from gems, seals, &c., the fused alloy should be placed on paper or pasteboard, and stirred about till it becomes pasty, from incipient cooling, at which moment the gem, die, or seal, should be suddenly stamped on it, and a very sharp impression will then be obtained.

CATALEPSY. *Syn.* TRANCE; CATALEPSIS, CATALEPSIA, L. A disease in which the organs of sense and motion cease to exercise their functions, and the heart and lungs feebly perform their offices, and in a scarcely perceptible manner. The paroxysm generally comes on without previous warning, and its duration varies from a few minutes to several days, and if medical reports are to be credited, sometimes for a much longer period. Dr. Cullen seriously affirms that this disease is always counterfeited.

Treat. Ammoniacal stimulants applied to

the nostrils, and spirituous liquors injected into the stomach, with general friction of the body, and free access to pure air, are the best remedies. Electricity and galvanism should also be had recourse to, when the necessary apparatus is at hand.

CATAPLASMS. See **POULTICES**.

CATARACT. An opaque condition of the lens of the eye. It is a common cause of blindness. It can only be cured by a surgical operation.

CATARRH. *Syn.* CATARRH'US, L. The "cold in the head," or "cold on the chest," of domestic medicine. Influenza is a severer form of this complaint, and has been called epidemic catarrh.

The common symptoms of catarrh are a copious discharge from the eyes and nose, a hoarseness, and generally a cough, more or less severe. The exciting causes are sudden changes of temperature, and exposure to currents of cold air while the body is heated; hence the frequency of colds in hot and changeable weather.

Treat. A light diet should be adopted, and animal food and fermented and spirituous liquors should be particularly avoided. Some mild aperient should be administered; and when the symptoms are severe, or fever or headache is present, small diaphoretic doses of antimonials, accompanied by copious draughts of diluents, as barley water, weak tea, or gruel, should be taken. This treatment, except in very bad cases, will generally effect a cure.

CATECHIN. *Syn.* CATECHU'IC ACID, RESINOUS TAN'IN. When cubical gambir, or catechu, in powder, is treated with cold water, a portion remains undissolved. This is catechin. By repeated solutions in alcohol, it may be obtained under the form of white, silky, acicular crystals.

Prop., &c. Catechin strikes a green colour with the salts of iron, but does not precipitate gelatin. When dissolved in caustic potassa, and the solution exposed to the air, it absorbs oxygen, and japônic acid is formed. If, instead of caustic potassa, carbonate of potassa is employed, it is converted into rutig acid.

CATECHU. *Syn.* CAS'HEW, CATCH, GAM'BIR; CAT'CHU (Ph. L. E. & D.), TER'RA JAPONICA, L.; CACHOU, Fr. "The extract from the wood of *Acacia Catechu*, or from the leaf of *Uncaria Gambir*." (PALE CATECHU, Catechu Pallidum, B. P.) Also of the "kernels of *areca catechu*; probably, too, from other plants." (Ph. E.) The term is now applied to several extracts similar in appearance and properties to that of *Acacia Catechu*.

There are several varieties of catechu known in commerce, of which the principal are—

CATECHU, BOMBAY. Firm, brittle, dark brown, of a uniform texture, and a glossy, semi-resinous, and uneven fracture. Sp. gr. 1.39. Richness in tannin, 52%.

CATECHU, BENGAL. Rusty brown colour externally; porous, and more friable than the preceding. Sp. gr. 1.28. Richness in tannin, 49.5%.

CATECHU, MALABAR. Resembles the last in appearance, but is more brittle and gritty. Sp. gr. 1.40. Richness in tannin, 45.5%.

Of the above varieties the first is the one generally employed in medicine, and which commonly passes by the name of catechu. The second popularly passes under the name of *terra Japonica* (Japan earth), from the old belief that it was of mineral origin.

CATECHU, PALE, is prepared at Singapore and in the Eastern Archipelago. It generally occurs in cubical reddish-brown pieces, porous, bitter, and astringent in taste. Entirely soluble in boiling water; the solution, when cold, is not rendered blue by iodine. Of 100 parts, only 60 are dissolved by cold water, and the solution is bright. Thirty parts of isinglass precipitate the whole of the astringent matter.—*Test.* Sp. gr. 1.39. "The pale catechu being already in the Edin., the B. P. 1864, retained it with the black; but the black is the one adopted by all other pharmacopœias, and is preferred in the arts and manufactures; it is well known to be far superior to the pale in astringency, and is always to be had of good quality; it is therefore a matter of surprise and regret that it has been rejected from the 'British Pharmacopœia.'" (Squire.)

Estim. It is often of importance to the tanner and dyer to determine the richness of this article in tannic acid or tannin. The following are two simple methods:—

1. Exhaust a weighed sample (in powder) with ether, and evaporate by the heat of a hot-water bath. The product, which is the tannin, must then be accurately weighed.

2. Dissolve the sample (in powder) in hot water, let it cool out of contact with the air, filter, and add a solution of gelatin, as long as a precipitate falls. The precipitate, after being washed and dried at a steam heat, contains 40% of tannin.

Uses, &c. Catechu is extensively employed in medicine, both internally and externally, as an astringent. It is used to flavour British brandy, and by the tanners as a substitute for oak bark. With it the dyer produces, inexpensively, many of his most pleasing browns. Alum mordants are mostly employed in dyeing with catechu. "The salts of copper with sal-ammoniac cause it to give a BRONZE COLOUR, which is very fast; the proto-chloride of tin, a BROWNISH YELLOW; the per-chloride of tin, with the addition of nitrate of copper, a DEEP-BRONZE HUE; acetate of alumina, alone, a REDDISH BROWN, and with nitrate of copper, a REDDISH-OLIVE GRAY; nitrate of iron, a DARK-BROWN GRAY. For dyeing a GOLDEN COFFEE-BROWN, it has entirely superseded madder; 1 lb. of it being equivalent to 6 lbs. of this root." (Urb.)—*Dose.* 10 grs. to 30 grs.

in solution, in water, or made into a bolus, or sucked as a lozenge.

CAT'GUT. The prepared and twisted intestines of animals. *Prep.* The guts, taken whilst warm from the animal, are thoroughly cleaned, freed from adherent fat, and well rinsed in pure water. They are next soaked for about 2 days in water, after which they are laid on a table and scraped with a copper-plate, having a semicircular notch, beginning the operation at the smaller end. In this way the mucous and peritoneal membranes are removed. The guts are then put into fresh water, and soaked until the next day, when they are again scraped, the larger ends cut off, and after well washing, again steeped for a night in fresh water, and then for 2 or 3 hours in a weak lye of pearlash or potash (2 oz. to the gal.). They are lastly washed in clean water, and passed through a polished hole in a piece of brass to smooth and equalise their surface; after which they are twisted, and sorted, according to the purposes for which they are intended. For many purposes the prepared gut is dyed or sulphured, and rubbed with olive oil. It improves by age. Red or black ink, or any of the simple dyes or stains, are used to colour it.

Uses, &c. Catgut is employed in several of the arts. The strings of harps, violins, &c., are formed of this material. Whipcord is made from catgut, which is sewed together while soft with the filandre or scrapings, after which it is put into a frame and twisted. Bowstrings for hatmakers are made out of the largest intestines, 4 to 12 of which are twisted together, until the cord is extended to 15 to 25 feet in length. It is then rubbed perfectly smooth and free from knots, half dried, sulphured twice, again stretched and sulphured, and lastly, dried in a state of tension. Clock-makers' cords are made of the smallest intestines, in a similar manner.

The best fine catgut is made at Venice or Rome, from the intestines of thin, sinewy sheep. That made in England is formed from the fat sheep killed for the shambles, and is, hence, inferior. Coarse catgut, for turning lathes, &c., is made from the intestines of horses, cut into 4 or 5 strips, by forcing a ball furnished with projecting knives placed crosswise along them. These strips are next twisted, dried, and rubbed smooth with fish skin. Gutta percha and vulcanized India rubber are now applied to many of the purposes formerly exclusively occupied by catgut.

CATHARTICS. See **PURGATIVES.**

CATHARTIN. The purgative principle of senna, first noticed by Lassaigne and Fenuelle. A strong aqueous infusion of senna leaves is evaporated to the consistence of a syrup, out of contact with the air; this fluid extract is then digested in alcohol or rectified spirit, and the tincture, after filtration, is evaporated to dryness by a gentle heat.

Prop., &c. A reddish-coloured, uncrySTALLISABLE mass; having a peculiar odour, and a bitter, nauseous taste; freely soluble in both water and alcohol, and strongly cathartic. Two or three grs. cause nausea, griping, and purging. It has been proposed to employ it, combined with aromatics, as a cathartic.

CATHETERS. Small tubes introduced into the bladder for the purpose of drawing off its contents. They may be regarded as hollow bougies.

Prep. 1. A piece of smooth catgut, or steel wire, bent to the proper shape, is coated with melted wax. When cold, it is dipped repeatedly into an ethereal solution of India rubber, until a sufficient thickness is obtained, after which it is dried by a gentle heat, and then boiled in water to melt out the wax, and to allow the catgut to be withdrawn. A solution of India rubber in bisulphide of carbon is now generally employed instead of an ethereal solution.

2. From slips of India rubber, as directed under **BOUGIES**.

3. A smooth tissue of silk is woven over a bent wire, and then coated with a surface of India rubber, or elastic varnish, and finished off as before. See **BOUGIES**.

CAU'DLE. Gruel enriched by various additions.

Prep. 1. Thick oatmeal gruel mixed with about one half its weight of good mild ale (made hot), and as much sugar, and mace, nutmeg, or ginger, as will make it agreeable.

2. To the last add an egg, well beaten.

3. Sugar, 3 or 4 lumps; hot water, a tablespoonful; dissolve; add 1 egg; beat well together; further add a glass of wine and a little nutmeg or ginger; mix well, and stir the mixture into good gruel (hot), $\frac{1}{2}$ pint.

Uses, &c. A nourishing and restorative mixture during convalescence, much used among certain classes after accouchement. It is an excellent domestic remedy for colds, &c., unaccompanied with fever; for which purpose it should be taken on retiring to rest at night, preceded by a dose of castor oil during the day.

CAUSTIC. *Syn.* **CAUSTICUM, ESCHAROTICUM, L.** A substance that corrodes or destroys the texture of organised bodies. This action is popularly termed "burning."

The principal caustics are nitrate of silver, caustic potassa, a mixture of caustic potassa and quick-lime, sulphate of copper, red oxide of mercury, verdigris, tincture of sesquichloride of iron, chloride of zinc, chloride of antimony, nitric acid, acetic acid, and carbolic acid.

Use. Caustics are employed to remove excrescences, morbid growths, granulations, &c., as corns, warts, and proud flesh; and to open issues, abscesses, &c. The first, second, and fourth are applied by gently rubbing them on the part previously moistened with water; the third is commonly made into a paste, with

rectified spirit or glycerin, before application; red oxide of mercury and verdigris (in the form of powder) are often sprinkled over foul and indolent ulcers; whilst the acids and other liquid caustics are applied with a feather, camel-hair pencil, or glass rod. The same applies to the liquid preparations below. In all cases care should be taken to confine the application to the affected part.

Caustic, Ammoni'cal. See OINTMENTS, and GONDRET'S CAUSTIC (*below*).

Caustic, Antimo'nial. *Syn.* CAUSTICUM ANTIMONIA'LE, L. Chloride of antimony.

Caustic, Arseni'cal. *Syn.* CAUSTICUM ARSENICA'LE, C. ARSENIO'SUM, C. A. COMPOSITUM, L. *Prep.* 1. See PLUNKET'S CAUSTIC.

2. (Cutan. Hosp.) Calomel, $2\frac{1}{2}$ oz.; red sulphide of mercury, 1 dr.; arsenious acid, 1 dr. to 2 drs.

3. (Van Mons.) Arsenious acid, 6 drs.; dragon's blood, 2 drs.; animal charcoal, $1\frac{1}{2}$ dr.; cinnabar, 3 oz.

4. (Ratier.) Arsenious acid, 1 part; kino, 8 parts; cinnabar, 16 parts. The ingredients of the last three must be separately reduced to fine powder, and then carefully mixed. They are favorite applications on the Continent, in cases of cancer, cancerous sores, obstinate lepra, &c. They are either dusted over the part, or are made into a paste with mucilage or the saliva, and applied like an ointment on a piece of rag or lint; due caution being observed, and the effects watched. The last is much used in the French hospitals.

Caustic, Canquoin's. See ZINC CAUSTIC (*below*).

Caustic, Canthar'idés. *Syn.* CAUSTICUM CANTHARIDIS, L. *Prep.* 1. Powdered cantharides made into a paste with concentrated acetic acid.

2. (Cutan. Hosp.) Tannin, 1 oz.; cantharides (powdered), 2 oz.; strong acetic acid, 8 oz.; digest a week, and strain. Blisters.

Caustic, Common. See POTASSA (Fused), and POTASSA WITH LIME.

Caustic, Duvill's. *Prep.* 1. Aloes, 5 oz.; proof spirit, 10 oz.; oil of vitriol, 6 oz.; mix.

2. Aloes (in powder), $2\frac{1}{2}$ oz.; rum, $\frac{1}{4}$ pint; mix, and the next day add, oil of vitriol, 1 oz. A favorite caustic in veterinary practice; especially in foot-rot.

Caustic, Filho's. *Prep.* From caustic potassa, 2 parts; quick-lime (in powder), 1 part; melt together in a ladle, mix well, and pour it into small leaden tubes, the size of a large swan-quill. When cold, coat each piece with melted bees' wax, to exclude the air. *Used* as a strong caustic in veterinary practice. It is applied like nitrate of silver.

Caustic, Golden. *Syn.* CAUSTIC OF CHLORIDE OF GOLD; CAUSTICUM AUR'EUM, C. AUR'II CHLORIDI, L. *Prep.* 1. (Recamier.) Terchloride of gold, 6 grs.; nitro-hydrochloric acid, 1 oz.; dissolve.

2. (Legrand.) As the last, but using nitric

acid. Both are recommended as caustics in syphilitic, scrofulous, and scorbutic ulcers, cancerous growths, &c.; applied by means of a dossil of lint.

Caustic, Gondret's. *Syn.* GONDRET'S AMMONI'CAL CAUSTIC; POMMADE DE GONDRET, Fr.; CAUSTICUM AMMONIACA'E, L. *Prep.* 1. See AMMONIACAL OINTMENT.

2. (Original formula.) Almond oil, 2 drs.; suet, 4 drs.; lard, 6 drs.; melt together in a wide-mouthed bottle, cool a little, add solution of ammonia, 12 drs.; and agitate until cold. A powerful rubefacient and counter-irritant; used to produce an immediate revulsion. If covered with a compress, it raises a blister in 4 or 5 minutes.

Caustic, Iodine. *Syn.* CAUSTICUM IODIN'II, L. *Prep.* (Lugol.) Iodine and iodide of potassium, of each, 1 part; water, 2 parts; dissolve. *Used* in similar cases to iodine paint, and to scrofulous growths and ulcers.

Caustic, Lu'nar. *Syn.* LAPIS INFERNALIS, L. *Prep.* 1. Nitrate of silver fused and formed into sticks by pouring it into moulds.

2. (E. R. Squibb.) Nitrate of silver fused with a small quantity of chloride of iron, and formed into sticks or points. The chloride of iron gives toughness to the caustic.

Caustic, Mercu'rial. *Syn.* CAUSTIC OF NITRATE OF MERCURY; CAUSTICUM ACIDI HYDRARGYRI NITRATIS, C. H. DEUTRONITRATIS, L. From mercury, 1 part; commercial nitric acid, 2 parts; dissolve.

2. (Cutan. Hosp.) Mercury, 1 part; nitric acid (sp. gr. 1.5), 2 parts.

3. (P. C.) As No. 1, but evaporating the solution to $\frac{2}{3}$ ths its weight. These liquids are applied with a pencil or lint, in scrofulous and syphilitic ulcers and eruptions, and in lupus, psoriasis, lepra, and other obstinate skin diseases; but their use requires great care.

4. (With arsenic.—Cutan. Hosp.) Mercury, $\frac{1}{2}$ oz.; nitric acid, $\frac{1}{2}$ oz.; arsenious acid, $\frac{1}{2}$ dr.; as before.

Caustic, Nitric. *Syn.* SOLIDIFIED NITRIC ACID; CAUSTICUM NITRICUM, L. *Prep.* (Dr. Rivalle.) Concentrated nitric acid is gradually dropped on a piece of lint, placed in a saucer or glass; as soon as the lint is gelatinised, it is pressed into a suitable shape with a glass rod, and applied to the part; it must be removed in 15 minutes. In cancerous tumours, fungoid growths, &c.

Caustic, O'piated. *Syn.* CAUSTICUM OPIATUM, L. *Prep.* 1. Common caustic (potassa with lime), 4 drs.; powdered opium, 1 dr.; soft soap, q. s. to make a paste. Applied to fungous ulcers.

Caustic, Plunket's. Upright crowfoot and lesser spear-wort, of each, 1 oz.; sulphur, 5 scrup.; white arsenic (in very fine powder), 1 dr.; beat to a smooth paste, form it into balls, and dry them in the sun. In cancer; a portion of one of the balls is reduced to powder, which is mixed up with yolk of egg, and applied on a piece of bladder.

Caustic, Potent'ial. Fused caustic potassa. **Caustic, Recamier's.** See GOLDEN CAUSTIC. **Caustic, Sulphu'ric.** *Syn.* CAUSTICUM SULPHURICUM, C. ACIDI SULPHURICI, L. *Prep.* 1. Plaster of Paris made into a paste with oil of vitriol.

2. Saffron, lint, or unsized paper, soaked in oil of vitriol, and triturated to a plastic mass.

Caustic, Zinc. *Syn.* CAUSTIC OF CHLORIDE OF ZINC, DR. CANQUOIN'S CANCER CAUSTIC; CAUSTICUM ZINCI, C. Z. CHLORIDI, L. *Prep.* 1. (Dr. Canquoin.)—*a.* From chloride of zinc, 1 dr.; flour, 2 drs.; made into a stiff paste with water, q. s.

b. From chloride of zinc, 1 dr.; flour, 3 drs.; water, q. s.; as the last.

c. From chloride of zinc, 1 dr.; flour, 4 drs.; water, q. s.; as before.

d. From chloride of zinc, 2 drs.; chloride of antimony, 1 dr.; flour, 5 drs.; as before.

2. (Alex. Ure.) As above, but substituting plaster of Paris for the flour there ordered.

Uses, &c. As a caustic in cancer, lupus, skin-marks (*navi*), &c. It is formed into small cakes or wafers not exceeding 1 or 2 lines in thickness, one of which is applied to the part, and allowed to remain on from 6 to 12 hours, when it is removed, and the part covered with a poultice. It produces an eschar, often exceeding a quarter of an inch in depth. The chlorides must be in the form of powder, and well mixed with the flour previously to adding the water. The last (No. 1, *d*) is recommended in nodulated cancerous tumours.

CAUSTICS (Vet'inary). In *veterinary practice*, any of the substances enumerated in the foregoing list may be employed; but nitric acid, sulphuric acid, carbolic acid, chloride of zinc, and nitrate of silver, are those most commonly used. See VETERINARY MEDICINES.

CAVIARE. *Syn.* CAVIAR, CAVIALE. The salted roe of several species of sturgeon. It is much esteemed by the Russians, as well as by some other nations of northern Europe, and is occasionally eaten as a delicacy in this country. It is, however, very oily, indigestible, and unwholesome.

CAYENNE. See CAPSICUM, PEPPERS.

CEDAR-WOOD (Oil of). See OILS.

Cedar-Wood (Tincture of). See TINCTURES.

CEDRAT. See LIQUEURS.

CEDRENE and **CEDROLA.** The oil of cedar-wood, by careful distillation, is separable into two substances—a solid crystalline compound (*cedrola*), and a volatile liquid hydrocarbon (*cedrene*). The first may be converted into the other by distillation with phosphoric anhydride.

CELULULOSE. See LIGNIN.

CEMENT. *Syn.* CEMENTUM, L. Any substance which, when applied to the surfaces of other bodies, causes them to adhere together when placed in contact. Those referred to below are amongst the most useful preparations of this class. The term cement is also applied by builders and architects to several

species of mortars and like compositions employed either to unite stones and bricks into masses, or as a protective covering against the weather or water, or to make statues, cornices, and similar ornamental articles.

In general, the thinner the stratum of interposed cement, the stronger is the junction of the surfaces operated on. This caution is necessary, as in their anxiety to unite broken articles persons generally defeat themselves, by spreading the cement too thickly on the edges of the fracture; whereas the least possible quantity should be used, so as to bring the edges as close as possible together.

Cement, Al'abaster. 1. From plaster of Paris (in fine powder), made into a cream with water, and at once applied.

2. Yellow resin, 2 parts; melt and stir in plaster of Paris, 1 part.

3. Yellow resin, bees' wax, and plaster of Paris, equal parts.

4. Resin, 8 parts; wax, 1 part; melt and stir in plaster of Paris, 4 parts, or q. s.

5. Sulphur or shell-lac, melted with sufficient plaster of Paris or colouring matter to give the desired shade. *Used* to join or mend pieces in alabaster, white marble, Derbyshire spar, porphyry, and other like substances; and to fill up cracks, supply chips out of corners, &c. The last four are applied hot, the surfaces to be united having been previously warmed.

Cement, Architectural. 1. From paper (reduced to a smooth paste by boiling it in water), sifted whiting, and good size, equal parts, boiled to a proper consistence.

2. Paper paste, size, and plaster of Paris, equal parts; as before.

Obs. This is a species of papier-maché. It is used to make architectural ornaments, busts, statues, columns, &c. It is very light, and receives a good polish, but will not stand the weather unless it is well varnished or painted.

Cement, Arme'nian. *Syn.* DIAMOND CEMENT, PERSIAN C., TURKISH C., JEWELLERS' C. The jewellers of Turkey, who are mostly Armenians, have a singular method of ornamenting watch-cases, &c., with diamonds and other precious stones, by simply gluing or cementing them on. The stone is set in silver or gold, and the lower part of the metal made flat, or to correspond with the part to which it is to be fixed; it is then gently warmed, and the glue is applied, which is so very strong that the parts thus cemented never separate. This glue will strongly unite pieces of glass and china, and even polished steel, and may be applied to a variety of useful purposes.

Prep. 1. (Original Armenian formula; Eton.) Dissolve five or six bits of gum mastic, each the size of a large pea, in as much rectified spirit of wine as will suffice to render it liquid; and, in another vessel, dissolve as much isinglass, previously a little softened in water (though none of the water must be used), in French brandy or good rum, as will make a two-ounce phial of very strong glue, adding

two small bits of gum galbanum or ammoniacum, which must be rubbed or ground till they are dissolved. Then mix the whole with a sufficient heat. Keep the glue in a phial closely stopped, and when it is to be used set the phial in boiling water.

2. (Keller's ARMENIAN CEMENT.) Soak isinglass, $\frac{1}{2}$ oz., in water, 4 oz., for 24 hours; evaporate in a water bath to 2 oz.; add rectified spirit, 2 oz., and strain through linen; mix this, whilst warm, with a solution formed by dissolving gum mastic (best), $\frac{1}{4}$ oz., in rectified spirit, 2 oz.; add of powdered gum ammoniac 1 dr., and triturate together until perfectly incorporated, avoiding loss of the spirit by evaporation as much as possible.

3. (Ure's DIAMOND CEMENT.) Isinglass, 1 oz.; distilled water, 6 oz.; boil to 3 oz., and add rectified spirit, $1\frac{1}{2}$ oz.; boil for a minute or two, strain, and add, while hot, first a milky emulsion of ammoniac, $\frac{1}{2}$ oz., and then tincture of mastic, 5 drs.

4. Isinglass soaked in water and dissolved in spirit, 2 oz. (thick); dissolve in this 10 grs. of very pale gum ammoniac (in tears), by rubbing them together; then add 6 large tears of gum mastic, dissolved in the least possible quantity of rectified spirit.

5. Isinglass dissolved in proof spirit (as above), 3 oz.; bottoms of mastic varnish (thick, but clear), $1\frac{1}{2}$ oz.; mix well.

Obs. When carefully made, this cement resists moisture and dries colourless. As usually met with, it is not only of very bad quality, but sold at exorbitant prices. "Some persons have sold a composition under the name of Armenian cement in England; but this composition is badly made; it is much too thin, and the quantity of mastic is much too small." (Eton.) Methylated spirit may be used instead of the pure spirit in the above preparations. Mastic and mastic varnish are also used by jewellers as cements.

Cement, Beale's. Chalk, 60 parts; lime and salt, of each, 20 parts; Barnsey sand, 10 parts; iron filings or dust, and blue or red clay, of each, 5 parts; grind together and calcine. Patented as a fire-proof cement.

Cement, Boiler. *Prep.* Dried clay in powder, 6 lbs.; iron filings, 1 lb. Make into a paste with boiled linseed oil. *Used* to stop cracks and leaks in iron boilers, stoves, &c. See IRON CEMENT, STEAM-BOILER C.

Cement, Botany Bay. Yellow gum (Botany Bay gum) and brickdust, equal parts, melted together. *Used* to cement coarse earthenware, &c.

Cement, Bottle. *Prep.* 1. Resin, 1 lb.; tallow or suet, $\frac{1}{4}$ lb.; melt together, and stir in the colouring matter.

2. Resin, 5 lbs.; bees' wax, 1 lb.; colouring, q. s.; as last.

3. (Red.) To each pound of the above add whiting (dry), 3 oz., and light red (burnt ochre), 4 oz.; or red bole, q. s.; (all in fine powder).

4. (Black.)—*a.* To each pound of No. 1, or No. 2, add ivory black (bone black), q. s.

b. From black pitch, 6 lbs.; ivory black and whiting, of each, 1 lb.; melted together. *Used* in the same way as common sealing-wax for bottle corks, cask buags, &c. See MAISIAT'S CEMENT.

Cement, Brimstone. Melted brimstone, either alone, or mixed with resin and brickdust. Cheap and useful.

Cement, Bruyere's. Clay, 3 parts; slaked lime, 1 part; mix and expose them to a full red heat for 3 hours, then grind to powder. Recommended as an hydraulic cement.

Cement, Building. *Syn.* ARTIFICIAL PUZZOLENE'. From a mixture of clay or loam, broken pottery, flints, or siliceous sand, or broken bottle glass, and wood ashes, exposed to a considerable heat in a furnace, until it becomes partially vitrified; it is then ground to fine powder, sifted, and mixed with one third its weight of quick-lime, also in fine powder, after which it must be packed (tight) in casks to preserve it from the air and moisture. For use it is mixed up with water and applied like Roman cement.

Cement, Cap. *Prep.* 1. Resin, 5 lbs.; bees' wax and dried Venetian red, of each, 1 lb.; melted together.

2. (C. G. Williams.) Equal weights of red lead and white lead. *Used* for chemical and electrical purposes. For cementing glass tubes, necks of balloons, &c., into metal mountings. No. 2 is preferable to white lead alone, and may be depended on for temperature up to 212°.

Cement, Cheese. From grated cheese, 2 parts; quick-lime (in fine powder), 1 part; white of egg, q. s.; beat to a paste. *Used* for earthenware, &c.

Cement, Chemical. *Syn.* SOFT CEMENT.

Prep. From yellow wax, 4 parts; common turpentine, 2 parts; Venetian red (well dried), 1 part; melted together. *Used* as a temporary stopping or lute for the ends or joints of tubes, which are not exposed to much heat; as in alkalimetry, &c. See ELECTRICAL CEMENT.

Cement, Chinese. *Syn.* SHELL-LAC CEMENT, LIQUID GLUE. *Prep.* 1. Finest pale orange shell-lac (broken small), 4 oz.; rectified spirit (strongest), 3 oz.; digested together in a corked bottle in a warm place until dissolved. Very strong and useful; almost odourless. It should have about the consistence of treacle.

2. As before, but using rectified wood naphtha as the solvent. Inferior to the last, but excellent for many purposes.

3. (Without spirit.) *Prep.* Borax, 1 oz.; water, $\frac{1}{2}$ pint; shell-lac, 3 oz.; boil in a covered vessel until dissolved, then evaporate to a proper consistence. Cheap and useful, but dries slowly.

Uses, &c. Employed to mend glass, china, fancy work, jewelry, &c., for which it is only

inferior to Armenian cement. The first formula produces a cement so strong that pieces of wood may be joined together, cut slopingly across the grain, and will afterwards resist every attempt to break them at the same place. In many of the islands of the Indian Ocean, in Japan, China, and the East Indies, a similar cement is used to join pieces of wood for bows, lances, &c. The fluid is thinly smeared over each face of the joint, a piece of very thin gauze interposed, and the whole pressed tightly together and maintained so until the next day. Joints so made will even bear the continual flexure of a bow without separating. It is admirably adapted for fishing rods. The product of the second formula is commonly sold as LIQUID GLUE. That of the last is much used by the druggists and oilmen, instead of gum, for fixing paper labels to tin, and to glass when exposed to damp.

Cement, Coppersmiths'. *Syn.* BLOOD CEMENT. From bullock's blood thickened with finely powdered quick-lime. *Used* to secure the edges and rivets of copper boilers, to mend leaks from joints, &c. It must be used as soon as mixed, as it rapidly gets hard. It is cheap and durable, and is suited for many other purposes.

Cement, Curd. *Prep.* 1. The curd of skimmed milk (obtained by the addition of vinegar or rennet) is beaten to a paste with quick-lime, in fine powder.

2. Add vinegar, $\frac{1}{2}$ pint, to skimmed milk, $\frac{1}{2}$ pint; mix the curd with the whites of 5 eggs; well beaten and powdered quick-lime, q. s. to form a paste. *Used* for mending glass and earthenware; they resist water and a moderate degree of heat.

Cement, Cutlers'. *Prep.* 1. Black resin, 4 lbs.; bees' wax, 1 lb.; melt, and add finely powdered and well-dried brickdust, 1 lb.; mix well.

2. Equal weights of resin and brickdust, melted together.

Use. To fix knives and forks in their handles. It is put into the hollow of the handle, and the metal, previously made hot enough to melt the composition, pressed into its place whilst warm, and the whole kept upright and still until quite cold.

Cement, Diamond. See ARMENIAN CEMENT.

Cement, Egg. White of egg thickened with finely powdered quick-lime. *Used* to mend earthenware, glass, china, marble, alabaster, par ornaments, &c. It does not resist long exposure to moisture, unless it has been exposed to heat.

Cement, Elastic. *Prep.* 1. Caoutchouc (in small pieces), 1 part; chloroform, 3 parts; dissolve.

2. (Lenher.) Caoutchouc, 5 parts; chloroform, 3 parts; dissolve, and add gum mastic (powdered), 1 part. Elastic and transparent.

3. Gutta percha, 3 parts; caoutchouc, 1

part (both cut small); bisulphide of carbon, 8 parts; mix in a close vessel and dissolve by the heat of a water bath. This is to be gently warmed before it is applied.

4. Gutta percha, 1 lb.; caoutchouc, 4 oz.; pitch, 2 oz.; shell-lac, 1 oz.; linseed oil, 2 oz.; melted together. This must be melted before being applied.

Obs. The cements 1 and 2 are elastic and transparent, and are applicable to many uses. The others, 3 and 4, are used for uniting leather, cloth, &c.

Cement, Electrical. *Syn.* CHEMICAL CEMENT. From black resin, 7 lbs.; red ochre, 1 lb.; plaster of Paris, $\frac{1}{2}$ lb.; (both well-dried and still warm); melted together, and the heat and agitation continued until all frothing ceases, and the liquid runs smooth; the vessel is then withdrawn from the fire, and the mixture stirred until cooled sufficiently. *Used* to cement the plates in galvanic troughs, join chemical vessels, &c. See CAP CEMENT, SINGER'S CEMENT, &c.

Cement, Engineers'. *Prep.* 1. Ground white lead, mixed with as much red lead as will make it of the consistence of putty.

2. Equal weights of red lead and white lead, mixed with boiled linseed oil to a proper consistence. *Used* by engineers and others to make metallic joints. A washer of hemp, yarn, or canvas, smeared with the cement, is placed in the joint, which is then "brought home," or screwed up tight. It dries as hard as stone. It also answers well for joining broken stones, however large. Cisterns built of square stones, put together, while dry, with this cement, will never leak or come to repair.

Cement, Extemporaneous. 1. Shell-lac, melted and run into small sticks the size of a quill. *Used* to join glass, earthenware, &c. The edges are heated sufficiently hot to melt the cement, which is then thinly smeared over them, and the joint made while they are still hot. This is the cement so commonly vended in the streets of London, and which used to surprise us in our boyhood days.

2. Tears of gum mastic, used in the same way. Commonly employed by jewellers and others.

Cement, Fireproof. *Prep.* From fire river sand, 20 parts; litharge, 2 parts; quick-lime, 1 part; linseed oil, q. s. to form a thin paste. Applied to walls, it soon acquires a stony hardness. It is also used to mend broken pieces of stone, stone steps, &c. See BEALE'S CEMENT, &c.

Cement, Flour. *Syn.* PASTE, FLOUR PASTE. This useful and well-known article is made by mixing about a tablespoonful of wheat flour with cold water, (say) $\frac{1}{2}$ pint, adding the latter gradually, and thoroughly stirring in each portion before pouring in more; the vessel is then placed over the fire, and the whole assiduously stirred until it boils, great care being taken to prevent caking on the bottom, or

burning. Some persons add about $\frac{1}{3}$ rd of a teaspoonful of powdered alum to the water, which is said to strengthen the product; the shoemakers add a little quantity of powdered resin to the flour, with the same intention. The addition of a little brown sugar and a few grains of corrosive sublimate will prevent it turning mouldy, and is said to preserve it for years. When too hard or dry, it may be softened by beating it up with a little hot water.

Cement, French. Mucilage of gum arabic, thickened with starch powder or farina; a little lemon-juice is sometimes added. *Used* by naturalists in mounting specimens; by artificial-flower makers; and by confectioners, to stick paper, wafer papers, ornaments, &c., on their fancy cakes. Plain mucilage is often used in the same way.

Cement, Gad's. *Syn.* GAD'S HYDRAULIC CEMENT. From clay (well dried and powdered), 3 parts; oxide of iron, 1 part; mixed together, and made into a stiff paste with boiled oil. *Used* for work required to harden under water.

Cement, Glass. *Syn.* GLASS FLUX. *Prep.* Red lead, 3 parts; fine white sand, 2 parts; crystallised boracic acid, 3 parts; mixed and fused; it is levigated, and applied with thin mucilage of tragacanth. *Used* for mending broken china, &c. The repaired article must be gently heated, so as partially to fuse the cement.

Cement, Gibbs'. Mr. Gibbs patented in 1850 various processes for making admirable building and architectural cements, equal in hardness and duration, and superior in colour, to the best Roman and Portland cements at present in use. His materials are obtained from "the vast beds of (natural) argillaceous marls and marly limestones, or marl stones, which contain the due admixture of lime, silica, and alumina, from which hydraulic cements and artificial stones may be manufactured." These materials he finds in "the chalk formation, the Wealden formation, the Purbeck beds, the lias formation, the mountain limestone, and the lowest strata of the coal-measures." After duly choosing his materials according to the particular object in view, he prepares them "by burning in kilns, and grinding in mills, in the way cement is now manufactured." Marls and limestones are to be "first dried in kilns or ovens, at a heat fit for baking, until all moisture be driven off, and that then the calcination be prolonged as much as possible; the heat being kept as low as is only just sufficient to effect complete calcination—this being indispensable, to avoid the commencement of vitrification, which would destroy the adhesive properties of the cement."

Cement, Glue. *Prep.* 1. From glue, 1 lb., melted with the least possible quantity of water, and then mixed with black resin, 1 lb., and red ochre, 4 oz.

2. Glue, melted as above, and mixed with

about $\frac{1}{4}$ th of its weight each of boiled oil and red ochre.

3. (Ure.) Melted glue (of the consistence used by carpenters), 8 parts; linseed oil boiled to varnish with litharge, 4 parts; incorporate thoroughly together.

4. Glue (melted as last), 4 parts; Venice turpentine, 1 part.

Obs. The first three dry in about 48 hours, and are very useful to render the joints of wooden casks, cisterns, &c., watertight; also to fix stones in frames. The last serves to cement glass, wood, and even metal to each other. They all resist moisture well.

Cement, Grinders'. *Prep.* 1. From pitch, 5 parts; wood ashes and hard tallow, of each, 1 part; melted together.

2. Black resin, 4 lbs.; bees' wax, 1 lb.; melt, and add of whitening (previously heated red hot, and still warm), 1 lb.

3. Shell-lac, melted and applied to the pieces slightly heated. *Used* to fix pieces of glass, &c., whilst grinding. The last is used for lenses and fine work.

Cement, Ham'elin's. *Syn.* HAMELIN'S MASTIC. From siliceous sand, 60 parts; Bath or Portland stone (in fine powder), 40 parts; lime-marl, 20 parts; litharge, 8 parts; ground together. For use, it is mixed up with linseed oil and used like mortar. When this cement is applied to the purpose of covering buildings intended to resemble stone, the surface of the building is first washed with linseed oil.

Cement, Hens'ler's. Litharge, 3 parts; quick-lime, 2 parts; white bole, 1 part; (all in fine powder); linseed-oil varnish, q. s. to make a paste. *Used* for china, glass, &c. It is very tenacious, but long in drying.

Cement, Hens'le's. Shell-lac, 2 parts; Venice turpentine, 1 part; fused together, and formed into sticks. It is used like extemporaneous cement for glass and earthenware.

Cement, Hydraulic. Hydraulic mortars or cements are those which set or become hard under water. Common lime does not possess this property; but limestones containing from 8 $\frac{1}{2}$ % to 25% of alumina, magnesia, and silica, yield a lime on burning, which does not slake when moistened with water, but forms a mortar with it, which hardens in a few days when covered with water, although it does not acquire much solidity in the air. Puzzolana, septaria, and argillaceous or siliceous earths, burnt, either with or without the addition of common limestone, and then ground to powder, form excellent hydraulic cements. The reniform limestone, commonly called "cement stone," which is found distributed in single nodules or lenticular cakes, in beds of clay, is the substance most commonly used in this country for the manufacture of the cement in question. See GAD'S, HAMELIN'S, and PARKER'S CEMENTS, &c.

Cement, Iron. This cement, which is much used for closing the joints of iron pipes and

similar purposes, is formed of the borings or turnings of cast iron, which should be clean and free from rust, mixed with a small quantity of sal-ammoniac and flowers of sulphur. For use, it is stirred up with just enough water to thoroughly moisten it, and it is rammed or caulked into the joints with a blunt caulking chisel and hammer, after which the joint is screwed up by its bolts as tightly as possible. If the turnings and borings are very coarse, they are broken by pounding in an iron mortar, and the dust sifted off before use. The following are good proportions:—

1. Sal-ammoniac (in powder), 2 oz.; flowers of sulphur, 1 oz.; iron borings, 5 lbs.; water, q. s. to mix.

2. Sal-ammoniac, 2 oz.; sulphur, 1 oz.; iron borings, 12 lbs.; water, q. s. to mix.

3. Sal-ammoniac, 2 oz.; iron borings, 7 or 8 lbs.; water, q. s. to mix.

4. Iron borings, 4 lbs.; good pipeclay, 2 lbs.; powdered potsherds, 1 lb.; make them into a paste with salt and water.

Remarks. The first of these forms is that generally employed for common purposes, but formerly much more sulphur and sal-ammoniac were used. We are told by one of the leading engineers in London, that the strongest cement is made without sulphur, and with only 1 or 2 parts of sal-ammoniac, to 100 of iron borings (see the third form); but that when the work is required to dry rapidly, as for the steam joints of machinery wanted in haste, the quantity of sal-ammoniac is increased a little, and a very small quantity of sulphur is added. This addition makes it set quicker, but reduces its strength. As the power of the cement depends on the oxidation and consequent expansion of the mass, it is evident that the less foreign matter introduced the better. No more of this cement should be made at a time than can be used at once, because it soon spoils. I have seen it become quite hot by standing even a few hours, when it contained sulphur; and I have been informed by workmen, that when much sulphur is used, and it has been left together in quantity all night, combustion has taken place. The last form produces a cement that gets very hard when allowed to dry slowly, and is excellent for mending cracks in iron boilers, tanks, &c.

Cement, Japanese. *Syn.* RICE GLUE. From rice flour, mixed with a little cold water, and boiling water gradually poured in until it acquires a proper consistence; when it is boiled for 1 or 2 minutes in a clean saucepan or earthen pipkin. It is beautifully white, and almost transparent, for which reason it is well adapted for fancy paper work, which requires a strong and colourless cement. It is superior to French cement. (See *anté*.)

Cement, Keene's Marble. Baked gypsum or plaster of Paris, steeped in a saturated solution of alum, and then recalcined, and reduced to powder. For use, it is mixed up with water, as ordinary plaster of Paris.

Obs. This cement has been most extensively applied as a stucco. It is susceptible of a high polish, and when coloured, produces beautiful imitations of mosaic, and other inlaid marbles, scagliola, &c. It is not adapted to hydraulic purposes, or for exposure to the weather, but it is admirable for internal decorations, and from its extreme hardness is very durable. It may be coloured or tinted of any shade, by diffusing mineral colours (levigated, if in powder) through the water used to mix up the cement with. A pleasing tint is given to this cement by adding a little solution of green copperas to the alum liquor.

Cement, Laboratory. *Syn.* CHEMICAL MASTIC. From equal parts of pitch, resin, and plaster of Paris (thoroughly dried), mixed together. *Used* for the masonry of chlorine chambers, vitriol works, &c.; and as a lining for casks intended to hold chloride of lime.

Cement, Letter-fixing. *Prep.* Copal varnish, 15 parts; drying oil, 5 parts; turpentine, 3 parts; oil of turpentine, 2 parts; liquefied glue (made with the least possible quantity of water), 5 parts; melt together in a water bath, and add fresh slaked lime (perfectly dry, and in very fine powder), 10 parts. *Used* to attach metal letters to plate glass in shop windows, &c.

Cement, Mahogany. *Prep.* 1. Melt bees' wax, 4 oz.; then add Indian red, 1 oz., and enough yellow ochre to produce the required tint.

2. Shell-lac, melted and coloured as above. Very hard. Both are used to fill up holes and cracks in mahogany furniture by the cabinet makers. Red putty is also used for the same purpose.

Cement, Mais'siat's. India rubber is melted, either with or without about 15% of either bees' wax or tallow; quick-lime (in fine powder) is gradually added; and the heat continued, until change of odour shows that combination has taken place, and until a proper consistence is obtained. *Used* as a waterproof and air-tight covering for corks, bungs, &c.

Cement, Marine. See MARINE GLUE and ELASTIC CEMENT.

Cement, Opticians. *Prep.* 1. Shell-lac softened with rectified spirit or wood naphtha. For fine work.

2. Bees' wax, 1 oz.; resin, 15 oz.; melt, and add, whiting (previously made red hot, and still warm), 4 oz.

3. Resin, 1 lb.; melt and add plaster of Paris (dry), 4 oz. The above are used to fix glasses, stones, &c., while polishing and cutting them. The last is a very strong cement for rough purposes.

Cement, Oxychloride of Zinc. (Sorel.) *Prep.* In solution of chloride of zinc, marking from 50° to 60° of Baumé's hydrometer (*i.e.* sp. gr. 1.490 to 1.652), dissolve 3% of borax or sal-ammoniac; then add oxide of zinc, which has been heated to redness, until the mass is of a proper consistence.

Obs. This cement becomes as hard as marble. It may be cast in moulds, like plaster of Paris, or used in mosaic work, &c.

Cement, Parabol'ic. *Syn.* UNIVERSAL CEMENT. *Prep.* Curdle skim milk with rennet or vinegar, press out the whey, and dry the curd by a very gentle heat, but as quickly as possible. When it has become quite dry, grind it in a coffee or pepper mill, and next triturate it in a mortar until reduced to a very fine powder. Mix this powder with $\frac{1}{10}$ th of its weight of new dry quick-lime, also in very fine powder, and to every ounce of the mixture add 5 or 6 grs. of powdered camphor; triturate the whole well together, and keep it in wide-mouth 1-oz. phials, well corked. *Used* to join glass, earthenware, &c. It is made into a paste with a little water, as wanted, and applied immediately.

Cement, Parker's. This cement is made of the nodules of indurated and slightly ferruginous marl, called by mineralogists "septaria," and also of some other species of argillaceous limestone. These are burnt in conical kilns, with pit coal, in a similar way to other limestone, care being taken to avoid the use of too much heat, as if the pieces undergo the slightest degree of fusion, even on the surface, they will be unfit to form the cement. After being properly roasted, the calx is reduced to a very fine powder by grinding, and immediately packed in barrels, to keep it from the air and moisture.

Uses, &c. This cement is tempered with water, and applied at once, as it soon hardens, and will not bear being again softened down with water. For foundations and cornices exposed to the weather, it is usually mixed with an equal quantity of clean angular sand; for use as a common mortar, with about twice as much sand; for coating walls exposed to cold and wet, the common proportions are 3 of sand to 2 of cement, and for walls exposed to extreme dryness or heat, about $2\frac{1}{2}$ or 3 of sand to 1 of cement; for facing cistern work, water frontages, &c., nothing but cement and water should be employed. Under the name of *compo'* or Roman cement, it is much employed for facing houses, water-cisterns, setting the foundations of large edifices, &c.

Cement, Pew's. Quick-lime, 1 part; baked clay, 2 parts—(both in powder); mix and calcine; then add gypsum (fresh baked and in fine powder), 1 part, to powdered baked clay, 2 parts; mix well, add the former mixture, and incorporate them well together. *Used* to cover buildings. It is applied like mortar, and is very hard and durable. See GIBBS' CEMENT, &c.

Cement, Plumb'ers'. Black resin melted with about an equal weight of brick-dust. Sometimes a little pitch or tallow is added.

Cement, Portland. From clay and chalk, or argillaceous river-mud and chalk or limestone, calcined together, and then ground to powder. See PARKER'S CEMENT.

Cement, Ro'man. Genuine Roman cement consists of puzzolene (a ferruginous clay from Pozzuoli, calcined by the fires of Vesuvius), lime, and sand. The only preparation which the puzzolene undergoes is that of pounding and sifting. It is generally mixed up with water, like most other cements, but occasionally with bullock's blood and oil, to give the composition more tenacity. That used in this country is now generally prepared from the septaria of either Harwich or Sheppy, or of the lias formation, or from the cement stone found in the upper division of the lias formation, or in the shale beds of the Kimmeridge clay. It is also prepared from several artificial mixtures of ferruginous clay and lime, calcined together. It must be kept in close vessels, and mixed with water when used. See PARKER'S and GIBBS' CEMENT.

Cement, Seal Engra'vers'. Resembles plumb'ers' cement. *Used* to fix the pieces of metal while cutting, and also to secure seals and tools in their handles. It grows harder and improves every time it is melted.

Cement, Sing'er's. *Prep.* 1. Melt together resin, 5 lbs., and bees' wax, 1 lb., and stir in finely powdered red ochre (highly dried and still warm), 1 lb., and plaster of Paris, 4 oz.; continuing the heat a little above 212° Fahr., and stirring constantly till all frothing ceases.

2. Resin, 6 lbs.; dried red-ochre, 1 lb.; calcined plaster of Paris, $\frac{1}{2}$ lb.; linseed oil, $\frac{1}{4}$ lb.

Used to cement the plates in voltaic troughs, to join chemical vessels, &c. No. 2 is specially applicable to troughs. See ELECTRICAL CEMENT.

Cement, Steam-boiler. *Prep.* Litharge, in fine powder, 2 parts; very fine sand and quick-lime (that has been allowed to slake spontaneously in a damp place), of each, 1 part; mix, and keep it from the air. *Used* to mend the cracks in boilers and ovens, and to secure steam joints. It is made into a paste with boiled oil before application.

Cement, Steam-pipe. *Prep.* Good linseed oil varnish is ground with equal weights of white lead, oxide of manganese, and pipeclay.

Cement, Transparent. See ELASTIC CEMENT.

Cement, Turn'ers'. *Prep.* Bees' wax, 1 oz.; resin, $\frac{1}{2}$ oz.; pitch, $\frac{1}{2}$ oz.; melt, and stir in fine brick-dust, q. s.

Cement, Var'ley's. *Syn.* VARLEY'S MASTIC. Black resin, 16 parts; bees' wax, 1 part; melt, add whiting (sifted, dried by a dull-red heat and allowed to cool), 16 parts; and stir until nearly cold.

Cement, Univers'al. See PARABOLIC CEMENT.

Cement, Water. *Prep.* 1. From good green clay, 4 parts; black oxide of manganese, 1 part; limestone (reduced to powder by sprinkling it with water), 90 parts; mix, calcine, and powder.

2. Mix white iron ore (manganese iron ore), 15 parts, with lime, 85 parts; calcine and powder as above. Both this and the preceding must be mixed up with a little sand for

use. A piece thrown into water rapidly hardens.

3. Fine clean sand, 1 cwt.; quick-lime, in powder, 28 lbs.; bone ashes, 14 lbs. The above are beat up with water for use. See **HYDRAULIC CEMENT**, &c.

Cement, Waterproof. Several compounds of this class have been already noticed. The celebrated "waterproof cement of Dhl" consists of porcelain clay or pipeclay, dried by a gentle heat, and powdered, mixed up to the consistence of a paste with boiled linseed oil, and, sometimes, a little oil of turpentine. It is coloured by adding a little red or yellow ochre, or any similar pigment. It is used to cover the fronts of buildings, roofs of verandahs, &c.

Concluding remarks. For mending broken CHINA, EARTHENWARE, GLASS, and WOOD, the preparations generally used are the cements described above as ARMENTIAN, BOTANY, BAY, CHEESE, CHINESE, CURD, EGG, EXTEMPORANEOUS, GLASS, GLUE, HENSLEY'S, HENLEY'S, MAHOGANY, and PARABOLIC. For SPAR, MARBLE, and similar materials, the ALABASTER CEMENT is specially adapted; the EGG and PARABOLIC CEMENTS will, however, answer the same purpose. For CLOTH, LEATHER, PAPER, CARD, and LIGHT FANCY WORK, the most suitable cements are the ELASTIC, CHINESE, FLOUR, FRENCH, and JAPANESE. The cements adapted for CHEMICAL and ELECTRICAL APPARATUS, and for SEALING BOTTLES, are those termed BOTTLE, BRIMSTONE, CAP, CHEMICAL, ELECTRICAL, LABORATORY, MAISSIAT'S, and VARLEY'S. The BUILDING and HYDRAULIC CEMENTS are described under the heads ARCHITECTURAL, BRALL'S, BRUYERE'S, FIREPROOF, GAD'S, GIBBS', HAMBLIN'S, HYDRAULIC, KERNE'S, OXYCHLORIDE, PARKER'S, PEW'S, PORTLAND, ROMAN, WATER, and WATERPROOF. The cements used for METAL-WORK, &c., in different trades, are noticed under the heads COPPER-SMITHS', CUTLERS', ENGINEERS', GRINDERS', IRON, LETTER-FIXING, OPTICIANS', PLUMBERS', SEAL-ENGRAVERS', STEAM-BOILER, STEAM-PIPE, and TURNERS'. See GLUE, LUTE, MORTAR, TOOTH-CEMENT, &c.

CEMENTATION. The process of imbedding a substance in, or covering it with, some powder or composition capable of acting on it when heated, and in this state exposing it to a red heat. Iron is converted into steel, and glass into Réaumur's porcelain, by cementation.

CEN'TAURIN. *Syn.* CENTAURIN'A. The bitter extractive matter of *Erythæa centaurium*, or common centaury. Combined with hydrochloric acid, it has been highly recommended as a febrifuge.

CER'ASIN. *Syn.* PRUN'INE. The insoluble portion of cherry-tree gum. It is identical with bassorin. Dr. John applies the term to all those gums which, like tragacanth, swell, but do not dissolve in water. See BASSORIN.

CERATE. *Syn.* CERA'TUM, L. A thick species of ointment containing wax. Cerates are intermediate in consistence between ointments and plasters; but are less frequently employed than either of those preparations. The medicinal ingredients which enter into the cerates are very numerous; indeed, almost every kind of medicine capable of exercising a topical effect may be prescribed in this form.

It is a general custom with the druggists to use a less quantity of wax for their cerates than that which is necessary to give them a proper consistence, and in many cases it is omitted altogether, and its place supplied by hard suet or stearine, and frequently by common resin. Lard is also very generally substituted for olive oil. Indeed, in no class of pharmaceutical preparations are the instructions of practitioners and the colleges more commonly disregarded. The operation of melting the ingredients should be performed in a water bath or steam bath, and the liquid mass should be assiduously stirred until cold.

All the medicated cerates may be prepared by adding the active ingredients, in the form of fine powder, soft extract, solution, &c., as the case may be, to either simple cerate or spermaceti cerate, in the proportions indicated under the head of "Doses" appended to every article of importance noticed in this work. The mixture, which must be complete, may be effected by working the articles together on a marble or glass slab or tile, or, still better, by trituration in a clean wedgwood mortar. In some cases the simple cerate is melted by a gentle heat, and the whole stirred or triturated until nearly solid; in others, digestion with heat is employed.

Cerate. *Syn.* SIM'PLE CERATE, SIMPLE DRESS'ING; CERATUM (Ph. L.), C. SIM'PLEX (Ph. L. 1824). *Prep.* (Ph. L.) Yellow wax, 20 oz.; melt by a gentle heat; add olive oil, 1 pint; and stir until it begins to solidify.

Used as a simple emollient dressing. The corresponding preparations of the other colleges will be found noticed under OINTMENTS. The *ceratum simplex*, of the Ph. E. is SPERMACE'TI CERATE.*

Cerate, Ac'etate of Lead. *Syn.* CERATE OF SUGAR OF LEAD; CERA'TUM PLUM'BI ACETATIS (Ph. L.), L. *Prep.* (Ph. L.) White wax, 5 oz.; olive oil, 18 fl. oz.; melt together; add, acetate of lead (in fine powder), 5 drs., previously triturated with olive oil, 2 fl. oz., and stir till they unite (begin to solidify). *Used* as a cooling dressing to burns, excoriations, and inflamed sores.

Cerate, Ammoni'cal. *Syn.* CERA'TUM AMMONIACALE, L. *Prep.* (Rechoux.) Simple cerate, 1 oz.; carbonate of ammonia, 1 dr.; mix. As a counter-irritant in croup, &c.

Cerate, Arseni'cal. *Syn.* CERA'TUM ARSENICI, C. ACIDI ARSENIO'SI, L. *Prep.* 1. (Ph. U. S.) Arsenious acid (in very fine powder), 20 grs.; simple cerate, 1 oz.

2. (Sir A. Cooper.) Arsenious acid and:

sublimed sulphur, of each, 1 dr.; spermaceti cerate, 1 oz. The above ingredients must be very carefully triturated together. The first is used as a dressing to cancerous sores; the second is applied on lint as a caustic in like cases.

Cerate, Belladonn'a. *Syn.* CERATE OF DEADLY NIGHTSHADE; CERA'TUM BELLADONNÆ, L. *Prep.* 1. (W. Cooley.) Extract of belladonna, 3 drs.; simple cerate, 1 oz.; olive oil, 1 dr.; triturate together in a warm mortar, until nearly cold. *Used* in frictions to indolent tumours.

2. (Compound; C. B. COMPOSITUM, L.) *Prep.* (W. Cooley.) Belladonna cerate, 1 oz.; iodide of gold, 12 grs.; carefully triturated together. *Used* as a friction to scrofulous and syphilitic tumours, and to remove syphilitic and rheumatic pains. A most active and excellent preparation.

Cerate, Brown. See PLASTERS.

Cerate, Caca'o. *Syn.* CACA'O POMMADE. *Prep.* Butter of cacao, white wax, and oil of almonds, equal parts, melted together and strained. *Used* as a cosmetic for chapped hands and lips, &c.

Cerate, Calamine. *Syn.* TURNER'S CERATE, HEALING SALVE; CERA'TUM CALAMINÆ (Ph. L. & E.), C. LA'PIS CALAMINARIS (Ph. L. 1788), L. *Prep.* 1. (Ph. L.) Yellow wax, 7½ oz.; olive oil, 1 pint; melt together, remove the vessel from the fire, and when they first begin to thicken, add prepared calamine, 7½ oz., and stir constantly until they cool.

2. (P. E.) Prepared calamine, 1 part; simple cerate (Ph. E.), 5 parts; mix.

3. (Ph. D.) See OINTMENT.

4. (Commercial.) Hard suet, 5 lbs.; lard, 3 lbs.; melt, and sift in, gradually, calamine, 4 lbs.; agitate well for a few minutes, or until the whole is perfectly mixed, and after one minute's repose, pour it off into another vessel, the coarse sediment that has fallen to the bottom being carefully avoided; hastily, stir assiduously, until it is nearly cold. This forms the TURNER'S CERATE of the wholesale druggists. In many cases nothing but lard and calamine are used.

Uses, &c. When honestly prepared with genuine calamine, it is a most valuable desiccant and astringent application to excoriations, ulcers, burns, scalds, sore nipples, &c. It has long been held in popular esteem as a drying and healing dressing for sores.

Cerate, Calamine with Mercury. *Syn.* CERA'TUM CALAMINÆ CUM HYDRÆGYRO, L. *Prep.* (Ph. Chirur.) Calamine cerate, 1 lb.; red oxide of mercury, 1 oz.; mix. *Used* as a stimulant application to foul and indolent ulcers, psorophthalmia, &c.

Cerate, Calomel. *Syn.* CERA'TUM CALOMELANOS, C. HYDRÆGYRI CHLORIDI, L. *Prep.* 1. Calomel, 1 dr.; spermaceti cerate, 1 drs. In herpes, and some other skin diseases.

2. (Compound; C. c. COMPOSITUM, L.)

Calomel, 2 drs.; calamine cerate, 1 oz.; olive oil, 1 dr.

Cerate, Cam'phor. *Syn.* CERA'TUM CAMPHORATUM, C. CAMPHORÆ, L.; POMMADE DU FRÈRE COSME, Fr. *Prep.* Olive oil, 1 lb.; white wax, ½ lb.; camphor, 3 drs. As an application to chaps, chilblains, abrasions, excoriations, and slight wounds. See CAMPHOR BALLS.

Cerate, Cantharides. *Syn.* BLISTERING CERATE; CERA'TUM LYTÆ, C. CANTHARIDIS, L. *Prep.* 1. (Ph. L.) Cantharides (in very fine powder), 1 oz.; spermaceti cerate, 6 oz.; mix.

2. (Parrish.) Cantharides, 12 parts; lard, 10 parts; yellow wax and resin, of each, 7 parts; incorporated by fusion. Irritant; used to keep blisters open, and to stimulate issues, and indolent ulcers and tumours.

Cerate, Chalk. *Syn.* CERA'TUM CRETÆ, L. *Prep.* 1. Chalk (thoroughly dried, and in fine powder), 2 drs.; simple cerate, 6 drs.; almond oil, 3 drs. *Used* in piles, and foul ulcers. 2. (Acetated.) See KIRKLAND'S NEUTRAL CERATE.

3. (Compound; CERA'TUM CRETÆ COMPOSITUM, L.)—*a.* To simple chalk cerate, 1 oz.; add powdered catechu, ½ dr. In piles, and foul and indolent ulcers.

b. (U.S. Hospital.) Lead plaster and olive oil, of each, 8 oz.; white wax, 3 oz.; melt together; add solution of subacetate of lead, 6 oz.; thoroughly incorporate, and then further add, chalk (in fine powder), 5 oz. Cooling and astringent. *Useful* in inflamed sores, excoriations, piles, &c.

Cerate, Cherry-laurel. *Syn.* CERA'TUM LAURO-CERASI, C. CALMANS, L. *Prep.* (Roux.) Simple cerate, 1 oz.; cherry-laurel water, ½ oz. As an application to burns.

Cerate, Cincho'na. *Syn.* BARK CERATE; CERA'TUM CINCHOINÆ, L. *Prep.* 1. Extract of bark, 2 drs.; simple cerate, 1 oz.

2. (Van Mons.) Simple cerate, 8 oz.; camphor, 1½ dr.; melt together by a gentle heat, then add gradually, decoction of Peruvian bark (concentrated), 1 oz., and triturate until cold. *Used* as a dressing for ill-conditioned ulcers.

Cerate, Cin'nabar. *Syn.* CERA'TUM RUBRUM, C. CINNABARIS, C. HYDRÆGYRI SULPHURETI RUBRI, L. *Prep.* 1. Camphor, 20 grs.; vermilion, 60 grs.; simple cerate, 1 oz. This is Alibert's "ANTIHERPETIC POMMADE."

2. (Ph. Chirur.) Yellow wax and lard, of each, ½ lb.; yellow resin, ½ oz.; red sulphide of mercury, 1 dr. *Used* as a common dressing.

Cerate, Cit'rine. See RESIN CERATE, NITRATE OF MERCURY C.

Cerate, Copai'ba. *Syn.* CERA'TUM COPAIBÆ, L. *Prep.* 1. Spermaceti cerate, 3 oz.; melt by a gentle heat, then add, balsam of copaiba, 1 oz.

2. (Dr. Houlton.) White wax, 1 oz.; balsam

of copaiba, 2 oz.; mix, as last. Both the above have been recommended as topical applications to wounds and ulcers of the rectum, vagina, and urethra; especially in those of a fistulous character; and in piles, &c.

Cerate, Cop'per. *Syn.* CUPRIATED CERATE; CERA'TUM CU'PRI; C. C. AMMONIA'TI, L. *Prep.* (Swediaur.) Simple cerate, 8 parts; melt, and add solution of ammoniuret of copper, 1 part. As a stimulant dressing for indolent ulcers; and in psorophthalmia, &c.

Cerate, Cosmet'ic. *Syn.* COLD CREAM, CERATE OF GA'LEN; CERA'TUM COSMET'ICUM, C. GALENI, CREMOR FRIGIDA, L.; POMMADE EN CRÈME, Fr. *Prep.* 1. Oil of sweet almonds, 1 lb.; white wax and spermaceti, of each, 2 oz.; melt, pour the mixture into a marble or wedgwood mortar, which has been heated by standing for some time in boiling water; add, gradually, rose water, 10 fl. oz., assiduously stirring until an emulsion is formed; then further add, oil of bergamot, $\frac{1}{2}$ oz.; oil of lavender, 1 dr.; and continue the stirring or trituration until the whole has become cold.

2. To the last, add otto of roses, 1 dr.; oil of rosemary, 15 drops.

3. Oil of almonds, 5 oz.; spermaceti, 5 drs.; white wax, 4 drs.; rose water, $3\frac{1}{2}$ oz.; balm of Mecca (genuine), 8 drops.

4. As the last, with essence of vanilla, 15 drops; essence of ambergris, 10 drops.

5. (P. C.) White wax, 1 part; oil of almonds, 4 parts; rose water, 3 parts; as before.

6. (Van Mons.) White wax and butter of cacao, of each, 1 part; oil of almonds and rose water, of each, 4 parts.

Obs. The above are used as agreeable and cooling emollients for irritable surfaces, excoriations, sore nipples, &c. See COLD CREAM and OINTMENTS.

Cerate, Cro'ton. *Syn.* CERA'TUM CRO'TONIS, L. *Prep.* (Cavoutou.) Lard, 5 parts; wax, 1 part; melt, and when nearly cold, add croton oil, 2 parts. *Used* as a counter-irritant; but is apt to affect the bowels.

Cerate, Goul'd's. See LEAD CERATE.

Cerate, Hem'lock. *Syn.* CERA'TUM CO'NII, L. *Prep.* (St. B. Hosp.) Spermaceti, 2 oz.; white wax, 3 oz.; melt, and add of hemlock ointment, 12 oz. *Used* for inveterate cancerous, scrofulous, and other sores.

Cerate, Hon'ey. *Syn.* CERA'TUM MEL'IS, L. *Prep.* 1. Simple cerate, 3 parts; honey, 1 part; oil of lemon grass, 6 drops. *Used* as cold cream.

2. (Ph. Chirur.) Olive oil, $\frac{1}{2}$ lb.; wax and lead plaster (or galbanum plaster), of each, 4 oz.; melt, and add honey, $\frac{1}{2}$ lb. As a cooling emollient dressing.

Cerate, Is'sue. *Syn.* CERA'TUM AD FONTICULOS, L. As issue plaster, but adding a little almond oil.

Cerate, Kirk'land's. *Syn.* KIRKLAND'S NEUTRAL CERATE; CERA'TUM NEUTRA'LE, C. OBERTA'NTIS, L. *Prep.* 1. Lead plaster, 8 oz.; olive oil, 4 oz. melt, sift in chalk,

4 oz.; mix well, then add gradually, Goulard's extract, $\frac{1}{2}$ oz.; distilled vinegar, 4 oz.; and stir until cold.

2. (Paris.) Lead plaster, 8 oz.; olive oil and chalk, of each, 4 oz.; sugar of lead, 3 drs., (dissolved in) distilled vinegar, 4 fl. oz. As a cooling dressing to irritable ulcers and excoriated parts.

Cerate, Lead (Compound). *Syn.* GOUL'D'S CERATE; CERA'TUM PLUM'BI COMPOSITUM (Ph. L.), L. *Prep.* (Ph. L.) Olive oil, 16 fl. oz.; yellow wax, 8 oz.; melt, remove the vessel from the fire, and when they begin to thicken, add gradually, solution of subacetate of lead (slightly warmed), 6 fl. oz.; and stir constantly until the whole is nearly cold; then add camphor, 1 dr., dissolved in olive oil, 4 fl. oz. (by heat), and stir until the cerate is quite cold. *Used* in similar cases to KIRKLAND'S CERATE (which see). See also ACETATE OF LEAD CERATE.

Cerate, Mar'shall's. *Prep.* 1. Palm oil and calomel, of each, 2 oz.; acetate of lead, 1 oz.; ointment of nitrate of mercury, 4 oz.; triturated together in a wedgwood mortar.

2. (Paris.) Palm oil, 5 oz.; calomel, 1 oz.; acetate of lead, $\frac{1}{2}$ oz.; citrine ointment, 2 oz.; as the last. Applied to the eyes, &c.

Cerate, Mercu'rial. *Syn.* CERA'TUM MERCURIA'LE, C. HYDRAR'GYRI, L. *Prep.* 1. (Guibourt.) Strong mercurial ointment and simple cerate, equal parts.

2. (Ph. L. 1746.) Strong mercurial ointment and yellow wax, of each, 6 oz.; lard, 3 oz. Both are used as dressings to venereal ulcers.

3. (Compound; CERA'TUM MERCURIA'LE COMPOSITUM, C. HYDRAR'GYRI, L.) *Prep.* (Ph. L.) Mercurial ointment (strong) and compound soap cerate, of each, 6 oz.; camphor (in powder), $1\frac{1}{2}$ oz.; triturate together. *Alternative and discutient; used* to disperse indolent tumours and swellings, and as a resolvent in enlarged joints, &c.

Cerate, Meto'pium. *Syn.* CERA'TUM METO'PII, L. *Prep.* (Dr. Barham.) Hog-gum (from *Rhus Metopium*), and lard, of each, 4 oz.; white wax and root of Sweet Aristolochia (powdered), of each, 2 oz.; yellow resin, 1 oz.; in stiff joints and rheumatic pains.

Cerate, Mez'ereon. *Syn.* CERA'TUM MEZ'EREI, L. *Prep.* 1. Extract of mezereon, 1 part; (dissolved in) alcohol, 5 parts; add bees' wax, 5 parts; olive oil, 11 parts; melt together, and continue the heat until all the alcohol is evaporated.

2. Green oil of mezereon, 1 part; simple cerate, 20 parts; melt together. Both are used to keep up the discharge from blistered surfaces, and as a stimulant application to indolent sores.

Cerate, Neut'ral. See KIRKLAND'S CERATE.

Cerate, Ni'trate of Mercury. *Syn.* CITRINE CERATE; CERA'TUM HYDRAR'GYRI NITRATIS, L. *Prep.* (St. B. Hosp.) Citrine

ointment and simple cerate, equal parts. See OINTMENTS.

Cerate, Opium. *Syn.* LAUD'ANUM CERATE, AN'ODYNE C.; CERA'TUM O'PII, C. OPIA'TUM, C. ANODYNUM, L. *Prep.* 1. Tincture of opium and olive oil, of each, 2 drs.; simple cerate, 1 oz.; digest with heat until all the spirit and water is evaporated, constantly stirring the mixture all the time.

2. (Gilbert.) Wine of opium, 1 dr.; simple cerate, 1 oz.

3. (Lagneau.) Opium (in fine powder), $\frac{1}{2}$ dr.; yolk of 1 egg; mix, then triturate it with simple cerate, 1 oz.

Uses. The above are applied to painful swellings, piles, and ulcers, and in chronic ophthalmia, &c.

Cerate, Phosphorated. *Syn.* CERA'TUM PHOSPHORI, C. PHOSPHORATUM, L. *Prep.* 1. Phosphorus, 6 grs.; simple cerate, 3 oz.; heat together in a phial placed in a water bath, with frequent agitation for 2 hours; and after repose for 10 minutes, pour off the clear portion, and stir it well until cold.

2. (Foy.) Phosphorated ether, 5 parts; simple cerate, 24 parts.—*Uses.* Both of the above have been recommended as frictions in obstinate cutaneous affections, and in rheumatism of the joints.

Cerate, Pitch. *Syn.* CERATUM PITCHIS BURGUNDICÆ, L. *Prep.* (Beral.) White wax, 3 parts; suet, 4 parts; Burgundy pitch, 6 parts; melted together. A mild stimulant and detergent dressing. See OINTMENTS.

Cerate, Quinine. *Syn.* CERA'TUM QUININÆ, L. *Prep.* 1. Sulphate of quinine, 5 or 6 grs.; simple cerate, 1 dr. Applied to the denuded dermis (endermically).

2. Sulphate of quinine and olive oil, of each, 1 dr.; simple cerate, 6 drs. As a friction. Both are used in intermittents.

Cerate, Resin. *Syn.* BASILICON, B. CERATE, B. OINTMENT, YELLOW B., CITRINE CERATE; CERA'TUM CITRINUM (Ph. L. 1788); C. RESINÆ FLAVÆ (Ph. L. 1745); C. RESINÆ (Ph. L. 1809 and since), L. *Prep.* 1. (Ph. L.) Yellow resin and bees' wax, of each, 15 oz.; melt, add olive oil, 1 pint; strain through a cloth, and stir the mixture until cold.

Obs. The above is the formula of the London College, but the basilicon of the shops is seldom, if ever, made in this manner. The following forms are those commonly used in trade, but the products are much inferior to that made according to the directions in the Pharmacopœia.

2. (Commercial).—*a.* Yellow resin, 10 lbs.; bees' wax, 2 lbs.; linseed oil, 7 lbs.; melt together, and stir until cold.

b. As the last, but using nut oil instead of linseed oil.

c. Nut oil, 1 gal.; bees' wax, 5 lbs.; yellow resin, 14 lbs.

d. Lard (common) and linseed oil, of each, 3 lbs.; yellow resin, 9 lbs.; as before.

Uses, &c. This cerate is a mild stimulant,

detergent, and digestive application; and as such is employed to dress foul and indolent ulcers, blistered surfaces, burns, &c. For the corresponding preparations of the other colleges, see OINTMENTS.

3. (Compound; DES'LER'S CERATE; CERA'TUM RESINÆ COMPOSITUM, L.) *Prep.* (Ph. U. S.) Resin, suet, and bees' wax, of each, 1 lb.; turpentine, $\frac{1}{2}$ lb.; flax-seed oil (linseed oil), $\frac{1}{2}$ pint; as above. Rather more stimulating than resin cerate, but used for the same purposes.

Cerate, Rose. *Syn.* LIP SALVE; CERA'TUM ROSA'TUM, L. *Prep.* (P. C.) Oil of almonds, 16 parts; white wax, 8 parts; alkanet root, 1 part; digest, with a gentle heat, until sufficiently coloured, then strain, and for every ounce of the cerate, add otto of roses, 2 drops. See LIP SALVE.

Cerate, Savine. *Syn.* CERA'TUM SAVINÆ (Ph. E.; and Ph. L. 1836), L. *Prep.* 1. (Ph. E.) Bees' wax, 1 part; lard, 4 parts; fresh savin (leaves, bruised), 2 parts; boil together until the leaves become crisp, then strain, with pressure, through a linen cloth.

2. (Ph. L. 1836.) Lard, 2 lbs.; savin leaves, 1 lb.; bees' wax, $\frac{1}{2}$ lb.; as last.

3. (Ph. L. 1851.) In the B. P. this preparation is included among the OINTMENTS (which see); in trade, however, the old name (Ph. L. 1836) is still generally retained.

Obs. The preparation of this cerate requires caution, as the active principle of the savin, being volatile, is injured by long boiling and a high temperature. The leaves are usually boiled until they are crisp, but as this takes some time, the essential oil, and consequently the odour, is nearly all dissipated. A better plan is to express the juice from the leaves, and to add it to the wax and oil melted together, and just beginning to cool. As usually met with in the shops, this cerate has a lively green colour, and the odour of the fresh plant; but neither of these is derived from the leaves in the common process of making it. The first is caused by the addition of powdered verdigris, and the last by adding a little of the essential oil of savin to the compound when nearly cold. The preparations of the British Colleges have only a very pale green colour, and even that rapidly changes by exposure to the air. A uniform green colour may therefore be regarded as a proof of adulteration; as the unadulterated compound, however skilfully prepared, is of a dingy green colour, of little intensity; and after it has been made a short time, it fades on the surface, and the under portion becomes streaky and mottled. A greater quantity of colour is obtained from the leaves by long digestion in the fat and wax in earthen vessels, at a moderate heat, than by hasty boiling. In this way a lively green is sometimes produced, but it rapidly changes in the manner just mentioned.

The following forms are those commonly

adopted by the wholesale druggists for the manufacture of this cerate:—

4. Lard and suet, of each, 6 lbs.; yellow wax, 2 lbs.; melt them together in an earthen vessel; add 2 oz. of distilled verdigris (previously rubbed down smooth in a mortar with an equal weight of sweet oil); strain, whilst hot, into a large earthen pot, and when the whole has cooled a little, add of oil of savin, 1 oz., and stir until cold.

5. Savin leaves, 4 lbs.; yellow wax, 2 lbs.; lard, 8 lbs.; boil until the leaves become crisp; then strain, and add, of green ointment (lively coloured), 5 lbs.; when cooled a little, further add, of oil of savin, 3 drs., and stir briskly until cold. *Prod.* 1½ lbs.

Uses, &c. Savin cerate and ointment are chiefly employed to keep up the discharge from blisters (perpetual blisters), for which purpose it is preferable to preparations of cantharides. The practice of colouring this cerate with verdigris, which is general in trade, cannot be too severely censured, as its therapeutic action is thereby altered. The copper may be detected by burning down a little in a platinum or Hessian crucible, washing out the ashes with a little dilute nitric acid, placing the liquor in a glass tube, and applying the usual tests. See COPPER and OINTMENTS.

Cerate, Simple. *Syn.* CERA'TUM SIM'PLEX, L. *Prep.* 1. (Ph. E.) Spermaceti, 1 part; white wax, 3 parts; olive oil, 6 parts; melt by a gentle heat, and stir until cold. This preparation is similar to SIMPLE OINTMENT (*Unguentum Simplex*) B. P. (which see).

Cerate, Soap. *Syn.* COMPOUND SOAP CERATE; CERA'TUM SAPO'NIS (Ph. L. 1836), C. SAPONIS COMPOSITUM (Ph. L. 1851), L. *Prep.* 1. (Ph. L.) Boil litharge, 15 oz., in distilled vinegar, 1 gal., until dissolved, stirring continually; then add of Castile soap, 10 oz.; again boil until all the moisture is evaporated; then add, gradually, bees' wax, 12½ oz., and olive oil, 1 pint, previously melted together, and stir until nearly cold. Similar to SOAP CERATE PLASTER (*Emplastrum Cerati Saponis*) B. P. (which see).

2. (Wholesale.) Distilled vinegar, 6 galls.; litharge, 5 lbs.; soap, 3½ lbs.; yellow wax, 4½ lbs.; olive oil, 6 pints. Mix as above. Good nut or poppy oil may be used instead of olive oil.

Obs. Unless the instructions contained in the above formulæ are followed in every particular, the process is apt to miscarry. When this is the case, the cerate, on cooling, separates into two portions, and is commonly full of hard, gritty particles. To prevent this, care should be taken to use soap of the best quality. This mishap cannot be got over by long boiling and stirring, as is generally supposed. The only remedy is the addition of a little more soap, previously melted with some water, and again evaporating to a proper consistence. A small quantity of solution of potassa has a similar effect.

The colour and consistence of soap cerate

chiefly depends on the length of time it is kept heated after the addition of the oil and wax. As evaporation proceeds, so the colour and consistence increase. Its usual colour is that of a lively, pale chocolate-brown, but occasionally it is much paler. This arises from its containing an undue quantity of moisture. When it has been kept heated for a period beyond that usually adopted, it attains greater hardness, and is then frequently called hard soap cerate (CERA'TUM SAPO'NIS DURUM); but by over-boiling it is apt to become gritty.

Uses, &c. Soap cerate is resolvent, cooling, and desiccative, and is chiefly employed as a cooling dressing for scrofulous swellings, &c. It may be spread on linen and applied like a plaster. It is sometimes used as a support for fractured limbs, and forms an excellent dressing for soft corns.

Cerate, Spermaceti. *Syn.* WHITE CERATE, WHITE LIP SALVE, SIMPLE C.; CERA'TUM SIM'PLEX (Ph. E.), C. ALBUM (Ph. L. 1745), C. SPERMA'TIS CÆTI (Ph. L. 1788), C. CÆTACEI (Ph. L. 1809, and since), L. *Prep.* 1. (Ph. L.) Spermaceti, 2 oz.; white wax, 8 oz.; melt by a gentle heat; add, olive oil (warm), 1 pint, and stir with a spatula until they cool.

2. (Ph. E.) See SIMPLE CERATE.

3. (Ph. D.) The corresponding preparation of the Ph. D. is classed under *Ointments*, and contains lard.

4. (*Commercial.*) On the large scale lard or suet is substituted for oil, by which means less wax is required. The following is a good form where a cheap article is wanted, and is that commonly adopted in the wholesale trade:—

Clarified mutton suet, 5½ lbs.; white wax and spermaceti, of each, ¾ lb.; as above.

Obs. The materials should be melted by a very gentle heat (that of a water bath is best) in a clean stoneware vessel, and as soon as perfect liquefaction takes place, the heat should be withdrawn, and the fluid cerate strained into a clean vessel, and stirred with a clean wooden spatula until it solidifies. To facilitate the cooling, the vessel may be placed in cold water or in a current of cold air. In this way the product is rendered both whiter and finer than when the liquid mass is allowed to cool by itself. By adding a little flowers of benzoin with the oil, or a little nitric ether when the cerate is about half cold, this, as well as other like preparations, will keep for years without becoming rancid or suffering any material change of condition.

Uses, &c. Emollient and cooling. It is commonly employed as a soft, cooling dressing, as a lip salve, as an application to chaps, chilblains, &c.

Cerate, Sulphur. *Syn.* CERA'TUM SULPHURIS, C. SULPHURATUM, L. *Prep.* (P. C.) Washed sulphur, 2 parts; cerate of Galen, 7 parts; almond oil, 1 part; mix. In itch, &c.

Cerate, Sulphide of Mercury. *Prep.* (Swe-diaur.) Yellow resin, ½ oz.; yellow wax and lard, of each, ½ lb.; vermilion, 20 grs. As a

dressing to unhealthy ulcers. See CINNABAR CERATE.

Cerate, Tobac'co. *Prep.* Bees' wax, 3 oz.; yellow resin, 1 oz.; olive oil, 6 oz.; tobacco, juice, 4 oz.; mix and evaporate to dryness, and when nearly cold, add bergamot, 2 drs. *Used* to destroy pediculi, &c.

Cerate, Touch. *Syn.* CERA'TUM PRO TECTU, L.; CRÉAT POUR LE TOUCHER, Fr. *Prep.* (Soubeiran.) Spermaceti and yellow wax, of each, 1 part; olive oil, 16 parts; melt, add caustic soda, 1 part, and stir until cold. *Used* in hospitals for practising the touching in accouchements.

Cerate, Turner's. See CALAMINE CERATE.

Cerate, Verdigris. *Syn.* CERA'TUM VERUGINIS, C. CUPRI DIACETATIS, L. *Prep.* 1. Resin cerate, 1 part; verdigris (in fine powder), 1 part.

2. (For Ph.) Wax and resin, of each, 6 parts; Venice turpentine, 5 parts; linseed oil, 2 parts; verdigris, 1 part. *Used* as a mild escharotic and stimulant to fungous ulcers, warts, corns, &c.

Cerate, White. See SPERMACE'TI CERATE.

Cerate, Zinc. *Syn.* CERA'TUM ZINCI, C. Z. OXYDI, L. *Prep.* 1. Oxide of zinc, 20 grs. spermaceti cerate, 1 oz. *Used* in sore nipples, excoriations, &c.; and in chronic ophthalmia.

2. (Compound; CERA'TUM ZINCI COMPOSITUM, L.)—*a.* To the last, add calomel, 10 grs.; *Used* as the last, and in scrofulous ophthalmia.

b. (Mid. Hosp.) Zinc ointment and compound lead ointment, equal parts. Cooling, astringent; in excoriations, and as a dressing for ulcers.

c. (Hufeland.) Oxide of zinc and lycopodium, of each, 15 grs.; simple cerate, $\frac{1}{2}$ oz. In sore nipples, ulcerations of the breast, tetters, &c. It acts best when diluted with half its weight of spermaceti cerate.

CEREBRIC ACID. A peculiar acid compound, first noticed by M. Frémy, obtained along with oleo-phosphoric acid when the brain and nerves are treated with hot alcohol. It is solid, white, crystalline; freely soluble in boiling alcohol, and forms a solid gelatinous mass with hot water; fusible with decomposition, exhaling a peculiar odour, and leaving much charcoal behind. It has been found also in the yolk of eggs, in seminal fluid, and in pus. With the alkalis it forms insoluble salts termed cerebrates.

CEREBROLEIN. When oleo-phosphoric acid is boiled in water, it is resolved into a fluid neutral oil and phosphoric acid, which dissolves. The former is cerebrolein.

CERIN. $\text{HC}_7\text{H}_{53}\text{O}_2$. (Brodie.) *Syn.* CEROTIC ACID. When pure bees' wax (bleached) is digested in boiling alcohol for some time, a solution of myricin and cerin is formed. The former is deposited as the liquid cools, and the latter may be obtained by evaporating the decanted portion. *Cerin* is a white, crystallisable substance, soluble in 16 parts of boiling alcohol; it fuses at 144°

Fahr.; and is readily saponified with caustic alkaline lyes. It greatly resembles white wax, of which, indeed, it forms from $70\frac{1}{2}$ to 80%.

CERIUM. Ce. A metal discovered in 1803 by Hisinger and Berzelius, in the mineral named cerite.

CEROMEL. *Prep.* (Van Mons.) Bees' wax 1 oz.; honey, 4 oz.; melt together and stir until cold. An excellent application to irritable ulcers, abraded surfaces, sore nipples, &c.

CERO'TIC ACID. See CERIN.

CETIN. $\text{C}_{32}\text{H}_{64}\text{O}_2$. Chevreul applied this name to pure spermaceti. *Prep.* Dissolve spermaceti in boiling alcohol, and collect the crystals that are deposited as the solution cools. Bright pearly crystals, melting at 120° , and subliming at 670° Fahr. See SPERMACE'TI.

CETRARIC ACID. $\text{H}_2\text{C}_{18}\text{H}_{34}\text{O}_8$. *Syn.* CETRAE'IN. The bitter principle of Iceland moss (*Cetraria Islandica*). It exists, in the free state, in the cortical portion of the thallus.

Prep. 1. Iceland moss (bruised), 1 part; rectified spirit, 6 parts; boil in a covered vessel for half an hour; express the liquor whilst hot, filter, and distil off the spirit; redissolve the residuum in boiling alcohol, decant the clear, and let the solution cool slowly; lastly, collect the crystals and preserve them out of contact with air.

2. (Herberger.) Iceland moss (in coarse powder), 1 lb.; alcohol (883), 4 lbs.; boil as before, cool until vapours cease to rise, express the tincture, add hydrochloric acid, 3 drs., (dissolved in) water, 2 oz.; let it rest for a night in a closed matrass; then decant, throw the deposit on a filter, press it in bibulous paper, and whilst still moist, wash it with both alcohol and ether; lastly, purify it by digestion in boiling alcohol, as before.

Prop., &c. Pure cetraric acid occurs under the form of minute, shining, acicular crystals; it is intensely bitter, non-volatile, scarcely soluble in water, ether, and cold alcohol; soluble in alkaline solutions forming soluble salts, which give a red colour with the persalts of iron, and a yellow one with acetate of lead. The compounds are called cetrarates.—

Dose. 2 to 4 grs. every three hours, as a febrifuge; 1 to 3 grs. thrice daily, as a tonic.

CHA'BERT'S OIL. *Syn.* CHABERT'S EMPYREUMATIC OIL; O'LEUM EMPYREUMAT'ICUM CHABERTI, O. CONTRA TENNIAM CHABERTI, L. *Prep.* (Ph. Bor. 1847.) From empyreumatic oil of hartshorn, 1 part; oil of turpentine, 3 parts; mix and distil over three fourths only in a glass retort, and keep it in well-stopped bottles. In tape-worm.—*Dose.* 2 teaspoonfuls in water, night and morning, until 4 to 6 or even 7 oz. have been taken; a cathartic being also administered from time to time.

CHAIRS. The black leather work of chairs, settees, &c., may be restored by first well

washing off the dirt with a little warm soap and water, and afterwards with clean water. The brown and faded portions may now be restrained by means of a little black ink, or preferably, black reviver, and when this has got thoroughly dry, they may be touched over with white of egg, stained and mixed with a little sugar-candy. When the surface is nearly dry, it should be polished off with a clean brush.

CHALK. *Syn.* SOFT CARBONATE OF LIME, or CARBONATE OF CALCIUM, EARTHY C. OF L.; CRE'TA, L. Chalk is largely used in the arts and manufactures, and in medicine. The natural varieties are remarkable for the fossils which they contain. The COLOURED CHALKS which are used as pigments and for crayons generally contain both clay and magnesia, as well as oxide of iron, and are minerals quite distinct from WHITE CHALK, or CHALK, properly so called. The latter is an AMORPHOUS CARBONATE OF LIME. Exposed for some time to a red heat, it is converted into QUICK-LIME; ground in mills and elutriated, it forms WHITING; the same process performed more carefully and on a smaller scale produces the PREPARED CHALK used in medicine. When prepared artificially (by precipitation), it is the PRECIPITATED CHALK of modern pharmacy. (See *below*.)

Chalk, Black. A variety of drawing slate.

Chalk, Brown. A familiar name for umber.

Chalk, Camphorated. *Syn.* CRETACEOUS TOOTH POWDER, CAMPHORATED T. P.; CRE'TA CAMPHORATA, C. CUM CAMPHORA, L. *Prep.* 1. Camphor, 1 oz.; add a few drops of spirit of wine, reduce it to a very fine powder, and mix it (perfectly) with precipitated chalk, 7 oz.; lastly, pass it through a clean, fine sieve, and keep it in a corked bottle. These proportions make the strongest "CAMPHORATED TOOTH POWDER" of the shops.

2. Camphor, 1 oz.; precipitated chalk, 15 oz.; as before. These are the best and safest proportions, and those now generally adopted by the West-end perfumers.

3. As either of the above, but using prepared chalk in lieu of precipitated chalk. Less white and velvety, but cleans the teeth better than the softer article.

Uses, &c. Camphorated chalk is much esteemed as a dentifrice; especially by smokers, and those troubled with foul teeth, or offensive breath. It may be scented with a few drops (3 or 4 to each oz.) of otto of roses, oil of cloves, or neroli, or of the essences of ambergris, musk, or vanilla; but care must be taken not to overdo it. When the teeth are much furred or discoloured, it may be mixed with about one seventh of its weight of finely powdered pumice stone (sifted through lawn), which will render it more effective. A little carmine, rouge, light red (burnt ochre), red coral, or rose pink, is also sometimes added to give it a tinge approaching that of the gums. The quantity of camphor (1 to 3 or 4) commonly

ordered in certain books is absurdly large, and would render the compound not only unpleasant in use, but actually detrimental to the teeth. See DENTIFRICES.

Chalk, French. Soap stone or steatite, a soft magnesian mineral, possessing the property of writing on glass. It is used by tailors for marking cloth. Its powder (obtained by scraping) is very soft, velvety, and absorbent of grease. It forms the best powder of the boot- and shoe-makers.

Chalk Mixture. *Syn.* MISTURA CRETE, L. Prepared chalk, 1 part; gum arabic (in powder), 1 part; syrup, 2 parts; cinnamon water, 30 parts; mix by trituration. *Dose.* 1 to 2 oz., with astringent tinctures and opium. Care should be taken to use the *prepared chalk*, as directed; the precipitated chalk has a crystalline character, and is said to occasion irritation of the bowels. (Squire.)

Chalk, Precipitated. *Syn.* PRECIPITATED CARBONATE OF LIME; CRE'TA PRECIPITATA, CAL'CIUS CARBONAS PRECIPITATUM, L. *Prep.* 1. By adding to a solution of chloride of calcium, any quantity, another of carbonate of soda (both cold), and well washing the precipitate with pure water, and drying it out of the dust.

2. (Ph. D.) Solution of chloride of calcium (Ph. D.), 5 parts; carbonate of soda, 3 parts; (dissolved in) water, 4 parts.

Uses, &c. It is chiefly employed for making aromatic confection, cretaceous powder, and chalk mixture. That of the shops is seldom pure, the refuse of the soda-water makers (sulphate of lime) being commonly sold for it. When pure, it is wholly soluble, with effervescence, in dilute hydrochloric acid. (See *below*.)

Chalk, Prepared. *Syn.* CRE'TA (Ph. E. & Ph. L. 1836), CRE'TA PREPARATA (Ph. L. 1851), CRE'TA AL'BA (Ph. D.), L. *Prep.* 1. (Ph. D. 1836) Rub chalk, 1 lb., with sufficient water, add gradually, until reduced to a smooth cream; then stir this into a large quantity of water, and, after a short interval, to allow the coarser particles to subside, pour off the supernatant water (still turbid) into another vessel, and allow the suspended powder to settle; lastly, collect the chalk so prepared and dry it. In the same way shells are prepared, after being first freed from impurities and washed with boiling water.

2. (Commercial; WHITING.) On the large scale, the chalk is ground in mills, and the elutriation and deposit made in large reservoirs. It is now seldom prepared by the druggist.

Pur. Almost entirely soluble in dilute hydrochloric acid, provided it contains no sulphate of lime or silica, giving off small bubbles of carbonic acid gas.

Test. The salt formed by dissolving the chalk in hydrochloric acid, if rendered neutral by evaporation to dryness and redissolved in water, gives only a very scanty precipitate on

the addition of a saccharated solution of lime, indicating absence of phosphate. (B. P.)

Uses, &c. In *medicine*, as an absorbent, antacid, and desiccant; in acidity, heartburn, dyspepsia, and other like stomach affections, and in diarrhœa, depending on acidity or irritation; in the latter, generally combined with aromatics, astringents, or opium. It forms a valuable dusting powder in excoriations, ulcers, &c., especially in those of children.—*Dose.* 10 grs. to a spoonful, in a little water or milk, or made into a mixture with mucilage or syrup.

Chalk, Red. A natural clay containing about 18½ of protoxide and carbonate of iron.

CHALYBEATES. *Syn.* CHALYBEA'TA, FER-BUGIN'EA, L. The medicinal qualities of the preparations of iron are noticed under the name of that metal. Those most frequently employed in medicine are—IRON FILINGS; QUEVENNE'S IRON; the BLACK OXIDE, MAGNETIC OXIDE, and SESQUIOXIDE OF IRON; the AMMONIO-CHLORIDE and SESQUICHLORIDE; the CARBONATE and SACCHARINE CARBONATE; the CITRATE and AMMONIO-CITRATE; the IODIDE; LACTATE, and SULPHATE; the TARTRATE, AMMONIO-TARTRATE, and POTASSIO-TARTRATE OF IRON; and, the CHALYBEATE MINERAL WATERS. For the doses, &c., see the respective articles.

CHAMOMILE. *Syn.* ANTHE'MIS, L. The flowers of the *Anthemis nobilis* (*Anthemidis Flores*, B. P.). They are bitter, stomachic, and tonic; in dyspepsia, loss of appetite, intermittents, &c. They are an effectual remedy for nightmare; and, according to Dr. Schall, the only certain remedy for that complaint.—*Dose.* 10 grs. to ½ dr., or more, in powder or made into a tea. Fomentations are also made with it. See EXTRACTS, OILS, PILLS, &c.

CHAMPAGNE. See WINES.

CHAPS. These are too well known to require description. Chapped hands are common amongst persons with a languid circulation, who are continually "dabbling" in water during cold weather. Chapped lips generally occur in persons with pallid, bluish, moist lips, who are much exposed to the wind in dry, cold weather; especially in those who are continually moving from heated apartments to the external air. The application of a little COLD CREAM, POMATUM, SPERMACETI OINTMENT, LARD, or any similar article, will generally prevent chaps on the lips, and chaps and chilblains on the hands. Persons employed in oil and tallow works, or about oil, and who have consequently their hands continually in contact with greasy matter, never suffer from these things. A little oil or unguent of any kind, well rubbed on the hands on going to rest (removing the superfluous portion with a cloth), will not only preserve them from cold, but tend to render them both soft and white. See CHILBLAINS.

CHAR (Potted). The flesh of the *Salmo*

Alpinus (Linn.), or trout of the Alps, common in the lakes of Lapland, preserved by the common process of potting.

CHAR/BON-ROUX [Fr.]. See WOOD CHARCOAL (*below*).

CHAR/COAL. Charcoal is made by charring organic substances, such as wood, bone, blood, &c., and is, in other words, the fixed residuum of vegetable or animal matter exposed to a high temperature out of contact with atmospheric air.

There are several different varieties of charcoal, the chief of which, however, are wood and animal charcoal.

Charcoal, Animal. *Syn.* ANIMAL BLACK, BONE BLACK, IVORY BLACK, CARBO ANIMALIS. The charcoal obtained by igniting bone in close vessels, but often applied likewise to any charcoal obtained from animal matter.

Commercial. Bones (deprived of their grease by boiling) are broken to pieces, and put into small cast-iron pots, varying from ¾ to ¾ an inch in thickness. Two of these being filled, are dexterously placed with their mouths together and then luted with loam. A number of these vessels are then placed side by side and piled on each other, in an oven resembling a potter's kiln, to the number of 100 or 150, or even more. The fire is next kindled, and the heat kept up strongly for 10 or 12 hours, according to circumstances, until the process is completed. The whole is then allowed to cool before opening the pots.

A more economical method is by distillation, as under:—

Bones (previously boiled for their grease) are introduced into retorts similar to those used in gas works, and heat being applied, the volatile products are conveyed away by iron pipes to cisterns where the condensable portion is collected. As soon as the process of distillation is finished, the solid residuum in the retorts, while still red hot, is removed through their lower ends into wrought-iron canisters, which are instantly closed by air-tight covers, and luted over. These are then raised to the ground by a crane, and set aside to cool.

The bones having been carbonised, are ground in a mill, and the resulting coarse powder, sorted by sieves into two kinds, one, granular, somewhat resembling gunpowder, for decolorising liquids, and the other, quite fine, to be used as a pigment. The first is sold under the name of animal charcoal; the second, as bone or ivory black. The latter and other fine varieties of animal charcoal are fully described under the head of BLACK PIGMENTS.

Uses, &c. This crude animal charcoal possesses the valuable property of taking lime and other saline matter from syrups and other aqueous solutions, especially organic ones, at the same time that it decolours them. Its power as a decolouriser may be tested by adding it to a solution of brown sugar or of molasses,

or to water containing $\frac{1}{1000}$ part of indigo dissolved in sulphuric acid. The test should be made in a small glass tube. By well washing and carefully reburning it, this charcoal may be used any number of times. As a decoloriser and deodoriser, animal charcoal is vastly superior to vegetable charcoal.

PREPARED ANIMAL CHARCOAL. Hydrochloric acid, 1 lb.; water, 1 pint; mix, add bone black, 7 lbs.; make a paste; in 2 or 3 days stir in boiling water, 1 quart; and the next day wash it with fresh water until the washings cease to affect litmus paper or a solution of carbonate of sodium; then collect it in a cloth, and drain, press, and dry it; lastly, heat it to redness, as before. Used to decolour syrups, &c.; and occasionally by the distillers and rectifiers.

The most powerful charcoal is prepared by calcining blood, and well washing the residue, and which is the method of the last 'London Pharmacopœia.'

Concluding remarks. Animal charcoal, however prepared, if intended to be used as a deodoriser or decoloriser, should be kept thoroughly excluded from the air, as by exposure it loses all its valuable properties, and becomes absolutely inert. Freshly burnt charcoal is therefore to be employed whenever it can be obtained.

Charcoal, Wood. *Syn.* VEG'ETABLE CHARCOAL; CAR'BO LIG'NI, L. The residue obtained after heating wood without access of air to about 572° Fahr. It is extremely porous, and retains the structure of the wood from which it is derived. It consists essentially of carbon and of the fixed or inorganic matter which exists in wood; but if carbonisation be imperfectly effected, it may contain a sensible amount of hydrogen.

Charcoal-burning is effected in the open air in piles or stacks provided with a yielding cover, in pits, in closed chambers of brick or stone, and in iron retorts heated externally like common gas retorts. The latter method is only practised by the manufacturers of pyroligneous acid and gunpowder.

CHARCOAL FOR FUEL, &c. The method of pile burning is that which is most extensively practised. Pieces of wood of equal length are piled concentrically round a sort of chimney formed by driving 3 stakes in the ground; those nearest the centre are almost vertical, and the surrounding pieces have a slight but gradually increasing inclination; a second row; and in the case of very large piles even a third, may be stacked in a similar manner one above the other. The pile is covered with turf and soil, and kindled by filling the space within the 3 central stakes with easily inflammable wood, which is ignited. The character of the smoke which issues from vents made in the pile indicates exactly the degrees of carbonisation in different parts. When the charcoal is drawn from the pile it is extinguished by cold water, or if that is not at

hand, by charcoal dust or dry soil. In some parts of Sweden the wood is charred in large rectangular stacks, and in China the method of charring in pits is practised.

CHARCOAL FOR GUNPOWDER; CYLINDER CHARCOAL. The charcoal employed in the manufacture of gunpowder is burnt in clay iron cylinders, and has hence received the name of cylinder charcoal. For this and other

purposes, it is essential that the last portion of the tar and vinegar should be sufficient to escape, and the reabsorption of the empyreumatic vapours prevented, by cutting off the communication between the cylinders and the condensing apparatus; as without this precaution, on the fire being withdrawn, a retrograde movement of the product takes place and the charcoal is much reduced in quality. Alder and willow are the woods chiefly used for making charcoal at Waltham Abbey. Dutch white willow, and after that the Haddingdon willow, are said to yield the best charcoal for gunpowder. The charcoal from the cylinders of the pyroligneous acid (vinegar) works is also called cylinder charcoal, and is that chiefly used for chemical purposes; but it is inferior to that prepared for gunpowder.

CHARCOAL FOR SCIENTIFIC PURPOSES. Box-wood charcoal, employed in voltaic electricity, is prepared by putting prismatic pieces of box-wood, about 1 inch long by $\frac{1}{2}$ inch thick, into a crucible, which is then filled with clean, dry sand, covered up, and exposed to red heat for about an hour.

Uses, &c. These are numerous and varied. Charcoal is extensively employed as a fuel and in metallurgy for tempering metal, making steel, &c.; reduced to powder, it is used to surround vessels and bodies required to retain their heat for some time; a coating of charcoal, formed on piles and stakes of wood by charring them, promotes their preservation. Fresh burnt charcoal, in coal powder, restores tainted meat and putrid water, decolours vegetable solutions, deodorises fetid substances, and withdraws lime from syrups filtered through it.

In *medicine*, charcoal is principally used as a deodoriser and disinfectant, either in the form of powder or made into a poultice. It has been given internally in dyspepsia, diarrhoea, dysentery, heartburn, agues, constipation, sickness of pregnancy, and various other diseases, with advantage. As a prophylactic of cholera and fevers it is invaluable and superior to all other substances. It forms the best tooth powder known, as it both whitens the teeth and deodorises the breath.—Dose 10 grs. to a teaspoonful, or more ad libitum. An ointment made with lard and charcoal has been successfully employed in some skin diseases. In all cases, to be useful, the charcoal must be both fresh burnt and fresh powder, and carefully preserved, out of contact with the air, until about to be administered.

Fresh carbonised bread forms an excellent charcoal, both for a prophylactic and a tooth powder.

Charcoal varies in its qualities according to the substance from which it is prepared; that of the soft woods (willow or alder) is best for crayons and gunpowder; that of the hard woods for fuel, and for blowpipe supports. That made by a low-red heat, not exceeding cherry red, and which has a dull surface, is the most valuable. If the heat is carried much beyond this point, the charcoal acquires a brilliant surface, and deteriorates in quality. Chestnut charcoal is preferred by smiths for forging, as it not only burns slowly, but deadens as soon as the blast ceases. Arcanum charcoal is preferred as a dentifrice; but the willow charcoal or box-wood charcoal is usually substituted for it by shopkeepers.

Ant., &c. Poisoning or suffocation, resulting from respiring the fumes of burning charcoal, has been already alluded to, and the treatment briefly pointed out. See CARBONIC ANHYDRIDE.

CHARGES (for Cattle). See VETERINARY MEDICINE.

CHARRING (Surface). The operation by which the surface of wood is carbonised, to prevent its decay from exposure to air and moisture. Stakes and piles are generally thus treated before they are driven into the ground. Casks are charred on the inside by coopers when they are intended to hold water: In both these cases the fire is commonly applied directly to the wood. A new method has, however, been lately employed with apparent success. This consists in washing the wood with the strongest oil of vitriol. In this way, not only the outer surface, but the surface of all the cracks and holes, gets carbonised, which is not the case when heat is employed. It succeeds admirably with musty casks and vats.

CHEESE. *Syn.* CA'SEUM, CA'SEUS; L. The curd of milk compressed into a solid mass. That of commerce is usually salted and dried, and in some varieties it is also coloured and flavoured.

The process of cheese-making is one which is eminently interesting and scientific, and which, in every gradation, depends on principles which chemistry has developed and illustrated. When a vegetable or mineral acid is added to milk, and heat applied, a coagulum is formed, which, when separated from the liquid portion, constitutes cheese. Neutral salts, earthy and metallic salts, sugar, and gum Arabic, as well as some other substances, also produce the same effect; but that which answers the purpose best, and which is almost exclusively used by dairy farmers, is rennet, or the mucous membrane of the last stomach of the calf. Alkalies dissolve this curd at a boiling heat, and acids again precipitate it. The solubility of cheese in milk is occasioned

free alkalies. In fresh milk these substances may be readily detected by the property it possesses of restoring the colour of reddened litmus paper. The addition of an acid neutralises the alkali, and so precipitates the curd in an insoluble state. The philosophy of cheese-making is thus expounded by Liebig:—

“The acid indispensable to the coagulation of milk is not added to the milk in the preparation of cheese, but it is formed in the milk at the expense of the milk-sugar present. A small quantity of water is left in contact with a small quantity of a calf's stomach for a few hours, or for a night; the water absorbs so minute a portion of the mucous membrane as to be scarcely ponderable; this is mixed with milk; its state of transformation is communicated (and this is a most important circumstance), not to the cheese, but to the milk sugar, the elements of which transmute themselves into lactic acid, which neutralises the alkali, and thus causes the separation of the cheese. By means of litmus paper the process may be followed and observed through all its stages; the alkaline reaction of the milk ceases as soon as the coagulation begins. If the cheese is not immediately separated from the whey, the formation of lactic acid continues, the fluid turns acid, and the cheese itself passes into a state of decomposition.

“When cheese-curd is kept in a cool place, a series of transformations takes place, in consequence of which it assumes entirely new properties; it gradually becomes semi-transparent, and more or less soft, throughout the whole mass; it exhibits a feebly acid reaction, and develops the characteristic caseous odour. Fresh cheese is very sparingly soluble in water, but after having been left to itself for two or three years, it becomes (especially if all the fat be previously removed) almost completely soluble in cold water, forming with it a solution, which, like milk, is coagulated by the addition of the acetic or mineral acids. The cheese, which whilst fresh is insoluble, returns during the maturation, or ripening, as it is called, to a state similar to that in which it originally existed in the milk. In those English, Dutch, and Swiss cheeses, which are nearly inodorous, and in the superior kinds of French cheese, the caseine of the milk is present in its unaltered state.

“The odour and flavour of the cheese is owing to the decomposition of the butter; the non-volatile acids, the margaric and oleic acids, and the volatile butyric acid, capric and caproic acids, are liberated in consequence of the decomposition of glycerin. Butyric acid imparts to cheese its characteristic caseous odour, and the differences in its pungency or aromatic flavour depend upon the proportion of free butyric, capric, and caproic acids present.” In the cheese of certain dairies and districts, valerianic acid has been detected along with the other acids just referred to.

Messrs. Jljenko and Laskowski found this acid in the cheese of Limbourg, and M. Bolard in that of Roquefort.

"The transition of the insoluble into soluble casein depends upon the decomposition of the phosphate of lime by the margaric acid of the butter; margarate of lime is formed, whilst the phosphoric acid combines with the casein, forming a compound soluble in water.

"The bad smell of inferior kinds of cheese, especially those called meagre or poor cheeses, is caused by certain fetid products containing sulphur, and which are formed by the decomposition or putrefaction of the casein. The alteration which the butter undergoes (that is, in becoming rancid), or which occurs in the milk-sugar still present, being transmitted to the casein, changes both the composition of the latter substance and its nutritive qualities.

"The principal conditions for the preparation of the superior kinds of cheese (other obvious circumstances being of course duly regarded) are a careful removal of the whey, which holds the milk-sugar in solution, and a low temperature during the maturation or ripening of the cheese."

Cheese differs vastly in quality and flavour, according to the method employed in its manufacture, and the richness of the milk of which it is made. Much depends upon the quantity of cream it contains, and consequently, when a superior quality of cheese is desired, cream is frequently added to the curd. This plan is adopted in the manufacture of Stilton cheese and others of a like description. The addition of a pound or two of butter to the curd for a middling size cheese also vastly improves the quality of the product. To ensure the richness of the milk, not only should the cows be properly fed, but certain breeds chosen. Those of Alderney, Cheddar, Cheshire, Gloucestershire, Guernsey, and North Wiltshire, deserve a preference in this respect.

The materials employed in making cheese are milk and rennet. Rennet is the stomach of the calf, and is used either fresh or salted and dried; generally in the latter state. The milk may be of any kind, according to the quality of the cheese required. Cows' milk is that generally employed; but occasionally ewes' milk is used; and sometimes, though more rarely, that from goats.

In preparing his cheese, the dairy farmer puts the greater portion of the milk into a large tub, to which he adds the remainder, sufficiently heated to raise the temperature to that of new milk. The whole is then whisked together, the rennet or rennet liquor added, and the tub covered over. It is now allowed to stand until completely "turned," when the curd is gently struck down several times with the skimming-dish, after which it is allowed to subside. The vat covered with cheese-cloth is next placed on a "horse" or "ladder"

over the tub, and filled with curd by means of the skimmer, care being taken to allow as little as possible of the oily particles or butter to run back with the whey. The curd is pressed down with the hands, and more added as it sinks. This process is repeated until the curd rises to about 2 inches above the edge. The newly formed cheese, thus partially separated from the whey, is now placed in a clean tub, and a proper quantity of salt added, as well as of annotta, when that colouring is used, after which a board is placed over and under it, and pressure applied for about 2 or 3 hours. The cheese is next turned out and surrounded by a fresh cheese-cloth, and then again submitted to pressure in the cheese press for 8 or 10 hours, after which it is commonly removed from the press, salted all over, and again pressed for 15 to 20 hours. The quality of the cheese especially depends on this part of the process, as if any of the whey is left in the cheese it rapidly becomes bad-flavoured. Before placing it in the press the last time, the common practice is to pare the edges smooth and slightly. It now only remains to wash the outside of the cheese in warm whey or water, to wipe it dry, and to colour it with annotta or reddle, as is usually done.

The storing of the newly made cheese is the next point that engages the attention of the maker and wholesale dealer. The same principles which influence the maturation or ripening of fermented liquors also operate here. In England, a cool cellar, neither damp nor dry, and which is uninfluenced by change of weather or season, is commonly regarded as the best for the purpose. If possible, the temperature should on no account be permitted to exceed 50° or 52° Fahr. at any portion of the year. An average of about 45° is preferable when it can be procured. A place exposed to sudden changes of temperature is as unfit for storing cheese as it is for storing beer. "The quality of Roquefort cheese, which is prepared from sheep's milk, and is very excellent, depends exclusively upon the places where the cheeses are kept after pressing and during maturation. Those are cellars, communicating with mountain grottoes and caverns, which are kept constantly cool, at about 41° to 42° Fahr., by currents of air from clefts in the mountains. The value of these cellars as storehouses varies with their property of maintaining an equable and low temperature. Giron mentions that a certain cellar, the construction of which had cost only 480*l.* (12,000 francs), was sold for 8,600*l.* (215,000 francs), being found to maintain a suitable temperature, a convincing proof of the importance attached to temperature in the preparation of these superior cheeses." (Liebig.)

It will thus be seen that very slight differences in the materials, in the preparation, or in storing of the cheese, materially influence the quality and flavour of this article. The richness of the milk—the addition or sub-

traction of cream from the milk—the separation of the curd from the whey with or without compression—the salting of the curd—the collection of the curd, either whole or broken, before pressing—the addition of colouring matter, as annotta or saffron, or of flavouring—the place and method of storing—and the length of time allowed for maturation, all tend to alter the taste and odour of the cheese, in some or other particular, and that in a way readily perceptible to the palate of the connoisseur. No other alimentary substance appears to be so seriously affected by slight variations in the quality of the materials from which it is made, or by such apparently trifling differences in the methods of preparing it.

Var. The varieties of cheese met with in commerce are very numerous, and differ greatly from each other in richness, colour, and flavour. These are commonly distinguished by names indicative of the places in which they have been manufactured, or of the quality of the materials from which they have been prepared. Thus, we have Dutch, Gloucester, Stilton, skimmed-milk, raw-milk, cream, and other cheeses; names which explain themselves. The following are the principal varieties met with in Europe:—

CHEESE, BRICK-BAT. From its form; made in Wiltshire of new milk and cream.

CHEESE, CHEDDAR. A fine, spongy kind of cheese, the eyes or vesicles of which contain a rich oil; made up into round, thick cheeses, of considerable size (150 to 200 lbs.).

CHEESE, CHESHIRE. From new milk, without skimming, the morning's milk being mixed with that of the preceding evening, previously warmed, so that the whole may be brought to the heat of new milk. To this the rennet is added, in less quantity than is commonly used for other kinds of cheese. On this point, much of the flavour and mildness of the cheese is said to depend. A piece of dried rennet, of the size of half-a-crown, put into a pint of water over night, and allowed to stand until the next morning, is sufficient for 18 or 20 gallons of milk. In large, round, thick cheeses (100 to 200 lbs. each). They are generally solid, homogeneous, and dry, and friable rather than viscid.

CHEESE, COTTENHAM. A rich kind of cheese, in flavour and consistence not unlike Stilton, from which, however, it differs in shape, being flatter and broader than the latter.

CHEESE, CREAM. From the "strippings" (the last of the milk drawn from the cow at each milking), from a mixture of milk and cream, or from raw cream only, according to the quality desired. It is usually made in small oblong, square, or rounded cakes, a gentle pressure only (that of a 2 or 4 lb. weight) being applied to press out the whey. After twelve hours, it is placed upon a board or wooden trencher, and turned every day, until dry. It ripens in about three weeks. A

little salt is generally added, and frequently a little powdered lump sugar.

CHEESE, DERBYSHIRE. A small, white, rich variety, very similar to Dunlop cheese.

CHEESE, DUNLOP. Rich, white, and buttery; in round forms, weighing from 30 lbs. to 60 lbs.

CHEESE, DUTCH. (Holland.) Of a globular form. 5 to 14 lbs. each. Those from Edam are very highly salted; those from Gouda less so.

CHEESE, GLOUCESTER. Single Glo'ster; from milk, deprived of part of its cream; Double Glo'ster, from milk retaining the whole of the cream. Mild tasted, semi-buttery consistence, without being friable; in large, round, flattish forms.

CHEESE, GREEN or SAGE. From milk mixed with the juice or an infusion or decoction of sage leaves, to which marygold flowers and parsley are frequently added.

CHEESE, GRUYÈRE. A fine description of cheese made in Switzerland, and largely consumed off the Continent. It is firm and dry, and exhibits numerous cells of considerable magnitude. Its flavour is peculiar, and is not generally liked by English people.

CHEESE, LINCOLN. From new milk and cream; in pieces about 2 inches thick; soft, and will not keep over 2 or 3 months.

CHEESE, NEUCHÂTEL. A much esteemed variety of Swiss cheese; made of cream, and weighs about 5 or 6 oz.

CHEESE, NORFOLK. Dyed yellow with annotta or saffron; good, but not superior; in cheeses of 30 lbs. to 50 lbs.

CHEESE, PARMESAN. (Parma, &c.) From the curd of skimmed milk, hardened by a gentle heat. The rennet is added at about 120°, and an hour afterwards, the curdling milk is set on a slow fire until heated to about 150° Fahr.; during which the curd separates in small lumps. A few pinches of saffron are then thrown in. About a fortnight after making, the outer crust is cut off, and the new surface varnished with linseed oil, and one side coloured red.

CHEESE, ROQUEFORT. From ewes' milk; the best prepared in France. It greatly resembles Stilton, but is scarcely of equal richness or quality, and possesses a peculiar pungency and flavour.

CHEESE, SLIPCOAT or SOFT. A very rich white cheese, somewhat resembling butter; for present use only.

CHEESE, STILTON. The richest and finest cheese made in England. From raw milk to which cream taken from other milk is added; in cheeses generally twice as high as they are broad. Like wine, this cheese is vastly improved by age, and is therefore seldom eaten before it is 2 years old. A spurious appearance of age is sometimes given to it by placing it in a warm, damp cellar, or by surrounding it with masses of fermenting straw, or dung.

CHEESE, SUFFOLK. From skimmed milk;

in round, flat forms, from 24 lbs. to 30 lbs. each. Very hard and horny.

CHEESE, SWISS. The principal cheeses made in Switzerland are the Gruyère, the Neuf-châtel, and the Schabzieger or green cheese. The latter is flavoured with mellilot.

CHEESE, WESTPHALIAN. In small balls or rolls of about 1 lb. each. It derives its peculiar flavour from the curd being allowed to become partially putrid before being pressed. In small balls or rolls of about 1 lb. each.

CHEESE, WILTSHIRE. Resembles poor Cheshire or Glo'ster. The outside is generally painted with a mixture of ruddle or red-ochre or whey.

CHEESE, YORK. From cream: it will not keep.

Qual., &c. Cheese has been objected to as an article of diet, but without sufficient reason, since it is, when of good quality, eminently nutritious, wholesome, and digestible. Like all other food, cheese digests more readily when well masticated, and the neglect of this precaution is one reason why it frequently disagrees with delicate stomachs. It is rendered more agreeable to many palates by toasting it, but becomes less digestible by that operation. The basis of cheese is casein or coagulated curd, a protein substance; it therefore cannot fail to prove nutritious, provided it is properly digested. Cheese-curd, carefully freed from water and milk by expression, and the addition of salt, is a mixture of casein and butter. It contains all the phosphate of lime and part of the phosphate of soda of the milk. (Liebig.) When taken as a condiment, especially when rich and old, it powerfully promotes the secretion of the saliva and gastric juice, and thereby aids the stomach in performing its proper functions. Rotten cheese is very unwholesome.

Concluding remarks. It is surprising that cheese is not more frequently made an article of domestic manufacture, especially by housewives resident in the country. The operations of cheese-making are all exceedingly simple, and not laborious, and will, in most cases, amply repay the outlay for the milk. Besides, cheese is not unfrequently coloured with stains and pigments, which are injurious, and even poisonous, the risk of taking which is not encountered when it is made at home. Several persons have nearly lost their lives from eating cheese coloured with annotta, for instance. This substance, though harmless in itself, is frequently adulterated with red lead, so that the cheesemonger may very innocently introduce a dreadful poison, when he only intends to improve the colour of his goods.

When a whole cheese is cut, and the consumption small, it is generally found to become unpleasantly dry, and to lose flavour before it is consumed. This is best prevented by cutting a sufficient quantity for a few days' consumption from the cheese, and keeping the remainder in a cool place, rather damp than dry,

spreading a thin film of butter over the cold surface, and covering it with a cloth or pan, to keep off the dirt. This removes the objection existing in small families against purchasing a whole cheese at a time. The common practice of buying small quantities of cheese should be avoided, as not only a higher price is paid for any given quality, but there is little likelihood of obtaining exactly the same flavour twice running. Should cheese become too dry to be agreeable, it may be used for stewing, or for making grated cheese or Welsh rare-bits.

Cheese, Apple. The pomace or ground apples from the cider press.

Cheese, Dam'son. *Prep.* From damsons boiled with a little water, the pulp passed through a sieve, and then boiled with about one fourth the weight of sugar, until the mixture solidifies on cooling; it is next poured into small tin moulds previously dusted out with sugar. Cherry cheese, gooseberry cheese, plum cheese, &c., are prepared in the same way, using the respective kinds of fruit. They are all very agreeable candies or confections.

Cheese, Factitious Roquefort. *Prep.* (Rouille.) The gluten of wheat is kneaded with a little salt, and a small portion of a solution of starch, and made up into cheeses. It is said that this mixture soon acquires the taste, smell, and unctuousness of cheese, and when kept a certain time is not to be distinguished from the celebrated Roquefort cheese, of which it possesses all the peculiar pungency. By slightly varying the process, other kinds of cheese may be imitated.

Cheese, Legu'minn. The Chinese prepare an actual cheese from peas, called "tao-foo," which they sell in the streets of Canton. The paste from steeped ground peas is boiled, which causes the starch to dissolve with the casein; after straining the liquid, it is coagulated by a solution of gypsum; this coagulum is worked up like sour milk, salted, and pressed into moulds.

Cheese, Toast'ed. This much relished article is seldom well prepared. The following has been recommended as an excellent receipt:—Cut the cheese into slices of moderate thickness, and put them into a tinued copper saucepan, with a little butter and cream; simmer very gently until they are quite dissolved, then remove the saucepan from the fire, allow the whole to cool a little, add some yolk of egg, well beaten, add spice, make the compound into a "shape," and brown it before the fire. See FOUDEE.

CHELSEA PENSIONER. *Prep.* From gum guaiacum, $\frac{1}{2}$ oz.; rhubarb, $\frac{1}{2}$ oz.; cream of tartar, 2 oz.; flowers of sulphur, 4 oz.; nutmegs, 2 in number; (all in powder); honey, $1\frac{1}{2}$ lb., or q. s.; made into an electuary by beating them together in a mortar. *Dose.* 1 to 2 table-spoonfuls, night and morning, in gout and chronic rheumatism. The name is

said to have been given to it from the circumstance of a Chelsea pensioner having cured Lord Amherst with it.

CHEL-TENHAM SALTS. See **SALTS**.

CHEMIQUE or **CHEMIC BLUE**. See **INDIGO**.

CHEROOT'. A species of cigar imported from Manilla, in the Philippine Islands, distinguished by extreme simplicity of construction, as well as delicacy of flavour. The cigars now so commonly sold as cheroots in England are, for the most part, made of inferior tobacco, and are often much adulterated articles.

CHER'RIES are the fruit of different species of the genus *Cerasus*. They are regarded as wholesome, cooling, nutritive, laxative, and antiscorbutic. Brandy flavoured with this fruit or its juice is known as cherry-brandy. Morello cherries preserved in brandy are called brandy cherries. See **BRANDY**, **FRUIT**, &c.

CHER'BY LAUR'EL. *Syn.* **LAUR'EL**. The *Cerasus Lauro-Cerasus*, a shrub common in every garden in England, and often confounded with the true Laurel or Sweet Bay, which does not possess any of its deleterious properties. Leaves, occasionally used instead of bay leaves in cookery. The distilled oil and distilled water are both poisonous. See **OIL**, **WATER**.

CHI'CA. The red colouring matter deposited by a decoction of the leaves of *Bignonia Chica* in cooling. *Used* by the American Indians to stain their skin. It is soluble in alcohol, ether, oil, fat, and alkaline lyes, and slightly so in boiling water.

Chi ca. See **MAIZE-BEER**.

CHIC'ORY. *Syn.* **WILD SUCCORY**; **CICHO'RIUM INTYBUS** (Linn.), **L.** A plant belonging to the natural order *Compositæ*. It is indigenous to this and many other countries of Europe, and is extensively cultivated for the sake of its roots, which are sliced, roasted, and ground, to form the chicory of the shops. Nearly 100 millions of pounds are annually consumed in Europe. Much of the chicory used in Britain is of home growth; but still more is imported in a raw state from Holland and other parts of the Continent. A blue dye has been prepared from the leaves of this plant.*

The **FRESH ROOT OF CHICORY** (*radix chicor'ii re'cents*) is reputed to be alterative, attenuant, diuretic, febrifuge, hepatic, resolvent, and tonic; and in large doses, aperient. It is now seldom used in medicine, although it appears to possess similar qualities and equal activity to those of dandelion. "An infusion of the root, mixed with syrup, becomes thick; forming the **GOMME SACCHO-CHICORINE** of *Lacarterie*." (Fee.)

The **ROASTED ROOT** is prepared by cutting the full-grown root into slices, and exposing it to heat in iron cylinders, along with about $1\frac{1}{2}\%$ or 2% of lard, in a similar way to that adopted for coffee. When ground to powder in a mill, it constitutes the **CHICORY** of the

grocers (**CHICORY COFFEE**, **SUCCORY C.**; **RADIX CHICOR'II TORREFAC'TA**, **R. C. T. CONTRI'TA**); so generally employed both as a substitute for coffee and as an adulterant of that article. The addition of 1 part of good, fresh roasted chicory to 10 or 12 parts of coffee forms a mixture which yields a beverage of a fuller flavour, and of a deeper colour than that furnished by an equal quantity of pure or unmix'd coffee. In this way a less quantity of coffee may be used, but it should be remembered that the article substituted for it does not possess in any degree the peculiar exciting, soothing, and hunger-staying properties of that valuable product. The use, however, of a larger proportion of chicory than that just named imparts to the beverage an insipid flavour, intermediate between that of treacle and liquorice; whilst the continual use of roasted chicory, or highly chicorised coffee, seldom fails to weaken the powers of digestion and derange the bowels. "There can be no doubt that roasted chicory must, when taken largely, have a tendency to excite diarrhœa." (Pereira.)

Pur., &c. The ground chicory of the shops, like ground coffee, is almost universally adulterated. Pigments are added to it to colour it, and various vegetable substances to lessen its value. The following articles have been reported to have been detected in roasted chicory, or to have been known to be used to adulterate it:—Venetian red, redde, and red clay; roasted acorns, beans, carrots, damaged dog-biscuits, damaged bread, damaged wheat, horse-chestnuts, mangel wurzel, parsnips, peas, rye, and sugar; coffee flights (coffee husks), coffina (roasted lupins), Hambro' powder (roasted peas coloured with redde), and the marc of coffee; exhausted bark (from the tan yards), logwood dust, mahogany dust, &c. It has also been asserted that the scorched livers of bullocks, horses, and dogs, have been applied to the same purpose; but of this there is not sufficient evidence. The only way to avoid being thus cheated or poisoned is to buy the chicory whole, and to grind it at home.

Roasted chicory is highly hygrometric or absorbent of moisture, and should, therefore, be always kept in close vessels (bottles or canisters), the same as coffee. If the lumps become tough or soft, or the powder cakes together, it is unfit for use; but in some cases it may be recovered, by exposing it on a plate in an oven until it again becomes perfectly dry or brittle.

Tests.—1. Powdered chicory thrown on water turns it reddish-brown and rapidly sinks, leaving light impurities either floating or diffused through the liquid.—2. The cold decoction tested with tincture, or solution of iodine, gives a brown colour; if it turns purple, blue, or black, it indicates the presence of roasted peas, beans, rye, or some other like substance, containing starch.—3. Persulphate or perchloride of iron, added in the

same way, should not materially affect the liquid; if it turns it bluish or blackish, it indicates the presence of roasted acorns, oak-bark tan, or some other substance containing tannin.—4. Water acidulated with vinegar, digested on the powder, should not be blackened, or even materially darkened, by tincture of galls or a solution of red prussiate of potash; the contrary shows the presence of ferruginous colouring matter.—5. The dry powder, when incinerated, should not leave more than $\frac{4}{5}$ to $\frac{5}{6}$ of ash, which should be of a grayish or fawn colour; the contrary indicates the presence of reddle, red clay, ochre, or the like.—6. To the above may be added attention to the odour, colour, and appearance, both to the naked eye and under the microscope; by the latter, adulteration may be easily detected. See COFFEE.

CHILBLAIN. *Syn.* PERINIO, L. An inflammatory swelling, of a purple or lead colour, produced by the action of cold. Chilblains (PERINIO'NES) exclusively attack the extremities of the body, and are generally confined to the fingers, toes, and heels. The common symptoms are itching and irritation, more or less intense, often accompanied with shooting pains, and tenderness, and tumefaction of the parts. Children, especially those of a scrofulous habit, and elderly persons, are generally the most liable to chilblains. The common cause of chilblains is holding the hands or feet to the fire after exposure to cold. The sudden change of temperature partially destroys the vitality of the minute surfacial vessels, and thus prevents the proper flow of blood through the part. The best preventives of chilblains are woollen socks or stockings, good waterproof shoes, woollen gloves, exercise, and friction. These act by promoting the circulation of the blood in the extremities, and protecting them from vicissitudes of temperature. When chilblains have once formed, the best treatment is friction with stimulants, as spirits of wine and camphor, oil of turpentine, opodeldoo, dilute spirits, camphorated oil, hartshorn and oil, &c. Linnæus recommends bathing the part with dilute muriatic acid, just strong enough to faintly prick the skin. When the inflamed parts have ulcerated, they are commonly called KIBES. In this state they should be dressed with a little resin cerate, or elemi ointment. If fungous granulations appear, they must be removed by touching them with nitrate of silver or blue vitriol. See CHAPS, &c.

REMEDIES FOR CHILBLAINS.—The following have been strongly recommended by different parties, and may all prove useful in their turns, as circumstances and convenience may suggest:—

1. Sulphate of copper, 1 oz.; rosemary water, 1 pint; dissolve.

2. Sal-ammoniac, 1 oz.; vinegar, $\frac{1}{2}$ pint.

3. Sal-ammoniac, 1 oz.; rum, $\frac{1}{2}$ pint; camphor, 1 dr. The affected part is wetted with

the above night and morning, and when dry, is touched with a little simple ointment, cold cream, or pomatum.

4. Soap liniment, 2 oz.; tincture of cantharides, 1 oz.; oil of cajeput, 2 drs.

5. Oil of turpentine, 2 oz.; camphor, 3 drs.; oil of cajeput, 1 dr. The application of the last two is accompanied by gentle friction.

6. (DR. GRAVES' PREVENTIVE.) Sulphate of copper, 20 grs.; water, 1 oz. As the first three.

7. (LEJEUNE'S BALSAM.) See CHILBLAIN BALSAM.

8. (LINNÆUS' REMEDY.) Hydrochloric acid, 1 oz.; water, 11 oz. As No. 6.

9. (MORTON'S LINIMENT.) Calomel and camphor, of each, 1 dr.; spermaceti ointment, 4 drs.; oil of turpentine and cocoa-nut oil, of each, 2 drs. As No. 5.

10. (RUSSIAN REMEDY.) The rind of perfectly ripe cucumbers, dried with the soft parts attached. For use, they are placed with the inner side, previously soaked in warm water, over the soft parts. (Med. Zeitung.)

11. (SWEDIAUR'S PASTE.) Bitter almonds, 8 oz.; honey, 6 oz.; powdered camphor and flour of mustard, of each, $\frac{1}{2}$ oz.; burnt alum and oilbanum, of each, $\frac{1}{2}$ oz.; yolks of 3 eggs; beat to a paste. To be applied night and morning.

12. (VANCE'S CREAM.) Ointment of nitrate of mercury, 1 oz.; camphor, 1 dr.; oil of turpentine, 2 drs.; oil of olives, 4 drs.; mix well together. To be applied, by gentle friction, 2 or 3 times daily.

Obs. All the preceding preparations are intended for chilblains before they break. The liniments of ammonia, camphor, opium, soap, and turpentine, as well as the compound camphor liniment of the British Pharmacopœia, are also excellent preparations for the same purposes.

13. (WAHLER'S OINTMENT.) Black oxide of iron, bole, and oil of turpentine, of each, 1 dr.; resin cerate, 1 oz. For broken chilblains. We have found a mixture of equal parts of calamine cerate and resin cerate answer quite as well. See CERATE, OINTMENT.

CHIL'DREN (Care of). See INFANCY.

Children (Diseases of). See the respective heads, and DISEASES.

• **CHIL'LIES.** See CAPSICUM, PEPPERS.

CHIM'NEYS were not introduced into England until the reign of Queen Elizabeth, and for a considerable period the principles of their construction were ill-understood. When the air inside and outside a chimney is at the same temperature, an equilibrium exists; there is no draught in the chimney, because the downward tendency of that within is counteracted by the upward pressure of that without. Let a fire be kindled in the grate; hot air is evolved, the chimney is heated, the air it contains suffers expansion, and a portion is expelled. The chimney now contains a smaller weight of air than it did before; the external

and internal columns no longer equilibrate each other, the warmer and lighter air is forced upwards from below, and its place is occupied by cold, and consequently heavier air. If the fire continues to burn, and the chimney retains its temperature, this second portion of air is disposed of like the first, and the ascending current continues, so long as the sides of the chimney are hotter than the surrounding air. Should the reverse happen to be the case, as sometimes occurs from sudden atmospheric changes, the column of air within the chimney rapidly contracts in volume, the deficiency is filled up from without, the column of air becomes heavier than one of a corresponding height on the outside of it, or in the apartment, and, obeying the common laws of gravitation, it falls out of the throat of the chimney or fire-place, just as a heavy body sinks in water, and has its place occupied by air from above. In this way, a descending current, of more or less intensity and duration, is established, and, if there is a fire in the grate, the chimney "smokes," or, if the grate is empty, perhaps, the smoke from neighbouring chimneys finds its way into our apartments. By the judicious arrangement of the fire-place, and the throat and flue of a chimney, an upward current may be constantly ensured so long as there is a fire in the grate, or the air of the apartment is warmer than the external atmosphere.

Count Pumford was the first who scientifically investigated the construction of chimneys. He showed that more heat is obtained from the fire by reflection when the coverings are placed in an oblique position. He also directed that the fire itself should be kept as near to the hearth as possible, and that the throat of the chimney should be constructed much narrower than was then the practice, in order to prevent the escape of so much heated air as happened with wide throats. By contracting the open part of the fire-place immediately over the fire, as by lessening the width of the hobs, or by bringing the throat of the chimney closer to the fire, and by contracting the throat of the chimney itself, within certain limits, any desired amount of draught may be obtained. When the space above the fuel is too small, the throat too near the burning fuel, or the throat itself too contracted, the draught of a common chimney is often too strong, and much fuel and heat is wasted. When the reverse is the case, the draught is commonly too languid, the fire draws badly, a portion of the smoke escapes into the room, and all the usual annoyances of a smoky chimney are suffered. By a proper attention to these conditions, a common fire-place may be adapted for the combustion of bituminous or easy burning coal, or of anthracite, and varieties of coal that require a considerable draught. It may even be converted into a wind furnace; whilst the inconvenience of smoky chimneys may be always avoided, and when existing, easily cured. This is pre-

suming, however, **COFFEE, SUCCORY C.**; **RAIR** exists in **TORREFACTA**, **R. C. T. CON-** apartment), generally employed both as a sub- the fuel, but also as an adulterant of that the chimney. Many of 1 part of good, fresh from the apartment before 12 parts of coffee the supply here alluded yields a beverage of a may be further stated, deeper colour than greater the length of a chimney, quantity of pure or will be the draught. Hence, a less quantity the upper rooms of a house should be remem- whilst the fires in the rooms beneath it does burn pleasantly and vigorously. **SUCCESSING**, are commonly relieved by a chimney-pot of cowl, of which numerous varieties are now before the public. The more crooked or tortuous the course of a chimney, the less likely is it to be affected by eddies and gusts of wind from neighbouring buildings or hills. See **FIRES, GRATE, SMOKE, STOVE**.

CHINA. In the purchase of china, glass, and earthenware, care should be taken to select those patterns which in case of breakage can be the most readily matched. Peculiar or rare patterns should be avoided, for if any such be broken, it will generally be found very difficult and expensive, and frequently impossible, to replace them.

China, glass, and earthenware, when very dirty, are best cleaned with finely powdered fuller's earth and warm water, followed by rinsing in clean water. A little clean soft soap may be added to the water instead of fuller's earth. See **PACKING, PORCELAIN**.

CHIN'OIDINE. See **QUINOIDINE**.

CHINOLINE BLUE. See **CYANINE**.

CHI'TIN. This name has been given to the hard, insoluble matter forming the shells and elytra of insects. It is obtained by boiling the elytra of the cockchafer with water, alcohol, ether, acetic acid, and alkalis.

CHITTICK'S REMEDY. Dr. Chittick's remedy for stone consisted of a fixed alkali, administered in veal broth. (Paris.)

CHLORAL. C_2HCl_3O . A peculiar liquid first obtained by Liebig, by the action of chlorine on alcohol.

Prep. (Liebig.) Anhydrous alcohol is placed in a tubulated retort, and dry chlorine gas passed through it, at first in the cold, but afterwards with the application of a gentle heat, until the chlorine passes unchanged through the liquor on raising it to the boiling temperature; on cooling, the whole forms a crystalline mass of chloral hydrate; this is melted by a gentle heat, and agitated with three times its volume of oil of vitriol; on increasing the heat a little, an oily stratum of impure chloral rises to the surface. It is purified by boiling it for some time (to drive off free hydrochloric acid and alcohol), next distilling it with an equal volume of oil of vitriol; and lastly, rectifying it from some powdered quick-lime, the process being stopped as soon as the surface of the lime becomes dry.

Prop., &c. Chloral is an oily liquid, pos-

same 'ng an ethereal smell; it is soluble in alcohol, ether, and water; with a small quantity of water the latter it rapidly changes into a semi-crystalline mass (chloral hydrate), which is insoluble in a larger quantity of water; boils at 101° ; sp. gr. 1.50%. It is decomposed by or even by earths and alkalis. By age it is converted into a white, solid, translucent substance (the conical chloral), which is reconverted by means of sulphuric acid into ordinary chloral. When incinerated as above, the chlorine is $4\frac{1}{2}$ to 5% conveniently introduced by a tube into or fawn into the tubulature of the retort, and a glass tube, bent upwards, should be connected with the beak to convey away the hydrochloric acid gas extricated, and to allow the volatilised alcohol and chloral to condense, and flow back into the retort.

CHLORAL HYDRATE. C_2HCl_3O . Aq. *Syn.* HYDRATE OF CHLORAL. *Prep.* "Pass dry chlorine gas, for several days, through absolute alcohol, sp. gr. 0.795, until it becomes a thick viscid liquid of sp. gr. 1.57. At the beginning of the operation the alcohol is well cooled to prevent inflammation and explosion, but towards the end of the operation the alcohol is heated nearly to the boiling-point. The resulting liquid, which after a day or two solidifies to a mass of crude chloral hydrate, is agitated with four times its bulk of concentrated sulphuric acid, and the anhydrous chloral which floats on the surface is separated and purified by fractional distillation. The purified anhydrous chloral is placed in a still, mixed with 11 per cent. of water, and distilled over chalk to remove any hydrochloric acid that may be present; the resulting solid distillate is then fused and poured out into shallow vessels to cast into cakes." (Squire.) The purest chloral hydrate is said to be that which has been crystallised two or three times out of pure bisulphide of carbon.—*Prop.* White opaque solid, having a pungent odour resembling that of a ripe melon. Soluble in water, glycerin, and alcohol. Gradually volatilises in the air, and may be distilled without decomposition. From 100 grs. dissolved in $\frac{1}{2}$ fl. oz. of water, well shaken with 1 fl. oz. of solution of potash (B. P.), and allowed to stand for several hours, at least 46 grain-measures of chloroform should separate.

Uses. An excellent sedative, antispasmodic, hypnotic, anodyne. It has done good service in hypochondriacal and other nervous affections, also in asthma, whooping-cough, and scarlet fever. It has also the reputation of being an efficient preventive of sea-sickness, especially on short voyages, such as crossing the Channel, which can be accomplished during the sleep occasioned by the agent.—*Dose.* From 10 to 60 grs.

CHLORALUM. An impure aqueous solution of chloride of aluminium, sp. gr. 1.15. 1 fl. oz. of the liquid contains 75 grains of anhydrous chloride. Introduced by Professor Gamgee as an antiseptic and disinfectant, for which pur-

poses it is recommended to dilute the article as sold with four times its bulk of water.

CHLO'RATE. *Syn.* HYPEROXYMU'Riate†, CHLO'RAS, L. A compound in which the hydrogen of chloric acid, $HClO_3$, is replaced by a metal or other basic radical, e.g. $KClO_3$, chlorate of potassium. Chlorates may be prepared by dissolving the hydrate or oxide in chloric acid, and crystallising. The alkaline chlorates, however, are made by passing chlorine into solutions of the hydrate or carbonate of potassium or sodium, boiling the resulting liquid, and separating the chlorate from the chloride, which is also formed, by crystallisation. They are very similar to the nitrates, both in their general properties and composition. They are all decomposed at a red heat, metallic chlorides being formed and oxygen gas given off. Like the nitrates, they deflagrate with inflammable substances, but with greater facility and violence. A mixture of this kind will detonate with a slight blow or friction. All the chlorates are soluble in water.

Char., Tests, &c. The chlorates are known by their deflagrating when placed on red-hot charcoal. By evolving a yellowish-green gas when treated with concentrated sulphuric acid, in the cold, which gas also communicates to the liquid a red or yellow tinge. By evolving oxygen gas when heated alone in a test-tube. This test is not characteristic, unless carried a stage further, by dissolving the residual chloride out of the tube, and adding to the filtered solution a few drops of nitrate of silver; then the formation of a white precipitate, insoluble in nitric acid, will show that the salt treated was a chlorate, and not a nitrate. Pure chlorates give no precipitate with nitrate of silver.

CHLORHY'DRIC ACID. See HYDROCHLORIC ACID.

CHLO'RIC ACID. $HClO_3$. *Syn.* HYPEROXYMURIATIC ACID; ACIDUM CHLO'RICUM, L. An acid discovered by Chenevix, but first obtained in a separate form by Gay-Lussac.

CHLO'RIDE (†id). *Syn.* CHLO'RURE†; CHLORIDUM, L. A chemical compound of chlorine with a metal or other basic radical, e.g. $NaCl$, chloride of sodium; C_2H_5Cl , chloride of ethyl.

Prep. The majority of the metallic chlorides may be made by simply dissolving the metal or its carbonate, oxide, or hydrate, in hydrochloric acid (previously diluted with about twice its weight of water), and evaporating and crystallising the solution, in the usual manner. Zinc, cadmium, iron, nickel, cobalt, and tin, dissolve readily in hydrochloric acid; copper only in strong boiling acid; silver, mercury, and gold, not at all. The insoluble chlorides, as those of silver and mercury, may be readily prepared by precipitating any of their corresponding soluble salts with hydrochloric acid, or a soluble chloride, such as

common salt. Anhydrous chlorides are generally prepared by the direct action of chlorine on the bases.

Char., Tests, &c. Most of the metallic chlorides are soluble in water. Many fuse when heated, and volatilise unchanged, but others are completely or partially decomposed at a red heat. All, with the exception of those of the alkali and earth metals, are decomposed at a red heat in a current of hydrogen. They are recognised by the following reactions:—1. Heated with a little peroxide of manganese and sulphuric acid, chlorine is evolved, and easily detected by its colour, smell, and bleaching properties:—2. The soluble chlorides may be readily detected by their solutions, slightly acidulated with nitric acid, giving with a solution of nitrate of silver a white, curdy precipitate (chloride of silver), insoluble in nitric acid, freely soluble in liquor of ammonia, and blackened by the light:—3. The insoluble chlorides may be tested by digesting them in a little liquor of potassa, when a solution of chloride of potassium will be formed, which may be treated as just directed (2); or the chloride may be dissolved in nitric acid, and tested with nitrate of silver as before.

CHLORIM'ETRY. See **CHLOROMETRY.**

CHLORINA'TED LIME. See **LIME.**

CHLORINA'TED SO'DA. See **SODA.**

CHLO'RINE. *Syn.* **CHLORIN'IUM, L.; CHLORE, Fr.; CHLOR, Ger.** An elementary substance discovered by Scheele in 1774, and at first supposed to be a compound body. In 1809, MM. Gay-Lussac and Thénard suggested the probability of it being a simple substance; but it was reserved for Sir H. Davy, shortly afterwards, to demonstrate the truth of the suggestion of these foreign chemists.

Nat. hist. It exists in nature chiefly in the form of chloride of sodium, which constitutes rock salt when deposited in inland beds, sea salt when dissolved in masses of water. The sea also contains chlorides of potassium, calcium, and magnesium. It is a constituent of several well-known minerals. It has been met with in the air of volcanic districts, combined with hydrogen, as hydrochloric acid.

Prep. Strong hydrochloric acid is poured on half of its weight of finely powdered peroxide of manganese, previously placed in a glass flask or retort; chlorine gas is immediately evolved, even in the cold, but much more rapidly on the application of a gentle heat, and is collected in clean, dry bottles by displacement. The tube conducting the gas is so arranged as to reach to the bottom of the bottle, and the chlorine, being heavier than the air, displaces the latter without mixing with it. The bottle is known to be full by the gas, easily perceived by its green colour, overflowing the top of the vessel. The bottle is then closed up with an accurately fitting stopper, previously greased, and an empty one put in its place, which is subse-

quently treated in like manner. To free the gas entirely from hydrochloric acid, it is passed through a wash bottle containing a small quantity of water; and to render it quite dry, it is passed over fused chloride of calcium. When the presence of moisture is no object, chlorine may be collected over warm water, or, what is better, a saturated solution of common salt, in the pneumatic trough. The mercurial trough cannot be employed, as the chlorine rapidly acts upon the metal, and becomes absorbed.

Commercial.—From oil of vitriol and water, of each, 7 parts, cautiously mixed, and allowed to cool; chloride of sodium (common salt), 4 parts, mixed intimately with peroxide of manganese, 3 parts. The dilute acid is placed in a retort or other generating vessel, and the powder added. The gas comes off slowly at first, but the application of a gentle heat causes it to rush forth in large quantities. Of late years, owing to the general demand for bleaching agents, numerous new methods for obtaining chlorine have been patented, with a view of adopting a continuous process.

Prop., Uses, &c. Chlorine is a gas possessing a yellowish-green colour, and a pungent, suffocating odour. It is one of the heaviest substances that are gaseous at ordinary temperatures, being nearly $2\frac{1}{2}$ heavier than atmospheric air—sp. gr. 1.47. It is soluble to a considerable extent in water, that liquid at 60° Fahr. absorbing about twice its volume. It is non-inflammable, but its union with some of the elements is attended with the phenomena of combustion; thus, phosphorus, copper leaf, powdered antimony and arsenic, and several other substances thrown into chlorine immediately inflame. Under a pressure of 4 atmospheres, it is condensed into a yellow, limpid liquid. Moist chlorine gas cooled to 32° Fahr. condenses into yellow crystals, containing $35\frac{1}{2}$ parts of chlorine and 90 parts of water. The most remarkable property of chlorine is, its power of destroying almost all vegetable and animal colours, and the putrid odour of decomposing organic matter; hence its value as a bleaching agent, and as a disinfectant and fumigation. When first proposed as a bleaching agent by Berthollet, it was used much the same way as sulphur is now in bleaching woollen goods; afterwards a solution of the gas in water was employed, but the final improvement was Tennant's patent of combining the gas with lime to form "chloride of lime." With the bases chlorine forms an important series of compounds called chlorides.

Tests. Free chlorine is readily distinguished from other gases by its colour, suffocating odour, and bleaching properties. The aqueous solution dissolves gold leaf, and with nitrate of silver gives a white, curdy precipitate.

CHLO'RITE. A salt in which the hydrogen of chlorous acid, HClO_2 , is replaced by a metal or other basic radical. See **CHLOROUS ACID.**

CHLOROCHROMIC ACID. CrOCl . *Syn.* CHLOROCHROMIC ANHYDRIDE. *Prep.* Bichromate of potassium, 3 parts; common salt, $3\frac{1}{2}$ parts; are intimately mixed together, put into a glass retort, and oil of vitriol, 9 parts, added; heat is next applied and maintained as long as dense, red vapours are given off. The product in the receiver is a heavy, deep-red liquor, greatly resembling bromine in appearance. Water resolves it into hydrochloric and chromic anhydride.

CHLO'RODYNE. See PATENT MEDICINES.

CHLO'ROFORM. CHCl_3 . *Syn.* TERCHLO'RID OF FOR'MYLE, FOR'MYL-CHLO'RID; CHLOROFORMYL, CHLOROFORMUM, L. A remarkable fluid discovered by Soubeiran in 1832, and carefully examined in 1834 by Dumas. In 1842 its action upon animals was investigated by Dr. M. Glover, and in 1847 it was introduced to the medical profession as an anæsthetic agent by Dr. Simpson, of Edinburgh.

It was first obtained by the action of caustic alkali upon chloral, but it is more easily prepared by distilling alcohol or wood spirit with chloride of lime.

Prep. 1. Chloride of lime (in powder), 4 lbs.; water, 12 lbs.; mix, in a capacious retort or still, add of rectified spirit, 12 fl. oz., and cautiously distil, as long as a dense liquid, which sinks in the water it passes over with, is produced; separate this from the water, agitate it with a little sulphuric acid, and, lastly, rectify it from carbonate of barium.

2. Chloride of lime, 4 lbs.; water, 10 pints; rectified spirit, $\frac{1}{2}$ pint; proceed as last, using a spacious retort that the mixture will only 1-3rd fill, and the heat of a sand bath. When ebullition commences remove the fire as quickly as possible, lest the retort be broken by the suddenly increased heat, and let the solution distil into a receiver as long as there is nothing which subsides, the heat being restored if it be at all needed. Add to the distilled liquid four times as much water, and shake the whole well together; next cautiously separate the heavier part as soon as it has subsided, and to this add of chloride of calcium, broken into fragments, 1 dr.; and shake occasionally during an hour; finally let the fluid again distil from a glass retort into a glass receiver.

3. Hydrate of lime, 1 part, is suspended in cold water, 24 parts, and chlorine passed through the mixture until nearly the whole of the lime is dissolved; hydrate of lime, q. s., just to restore the alkaline reaction of the liquid, is then added; and, afterwards, rectified spirit of wine or wood spirit, 1 part, is mixed in; the whole, after repose for 24 hours in a covered vessel, is cautiously distilled as before.

Prop. &c. Liquid; transparent; colourless; odour, fragrant, ethereal, and apple-like; taste, ethereal, sweetish, but slightly acid; soluble in 2000 parts of water; mixes in all proportions with alcohol and ether; dissolves (readily) bromine, camphor, caoutchouc, gutta

percha, iodine, oils, resins, wax, and several other like substances; boils at 141.8° Fahr.; kindles with difficulty; burns with a greenish flame; and communicates a dull, smoky-yellow colour to the flame of alcohol. Sp. gr. 1.48 (1.497, Miller); density of vapour, 4.2. The vapour has the remarkable property of rendering a person breathing it temporarily insensible to pain.

Pur. Chloroform is frequently adulterated with alcohol and ether; and, owing to careless manipulation, is also sometimes contaminated with other substances, as chloral, hydrochloric acid, and free chlorine. When pure, it is free from colour, and of a pleasant odour. Sp. gr. not less than 1.48. It is not perfectly soluble in water; and does not turn the colour of litmus red. Rubbed on the skin, it quickly evaporates, scarcely leaving any odour. Dropped into water, it falls to the bottom and remains bright and limpid; but if it contain alcohol the surface of the drop becomes opaline. If the same experiment be made with diluted sulphuric acid, sp. gr. 1.44, the drop of pure chloroform will fall to the bottom; but that which contains spirit, if not shaken, will float or remain suspended in the acid solution. When contaminated with heavy hydrocarbon oils, a drop evaporated from the palm of the hand leaves behind a strong smell. Hydrochloric acid and free chlorine are detected by the ordinary tests.

Uses, Action, &c. Chloroform is anodyne, antispasmodic, sedative, stimulant, and anæsthetic. In small doses (5 to 12 or 15 drops, in water, mixed with a little syrup or mucilage), it is employed in spasmodic disorders, and as a stimulant and diaphoretic. It is now chiefly used as an anæsthetic to produce insensibility to pain during surgical operations. The dose for inhalation is 1 fl. dr., which is repeated, in a few minutes, if no effect is produced, until 3 fl. dr. have been thus exhibited; the effects being carefully watched, and the source of the chloroform vapour removed as soon as a sufficient degree of anæsthesia is produced, or any unpleasant symptoms develop themselves.

Chloroform in large doses depresses the heart's action, and causes profound coma, and death. It is therefore dangerous in all cases complicated with diseases of the heart or brain, or any visceral affections of a congestive character.

The treatment of asphyxia from chloroform is—the horizontal position, cold affusion to the head and spine, artificial respiration, and, if possible, either the application of electricity, or the inhalation of protoxide of nitrogen or oxygen gas, largely diluted with atmospheric air.

Concluding remarks. The preparation of chloroform is not unattended with danger, and frequently miscarries in careless or inexperienced hands. This arises chiefly from the violent reaction which immediately follows

the application of the heat. On the common plan there is great danger of explosion, or of the liquid in the still being forced over into the receiver, owing to the extraordinary rapidity with which the vapours are eliminated, and the ingredients, in consequence, swell up. The method we have successfully adopted on the large scale, is to employ a very broad and shallow capsule-shaped still, having a flat rim round it, with a head or capital furnished with a corresponding rim at its lower part. In use, a flat, endless band of vulcanised India rubber is placed between the two rims, which are then held air-tight together by means of small, iron clamps. The application of heat is also delayed for some time after the admixture of the spirit with the other ingredients, and the process is interrupted as soon as the first violence of the reaction has subsided, by which time the whole product of chloroform will have passed over into the receiver. If the distillation is continued beyond this point, the remaining product is water. On the small scale, a very capacious, flat-bottomed retort or cucurbit should be employed. A similar refrigeratory may be used to that noticed under ether.

CHLOROHYPONITRIC GAS (NOCl) and **CHLORONITROUS GAS** ($\text{N}_2\text{O}_2\text{Cl}_4$) are two peculiar compounds, formed when nitric acid and hydrochloric acid are mixed.

CHLOROMETER. *Syn.* **CHLORIMETER.** An instrument or apparatus employed in chlorometry. The chlorometers in common use are graduated measures and tubes precisely similar to those used in **ACIDIMETRY**, **ALKALIMETRY**, &c.

CHLOROMETRY. *Syn.* **CHLORIMETRY.** The estimation of the available chlorine in the bleaching powder of commerce, which is valued and sold in this country by its percentage of that element. The plans generally adopted are applicable to the so-called chlorides of soda and potassa, as well as to the ordinary bleaching powder, chloride of lime. Most of them depend on the oxidising effect of water when undergoing decomposition through the action of chlorine.

Dalton's Process. The test-solution is prepared as follows:—Pure protosulphate of iron (previously dried by strong pressure between the folds of cloth or bibulous paper), 78 grs., are dissolved in distilled water, 2 oz., and a few drops of hydrochloric or sulphuric acid added. This quantity of protosulphate requires for complete peroxidation just the quantity of oxygen liberated by 10 grs. of chlorine; in other words, the solution exhibits the indirect effect produced by exactly 10 grs. of the bleaching element.

Exactly 50 grs. of the sample of chloride of lime to be examined are next weighed, and well mixed in a glass or wedgwood mortar with tepid water, 2 oz.; and the mixture poured into a graduated tube or chlorometer. The tube is next filled up to 0, or zero, with

the washings of the mortar, and the whole well mixed, by placing the thumb over the orifice and shaking it. The solution of chloride of lime, thus formed, is next gradually and cautiously added to the solution of sulphate of iron, previously noticed, until the latter is completely peroxidised, which may be known when it ceases to be affected by a solution of red prussiate of potash. When a drop of the latter test, placed upon a white plate, ceases to give a blue colour on being touched with the point of a glass stirrer or rod dipped in the liquor under examination, enough of the solution of the chloride has been added. The number of measures thus consumed must now be carefully read off from the graduated scale of the chlorometer, from which the richness of the sample may be estimated as follows:—As 100 of the chlorometer divisions contain exactly 50 grs. of the chloride under examination, each measure will contain only $\frac{1}{2}$ gr., and, consequently, the number of measures consumed will represent half that number of grains of the chloride examined; and the weight of the chloride thus used will have contained 10 grs. of chlorine—the constant quantity of that substance required to peroxide the test-solution of sulphate of iron. Thus:—If 80 measures of the liquor in the chlorometer have been consumed, this quantity will represent 40 grs. of chloride of lime, and 10 grs. of chlorine. By dividing 1000 by this number, the per-centage of chlorine will be obtained. In the present instance this would be—

$$\frac{1000}{40} = 25\frac{1}{2}\%$$

Crum's Process. Equal weights of water and hydrochloric acid are mixed together, and cast-iron borings digested in the diluted acid until saturation is complete; a large excess of iron being purposely employed, and the liquid kept at the heat of boiling water for some time. One measure of the solution, marking 40° on Twaddell's scale (sp. gr. 1.200), is then mixed with an equal quantity of acetic acid (sp. gr. 1.048). This forms the test-liquid. When mixed with 6 or 8 parts of water, it is quite colourless, but chloride of lime occasions the production of peracetate of iron, which gives it a red colour.

The above proof-solution is next poured into 12 two-oz. vials, of exactly equal diameters, to the amount of $\frac{1}{4}$ th of their capacity; these are filled up with bleaching liquid of various strengths; the first at $\frac{1}{16}$ th of a degree of Twaddell, the second $\frac{1}{8}$ th, and so on up to $\frac{1}{2}$ ths of 1°. They are then well corked up, and, after agitation, arranged side by side on a tray, furnished with holes to receive them. (See *engr.*) To ascertain the strength of an unknown sample of bleaching liquor, the proof-solution of iron is put into a phial, exactly similar to the 12 previously used, and

in precisely the same proportion ($\frac{1}{10}$ th). The phial is then filled up with the bleaching liquor, well shaken, and placed beside that one of the 12 already prepared which it most resembles in colour. The number on that phial expresses the strength of the sample under examination, in twelfths of a degree of Twaddell's hydrometer.

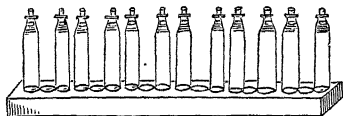

TABLE exhibiting the quantity of Bleaching Liquid, at 6° on Twaddell's scale (sp. gr. 1.030), required to be added to a weaker liquor, to raise it to the given strengths. Adapted from Mr. Crum's table by Mr. Cooley.

Strength of sample in $\frac{1}{12}^{\circ}$.	Required Strength.	Proportions required.	
		Given Sample.	Liquor at 6°.
		Parts.	Part.
Water.	$\frac{1}{12}^{\circ}$	8	1

1	"	35	1
2	"	71	1

Obs. The preceding method is admirably suited for weak solutions, such as are employed for bleaching textile fabrics, and is well adapted (from its simplicity) to the purposes of practical men. Indeed, it is quite astonishing to see with what ease and accuracy it is applied by unlettered operatives. This gives it great practical value. It has been for some time in extensive use in the bleaching houses of Scotland.

According to Mr. Crum, the range of strength within which cotton is "safe," is very limited. A solution at 1° of Twaddell's scale (sp. gr. 1.005), is not more than safe, while one at $\frac{1}{2}^{\circ}$ is scarcely sufficiently strong for the first ope-

ration on stout cloth, unless it is packed more loosely than usual.

Gay-Lussac's Indigo Process. One part of the best indigo is dissolved in 9 parts of strong sulphuric acid, by the aid of a gentle heat; this solution is then mixed with distilled water, in such proportion, that 1 volume of chlorine gas shall exactly decolour 10 volumes of this solution. Each measure so decoloured is called a degree, and each degree is divided into fifths. 5 grs. of the best chloride of lime, dissolved in 500 gr. measures of water, possess the above power, and indicate 10° or proof; or in other words, will decolour 10 times its volume of the indigo solution.

Obs. This method of chlorometry is objectionable, and liable to error, from the indigo solution altering by keeping. When, however, the proper precautions are used, it may be safely trusted for weak bleaching liquors.

Arsenious Acid Process. This depends on the conversion, by oxidation, of arsenious acid into arsenic acid, in the presence of chlorine and water.

To prepare the test-liquor, pure arsenious acid, 100 grs. are dissolved in about 4 fl. oz. of pure hydrochloric acid (free from sulphurous acid), and the solution diluted with water until, on being poured into a graduated 10,000 grains-measure-glass, it occupies the volume of 7000 grains measure marked on the scale. Each 1000 grains measure of this liquid now contains 14.29 grs. of arsenious acid; corresponding to 10 grs. of chlorine, or $\frac{1}{10}$ th gr. of chlorine for every division or degree of the scale of the chlorometer.

100 grs. of the chloride of lime to be examined are next dissolved in water as before, and poured into a tube graduated up to 2000 grains measure. The whole is now well shaken, in order to obtain a uniformly turbid solution, and half of it (1000 grains measure) transferred to a graduated chlorometer, which is, therefore, thus filled up to 0°, or the zero of the scale, and contains exactly 50 grs. of the chloride of lime under examination; whilst each degree or division of the scale contains only $\frac{1}{2}$ gr.

1000 grains measure of the arsenious acid test-liquor are now poured into a glass beaker, and a few drops of solution of sulphate of indigo added in order to impart a faint but distinct blue colour to it; the glass is then shaken so as to give a circular movement to the liquid, and whilst it is whirling round, the chloride of lime solution from the chlorometer is gradually and cautiously added, until the blue tinge given to the arsenious acid test-liquor is destroyed; care being taken to stir the mixture well during the whole process, and to stop as soon as the decolorisation is completed.

Let us suppose now, that in order to destroy the blue colour of the 1000 grains measure of the arsenious acid test-liquor, 90 divisions or degrees of the chloride of lime solution have been employed. These 90 divisions, therefore,

contained the 10 grs. of chlorine required to destroy the colour of the test-solution; and since each division represents $\frac{1}{2}$ gr. of chloride of lime, 45 grs. of chloride of lime (10 grs. of chlorine) were present in the 90 divisions so employed, from which the per-centage strength may be ascertained. For—

45 : 10 • : 100 : 22.22

The chloride of lime examined, therefore, contained 22 $\frac{1}{2}$ per cent. (nearly) of chlorine.

Obs. This method is extremely simple and trustworthy when properly employed; but to ensure accuracy, certain precautions must be adopted. Instead of pouring the test-liquor into the solution of the sample (as in alkali-metry), the solution of the sample must be poured into the test-liquor.

Another process is that of Dr. Ure, as follows:—Liquor of ammonia, of a known strength, tinged with litmus, is added to a solution of a given weight of the chloride under examination, until the whole of the chlorine is neutralised, which is known by the colour being destroyed. From the quantity of ammonia consumed the strength of the sample is estimated.

CHLOROPHYLL. The green colouring matter contained in the leaves, stalks, unripe fruit, and juices of most plants.

CHLOROSIS. *Syn.* GREEN SICKNESS. A disease which principally affects young unmarried females.

Symp. Languor, listlessness, fatigue after the least exercise, palpitation of the heart, flatulency, indigestion, acidity of stomach and bowels, constipation (generally), appetite for unnatural food, general debility, &c. As the disease advances, the skin, at first pale, assumes a peculiar greenish tint, the respiration becomes affected, the feet and legs swell, and various organic affections of the viscera ensue. During the early stages of this disease the catamenia are usually pale and scanty, and return at irregular intervals, and as it progresses they disappear altogether.

Treat. This should be tonic and restorative. That recommended under ANEMIA may be adopted with advantage. See also APPETITE, ATROPHY.

CHLOROUS ACID. HClO_2 . *Syn.* ACIDUM CHLOROSUM, L. *Prep.* From chlorate of potassium, 4 parts; arsenious anhydride, 3 parts; nitric acid, 12 parts; (diluted with) water, 4 parts; heated together in a glass flask, furnished with a bent tube, and placed in a water bath. It must be collected in the same way as chlorine, or passed into water, when it forms a solution of chlorous acid.

Prop. &c. Chlorous acid is a greenish-yellow gas, non-condensable by a freezing mixture of salt and ice, but liquefiable by extreme cold. The aqueous solution undergoes gradual decomposition, yielding chloric acid and chlorine. Chlorous acid possesses powerful oxidising and bleaching properties; with the

bases it forms salts called CHLORITES. These are all soluble in water, and bleach like the acid. They may be recognised by the evolution of chlorous acid gas when acted on by an acid. The use of the arsenious acid is to deoxidise the nitric acid employed in the process. Tartaric acid, or other deodorising agent, may be substituted for it.

CHOCOLATE. *Syn.* CHOCOL'ATA, L.; CHOCOLLATI, Mexican; CHOCOLAT, Fr. A beverage or paste made from the roasted seeds of the *Theobroma Cacao*, or COCOA. Strictly speaking, the term "chocolate" is applicable to all genuine preparations of cocoa, but it is now generally used to distinguish those which contain sugar, and, commonly, flavouring substances. Of late years great attention has been paid to the manufacture of chocolate in England; our principal makers now import the finest descriptions of cocoa, and produce varieties of the manufactured article which are scarcely inferior to those of their French rivals. The different kinds of cocoa, and the processes of roasting, sweating, &c., are described under COCOA, to which article we refer the reader also for particulars respecting the chemistry of chocolate.

Prep. The cocoa nibs¹ are ground in a mill consisting of stone or metal rollers, which are usually heated either by charcoal fires or by steam, so as to soften or melt the natural fat.² The warm, smooth paste which passes from the mill is then placed in a mixing mill, and incorporated with refined sugar, and usually vanilla or other flavouring substance. The trituration is continued until the whole paste is converted into an entirely homogeneous mass, which is finally shaped, by means of suitable moulds, into various forms, as blocks, loaves, tablets, lozenges, &c.

Obs. Chocolate, prepared as above, without the addition of aromatics, is known in the trade as PLAIN CHOCOLATE. The Spaniards flavour it with vanilla, cloves, and cinnamon, and frequently scent it with musk and ambergris. With these additions it is termed SPANISH CHOCOLATE. In general, they add too large a quantity of the last four articles. The Parisians, on the contrary, use little flavouring, and that principally vanilla. They employ the best kinds of cocoa, and add a considerable quantity of refined sugar. So prepared, it is called FRENCH CHOCOLATE.

Proportions. 1. FRENCH CHOCOLATE:—The proportions used for the best description are said to be—2 beans of vanilla, and 1 lb. of the best refined sugar, to every 3 lbs. of the choicest cacao nuts.

2. SPANISH CHOCOLATE:—The following forms are said to be commonly adopted:—

a. Caracas cocoa, 11 lbs.; sugar (white), 3 lbs.; vanilla, 1 oz.; cinnamon (cassia); $\frac{1}{2}$ oz.; cloves, $\frac{1}{2}$ dr.

¹ The bruised, roasted seeds, freed from husk and membrane.

² Cacao- or cocoa-butter.

b. Caracas cocoa, 10 lbs.; sweet almonds, 1 lb.; sugar, 3 lbs.; vanilla, $1\frac{1}{4}$ oz.

c. Caracas cocoa, 8 lbs.; island cocoa, 2 lbs.; white sugar, 10 lbs.; aromatics, as above.

d. Island cocoa, 7 lbs.; farina, q. s. to absorb the oil. Inferior.

3. VANILLA CHOCOLATE. *Syn.* CHOCOLAT À LA VANILLE, Fr. A variety of French or Spanish chocolate highly flavoured with vanilla. The following proportions have been recommended:—

a. Caracas cocoa, 7 lbs.; Mexican vanilla, 1 oz.; cinnamon, $\frac{1}{2}$ oz.; cloves, 3 in no.

b. Best chocolate paste, 21 lbs.; vanilla, 4 oz.; cinnamon, 2 oz.; cloves, $\frac{1}{2}$ dr.; musk, 10 grs.

Obs. The vanilla used in making chocolate is reduced to powder by rubbing it with a little sugar, before adding it to the paste.

Pur., &c. The chocolate commonly sold in England is prepared from the cake left after the expression of the oil, and this is frequently mixed with the roasted seeds of ground peas, and maize or potato flour, to which a sufficient quantity of inferior brown sugar, or treacle and mutton suet, is added to make it adhere together. Inferior sweet almonds are also employed in the same way.

Since the above paragraph was written there has been a vast improvement in English chocolates, though the cheaper sorts of certain makers are still much adulterated. Genuine chocolate should dissolve in the mouth without grittiness, and should leave a peculiar sensation of freshness; after boiling it with water the emulsion should not form a jelly when cold, for if it does starch or flour is present. The presence of animal fat may generally be detected by a cheesy or rancid flavour. See COCOA.

Qual., &c. Chocolate is nutritive and wholesome, if taken in moderation, but is sometimes apt to disagree with weak stomachs, especially those that are easily affected by oily substances or vegetable food. When this is the case, by adopting the simple plan recommended under BUTTER, chocolate may generally be taken with impunity, even by the dyspeptic. The quantity of aromatics mixed with the richer varieties of chocolate improve the flavour, but render them more stimulant and prone to produce nervous symptoms and head complaints.

Chocolate is taken in the solid form, or made into a beverage; or, combined with sugar, is made into various articles of confectionery.

CHOCOLATE FOR THE TABLE is prepared by slicing or scraping very finely the required quantity into a jug, and adding to it a small quantity of boiling water. This is worked into a thin, smooth paste, and the jug immediately filled up with boiling milk-and-water. A froth is produced by the same means that eggs are beaten up. The operation of "milling," performed by rapidly twirling a notched

cylinder of wood in the emulsion, raises the froth very quickly. Sugar may be put in with the scraped chocolate, or added afterwards at pleasure.

Chocolate should never be made for the table before it is wanted, because heating it again injures the flavour, destroys the froth, and separates the body of the chocolate, the oil of the nut being observed, after a few minutes' boiling, or even standing long by the fire, to rise to the top. This is one of the principal reasons why chocolate offends the stomach.

Preparations of chocolate, intended either as nutritious articles of food for convalescents, or as vehicles for medicine, are common among the pharmacopœial and magistral formulæ of the Continent. The following are a few examples:—

Chocolate, Aromatic. *Prep.* (Weiglebt.) Cocoa beans and sugar, of each 16 oz.; cinnamon, $\frac{1}{2}$ oz.; cloves 2 drs.; cardamoms and vanilla, of each, 1 dr.

Chocolate, Car'rageen. See WHITE CHOCOLATE (Nos. 1 and 2).

Chocolate, Chalybeate. *Syn.* FERRUGINOUS CHOCOLATE; CHOCOLATA CHALYBEATA, C. MÆTIS, L. *Prep.* 1. (Trousseau.) Spanish chocolate, 16 oz.; carbonate of iron, $\frac{1}{2}$ oz.; mix, and divide into 1-oz. cakes. One at a time; in anæmia, amenorrhœa, chlorosis, &c.

2. (Pierquin.) Iodide of iron, 2 drs.; chocolate, 16 oz. For $\frac{1}{2}$ -oz. cakes; as above, and in scrofulous and glandular affections.

Chocolate, Guarana'. *Syn.* PAULLINIA CHOCOLATE; CHOCOLATA PAULLINÆ, C. GUARANÆ, L. *Prep.* From guarana and white sugar, of each, 1 oz., triturated together, and afterwards thoroughly mixed with good plain chocolate, 18 oz. Recommended as a restorative in debility, chlorosis, and other diseases of debility, especially those of a nervous character.

Chocolate, Iceland Moss. *Syn.* CHOCOLATA CETRARIE ISLANDICÆ, C. LICHENIS, L. *Prep.* 1. (P.C.) Simple chocolate (P.C.), 32 parts; sugar, 20 parts; dried jelly of Iceland moss, 11 parts; mix.

2. (Cadet.) Chocolate, 4 lbs.; sugar, 2 lbs.; Iceland moss (freed from its bitter, and powdered), $1\frac{1}{2}$ lb.; tragacanth and cinnamon, of each, 4 oz.; water, q. s.; to be beaten in a warm mortar, or ground with a muller on a warm slab to a paste. Recommended in pulmonary affections, general debility, weakness of stomach, &c. See COCOA (Iceland Moss).

Chocolate, Purgative. *Syn.* CHOCOLATA PURGANS, C. CATHARTICA, L. *Prep.* 1. Jalap, 1 oz.; chocolate, 9 oz.; mix, and divide into 1-dr. cakes.—*Dose.* 1 to 2 cakes, as a purge.

2. Jalap, 2 oz.; calomel and sugar, of each, 1 oz.; triturate together, then add chocolate, 20 oz.; for 1-dr. cakes.

3. Scammony, 2 drs.; chocolate, 3 oz.; for 1 dozen cakes. The last two are given in

worms.—*Dose* (for an adult). 1 cake, taken fasting.

Chocolate, Sal'ep. *Syn.* SAL'OOP CHOCOLATE; CHOCOLA'TA CUM SAL'EP, L. *Prep.* 1. (P.C.) Chocolate, 16 oz.; powdered salep, $\frac{1}{2}$ oz.

2. (Cadet.) Cacao paste and sugar, of each, 1 lb.; powdered salep, 1 oz. Arrowroot chocolate and tapioca chocolate are made in the same manner. (See *below*.)

Chocolate, Sim'ple. *Syn.* HYGIEN'IC C., HOMOEOPATH'IC C.; CHOCOLA'TA, C. SIM'PLEX, C. SALUTIS, L.; CHOCOLAT DE SANTÉ, Fr. *Prep.* (P.C.) Caracas and Maragnan cocoa, of each, 96 lbs.; sugar, 160 lbs.; cinnamon, 1 oz. (to 2 oz.); triturated together in the usual manner, and formed into cakes or powder.

Chocolate, Vanil'la. *Syn.* CHOCOLA'TA CUM VANIL'LA, L. *Prep.* 1. (P.C.) Chocolate (plain.—P.C.), 16 oz.; vanilla, $\frac{1}{2}$ dr.

2. (Cottreau.) Cocoa paste, 6 lbs.; sugar, 10 lbs.; vanilla, 11 drs.

See forms previously given.

Chocolate, Vermifuge. *Syn.* CHOCOLA'TA VERMIFUGA, L. See PURGATIVE CHOCOLATE (Nos. 2 and 5, *above*).

Chocolate, White. *Syn.* WHITE COCOA, CAR'AGEEN C.; CHOCOLA'TA CUM CHON'DRO, PAS'TA CACA'O CUM CHON'DRO, P. C. C. LI-CHEN'E CAR'AGEEN'O, L. *Prep.* 1. As Iceland moss chocolate, but employing carrageen moss.

2. (Ph. Dan.) Roasted and decorticated cocoa seeds (reduced to a subtile mass in a warm iron mortar) and powdered white sugar, of each, 2 lbs.; powdered carrageen (debit-terised), 3 oz.

3. (Cottreau.) Sugar, 6 lbs.; rice flour, $1\frac{1}{2}$ lb.; potato starch and butter of cocoa, of each, $\frac{1}{2}$ lb.; gum arabic $\frac{1}{2}$ lb. (dissolved); tincture of vanilla, $\frac{1}{2}$ fl. oz.; boiling water, q.s.; triturate to a stiff paste. The above are highly nutritious, and are recommended as articles of diet for convalescents and debilitated persons.

CHOLERA-DAMP. *Syn.* AFTER-DAMP. The term applied by miners to carbonic anhydride (carbonic acid) and other irrespirable gases and vapours evolved in mines. See CARBONIC ACID, FIRE DAMP, VENTILATION, &c.

CHOLALIC ACID. $C_{24}H_{40}O_5$. *Syn.* CHOL'IC ACID.¹ A non-nitrogenous acid existing in bile. It is best prepared by boiling the resinous mass precipitated by ether from an alcoholic solution of ox bile with a dilute solution of potassa, for 24 to 36 hours, till the amorphous potassa-salt that has separated begins to crystallise. The dark-coloured soft mass is then removed from the alkaline liquid, dissolved in water, and hydrochloric acid added. A little ether will cause the deposition of the CHOLALIC ACID from this solution in crystals. With sulphuric acid and solution of sugar, it strikes a purple-violet colour; this constitutes Pettenkofer's test for bile.

CHOLE'IC ACID. *Syn.* TAURO-CHOLAL'IC ACID.¹ This name is generally applied to another compound. See CHOLIC ACID.

ACID. A peculiar conjugated compound of cholalic acid with a substance called taurine, which contains both nitrogen and sulphur. In combination with soda, choleic acid constitutes a principal ingredient in *bile*.

CHOL'ERA. This word, which, from its derivation, can be only applied correctly to a bilious affection of the stomach and bowels, has been of late years very loosely extended to a malignant disease, the most marked characteristic of which is a total suspension of the functions of the biliary organs.

Cholera, En'glish. *Syn.* COM'MON CHOLERA, BILIOUS C.; CHOL'ERA MOR'BUS, L. A disease characterised by bilious vomiting and purging, accompanied by more or less pain and debility. Diarrhoea is the most common precursor of the disease, and ought to be attended to without delay, particularly if the weather be warm. Cholera most frequently occurs towards the end of the summer and early in the autumn, when the increased heat of the sun stimulates the liver to an inordinate secretion of bile, by which the whole system becomes overloaded with it. Among secondary and accidental causes, are sudden changes of temperature, checked perspiration, and the use of indigestible food, and food and beverages in a state of incipient decomposition. It is usually accompanied by fever, thirst and severe colic, and sometimes, by cold sweats, extreme debility, feeble pulse, &c., under which the patient sinks in 24 hours.

Treat. In most cases this complaint is not dangerous, and yields to proper treatment in a few days. As soon after the commencement of the attack as possible, some mild aperient should be administered. Opiates may be employed, both topically and by the mouth. Jeremie's solution is stated to be very efficacious in the diarrhoea which so generally precedes cholera. A teaspoonful or two of laudanum, rubbed over the region of the stomach and bowels, is a simple application which will generally allay the pain. 10 to 20 drops of laudanum, mixed with a table-spoonful of good brandy, or a few grains of cayenne pepper, may also be taken every hour, if the pain is severe. Should the stomach reject the medicine, or the vomiting be apparently increased by drinking warm diluents, a few spoonfuls of ice-cold water, or of a mixture of lemon-juice and water, may be taken instead, until the sickness abates. Dr. Copeland recommends spirit of turpentine in violent attacks, both internally and as an external application in the form of warm epithems. When the violence of the symptoms has abated, tonics and bitters (as calumba, gentian, orange-peel, &c.) may be advantageously had recourse to. Calumba, in the form of a weak infusion, conjoined, if necessary, with aromatics, is, perhaps, the most valuable agent we possess for the after-treatment of the disease. See DIARRHOEA.

Cholera, Malig'nant. *Syn.* ASIAT'IC CHO-

LETTA, EPIDEMIC C., BLUE C., PESTILENTIAL C., SPASMODIC C.; CHOLERA ASIATICA, C. ASPHYXIA, C. MALIGNA, L. This fearful disease first became known in this country in the autumn of 1831. The attack usually begins with sickness and purging; this discharge, however, is not bilious, as in ordinary cholera, but a thin, colourless fluid, like rice-water; at the same time there is great prostration of strength, and cold, clammy sweats. In a short time dreadful cramps assail the extremities and afterwards the abdomen; the body becomes bent, the limbs twisted, the countenance cadaverous, the pulse almost imperceptible, and the eyes sunken; the patient sinks into a state of apathy, and unless a favorable change speedily takes place, soon expires from exhaustion. When there is a reaction the pulse gradually returns, the natural warmth of the body is restored, and the spasms and difficulty of breathing give way. Frequently, however, the reaction is accompanied by fever closely resembling typhus, and which often terminates fatally in from four to eight days. The symptoms of epidemic cholera are not always of this terrible character.

Treat. The following are a few of the many remedies that have been recommended for this terrible malady:—

1. (American remedy.) Equal parts of maple sugar and powdered fresh-burnt charcoal, made into a stiff paste with lard, and divided into pieces the size of a filbert.—*Dose.* One, occasionally, swallowed whole.

2. (Austrian specific.) The proportions of the ingredients in the following formulæ are founded on Mr. Herapath's analysis of this celebrated preparation, and are given in the nearest available whole numbers:—

a. Sulphuric acid (sp. gr. 1.845), 20 grs.; nitric acid (sp. gr. 1.500), 12 grs.; sugar and gum, of each, 15 grs.; distilled or pure soft water, q. s. to make the whole weigh exactly 1 oz.

b. Sulphuric acid, 3 drs.; nitric acid, 2 drs.; simple syrup, 6 drs.; water, q. s. to make the whole weigh exactly 10 oz. A single drop of essential oil of lemon may be added.

Doses, &c. One table-spoonful is ordered to be taken in water, on the first appearance of premonitory symptoms, followed by the free use of very cold water. In half an hour a second dose is to be taken. *This (as asserted) is generally sufficient to arrest the progress of the disease. A table-spoonful is then to be added to a pint of cold water, and drank *ad libitum*. In more obstinate cases it is said that 4 or 5 doses are generally required to effect a cure. When collapse sets in, double doses are ordered to be given, and to be repeated after every attack of vomiting until the sickness and cramp abate. After the vomiting abates, the doses are still to be repeated until 5 or 6 doses are retained by the stomach. Should quiet sleep or drowsiness come on, it is not to be interfered with. The free use of cold water

or soured water is to be allowed until perspiration sets in and the warmth of the body returns. According to the report, the use of warm liquors, wines, spirits, &c., must be carefully avoided, as so much poison.

Obs. A bottle of the above remedy was handed to the late Mr. Wm. Herepath, by the superintendent of the Birmingham police, who had received it from the head of the Austrian police, as being in general use in Austria, under the sanction of the medical department of the government, and being found to act almost as a specific in cholera. In 1831-2, it was first tried on some criminals, with perfect success, and soon afterwards with similar results on thousands of the general public. In 1849 the Austrian government ordered its use in the public establishments of the empire, since which not a single case of failure had occurred in which it had been fairly tried.

3. (Mr. Buxton's Remedy.) From dilute sulphuric acid (spirit of vitriol), 25 drops; water, 1 fl. oz. For a draught; as the last.

4. (College of Physicians and Board of Health; for Premonitory Diarrhoea.) Chalk mixture, 1 oz.; aromatic confection, 10 to 15 grs.; tincture of opium, 5 to 15 drops; to be repeated every 3 or 4 hours, or oftener, if required, until the looseness is arrested.

5. (Dr. Graves's Astringent Pills.) Acetate of lead, 20 grs.; opium, 1 gr.; conserve of roses, q. s.; for 12 pills.—*Dose.* One every ½ hour or hour, at first; then one every two hours.

6. (Homœopathic Preventive.) Camphor, 1 dr.; rectified spirit, 6 drs.; dissolve, and preserve it in a well-corked bottle.—*Dose.* 2 drops on a lump of sugar, sucked as a lozenge two or three times a day.

7. (Homœopathic Remedy.) As the last, repeating the dose every 10 or 15 minutes, followed by draughts of ice-cold water, until the symptoms abate.

8. (Mr. Hope's Remedy.) Red nitrous acid, 2 drs.; peppermint water or camphor julep, 1 oz.; tincture of opium, 40 drops; mix.—*Dose.* One to two teaspoonfuls in a cupful of thin gruel every 3 or 4 hours.

9. (Liverpool Preventive Powders.) Bicarbonate of soda, 20 grs.; ginger, 10 grs.; for a dose. One to be taken in a glass of water after breakfast and supper daily.

10. (Police Remedy; Mr. B. Child's r.) Rectified sulphuric ether and tincture of opium, of each, 30 drops; for a dose for an adult; especially during the earlier stages.

11. (Mr. Ross's Astringent Pills.) Each pill contains 1 gr. of nitrate of silver, made up with crumb of bread, q. s.—*Dose.* One pill, to be repeated after the interval of half an hour or an hour, should the symptoms continue unabated.

12. (Russian Remedy.) Sumbul, in the form of tincture, concentrated essence, in decoction, in cold infusion, and in powder in the form of pill.—*Doses.* Tincture, from 20 to 60 drops;

essence, from 5 to 10 or 20 drops; in a little camphor julep or plain water. The physicians of Moscow and St. Petersburg ascribe to the virtues of this drug the saving of thousands of lives during the last epidemic. See *SUMBUL*.

13. (Dr. Stevens's Saline Powders.) Bicarbonate of soda, $\frac{1}{2}$ dr.; common salt, 20 grs.; chlorate of potassa, 7 grs.; for a dose.

14. (Sir M. Tierney's Remedy.) Cajeput oil, in doses of 20 to 30 drops, every two or three hours. The oil excites the nervous system and equalises the circulation. The late Sir M. Tierney and others prescribed it frequently, it is said with considerable success.

15. (Common Remedies of the Shops.) These generally consist of chalk mixture, with a little laudanum, and some aromatic or carminative, as cassia, cinnamon, cardamoms, nutmeg, or peppermint. In a few, some astringent, as tincture of catechu, or extract of logwood, is added.

CHOLESTERIN. $C_{25}H_{44}O \cdot H_2O$. This substance is found in the bile, brain, nerves, blood, &c., and forms the principal ingredient of biliary calculi (*gall-stones*).

Note.—The remedies containing astringents are the most efficacious.

CHOLIC ACID. *Syn.* GLECO-CHOLALIC ACID. A peculiar acid, existing as cholate of sodium, and associated with choleic acid in the bile. It is a conjugate compound of cholalic acid with a nitrogenised substance called glycocin.

CHONDRIIN. Gelatin obtained from cartilage. It differs from ordinary gelatin, in being precipitable by acetic acid, alum, and acetate of lead.

CHROMATE. *Syn.* CHROMAS, L. A salt in which the hydrogen of (hypothetical) chromic acid, $HCrO_3$, is replaced by a metal or other basic radical.

Chromates:—

Prep. The insoluble chromates, as those of barium, zinc, lead, mercury, silver, &c., may be made by mixing a soluble salt of those bases with neutral chromate of potassium. The first three are yellow; the fourth, brick-red; and the fifth, reddish-brown, or ruby red when crystallised. The soluble chromates may all be made by direct solution of the base in the acid, or by double decomposition. The chromates of commerce are prepared from either chrome ore or chromate of potassium.

Prop., Uses, &c. The chromates are characterised by their yellow or red colour, the latter predominating when the acid is in excess; and except those with the alkaline bases, they are, for the most part, insoluble in water. Both the chromate and the bichromate of potassium are extensively used in dyeing and calico-printing. The former is employed in conjunction with sulphuric acid in the laboratory as an oxidising agent, and in the manufactory for bleaching sperm oil. The bichromate of ammonium and potassium are used in photography.

They are readily recognised by the following tests:—

On boiling a chromate in hydrochloric acid mixed with alcohol, chromic acid is first set free, and then decomposed, forming a green solution of chloride of chromium. Sulphuretted hydrogen and sulphurous acid effect similar changes. With acetate of lead, the chromates give a yellow precipitate; with nitrate of silver, a reddish-brown; with nitrate of mercury, a red one.

CHROME ALUM. See *ALUMS*.

CHROME GREEN. See *GREEN PIGMENTS*.

CHROME RED. See *RED PIGMENTS*.

CHROME YELLOW. See *CHROMATE OF LEAD*.

CHROMIC ACID. See *CHROMIC ANHYDRIDE*.

CHROMIUM. Cr. A metal discovered in native chromate of lead by Vauquelin in 1797. It is found in the state of oxide, combined with oxide of iron, in some abundance, in the Shetland Islands, and elsewhere; as chromate of lead, it constitutes a very beautiful material.

Prepared in an impure condition as a white, very infusible, hard metal, by igniting the oxide with charcoal, at a white heat, in a lime crucible.

Chromous Chloride. $CrCl_2$. *Syn.* PROTOCHLORIDE. *Prep.* Ignite the chromic chloride in a current of dry hydrogen. A white, foliated mass, soluble in water (evolving much heat), and yielding a blue solution, which absorbs atmospheric oxygen with astonishing rapidity, acquiring a deep-green colour, and passing into the state of oxychloride of chromium. It is the most powerful reducing or deoxidising agent known.

Chromic Chloride. Cr_2Cl_6 . *Syn.* SESQUICHLORIDE. *Prep.* Pass dry chlorine over a mixture of sesquioxide of chromium and charcoal, heated to redness, in a porcelain tube. The chloride collects as a sublimate, of a peach or violet colour, in the cool part of the tube.

Dissolve chromic oxide in hydrochloric acid and evaporate to dryness; the residue is chromic chloride. It forms a dark green mass, containing water, which is evolved by igniting at a temperature of 400°, turning a purplish red.

Chromium Oxides:—

Chromous Oxide. CrO . *Syn.* PROTOXIDE OF CHROMIUM. This oxide has not yet been obtained in a satisfactory manner, but the hydrate is prepared by the addition of potassium hydrate solution to a solution of chromous chloride or sulphate. A brownish-red powder, speedily passing to a deep foxy-red, with disengagement of hydrogen, and forming pale, blue-coloured salts with the acids, which absorb oxygen with avidity, whilst the metal passes into a higher state of oxidation.

Chromic Oxide. Cr_2O_3 . *Syn.* SESQUIOXIDE. Prepared by igniting potassium bichromate at a red heat and well washing the residue, and as hydrate by cautiously adding equal parts of hydrochloric acid and alcohol or sugar to a boiling solution of chromate of potassa in water,

in small portions at a time, until the red tint disappears, and the liquid assumes a green colour; pure ammonia, in excess, is next added, and the precipitate which subsides is collected, and washed with water.

Prop., &c. The anhydrous oxide is a rich crystalline, green powder, insoluble in both water and acids; fused with borax and glass, it imparts a beautiful green colour.

The hydrate is soluble in the acids and in alkaline lyes; with the first, it forms salts which have a green or purple colour. These compounds may be made by direct solution of the hydrate in the dilute acids. Chromic sulphate combines with the sulphates of potassium and ammonium, giving rise to salts (CHROME ALUMS) which crystallise in magnificent octahedrons of a deep claret colour. The finest crystals are obtained by spontaneous evaporation.

These salts of chromium are the most important, the chromous salts being seldom met with, and are best recognised by the following reactions:—Caustic alkalies precipitate the hydrate, easily soluble in excess of the precipitant.—Ammonia, the same, but the precipitate is nearly insoluble.—The carbonates of potassium, sodium, and ammonium, throw down a green precipitate of carbonate and hydrate, slightly soluble in a large excess.—Sulphuretted hydrogen causes no change.—Sulphhydrate of ammonium precipitates the hydrate of a bluish-green colour.

Chromic Anhydride. CrO_3 . *Syn.* CHROMIC ACID, ANHYDROUS CHROMIC ACID, CHROMIC TEROXIDE. *Prep.* By conducting gaseous fluoride of chromium into a silver or platinum vessel, the sides of which are just moistened with water, and the aperture covered with a piece of moist paper, the anhydride will be deposited under the form of red, acicular crystals, which will nearly fill the vessel. When the process is skilfully conducted, the product is of exquisite beauty and chemically pure. The fluoride referred to above is obtained from fluor spar, 3 parts; chromate of lead, 4 parts; fuming (or the strongest) sulphuric acid, 5 parts; mixed cautiously, in a silver or leaden retort. A red-coloured gas is evolved, which acts rapidly on glass, forming fluosilicic acid gas, and upon water, forming hydrofluoric acid and chromic anhydride. The moisture of the atmosphere is sufficient to effect the decomposition last referred to; the former substance escaping as gas, and the latter being deposited in small crystals.

It is also prepared nearly pure by adding a cold saturated solution of potassium bichromate to once and a half its bulk of pure strong sulphuric acid. As the liquor cools, the anhydrous chromic acid is deposited under the form of brilliant crimson-red prisms; the mother-liquor is then poured off, and the crystals, placed between two tiles of glass or porcelain, are submitted to strong pressure for some time, under a bell-glass or jar, when the anhy-

dride will be found sufficiently dry. It may be deprived of a little adhering moisture, by placing it over sulphuric acid for a short time *in vacuo*.

Commercially, it is prepared by one of the two following processes:—

To a saturated solution of chromate of potassium, 100 parts, add oil of vitriol (sp. gr. 1.845), 49 parts; and let the whole cool. This is the common process. The product contains sulphate of potassium, but this does not much interfere with its value as a bleaching agent.

From chromate of barium, decomposed by concentrated nitric acid. The anhydrous chromic acid is separated from the nitrate of barium by decantation, or, which is still better, by filtration through glass or asbestos. It is then evaporated to dryness, when the nitric acid is volatilised, and pure chromic anhydride left behind. The volatilised nitric acid may be condensed, and again used for the same purpose. The only precautions necessary to ensure the purity of the anhydrous chromic acid prepared by this plan are—to use a sufficient quantity of nitric acid, and to take care that the nitric acid is sufficiently concentrated and pure.

Prop., &c. Forms ruby-red anhydrous prisms, very soluble in water, with formation of true chromic acid, and extensively manufactured for the purpose of oxidising and bleaching substances.

CIDER. *Syn.* CYDER; POMACEUM, L. Cider is the fermented juice of the apple, and is a very ancient beverage. Pliny calls cider and perry the "wine of apples and pears."

The attention of the cider farmer should be first directed to the culture of the apple tree. The situation most appropriate for an orchard is, one on rising ground, rather dry than moist, and unexposed to sea air or high winds. The soil should be strong, but not too heavy, and should be rich in the alkaline and earthy bases, especially the phosphates. The selection of the proper varieties of the apple for grafting, is also a point on which particular care should be taken. It is found that the juices of different kinds of apples vary in the quantity of saccharine matter which they contain, as well as in other particulars that influence the quality and flavour of the cider prepared from them. As a general rule, those varieties should be chosen that yield a juice rich in sugar, and contain no undue amount of acid, and which, after the period of active fermentation is past, furnishes a liquor which clarifies itself, and keeps well. This quality of the juice may generally be determined from its specific gravity. The heaviest and clearest is the best, other points being equal. The specific gravity of the juice of the different varieties of apple varies from 1.060 to 1.100.

Cider apples are classed under three heads—bitter, sweet, and sour. The first are the best; their juice has the greatest specific gra-

vity, is the richest in sugar, ferments the most freely, clarifies spontaneously the quickest, and keeps the best after fermentation. They contain a minute quantity of extractive matter which is not present in other apples. The juice of sweet apples ferments tumultuously, clears with difficulty, and the resulting cider does not keep so well as that produced from the first variety. The juice of sour apples contains less sugar and more acid than the other two, and consequently, not only produces the weakest, but the worst cider; it, however, "fines" well, although it "stores" badly. Sour and "rough-tasted" apples are usually preferred by farmers for making cider. This preference, which is very decided in the West of England, may be readily accounted for. The sour and rough-tasted apples contain less sugar, and more malic acid, than some of the other varieties, and the presence of this acid impedes the conversion of the alcohol of the cider into vinegar; a change which their rude mode of operating renders otherwise inevitable. But cider made with such apples never equals in quality that prepared at a low temperature, from fruit abounding in sugar, provided equal skill is exercised in the manufacture as in the process of converting malt-worts into beer.

The process of making cider varies in different places, but in every case essentially consists of the collection of the fruit, the expression and fermentation of the juice, and the storing and management of the fermented liquor.

The collection of the fruit should not be commenced before it has become sufficiently mature, and should be performed with greater care than is commonly bestowed upon it. The apples, after being gathered, are usually left for 14 or 15 days in a barn or loft, to mellow, during which time a considerable portion of the mucilage is decomposed, and alcohol and carbonic acid developed. If this "ripening" is allowed to go too far, loss arises, notwithstanding the vulgar prejudice in its favour. The spoiled apples are then separated from the sound ones, as they not only impart a bad flavour to the cider, but impede its spontaneous clarification.

The expression of the juice is the next step in the process of cider-making. The apples are crushed or ground in mills consisting of two fluted cylinders of hard wood or cast iron, working against each other. The common practice is next to sprinkle the pulp with $\frac{1}{4}$ th to $\frac{1}{2}$ th of its weight of spring or river water, and then to allow it to remain in tubs or wooden cisterns for 12 or 14 hours, during which time incipient fermentation commences, and the breaking up of the cells of the membrane takes place, by which the subsequent separation of the juice is facilitated. This plan, though general among cider manufacturers, is prejudicial to the quality of the future liquor; as not only is a portion of the newly formed alcohol lost, but the skins and pips

often impart to it a disagreeable flavour. By employing more efficient crushing machinery, this system of vatting is rendered quite unnecessary. A machine furnished with a revolving circular rasp, similar to that used in making potato starch, is admirably adapted to this purpose.

The pulp of the crushed or ground apples is now placed on a kind of wicker frame, or in hair-cloth or coarse canvas bags, and after being allowed to drain into suitable tubs or receivers, is subjected to powerful pressure, gradually applied, in the cider press. The liquor which runs off first is the best, and is usually kept separately; whilst that which follows, especially the portion obtained by much pressure, tastes of the "pips" and skins.

The expressed juice or must, obtained as above, is next put into clean casks with large bung-holes, and freely exposed to the air in the shade, where they are placed on "stillions," with flat tubs under them to catch the waste. They are now constantly attended to, and kept quite full, in order that the yeast, as it forms, may froth over and be carried off from the surface of the liquor. After 2 or 3 days for weak cider, and 8 or 10 days for strong cider, or as soon as the sediment has subsided, the liquor is "racked off" into clean casks, which have been (according to the common practice) previously sulphured with a cooper's match. The casks containing the "racked cider" are then stored in a cellar, shaded barn, or other cool place, where a low and regular temperature can be ensured, and are left to mature or ripen. By the following spring the cider is commonly fit for use, and may be "re-racked" for sale.

The marc, or pressed pulp, is generally again sprinkled with $\frac{1}{2}$ or $\frac{3}{4}$ its weight of water, and re-pressed. The resulting liquor, when fermented, forms a weak kind of cider (cider moi, water moi), which is reserved for domestic use in the same way as table-beer. The refuse-pulp (apple marc, pomace, pommage, apple cheese) is used as food for pigs and store cattle, and is very acceptable to them.

The storing and management of cider are matters of vast importance to the cider farmer, the factor, the wholesale dealer, and the bottler. The principles by which these should be directed are precisely similar to those which are explained under the heads BREWING, FERMENTATION, and MALT LIQUORS; and which, indeed, refer, with slight modifications, to all fermented liquors.

Preparatory to bottling cider, it should be examined, to see whether it is clear and sparkling. If not so, it should be clarified, in a similar way to beer, and left for a fortnight. The night before it is intended to put it into bottles, the bung should be taken out of the cask, and left so until the next day, and the filled bottles should not be corked down until the day after; as, if this is done at once, many of the bottles will burst by keeping. The

best corks should alone be used. Champagne bottles are the variety generally chosen for cider. It is usual to wire down the corks, and to cover them with tinfoil, after the manner of champagne. A few bottles at a time may be kept in a warm place, to ripen. When the cider is wanted for immediate use, or for consumption during the cooler portion of the year, a small piece of lump sugar may be put into each bottle before corking it; or, what is the same thing in effect, the bottles may be corked within 2 or 3 hours after being filled. In summer, and for long keeping, this practice is, however, inadmissible. The bottled stock should be stored in a cool cellar, when the quality will be greatly improved by age. Cider for bottling should be of good quality, sound and piquant, and at least a twelve-month old. When out of condition it is unfit for bottling.

Qual., &c. Cider, when of good quality, and in good condition, is doubtless a very wholesome liquor. Cider consumers, living in the cider districts, appear to enjoy almost an immunity from cholera, and often from other diseases which are common in other parts of the kingdom. At the same time, however, it is right to mention, that the dry colic or belly-ache (*colica pictorum*) is far from uncommon in these districts, but is wholly confined to those who drink early, hard, or inferior cider, made from harsh, unripe fruit. We believe that, in most cases, it may be referred to the acid of the common cider having acted on the lead, pewter, or copper of the articles or utensils with which it has come in contact, and of which it has dissolved a very minute portion. The best cider contains from 8½ to 10½ of absolute alcohol; ordinary cider, from 4½ to 6½.

Concluding remarks. Much of the excellence of cider depends upon the temperature at which the fermentation is conducted; a point utterly overlooked by the manufacturers of this liquor. Instead of the apple-juice, as soon as it is expressed from the fruit, being placed in a cool situation, where the temperature should not exceed 50° or 52° Fahr., it is frequently left exposed to the full heat of autumn. In this way much of the alcohol formed by the decomposition of the sugar is converted into vinegar, by the absorption of atmospheric oxygen, and thus the liquor acquires that peculiar and unwholesome acidity, known in the cider districts by the name of "roughness." When, on the contrary, the fermentation is conducted at a low temperature, nearly the whole of the sugar is converted into alcohol, and this remains in the liquor, instead of undergoing the process of acetification. The acetous fermentation, by which alcohol is converted into vinegar, proceeds most rapidly at a temperature of about 90° Fahr., and at lower temperatures, the action becomes gradually slower, until at 46° to 50° Fahr. no such change takes place.

(Liebig.) It is therefore evident, that if the saccharine juice of apples, or any other fruit, is made to undergo the vinous fermentation in a cool situation, less of the spirit resulting from the transformation of the sugar, will be converted into acetic acid, and, consequently, more will be retained in an unaltered state in the liquor, to improve its quality, and by its conservative and chemical action, to preserve it from future change. This is the principal cause, other circumstances being alike, of the difference in the quality of the cider made by persons living in the same district. The one has probably a cooler barn and cellar than the other, to store his liquor in, and is more careful to keep the pulp and juice cool during the early part of the process. In Devonshire, the pressing and fermentation are conducted in situations where the temperature varies little from that of the external air, and fluctuates with all its changes; the result is, that Devonshire cider, of the best class, will rarely keep more than 4 or 5 years, and seldom improves after the second or third year; whilst the cider of Herefordshire and Worcestershire, where these operations are more carefully attended to, will keep for 20 or 30 years.

When the pressing the apples for the juice is deferred until late in the season, it sometimes happens that the fermentation is sluggish. Though the juice has been set on the old system, in November or December, the working hardly commences until March. At this time the cider is sweet; it now rapidly becomes pungent and vinous, and is soon ready to be racked for use. If the fermentation still continues, it is again racked into a clean cask that has been sulphured; or, two or three cans of the cider are put into a cask, and a brimstone-match burned in it. The cask is then agitated, after which it is nearly filled with the cider. By this process the fermentation is checked, and the cider in a short time becomes fine. Great care must be taken that the sulphuring be not overdone, as it is apt to impart a slightly unpleasant flavour to the liquor. If, on the first operation, the fermentation is not checked, the process of 'racking' is repeated, until the liquor becomes clear, and is continued from time to time, till the cider is in a quiet state, and fit for drinking.

A common practice in Devonshire is to add a stuff called 'stum,' sold by the wine-coopers, or an article called 'antiferment,' sold by the druggists, for the purpose of checking the fermentation, but a much better plan is that described above.

To improve the flavour of weak cider, or to render ordinary cider more vinous, various plans are followed by the cellarmen and bottlers. An excellent one is to add to each hogshead 1½ gal. of good brandy or rum, with 2 oz. of powdered cayenne (dissolved in water), 10 lbs. of good moist sugar or honey, ½ oz. each of bitter almonds and cloves, and 4 oz. of mustard seed (all in powder). These must be

well 'rummaged' into the liquor, and the whole occasionally stirred up for a fortnight, after which it must be allowed to repose for 3 or 4 months, when it will usually be found perfectly 'bright,' and no bad substitute for foreign wine. Should this not be the case, the liquor must be 'fined' with a pint of isinglass finings, or a dozen eggs, and allowed to rest for a fortnight. If the cider is preferred pale, the catechu must be omitted, and instead of isinglass, a quart of skimmed milk is to be used as 'finings.' When desired of a pinkish tint, 1 oz. of cochineal (in powder) may be added, instead of the catechu.

About 13 cwt. of November apples commonly yield one hoghead of cider. In Devonshire, about 6 sacks or 24 bushels are the common quantity for the hoghead of 63 galls.

The best cider made at the present day is that of Normandy, Herefordshire, and New Jersey (U. S.), and next that of Devonshire and Somersetshire. See ANTIFERMENT, FERMENTATION, &c.

Cider, Champagne. This name is given in the United States of America to a fine, pale variety of cider, much used for bottling, which has a great resemblance to inferior champagne. The best variety comes from New Jersey. The name is also applied in this country in a similar manner. The following is a good form for a 'made' cider of this class:—

Prep. Good pale vinous cider, 1 hhd.; proof spirit (pale), 3 galls.; honey or sugar, 14 lbs.; mix well, and let them remain together in a temperate situation for 1 month; then add orange-flower water, 3 pints; and in a few days fine it down with skimmed milk, $\frac{1}{2}$ gal. A similar article, bottled in champagne bottles, silvered, and labelled, is often sold to the ignorant for champagne.

Cider, Made. An article under this name is made in Devonshire, chiefly for the supply of the London market, it having been found that the ordinary cider will not stand a voyage to the metropolis without some preparation. The finest quality of 'made' cider is simply ordinary cider racked into clean and well-sulphured casks; but the mass of that which is sent to London is mixed with water, treacle, and alum. The cider sold in London under the name of Devonshire cider, would be rejected even by the farmers' servants in that county.

Cider, Raisin. This is made in a similar way to raisin wine, but without employing sugar, and with only 2 lbs. of raisins to the gal., or even more, of water. It is usually fit for bottling in 10 days, and in a week longer is ready for use.

Ci'derkin. *Syn.* CIDER MOIL. See above.

CIDER SPIRIT. See BRANDY.

CIGAR. *Syn.* SEGAR'; CIGARRE, Fr.;

CIGARRO, Span. A small roll of tobacco-leaf used for smoking. The leaf is stalked or stripped of its midrib, and damped before it

passes into the hands of the cigar-roller. The envelope or skin is cut from a smooth, unbroken leaf, and is quickly rolled round sufficient tobacco to form the inside. To secure the loose end of the envelope a small quantity of paste, coloured brown with chicory, is generally used. Only those who have had great practice can make cigars of a good shape. A full account of the manufacture of cigars does not come within the scope of this work. Although cigars of British make cannot compete in point of flavour with those manufactured in tobacco-growing countries, they have obtained a high degree of favour from the excellent manner in which they are made, and from their comparative cheapness. For information respecting the adulteration of cigars, and the influence of their use upon health, see TOBACCO.

CIGARS'. (In *pharmacy*.) *Syn.* MEDICATED CIGARS, M. CIGARETTES'. The administration of medicinal agents in the form of cigars, is of recent introduction, and as yet, in only very limited use. The medicinal substance, if of a suitable description, as the leaves of plants, is made up into small rolls, like cheroots, and then smoked in the usual manner. In some cases, common cigars, or paper cigars (cigarettes), are medicated by moistening them in a preparation of the article to be administered. When the narcotic property of the tobacco would prove injurious, it is first exhausted by soaking and washing it in water.

Cigars, Aromatic. *Syn.* AROMATIC CIGARETTES; CIGARETTES AROMATISEES, L.; CIGARETTES AROMATIQUES, Fr. Aromatic spices, lavender flowers, &c., made into cigarettes. Smoked for their odour; and in tooth-ache, face-ache, &c. See SCENTED CIGARS (below).

Cigars, Arsenical. *Syn.* CIGARETTES ARSENICALES, L. *Prep.* Dissolve arseniate of soda, 1 part, in water, 30 parts; dip white, unsized paper into the solution, and form it into small rolls, 3 or 4 inches long. *Used* in pulmonary consumption; 4 or 5 whiffs as many times a day.

Cigars, Balsamic. *Syn.* BALSAMIC CIGARETTES; CIGARETTES BALSAMISEES, CIGARETTES B., L. Thick, unsized paper is soaked in a solution of saltpetre, and dried; after which it is brushed over first with tincture of cascarrilla, and when again nearly dry, with compound tincture of benzoin; in about half an hour, it is cut into pieces ($1\frac{1}{2} \times 4$ inches), and rolled into cigarettes. *Used* in hoarseness, loss of voice, asthma, &c.

Cigars, Belladonna. *Syn.* BELLADONNA CIGARETTES; CIGARETTES BELLADONNISEES, L. *Prep.* 1. Belladonna leaves made into cigarettes of 1 dr. each.

2. (Compound—C. B. COMPOSITUM.) From belladonna leaves, 4 parts; moistened with tincture of opium (Ph. L.), 1 part; dried, and made into 1 dr. cigarettes, as before.

Used as an anodyne and antispasmodic, in

troublesome coughs, hooping-cough, tooth-ache, sore throat, tic douloureux, &c.

Cigars, Camphor. *Syn.* CAMPHOR CIGARETTES; CIGARETTÆ CAMPHORÆ, L.; CIGARETTES DE CAMPHRE, Fr. *Prep.* 1. Bibulous paper, moistened with 2 or 3 drops of essence of camphor, and rolled into cigarettes. For use, they are loosely placed in a tubular cigar-holder.

2. (Raspail.) These are made by loosely filling a quill or large straw with small fragments of camphor, closing the open end with a little cotton wool or bibulous paper, and piercing the closed end with a pin, to allow the passage of air.

Obs. Both the above are used unlighted, by drawing the air through them into the mouth, which then becomes very slightly charged with the vapour of camphor. In cold weather, the vaporisation is promoted by holding the cigarette for a few minutes in the warm hand. The homœopaths regard them as prophylactic of cholera, and the common people hold them to possess the same virtue in reference to contagious diseases generally, but especially typhus and scarlet fever. They should not be employed oftener than 3 or 4 times a day.

Cigars, Henbane. *Syn.* CIGARETÆ HYOSCYAMI, L. From henbane leaves, as directed under BELLADONNA CIGARS.

Cigars, Mercurial. *Syn.* CIGARETÆ MERCURIALES, L. *Prep.* (Paul Bernard.) Ordinary cigars are deprived of their narcotic properties by soaking them in water, and are then wetted with a weak solution of corrosive sublimate, to which a little opium is generally added. The proportion may be, of corrosive sublimate, 1 gr.; rectified spirit, 20 drops; dissolve; add laudanum, 15 drops; with this solution, 6 cigars are to be equally moistened to within about 1½ inch of the mouth end, and then set aside to dry.

Used by persons afflicted with syphilitic affections of the throat and palate, as a convenient method of mercurial fumigation. For those accustomed to the use of tobacco, mild cigars, undeprived of their nicotine, may be employed for the purpose.

Cigars, Scented. *Syn.* PERFUMED CIGARS; CIGARETÆ AROMATICÆ, L. *Prep.* 1. By moistening ordinary cigars with a strong tincture of cascarilla, to which a little gum benzoin and storax may be added. Some persons add a small quantity of camphor, or of oil of cloves or cassia.

2. By soaking the tobacco, of which the cigars are to be made, or the cigars themselves, for a short time, in a very strong infusion of cascarilla, and then allowing them to dry by a very gentle heat.

3. By simply inserting very small shreds of cascarilla bark between the leaves of the cigar, or in small slits made for the purpose.

Obs. The above yield a very agreeable odour when smoked; but are said to intoxi-

cate quicker than unprepared cigars of equal strength and quality. They lose much of their fragrance by age.

Cigars, Stramonium. *Syn.* DATURA CIGARS; CIGARETÆ STRAMONII, L. From the leaves of *Datura stramonium*, or preferably those of the eastern species, *Datura tatula*. See ASTHMA, DATURA.

CINCHONA.
CINCHONICINE.
CINCHONIDINE.
CINCHONINE.
CINCHOVATINE. } See QUINIA.
Syn. CINCHOVINE. See Appendix.

CINNAMEIN. $C_9H_7O_2$. *Syn.* OIL OF BALSAM OF PERU. A volatile oil existing in balsam of Peru.

CINNAMIC ACID. $HC_9H_7O_2$. A colourless, transparent, crystalline substance, obtained from oil of cinnamon, liquid storax, balsam of Peru, and balsam of tolu. It is freely dissolved by alcohol, but nearly insoluble in water. At 245° Fahr. it fuses, and at 560° Fahr. it sublimes unchanged. Distilled with dichromate of potassium and sulphuric acid, it is converted into benzoic acid. Its salts are called cinnamates.

CINNAMON. *Syn.* CINNAMON BARK; CINNAMOMI CORTEX (B.P.), L. The inner bark of shoots from the truncated stock of the *Cinnamomum Zeylanicum*, imported from Ceylon, and distinguished in commerce as Ceylon cinnamon. The best is obtained from branches about three years old.

Used in medicine as a carminative and astringent, chiefly as an adjuvant to other medicines, e.g. with chalk, in diarrhoea.

Dose. 10 to 20 grains.

Obs. Owing to the high price of this drug, it has become a general practice to substitute the bark of cassia (*Cassia*; *Cortex cinnamomi cassia*) for it, which so closely resembles it in flavour that the uninitiated regard them as the same. Cassia, however, is not only thicker and coarser than cinnamon, but its fracture is short and resinous, and its flavour is more biting and hot, whilst it lacks the peculiar sweetish taste of cinnamon. The thickness of cinnamon seldom exceeds that of good drawing paper.

CITRATE. A salt in which the hydrogen of citric acid is replaced by a metal or other basic radical.

CITRIC ACID. $H_3C_6H_5O_7$. *Syn.* ACID OF LEMONS, CONCRETE A. OF L.; ACIDUM LIMONIS, ACIDUM CITRICUM (B.P.), L.; ACIDE CITRIQUE, Fr.; CITRONENSÄURE, Ger. An acid peculiar to the vegetable kingdom. It is obtained in large quantity from the juice of lemons, and other fruits of the genus *Citrus*; it is found in gooseberries, currants, &c.; in conjunction with malic acid.

Prep. The citric acid manufacture consists in separating it from the mucilage, sugar, and other foreign matter with which it is combined in the juice of lemons and oranges.

1. (Ph. L. 1836.—Scheele's process.) Take of lemon juice, 4 pints; prepared chalk, $4\frac{1}{2}$ oz.; diluted sulphuric acid, $27\frac{1}{2}$ fl. oz.; distilled water, 2 pints. Add the chalk by degrees to the lemon juice, made hot, and mix well; set by, that the powder may subside, and, afterwards, pour off the supernatant liquor. Wash the precipitated citrate of lime frequently with warm water; then pour upon it the diluted sulphuric acid, mixed with the distilled water, and boil the whole for 15 minutes, in glass, stoneware, or lead; press the mixture strongly through a linen cloth, and filter it. Evaporate the filtered liquor with a gentle heat, and set it aside, that crystals may form. To obtain the crystals pure, dissolve them in water a second and a third time; filter each solution, evaporate, and set it apart to crystallise.

2. (Ph. L. 1851.) Merely placed in the materia medica.

3. (Ph. E. 1841.) Similar to that of Ph. L. 1836, except that the washed citrate of lime is ordered to be squeezed in a powerful press, and that the filtered solution of citric acid is ordered to be tested with nitrate of baryta, and if the precipitate is not nearly all soluble in nitric acid, to add a little citrate of lime to the whole liquor, till it stands this test.

4. (Ph. D. 1826.) Same as that of Ph. L. 1836.

5. (Ph. D. 1851.) Included in the materia medica.

6. (Dr. Price.) The crude juice is saturated with ammonia, potassa, or soda (carbonates), or with the ammoniacal product distilled from gas liquor; chalk 150 parts, or hydrate of lime, 90 parts, are then added for every 192 parts of citric acid contained in the liquor, and the whole stirred well together; heat is next applied, and the ammonia distilled into another quantity of lemon juice; the citrate of lime thus obtained is then decomposed with dilute sulphuric acid, and the whole process conducted as before. When potassa or soda is used, the distillation is omitted, and the expressed liquor, after filtration, used to decompose fresh lemon juice.

7. (Ordinary manufacturing process.) To crude lemon or lime juice, mixed with water, is added ground chalk; the precipitate is washed to free it from the impurities dissolved in the water, and afterwards decomposed by sulphuric acid. If the citric acid is not sufficiently white, it is decolorised by digestion with animal black.

Obs. If the lemon or lime juice be allowed to ferment a short time, the mucilage and other impurities will, to a certain extent, separate and subside. See *Concluding remarks*.

Prop., Uses, &c. Citric acid forms rhomboidal prisms, which are clear colourless, odourless, sour, and deliquescent in a moist atmosphere. It is an agreeable acid, at once cooling and antiseptic. It is much used in medicine as a substitute for lemon juice,

and to form effervescing draughts, citrates, &c.

17 grs. citric acid, in crystals, or $\frac{1}{2}$ fl. oz. of lemon juice,

are equivalent to

25 grs. bicarbonate of potash;
20 „ carbonate of potash;
15 „ carbonate of ammonia;
20 „ bicarbonate of soda;
35 „ carbonate of soda.

The bicarbonate of potassa is that generally preferred for making saline draughts with citric acid; and when flavoured with a little tincture of orange peel and simple syrup, or syrup of orange peel alone, it forms a most delicious effervescing beverage. Citric acid in pure crystals or in lime juice is much used by the calico-printer, being the best known 'resistant' for iron and alumina mordants.

Pur. Citric acid is frequently met with adulterated with tartaric acid; the fraud is easily detected by dissolving the acid in a little cold water, and adding to the solution a small quantity of acetate of potassa. If tartaric acid be present, a white, crystalline precipitate of cream of tartar will be produced on agitation. When pure, it is devoid of colour, is entirely, or almost entirely, decomposed by heat. It is soluble in water and in spirit, and what is thrown down from its watery solution by acetate of lead, is dissolved by nitric acid. No salt of potassium precipitates anything with citric acid except the tartrate. When a few drops of a solution of citric acid are added to lime water, a clear liquid results, which, when heated, deposits a white powder, soluble in acids without effervescence. By the action of nitric acid, citric acid is converted into oxalic acid.

Estim. See ACIDIMETRY and LIME JUICE.

Tests. See above.

Concluding remarks. The preparation of citric acid has now become an important branch of chemical manufacture, from the large consumption of this article in various operations in the arts. In conducting the different steps of the process some little expertness and care are, however, necessary to ensure success. The chalk employed, which should be dry, and in fine powder, is added to the juice, from a weighed sample, until the latter is perfectly neutralised, and the quantity consumed is exactly noted. The precipitated citrate of lime is next thoroughly washed with water, and the sulphuric acid, diluted with 6 or 8 times its weight of water, whilst still warm, is poured upon it, and thoroughly mixed with it. The agitation is occasionally renewed for 8 or 10 hours or longer, when the solution of citric acid is poured off, and the residuum of sulphate of lime thoroughly washed with warm water, the washings being added to the liquid acid. This last is then poured off from the impurities that may have been

deposited, and evaporated in a leaden boiler, over the naked fire, or by high-pressure steam, until it acquires the gravity of 1.13, when the process is continued, at a lower temperature, until a syrupy aspect is assumed, and a pellicle appears on the surface of the liquor. Without great care at this part of the process, the whole batch may be carbonised and spoiled. At this point the concentrated solution is emptied into warm and clean crystallising vessels, set in a dry apartment, where the thermometer does not fall below temperature. At the end of 4 days the crystals are found ready for removal from the pans. They are thoroughly drained, redissolved in as little water as possible, and after being allowed to stand for a few hours to deposit impurities, again evaporated and crystallised.

The acid of the second crystallisation is usually sufficiently pure for the market; when this is not the case, a third, or even a fourth crystallisation must be had recourse to. The mother-liquors from the several pans are now collected together, and a second or third crop of crystals obtained from them, by evaporation, as before.

A frequent cause of difficulty in obtaining crystals from the solutions, is the employment of too little sulphuric acid to decompose the whole of the citrate of lime; the consequence of which is, that a little of that salt is taken up by the free citric acid, and materially obstructs the crystallisation. 40 parts of dry sulphuric acid are required to decompose 50 parts of chalk. Commercial sulphuric acid (oil of vitriol) is usually of the sp. gr. of 1.845, and it therefore requires 49 lbs. of this acid for every 50 lbs. of chalk employed in the process. In practice, it is found that a very slight excess of sulphuric acid is preferable to a preponderance of undecomposed citrate of lime.

The first crop of crystals is called 'brown citric acid,' and is chiefly sold to the calico-printers. Sometimes a little nitric acid is added to the solution of the coloured crystals, for the purpose of whitening them, but in this way a minute quantity of oxalic acid is formed. A more general plan is to bleach the citrate of lime, by exposing it in shallow vessels to the sun's rays, covered with a weak solution of chloride of lime, and to re-wash it before decomposing it with the sulphuric acid. A safer plan is to dissolve the crude citric acid, digest with animal charcoal, and again concentrate the solution to the crystallising point.

Good lemon juice yields about $6\frac{1}{2}\%$ of crystallised lemon acid; 2 galls. yield fully 1 lb. of crystals. See LEMON JUICE, LIME JUICE, &c.

CITRON. The fruit of the citron tree (*Citrus medica*) is acidulous, antiseptic, and antiscorbutic; it excites the appetite, and stops vomiting; and, like lemon juice, has been greatly extolled in chronic rheumatism, gout, and scurvy. Mixed with cordials, it

is used as an antidote to the manchineel poison.

Citron, Oil of. See OIL.

Citron Peel. This is prepared in the same way as candied orange and lemon peel, which it for the most part resembles.

Citron. *Syn.* LEMON COLOUR. The term applied to a pale and delicate shade of yellow. See YELLOW DYES, &c.

CITRONELLE. See LIQUEURS and OILS (Lemon-grass).

CITRUS. A genus of plants belonging to the natural order *Aurantiacæ*, the species of which yield useful fruits. From *Citrus Aurantium*, and its varieties, all the various descriptions of sweet oranges are obtained. The species *C. Bigaradia* or *vulgaris* yields the bitter or Seville orange; *C. Limonum*, and its varieties, yield the lemons; *C. Limetta* is the source of the lime; *C. medica*, of the citron; *C. Decumana*, of the shaddock; *C. paradisi*, of the forbidden fruit; *C. Pampelmos*, of the Pampelmoose; and *C. japonica*, of the kumquat.

Citrus Bergamia. (Ind. Ph.) *Syn.* THE LIME TREE. *Habitat.* Commonly cultivated in India and other tropical countries.—*Official part.* The fruit (*lime*) closely resembles the lemon, but is smaller, with a smoother, thinner rind, and of somewhat less fragrant odour. Its juice (*lime juice*) has the same pungent acid taste, and contains the same ingredients, as lemon juice, though in somewhat different proportions, that of the citric acid being larger, and that of the mucilage less in quantity. Much of the article imported into England under the name of lemon juice is obtained from the lime.—*Properties and Uses.* Very similar to those of the lemon, the juice being equally refrigerant and antiscorbutic; indeed, it is preferred by many tropical practitioners.

• The fresh juice of the lime is procurable in almost every portion of the tropics, and is considered more effectual than preserved lemon juice.

Lime juice may be advantageously employed in the manufacture of citric acid, the proportion of this acid being larger than in lemon juice.

CIV'ET. *Syn.* CIVETTA, ZYBETHUM, L. A perfume, obtained from the civet cat (*Vierra civetta*,—Linn.), a fierce, carnivorous quadruped, somewhat resembling a fox, found in China and the East and West Indies. The civet is secreted in a sort of pouch between the anus and the sexual organs. "Several of these animals have been brought into Holland, and afford a considerable branch of commerce, especially at Amsterdam. The civet is squeezed out in summer every other day, in winter twice a week; the quantity procured at once is from 2 scruples to 1 drachm or more."

Civet is frequently adulterated with spermaceti and butter, and a similar substance to civet, but of a darker colour, obtained from the polecat. When pure it has an odour intermediate between that of musk and am-

bergris, but less refined; a pale-yellow colour; an acrid taste; and the consistence of honey. It is used in perfumery.

CLAIRET. See LIQUEUR.

CLAR'ET RAGS. *Syn.* TOURNESOL EN DRAPEAU, Fr.; BEZETTA CERULEA, L. 1. Pieces of clean linen coloured with Auvergne—or ground archil.

2. Pieces of linen dipped into the juice of mulberries, blood-red grapes, lees of red wine, &c. Used to colour jellies, confectionery, the rind of cheeses, &c.

CARIFICATION. The act of clearing or making bright; commonly applied to the process of 'clearing' or 'fining' liquids by chemical means, instead of by filtration. The substances used for this purpose are popularly known as 'clarifiers' or 'finings.'

The substances employed in the clarification of liquids, operate by either mechanically embracing the feculous matter, and subsiding with it to the bottom of the vessel, or by inducing such a change in its nature or bulk that it subsides by its own density, in each case, leaving the liquor transparent. Albumen, gelatin, the acids, certain salts, blood, lime, plaster of Paris, alum, heat, alcohol, &c., serve in many cases for this purpose. The first is used, under the form of white of egg, for the clarification of syrups, as it combines with the liquid when cold, but on the application of heat rapidly coagulates and rises to the surface, carrying the impurities with it, forming a scum which is easily removed with a skimmer. It is also much used for fining wines and liqueurs, particularly the red wines and more limpid cordials. Gelatin, under the form of isinglass, dissolved in water or weak vinegar, is used to fine white wines, beer, cider, and similar liquors that contain a sufficient quantity of either spirit or astringency (*tannin*), to induce its precipitation. Sulphuric acid is frequently added to weak liquors for a similar purpose, either alone, or after the addition of white of egg or gelatin, both of which it rapidly throws down in an insoluble form. A pernicious practice exists among some unprincipled manufacturers, of using certain salts of lead and potassa to clear their liquors; especially those that are expected to sparkle in the glass, as 'cordial gin,' &c. For this purpose, a little sugar of lead, dissolved in water, is first mixed up with the fluid, and afterwards a little more than $\frac{1}{2}$ its weight of sulphate of potassa, also dissolved in water, is added, and the liquor is again 'roused' up. By standing, the sulphate of lead, formed by this mixture, subsides, and leaves the liquor clear. Bullock's blood is used in the same way as isinglass or white of eggs, for fining red wines, beer, and porter. Lime, alum, alcohol, the acids, and heat, act by curdling or coagulating the feculencies, and thus, by increasing their density, induce their subsidence. Plaster of Paris acts, partly like the above, and partly

like albumen, or gelatin, by enveloping and forcing down the suspended matter. Sand is often sifted over liquors (especially cordials and syrups), for the simple purpose of acting by its gravity, but appears to be quite useless, as it sinks too rapidly. The juices of plants are clarified by heat, which coagulates the albumen they contain. Marl or clay is frequently used to clear cider and perry. A strip of isinglass is generally employed to clarify coffee. See WINE, BREWING, CORDIAL, COFFEE, FININGS, INFUSION, &c.

CLAY. Clay is formed from the disintegration of felspathic rocks, by the combined action of air and water. Its plasticity, when moist, and its capability of being made hard by heat, are properties which render it available for many useful purposes. The purest kind of clay is kaolin, or China clay, which consists almost entirely of silicate of aluminum. It is found in China; but a precisely similar substance is obtained from deposits in Cornwall and some parts of France. Pipe clay, a white clay nearly free from iron, is found in large quantity in the island of Purbeck. Potter's clay is found in many parts of Britain; that of Devonshire and Dorsetshire is much valued. Brick clay contains varying proportions of iron; hence the different colours of the bricks used in different counties. See ALUMINIUM, FULLER'S-EARTH, OCHRE, &c.

CLEAN'ING. In domestic economy, the best way to clean a house is to keep it clean by a daily attention to small things, and not allow it to get into such a state of dirtiness and disorder as to require great and periodical cleanings. Some mistresses, and also some servants, seem to have an idea that a house should undergo regular cleanings, or great washing and scrubbing matches, once every three or six months, on which occasions the house is turned almost inside out, and made most uncomfortable. All this is bad economy, and indicates general slovenliness of habits. (Chambers.) For hints upon cleaning, see CARPETS, CLOTHES, &c.

CLEANLINESS. See ABLUTION, BATHING, and SICKNESS.

CLOTHES. Economy and cleanliness require due attention to be paid to every article of clothing, but more especially to those which are the most exposed to dirt and the weather. The following remarks, having reference chiefly to woollen articles, may prove useful to the reader:—If very dusty, hang them on a horse or line, and gently beat them with a cane; then lay them on a clean board or table and well brush them, first with a stiff brush, to remove the spots of mud and the coarsest of the dirt, and next with a softer one, to remove the dust and to lay the nap properly. If clothes are wet and spotted with dirt, dry them before brushing them, and then rub out spots with the hands. The hard brush should be used as little as possible, and then with a light hand, as it will, if

roughly and constantly employed, soon render the cloth threadbare. Spots of tallow-grease on the clothes may be taken off with the nail, or, if that cannot be done, have a hot iron with some thick brown paper, lay the paper on the part where the grease is, then put the iron upon the spot; if the grease comes through the paper, put on another piece, till it ceases to soil it. Moths may be prevented attacking clothes, by putting a few cloves or allspice into the box or closet with them. See CLOTHES BALLS, SCOURING, &c.

CLO'THING. In our changeable climate great care should be taken to clothe the body effectually; for when the skin is chilled, the blood is determined in increased and injurious quantity to the internal organs, causing colds and inflammations. The ordinary materials for clothing are cotton, linen, woollen, and silk. Cotton is generally employed for undergarments, for which its softness and warmth render it well adapted. Linen is not nearly so warm, but it keeps its colour better; it is more expensive, and although it wears much longer, it is not so economical as cotton. Woollen garments are, in cold and variable climates, almost essential to comfort; the warmth obtained by wearing flannel next the body is very beneficial, and the slight stimulating effect arising from its roughness tends to keep the skin in healthy action.

CLOVE. *Syn.* CARYOPHYLLUM (B. P.), L. The flower-buds of the *Caryophyllus aromaticus* (Linn.), or clove tree, collected before they open, dried, and smoked. Cloves are aromatic, stimulant, carminative, and stomachic; and according to some, possess febrifuge properties. They are chiefly used as an adjuvant in compound medicines. A few cloves kept in a closet or box prevent moths or mould attacking furs, woollens, &c.

It is a common practice to adulterate this spice in the same manner as cinchona bark. Cloves from which the oil has been distilled, are dried and rubbed between the hands, previously moistened with a little sweet oil, to brighten their colour, after which they are mixed up with fresh spice for sale.

Cloves, Mother of. The unripe fruit of the clove tree; they are frequently imported preserved (preserved mother of cloves), and are reputed stomachic and antispasmodic.

Cloves, Oil of. *Syn.* OLEUM CARYOPHYLLI (B. P.), L. This possesses similar virtues to the unexpanded flower-buds, and is esteemed as a remedy for the tooth-ache. Used to flavour liqueurs and confectionery.

CLYSTERS. See ENEMAS.

COAL. The varieties of this valuable substance may be conveniently described under the three heads ANTHRACITE, LIGNITE, and PIT-COAL (which see). See also FUEL.

COBALT. Co. *Syn.* REGULUS OF COBALT; COBALTUM, L. A metal discovered by Brandt, in 1733. It generally occurs in the same ore as nickel, and the separation of the two

metals is a task requiring great patience and expertness. Speiss cobalt and cobalt glance are the ores from which the metal is commonly extracted.

Prep. 1. Dissolve oxide of cobalt in hydrochloric acid, and pass sulphuretted hydrogen gas through the solution, until all the arsenic is thrown down; filter, and boil with a little nitric acid, then add carbonate of potassium, in excess, and digest the precipitate in a solution of oxalic acid, to remove any oxide of iron; wash and dry the residuum (oxalate of cobalt), and expose it to great heat, in a covered crucible lined with charcoal; the product is pure metallic cobalt.

2. Mix equal parts of oxide of cobalt or roasted Cornish cobalt ore, and soft soap, and expose them to a violent heat in a covered crucible.

3. Pass hydrogen gas over oxide of cobalt strongly heated in a porcelain tube.

Prop., Use, &c. Cobalt is a white, brittle metal; unchanged in the air; feebly acted on by dilute hydrochloric and sulphuric acids; has a high melting-point, and is strongly magnetic; sp. gr. 8.5. It is seldom employed in the metallic state, from the great difficulty of reducing its ores, but its oxide (black oxide) is largely employed in the arts. It forms salts with the acids, which are interesting from the remarkable changes of colour which they exhibit. See INK, SMALT, ZAFFRE, and below.

Char., Tests. Solutions of the salts of cobalt are known as follows:—1. Ammonia gives a blue precipitate, slightly soluble in excess, giving a brownish-red colour.—2. Potassa gives a blue precipitate, turning to violet and red when the solution is heated.—3. Carbonate of ammonium and carbonate of sodium give pink precipitates; that from the former is soluble in excess.—4. Cyanide of potassium gives a yellowish-brown precipitate, soluble in excess; and the clear solution, after being boiled, is unaffected when mixed with hydrochloric acid.—5. Sulphuretted hydrogen produces no change in acid solutions.—6. Sulphhydrate of ammonium gives a black precipitate in neutral solutions.—7. Melted with borax, before the blowpipe, it gives a head of a magnificent blue colour, almost verging on black, if much is present. Phosphate of sodium and ammonium give a similar bead; but the colour is less intense.

Cobalt, Acetate of. $\text{Co}(\text{C}_2\text{H}_3\text{O}_2)_2$. *Prep.* From the carbonate or protoxide and acetic acid. It forms a sympathetic ink which turns blue when heated.

Cobalt, Carbonate of. CoCO_3 . *Prep.* By adding an alkaline carbonate to a solution of the nitrate or sulphate. A pale peach-coloured powder, soluble in acids. It contains some hydrate.

Cobalt, Chloride of. CoCl_2 . *Syn.* HYDROCHLORATE OF COBALT. *Prep.* By dissolving the carbonate or protoxide in hydrochloric acid; the solution deposits deep

duced which is capable of forming an emulsion with boiling water. The following are the principal varieties of the so-called soluble cocoa:—

1. **COCOA, GRANULATED.** From cocoa nibs and sufficient sugar and arrow-root to keep the fatty particles from forming a pasty mass. As it is impossible to granulate the nibs without the admixture of some other substance, those makers who declare that their granulated cocoas are perfectly pure do not act honestly towards their customers.

2. **COCOA, HOMŒOPATHIC.** A kind of soluble cocoa prepared with arrow-root, but without sugar.

3. **COCOA, ICELAND-MOSS.** From cocoa and Iceland moss, freed from its bitter principle, cetrarine. This form of cocoa was introduced by Messrs. Dunn and Hewett, and is said to form a very valuable article of diet for invalids.

4. **COCOA, MARAVILLA.** This is stated to be "the perfection of prepared cocoa." It consists of cocoa, sugar, and sago flour, the last two being in great excess.

5. **COCOA, CARACAS.** This is similar to the last, being a mixture of cocoa, sugar, and sago flour. The cocoa used in its manufacture is said to be imported from the Caraccas, on the north coast of South America, and to possess a peculiarly delicious flavour.

The amount of flour or starch in these so-called soluble cocoas frequently exceed 40 per cent., and the amount of sugar 20 per cent. They have been, but inaptly, called "soups."

Within the past year or two a new variety of soluble cocoa has been brought into the market. It is sold under various names, thus, 'Theobromine, or Concentrated Cocoa, 'Cocoa Essence,' 'Cocoatina,' &c. We have examined many of these varieties, and find them to consist of pure cocoa deprived of about two thirds of its fat. It appears very suitable for people of weak digestion.

Obs. No warm drink that we take approaches cocoa in its nutritive character, because, while performing to a certain extent the exhilarating work of coffee or tea, it presents to the stomach a very considerable quantity of nitrogenous and carbonaceous matter; this advantage is partly due to the fact that cocoa is taken in the form of an emulsion, instead of an infusion or decoction.

COCOA FOR THE TABLE is readily prepared from the soluble varieties by simply pouring boiling water upon the powder. From cocoa nibs, or flaked cocoa, the beverage is prepared by first pouring boiling water upon them, and then allowing the mass to simmer from 4 to 6 hours. The cocoa must on no account be allowed to boil, for in that case a coagulum will be formed, which cannot be dissolved in water.

COCOA-NUT OIL. A species of vegetable butter obtained from the common cocoa nut—the fruit of *Cocos nucifera*, the cocoa palm. It

is separated from the dried kernel by hydraulic pressure. It contains olein, and a solid fat often used as a candle material. Large plantations of the cocoa palm, connected with Price's candle company, exist in Ceylon. Cocoa-nut oil is often confounded with cocoa- or cacao-butter, which is the produce of a very different plant, namely, *Theobroma cacao*. See **COCINIC ACID**, **COCOA**, **STEARIC ACID**, &c.

COD. *Syn.* **GADUS MORRHUA** (Ph. L.), **MORRHUAVULGARIS** (Linn.), **ASEL'LUS** (Pliny), L. A fish common in the seas of the northern hemisphere, from about 40° to 75° of latitude. The flesh forms a most wholesome and excellent article of food. The best fish are very thick about the neck; and, when fresh, are marked by the redness of the gills, freshness of the eyes, and the whiteness and firmness of the flesh. The fish so largely imported from Newfoundland (**NEWFOUNDLAND FISH**) are cod, beheaded, split open, gutted, and salted. They are caught by millions on the 'Grand Bank.' **COD-SOUNDS** are pickled in brine and also made into isinglass. The spawn is made into **CAVIARE**, and the liver is both pressed and boiled for its oil (see *below*).

COD is GENERALLY COOKED by boiling it, but is sometimes baked, or cut into slices and broiled or fried. Cod's head and shoulders with oyster sauce is a favorite dish. Shrimp and anchovy sauce are also good additions.

COD-LIVER OIL. *Syn.* **MORRHUE O'LEUM**, B. P.; **O'LEUM JECORIS ASEL'LI**, L.; **HUILE DE MORUE**, Fr. The oil obtained from the liver of the common cod (*oleum e jecore comparatum*).

Prep. 1. The livers being removed from the fish, are piled on layers of fir-twigs placed in tubs perforated at the bottom, and are allowed to remain for a considerable time exposed to the sun and air. As the livers putrefy, the oil runs out and flows through the holes in the tubs into vessels placed to receive it.

2. The partially decomposed livers, cut into pieces, are heated in iron pots without water, and the oil is poured off and set aside to deposit impurities.

3. (Savory.) The livers taken from the fresh fish are carefully washed. The large veins are then divided through their whole length, and any blood in them is carefully rinsed away. The livers are now cut into pieces, again washed and drained, and afterwards placed with a small quantity of water in vessels gently heated by steam. As the heat increases, the oil separates and rises to the surface, from which it is skimmed off; and after well cooling, to allow the deposit of some of the margarine, it is repeatedly filtered through flannel bags and finally through paper. This process gives a fine, clear, straw-coloured oil, having but a slight smell and taste.

4. (Doñovan.) The perfectly fresh livers are

placed in a metallic vessel and heated with constant stirring to 180° Fahr., by which treatment they break down into a uniform pulpy, liquid mass. This mass is immediately transferred to calico bags, whence the oil drains out; after filtration, while still warm, this oil is sufficiently pure for use.

Obs. Three kinds of cod-liver oil are usually distinguished—the pale yellow, pale brown, and dark brown. The latter is the most impure; its odour and taste are extremely disagreeable. The most conflicting opinions have been expressed by medical men as to the relative value of the light-brown and yellow varieties. Ozonised cod-liver oil is said to be prepared by passing oxygen into the oil, and then exposing it to sunlight. Dr. Letheby has applied the most delicate tests to this much-vaunted remedy, but has not been able to detect the slightest trace of ozone.

Prop. and Uses. Cod-liver oil has acquired much reputation for its remedial powers in pulmonary consumption, scrofulous and other glandular affections, chronic gout and rheumatism, certain skin diseases, and several other ailments. It is generally supposed that the iodine and bromine, which are present in minute quantities in this fish, are the substances to which it owes its efficacy. "Dr. De Jongh refers its virtues to the presence of both iodine and the elements of the bile. Our own researches lead us to infer, that one of its most active constituents is free phosphorus. Good cod-liver oil contains fully .02 of this substance, as well as about .09 of phosphoric acid. Now, the marked action of minute doses of phosphorus on the nervous, vascular, and secreting organs, is well known to every experienced surgeon. The difficulty, however, of bringing it into a form adapted for administration, has hitherto prevented phosphorus being extensively employed as a therapeutic agent. This obstacle is removed by the employment of cod-liver oil. Nature has here provided a simple remedy, which the ingenuity of man has failed to produce artificially. This opinion is borne out by the facts, that cod-liver oil cures those forms of scrofula and other diseases which do not yield to iodine, and that those varieties of the oil are the most active which contain the most free phosphorus. We, therefore, think it reasonable to conclude, that the efficacy of cod-liver oil depends on the joint action of the minute quantities of iodine, phosphorus, and the elements of the bile, which it contains, and not on any one separately; and that no substance, at present known, can be used as a substitute for it." (Cooley).—*Dose.* 1 to 8 drms., on water, syrup, or orange juice; or made into an emulsion with 1 fl. oz. of peppermint water.

CODEIA. $C_{15}H_{21}O_3$. Aq. *Syn.* CODEINE. An alkaloid discovered by Robiquet associated with morphia.

Prep. Dissolve commercial hydrochlorate of morphia in water, and precipitate the morphia

with ammonia. Codeia is left in solution, and is obtained in octahedral crystals by spontaneous evaporation. It may be further purified by solution in ether. By the addition of a little water to the ethereal solution, and spontaneous evaporation, it may be obtained quite pure and in a crystalline state.

Obs. The morphia may be recovered by digesting the precipitate in weak solution of potassa.

Prop., &c. Freely soluble in alcohol and ether; soluble in 80 parts of cold and 17 parts of boiling water. Its solution in the latter, by slow evaporation, yields large, transparent octahedra. With the acids it forms crystallisable salts. These possess the singular property of producing a general and violent itching of the surface of the body when administered internally. The same symptoms frequently follow the exhibition of opium and hydrochlorate of morphia, and are referred to the presence of codeia. The commercial muriate of morphia frequently contains 3% to 4% of codeia.

Tests. It is distinguished from morphia by not becoming blue on the addition of sesquichloride of iron, nor turning red with nitric acid; and by not being precipitated by ammonia, when dissolved in hydrochloric acid and mixed with a large quantity of water. Unlike morphia, it is insoluble in weak solution of potassa, and is soluble in ether. The salts of codeia are known by tincture of galls throwing down a copious precipitate from their solutions; this does not occur with the salts of morphia. It is distinguished from meconia by its aqueous solution showing an alkaline reaction with test-paper.

COFFEE. The seeds or berries of the *Coffea arabica* (Linn.) or coffee plant; a shrub of the natural order *Cinchonaceae*, sub-order *Coffeeae*, indigenous in the low mountainous districts of Arabia Felix, and largely cultivated in various other parts of the world. About 40 millions of pounds of coffee are annually consumed in this country, and the consumption for the whole world has been estimated at about 600 millions of pounds. The seeds are roasted and ground, and used in the form of a decoction or infusion. The term coffee is applied to the prepared beverage as well as to the seeds. The valuable properties of coffee are mainly due to the presence of the alkaloid **CAFFEIA** or **CAFFEINE**.

Prep., &c. The finest kind of coffee is that called mocha, from Aden, but that in common use is principally supplied from the British plantations in the West Indies. The selection being made, the berries are carefully roasted in revolving cylinders by a gradually applied heat, until the aroma is well developed, and the toughness destroyed. Too much heat is avoided, as the volatile and aromatic properties of the coffee, and, consequently, the flavour, are thereby injured; whilst, on the other hand, if the berries are roasted too

little, they produce a beverage with a raw, green taste, very liable to induce sickness and vomiting. When properly roasted, coffee has a lively chocolate-brown colour, and should not have lost more than 18% of its weight by the process. If the loss exceeds 20%, the flavour suffers in proportion. The roasted coffee should be placed in a very dry situation, and excluded from the air as soon as possible. It loses flavour by keeping, and also powerfully absorbs moisture from the atmosphere by reason of its hygrometric power.

Qual., &c. Coffee promotes digestion, and exhilarates the spirits, and when strong, generally occasions watchfulness, but in some phlegmatic constitutions induces sleep. Drunk in moderation, especially if combined with sugar and milk, it is perhaps the most wholesome beverage known. The various qualities that have been ascribed to it by some persons, such as dispelling or causing flatulency, removing dizziness of the head, attenuating the blood, causing biliousness, &c., appear to be wholly imaginary. In a medical point of view, it has been regarded as a cerebral stimulant and anti-soporific, and as a corrector of opium. As a medicine, it should be strong, and is best taken only lukewarm.

Adult., &c. The principal substances used for the purposes of adulteration, are caramel, roasted chicory, roasted locust beans, roasted corn, &c. Chicory being now charged with the same amount of duty as coffee, is not considered, in a revenue point of view, an adulteration; nevertheless, when we contrast coffee with chicory, we at once see the vast superiority of the former over the latter, thus:—

Coffee is the fruit of a tree, whilst chicory is the root of an herbaceous plant, and it is well known that more virtues exist in fruits and seeds than in roots.

Coffee contains three active principles, viz. an essential oil, caffeine, and tannic acid, and these exercise a powerful influence on the system, retarding the waste of the tissues of the body, exciting the brain to increased activity, and exhilarating without intoxicating. Chicory contains none of these constituents.

Coffee exerts on the system highly beneficial physiological effects; chicory possesses medicinal properties, which are not desirable in an article of food.

Chicory, therefore, is very objectionable, and when a dealer sells a mixture of coffee and chicory for pure coffee, as is almost invariably the case, he is guilty of selling an adulterated article, and ought to be punished accordingly.

The adulteration with caramel or chicory may readily be detected as follows:—

1. A spoonful of pure coffee placed gently on the surface of a glass of cold water will float for some time, and scarcely colour the liquid; if it contains caramel or chicory, it will rapidly absorb the water, and, sinking to

the bottom of the glass, communicate a deep reddish-brown tint as it falls. Another method of applying this test is by expertly shaking a spoonful of the suspected coffee with a wine-glassful of cold water, and then placing the glass upon the table. If it is pure, it will rise to the surface, and scarcely colour the liquid, but if caramel or chicory is present, it will sink to the bottom, and the water will be tinged of a deep red, as before.

2. The brown colour of decoction or infusion of roasted coffee becomes greenish when treated with a per-salt of iron; and a brownish-green, flocculent precipitate is formed. The colour of chicory is only deepened, but not otherwise altered, and no precipitate is formed, under the same treatment. A mixture of chicory and coffee retains a brownish-yellow colour after the precipitate has subsided, and the liquid appears brownish-yellow by refracted light. The addition of a little weak ammonia water aids the subsidence of the precipitate.

3. Under the microscope, the presence of chicory may be readily detected by the size, form, and ready separation of the cells of the cellular tissue, and by the presence and abundance of the pitted tissue or dotted ducts, which are absent from coffee, and by the size of the spiral vessels, which are very small in coffee. The most characteristic structure, however, and that by which chicory can be easily identified, is the lacticiferous tissue. Roasted corn, and other amylaceous substances, may also be detected, in the same way, by the peculiar size and character of their starch grains.

Roasted corn, beans, &c., may be detected by the cold decoction striking a blue colour with tincture of iodine. Pure coffee is merely deepened a little in colour by this substance.

Obs. A few years ago the attention of the scientific world was drawn to the value of roasted coffee leaves, as furnishing materials for a beverage unexcelled in excellence by the coffee berry itself. It appears that the leaves, prepared for use, may be purchased for 1½d. per lb., or packed ready for export at 2d. per lb. "That this preparation contains a considerable amount of the nutritious principles of coffee is evident from the analysis; but as the leaves can only be collected in a good state at the expense of the coffee-bush, it is doubtful whether the coffees produced by the berries be not, after all, the cheapest, as it certainly is the best." (Jury Report, Exhibition, 1851.) Coffee for the table is best prepared with the aid of a French cafetière, or coffee biggin, furnished with a percolator or strainer, which will permit a moderately rapid filtration. To produce this beverage in perfection, it is necessary to employ the best materials in its preparation—fresh roasted and fresh ground. "At least 1 oz. of coffee should be used to make 3 common-sized coffee-cupfuls, with 1 teaspoonful of freshly roasted and ground

chicory. If desired strong, the quantity of both should be doubled." (Cooley.) Many habitual coffee drinkers cannot tolerate the use of chicory, which is a doubtful improver of coffee. The prevailing fault of the coffee made in England is its want of strength and flavour. The coffee-pot should be heated previously to putting in the coffee, which may be done by means of a little boiling water. The common practice of boiling coffee is quite unnecessary, for all its flavour and aroma is readily extracted by boiling hot water. Indeed, all the "useful and agreeable matter in coffee is very soluble; it comes off with the first waters of infusion, and needs no boiling." (Ure.) Should prejudice, however, induce the housewife or cook to boil her coffee, it should be only just simmered for a minute, as long or violent boiling injures it considerably.

When coffee is prepared in a common pot, the latter being first made hot, the boiling water should be poured over the powder, and not, as is commonly the plan, put in first. It should then be kept stirred for 4 or 5 minutes, when a cup should be poured out and returned again, and this operation repeated 3 or 4 times, after which, if allowed to repose for a few minutes, it will generally become fine of itself. In all cases, when a percolator is not used, the liquor should be well stirred up several times before finally covering it up to settle for use.

Coffee is sometimes clarified by adding a shred of isinglass, a small piece of clean eel or sole-skin, or a spoonful of white of egg. An excellent plan, common in France, is to place the vessel containing the made coffee upon the hearth, and to sprinkle over its surface half a cupful of cold water, which from its greater gravity descends, and carries the 'foulness' with it. Another plan sometimes adopted is to wrap a cloth, previously dipped into cold water, round the coffee-pot. This method is commonly practised by the Arabians in the neighbourhood of Yemen and Moka, and rapidly clarifies the liquor, unless a very large quantity of chicory is present. It should be recollected that the use of isinglass, white of egg, and all like artificial finings, remove much of the astringency and vivacity of the liquor.

The French, who are remarkable for the superior quality of their coffee, generally allow an ounce to each large coffee-cupful of water, and they use the coffee both newly ground and freshly roasted. A shred of saffron, or a little vanilla, is frequently added, whilst the percolating coffee-pot is generally employed. When the Parisian uses a common coffee-pot, he generally divides the water into 2 parts. The first portion he pours on boiling hot, and allows it to boil for 4 or 5 minutes; he then pours this as clear as possible, and boils the grounds for 3 minutes with the remaining half of water. As soon as this has deposited the sediment, it is decanted, and mixed with the second portion. The object of this process is to obtain the whole of the strength as well as the

flavour. The infusion is thought to contain the latter, and the decoction the former; a plausible, but erroneous idea, since both of them were carried off by the first water.

A much better method, and one we can recommend from experience, is to divide the coffee into 2 parts. Boil the first portion in the coffee-pot, for 4 or 5 minutes, then add the other portion, and allow it to infuse slowly for about 10 minutes, the coffee-pot lid being kept well closed. This gives a coffee possessing a flavour which even the French cannot excel.

Coffee, Essence of. A highly concentrated infusion of coffee, prepared by percolation with boiling water, gently and quickly evaporated to about $\frac{1}{3}$ rd or $\frac{1}{4}$ th of its bulk, and mixed with a thick aqueous extract of chicory and syrup of burnt sugar, so as to give the whole the consistence of treacle. The proportions of the dry ingredients should be—coffee, 4 parts; chicory, 2 parts; burnt sugar (caramel), 1 part. It should be kept in well-corked bottles in a cool place. This preparation is very convenient for making extemporaneous coffee; but the beverage so made, though superior to much of that sold at coffee-houses, is inferior in flavour, aroma, and piquancy, to that we are accustomed to drink at home. Much of the so-called 'Essence of Coffee' is simply treacle and burnt sugar, flavoured with coffee.

Coffee, Searle's Patent. This is prepared by mixing condensed milk with a very concentrated essence of coffee and evaporating at a low temperature (*in vacuo*, if possible), until the mixture acquires the consistence of a syrup (coffee syrup), paste (coffee paste), or candy (coffee candy). The last may be powdered (coffee powder, dry essence of coffee).

Coffee, Substitutes for. These are numerous, but are now seldom employed, owing to the cheapness of the genuine article, and the stringency of the revenue laws. Among the principal are the following:—

1. **COFFEE, ACORN.** From acorns deprived of their shells, husked, dried, and roasted.
2. **COFFEE, BEAN.** Horse-beans roasted along with a little honey or sugar.
3. **COFFEE, BEET-ROOT.** From the yellow beet-root, sliced, dried in a kiln or oven, and ground with a little coffee.
4. **COFFEE, DANDELION.** From dandelion roots, sliced, dried, roasted, and ground with a little caramel.
5. **COFFEE, GERMAN.** *Syn.* **SUCCORY C.**, **CHICORY C.** From chicory or succory. Used both for foreign coffee, and to adulterate it.

Obs. All the above are roasted, before grinding them, with a little fat or lard. Those which are larger than coffee-berries are cut into small slices before being roasted. They possess none of the exhilarating properties or medicinal virtues of foreign coffee.

COINS. See **MEDALS** and **ELECTROTYPING**.
COKE. Charred or carbonised coal. The principle of its manufacture is similar to that

of charcoal. There are three varieties of coke:—

1. **KILN-MADE COKE; STIEPLED COKE.** Made by burning pit-coal in a pile, kiln, or stove. It has a dull-black colour, and produces an intense heat when used as fuel. By condensing the bituminous vapours which are given off during the process, about $\frac{3}{8}$ of tar may be obtained from common coal, and from some strong coal, by careful treatment, fully $10\frac{1}{2}$ of its weight. The screenings, or dust coal, separated from the better kinds of bituminous coal, is the sort commonly used for making coke in ovens.

2. **GAS COKE; DISTILLED COKE.** The cinder left in the gas-retorts. Gray; produces a weak heat, insufficient to smelt iron.

3. **SHALE COKE; MINERAL CARBON.** From bituminous shale, burned in covered iron pots, in a similar way to that adopted for making bone-black; or in piles. Black and friable. Used to clarify liquids, but is vastly inferior to bone-black, and does not abstract the lime from syrups. See **FUEL, PIT-COAL, &c.**

COLCHICIN'A. *Syn.* COLCHICINE, COLCHICIA. A peculiar principle discovered by Gieger and Hesse in the seeds of the *Colchicum autumnale* or common meadow saffron. It also exists in the corms or bulbs.

Prep. Macerate the bruised seeds in boiling alcohol, add magnesia, to throw down the alkaloid, digest the precipitate in boiling alcohol, and filter. By cautious evaporation colchicine will be deposited, and may be purified by re-solution and crystallisation in alcohol.

Prop., &c. Odourless; bitter; soluble in water and alcohol; forms salts with the acids. It is very poisonous. $\frac{1}{10}$ th of a grain, dissolved in spirit, killed a cat in 12 hours. It differs from veratria in being soluble in water and crystalline, and in the non-production of sneezing when cautiously applied to the nose. Strong oil of vitriol turns this alkaloid of a yellowish-brown; nitric acid turns it of a deep violet, passing into indigo-blue, green, and yellow. It is not used in medicine.

COLCHICUM. *Syn.* MEADOW SAFFRON; COLCHICUM AUTUMNALE (Linn.). L. The recent and dried corms or bulbs (*colchici cormus*), as well as the seeds (*colchici semina*), are official in the British Pharmacopœia. The corms are ordered to be dug up in the month of July, or before the autumnal bud has projected. The dry coatings having been torn off, cut the corms transversely in thin slices, and dry, at first with a gentle heat, but afterwards slowly increased to 150° Fahr.

Dose (of the corms), 2 to 8 or 9 grs.; (of the seeds), 2 to 7 grs., made into a pill or bolus with syrup or conserve; chiefly, as a specific in gout, to alleviate or check the paroxysm. This drug forms the base of almost all the advertised gout nostrums. It is, however, an active poison, and its administration requires care. "After all that has been said respecting colchicum in gout, and admitting that it rarely

fails to allay pain and check a paroxysm, I would record my opinion that he who would wish to arrive at a good old age, should eschew it as an ordinary remedy, and consider that he is drawing on his constitution for a temporary relief, with a certainty of becoming prematurely bankrupt in his vital energies." (Coulter.)

COLCHICAR. See **OXIDES OF IRON.**

COLD. *Syn.* FRIGUS, L. The privation of heat. The term is also applied to the sensation and effects which this privation produces.

When the body of an animal is immersed in an atmosphere at a temperature below a healthy standard, a sensation of coldness experienced, produced by the passage of caloric or heat of the body into the cold medium. If this abstraction of caloric exceeds the quantity produced by the vital system, the temperature of the body decreases, until it sinks below the point at which the functions of life can be performed. This declination of the heat of the body is gradual; the external sensation of coldness changes into a disinclination for voluntary motion; next comes drowsiness, followed by numbness and insensibility. At this point, if the sufferer is rescued, and remedial measures had recourse to, death inevitably and rapidly ensues.

The prevention of the effects of cold consists in the use of ample food and clothing proportioned to the inclemency of the weather, exposure to be endured, and the habits of the wearer. The circulation of the blood should be promoted by active exercise, and arrangement to sleep shaken off by increased exertion. The principal endeavour should be to keep the extremities and chest warm; this can be accomplished, no danger is feared.

In cases of asphyxia produced by cold, the patient should be laid in a remote place from the fire, and bathed with salt-and-water, or water to which some vinegar has been added; after which the body should be wiped dry, and frictions vigorously applied by the hands of the attendant (warmed); as many operating at once conveniently do so. Gentle stimulants should be administered by the mouth, and the patient excited by some mild, stimulating elixir. The lungs should also be inflated, and made to re-establish the respiration. As symptoms of returning animation are evinced, and the breathing and circulation restored, the patient should be laid between blankets, and a little wine administered, and perspiration promoted by heaping an ample quantity of clothing about the bed. Should the patient have suffered from hunger as well as cold, the appetite should be appeased by the administration of a quantity of light food, taking especial care to avoid excess, or anything indigestible. See **ASPHYXIA, BRONCHITIS, TARRH, &c.**

COLD CREAM. A snow-white, bland ointment, about the consistence of good lard, and an admirable substitute for that exipient where expense is no object, especially for applications about the face. It is commonly sold as a lip-salve and as a healing application to abraded and chapped surfaces generally. The ordinary receipts are given under the head of **COSMETIC CREASE** (which *see*). The following produces a superior article.

Prep. (Dr. L. Turnbull.) From white wax, 1 oz.; oil of almonds, 4 oz.; rose-water, 2 oz.; borax, $\frac{1}{2}$ dr.; oil of roses, 5 drops. Melt, and dissolve the wax in the oil of almonds by a gentle heat; dissolve the borax in the rose-water, which is then to be warmed a little and added to the heated oil; lastly, add the oil of roses, stirring.

COLIC. *Syn.* COLICA, L. The belly-ache or gripes. The name is popularly given to all severe gripping abdominal pains, without reference to the cause. There are several varieties of this disease, as noticed below.

Colic, Accidental. Produced by improper food, and poisons. The treatment may be similar to that recommended for bilious or flatulent colic.

Colic, Bilious. In this variety the pain is intermittent and transient, accompanied by constipation, nausea, and vomiting. The feces, if any, are bilious, dark-coloured, and offensive. The common remedies are, a full dose of blue pill, calomel, colocynth, or aloes, followed by a sufficient quantity of Epsom salts or Glauber's salts. Warm fomentations are also serviceable.

Colic, Flatulent. Marked by constipation, and the irregular distension of the bowels by gas, accompanied by a rumbling noise, &c. It is commonly produced by the use of indigestible vegetables and slops. The remedies are, a full dose of tincture of rhubarb combined with a few drops of essence of peppermint. If this does not afford relief, an Abernethy pill may be taken, washed down with a glass of any cordial water, as peppermint, cinnamon, or caraway. When the pain is extreme, warm fomentations to the belly, or a carminative elyser, will generally give relief.

Colic, Painter's. *Syn.* PLUMBER'S COLIC, DEVONSHIREC, LEAD C.; COLICA PICTORUM, L. The dry belly-ache. It is marked by obstinate costiveness, acid bilious vomitings, violent pains about the region of the navel, convulsive spasms in the intestines, and a tendency to paralysis in the extremities. It is most prevalent in the cider counties, and amongst persons exposed to the fumes of lead. The remedies are the same as for the spasmodic variety. Should these fail, after the bowels have been thoroughly evacuated, small doses of camphor and opium may be administered, and sulphuric beer or sweetened water very slightly acidulated with sulphuric acid, had recourse to as a beverage. Mr. Benson, the managing director of the British White-lead

Works at Birmingham, says:—"Although during several weeks after the addition of the sulphuric acid to the treacle beer, drank at the works, little advantage seemed to be derived, yet the cases of lead colic became gradually less frequent, and since October of that year, or during a period of fifteen months, not a single case of lead colic has occurred amongst the people." ('Lancet.') See **SULPHURIC BEER** and **SULPHURIC ACID**.

Colic, Spasmodic. Marked by a fluctuating pain about the navel, which goes away and returns by starts, often leaving the patient for some time. The belly is usually soft, and the intestines may often be felt in lumps, which move about under the hand, or are wholly absent for a time. It is unaccompanied by flatulency. The remedies are warm fomentations, warm clysters, and carminatives, accompanied by small doses of camphor and opium.

Colic, Stercoraceous. Marked by severe gripping pains and constipation of the bowels. The remedies are powerful cathartics, as full doses of calomel, aloes, colocynth, jalap, &c., followed by purgative salts, as sulphate of magnesia, or sulphate of soda.

COLLODION. *Syn.* COLLODUM, L., B. P. A viscid fluid formed by dissolving pyroxylin (Schönbein's gun-cotton) in a mixture of ether and alcohol. In surgery, it is used in its natural state, and combined with certain elastic and medicinal substances. In photography, it is used in combination with agents that render it sensitive to the action of light.

Collodion. *Syn.* PLAIN COLLODION. The following are the best methods of preparing plain collodion for surgical purposes:—

Prep. 1. (Ph. U. S.) Nitrate of potassa, in powder, 10 oz.; sulphuric acid, $8\frac{1}{2}$ fl. oz.; tincture together in a wedgwood mortar until uniformly mixed; then add of fine carded cotton (free from impurities), $\frac{1}{2}$ oz.; and by means of the pestle or a glass rod, saturate it thoroughly with the liquor for a period of about 3 or 4 minutes; next transfer the cotton to a vessel containing water, and wash it in successive portions of pure water, with agitation and pressure, until the washings cease to affect litmus paper or a solution of chloride of barium; it is then to be spread out and dried by a very gentle heat, and dissolved by agitation in a stoppered bottle with rectified sulphuric ether, 1 quart, to which rectified spirit (alcohol), 1 fl. oz., has been previously added.

2. (Mialhe.) Nitrate of potassa, 40 parts; concentrated sulphuric acid, 60 parts; carded cotton, 2 parts; pressed as last until the dry cotton is obtained, then take of the prepared cotton, 8 parts; rectified sulphuric ether, 125 parts; mix in a well-stoppered bottle, and agitate it for some minutes; then add gradually, rectified alcohol, 1 part; and continue to shake until the whole of the liquid requires a syrupy consistency. It may be now passed through a cloth; but a better way to prevent

loss is to let it repose for a few days, and then decant the clear portion.

3. (Lauras.) This process only differs from No. 2 in the following particulars:—The cotton is immersed for 12 minutes, then rinsed 2 or 3 times in cold water, and afterwards immersed in a solution of carbonate of potassa, 4 parts, and water, 200 parts. Lastly, it is plunged again into simple water, and dried at a temperature of 77° to 86° Fahr.

4. (B. P.) Pyroxylin, 1 part; rectified spirit, 12 parts; ether, 36 parts; mix the ether and spirit, and add the pyroxylin.

5. (Parrish.) Thoroughly saturate clean carded cotton, $\frac{1}{2}$ oz., with fuming nitric acid and sulphuric acid, of each, 4 fl. oz., previously mixed and allowed to become cool; macerate for 12 hours; wash the cotton in a large quantity of water; then free it from the water by successive washings in alcohol, and dissolve in ether, 3 pints.

Obs. For success in the manufacture of collodion, it is absolutely necessary to avoid the presence of water. The ordinary commercial oil of vitriol, sp. gr. 1.84, may be used. Professor Procter, of Philadelphia, gives preference to the process with the mixed acids (No. 5), and directs that the cotton should be allowed to macerate for four days. In drying the cotton great care should be taken to prevent an explosion.

Uses, &c. In surgery, plain collodion is employed as a dressing for wounds, and as a protection to abraded surfaces. On drying, it unites the former closely, and preserves the latter from the action of the air. It is impervious to water, and being transparent, it admits of the progress of the wound being inspected when necessary. Such is its adhesive power, that a piece of cloth cemented with it to the dry palm of the hand will support a weight of 25 to 30 lbs. The parts to which it is applied should be freed from moisture. See COLOURED, ELASTIC, MEDICATED, and VESICATING COLLODIONS (*below*).

Collodion, Blist'ring. See VESICATING COLLODION.

Collodion, Coloured. *Syn.* COLLODIIUM TINCTUM, L. *Prep.* (Cutan. Hosp.) Collodion, 2 oz.; palm oil, 1 dr.; alkanet root, q. s. to colour (say 15 grs.); digest and decant the clear. Colour bears a greater resemblance to the skin than that of common collodion, whilst it is more flexible; but it is weaker than the latter.

Collodion, Elastic. *Prep.* 1. (Lauras.) Heat together Venice turpentine, 2 parts; castor oil, 2 parts; and white wax, 2 parts; add sulphuric ether, 6 parts; and mix all with the product of No. 3 (*above*), that is, to the collodion formed with 8 parts of prepared cotton, 125 ether, and 8 alcohol.

2. (C. S. Rand.) Dissolve prepared cotton (No. 5, *above*), 2 drs., in sulphuric ether, 5 fl. oz.; then add, Venice turpentine, 2 drs., and complete the solution by slight agitation.

Obs. The collodion made by either of the above processes, when applied to the skin, forms a transparent pellicle, more pliable and more difficult to remove than that of ordinary collodion.

Collodion, Medicated. It has been proposed to medicate collodion in several ways, but the practice has not found much favour with the medical profession. The following preparations have been described:—

COLLODION, ACONITE. From aconite root, by a similar formula to that of BELLADONNA C. (*below*).

COLLODION, BELLADONNA. *Prep.* Macerate select belladonna leaves, powdered, 8 oz., in ether, 12 fl. oz., with alcohol (95%), 4 fl. oz., for six hours. Pack in a percolator, and pour on alcohol till a pint of tincture is obtained; in this dissolve pyroxylin (gun-cotton), 1 dr., and Canada balsam, $\frac{1}{2}$ oz. Used as a substitute for BELLADONNA PLASTER.

COLLODION, CANTHARIDIN. See VESICATING COLLODION.

COLLODION, IODINE. *Prep.* Dissolve iodine and Canada balsam, of each, $\frac{1}{2}$ oz., in collodion, 1 pint. Used as a substitute for IODINE OINTMENT.

Collodion, Photograph'ic. There are so many methods adopted for preparing photographic collodion, that a large volume might be filled with notices of them. We will merely give Mr. Hardwich's forms, which are much esteemed by practical photographers. The preparation of a sensitive collodion, whether positive or negative, includes three distinct operations, namely, the formation of the pyroxylin or gun-cotton, the conversion of this into plain collodion, and the final process of iodising the collodion.

1. Collodion, Pos'itive. (Hardwich.) To form the PYROXYLIN.—Take sulphuric acid, sp. gr. 1.845, at 60° Fahr., 12 fl. oz.; nitric acid, sp. gr. 1.45, at 60°, 12 fl. oz.; water, 3 $\frac{1}{2}$ fl. oz.; mix, and allow the temperature to fall to 140°; then immerse cotton, 300 grains. (If the cotton is found to gelatinise or dissolve in the acid mixture, the quantity of water is too great, and may be reduced to 3 fl. oz.) The cotton should be well pulled out in pieces, weighing about 30 grains each; and should be left in the acid for about 8 minutes, the vessel being covered over. It is taken out with a glass spatula, squeezed to remove acid, washed for at least 24 hours by a stream of water, then squeezed in a cloth, and pulled out to dry. To form the PLAIN COLLODION:—Shake up the dry pyroxylin, 48 grains, with alcohol, sp. gr. 805, 1 $\frac{1}{2}$ fl. oz., and then add ether, sp. gr. 725, 4 $\frac{1}{2}$ fl. oz. The solution should be allowed to rest for a week or ten days, when the clear fluid should be decanted from the sediment. To prepare the IODISING SOLUTION:—Take of iodide of ammonium, 1 $\frac{1}{2}$ dr.; iodide of cadmium, 1 $\frac{1}{2}$ dr.; bromide of ammonium, 40 grains; powder, and dissolve in alcohol, sp. gr. 805 to 816, 10 fl. oz. The collodion is.

iodised by adding the solution to it in the proportion of 1 part solution to 3 parts collodion. The iodised collodion should be kept for at least six weeks before using. If required for immediate use, add a few drops of an alcoholic solution of iodine, formed by dissolving 5 grains of iodine in 1 fl. oz. of alcohol.

Obs. Mr. Hardwich recommends that the cotton, before being converted into pyroxylin, should be cleansed by boiling for two hours in a solution of caustic potassa (2 oz. to the gallon), and by being afterwards repeatedly washed and dried. The purest nitric acid, sp. gr. 1.45, should be employed, but the ordinary commercial sulphuric acid (oil of vitriol) is sufficiently pure for use. To purify the ETHER, and to get rid of a certain ozonised principle, which would decompose the iodising solution, Mr. Hardwich recommends the following process:—Take the best washed ether of commerce, and agitate it thoroughly with a small portion of dilute sulphuric acid, and then introduce it into a retort, and distil over one third. The alcohol used is of the strength of that sold for absolute alcohol; it should be pure.

2. Collodion, Negative. (Hardwich.) To form the PYROXYLIN:—Take of sulphuric acid, sp. gr. 1.845, at 60°, 18 fl. oz.; nitric acid, sp. gr. 1.475, at 60°, 6 fl. oz.; water, 5½ fl. oz.; cotton, 300 grains. Mix, and allow the temperature to fall to 150° Fahr. The weight of the pyroxylin ought to be 375 grains. To form the PLAIN COLLODION:—Take alcohol, sp. gr. .806, ½ gallon; ether, sp. gr. .725, 1 gal.; pyroxylin, 1900 grains. Saturate the pyroxylin with the alcohol, then pour in half a gallon of the ether, agitate for 3 or 4 minutes, and repeat the process in adding the remainder. Decant the clear liquid from the sediment after a week or ten days' rest. The following forms for IODISING SOLUTIONS are recommended:—*a.* (Potassium Iodiser.) Iodide of potassium, 135 grains; alcohol, sp. gr. .816, 10 fl. oz. Powder and dissolve in the alcohol, previously heated to 140°.—*b.* (Cadmium Iodiser.) Iodide of cadmium, 170 grains; alcohol, sp. gr. .816, 10 fl. oz. Dissolve in the cold, and filter.—*c.* (Bromo-iodiser.) Bromide of ammonium, 40 grains; iodide of ammonium, 90 grains; iodide of cadmium, 90 grains; alcohol, sp. gr. .816, 10 fl. oz. Pulverise, and dissolve in the cold. To sensitise the collodion, add to three parts one part of either *a*, *b*, or *c*.

Obs. Most of the practical directions given under the head of POSITIVE COLLODION apply equally to NEGATIVE COLLODION. Nothing but patient and intelligent practice will ever lead to success in preparing collodion for photographic purposes. Although formulæ of undoubted excellence may be used, it continually happens that the results are entirely negatory from some trifling cause. See PHOTOGRAPHY.

Collodion, Vesicating. *Syn.* BLISTERING COLLODION, CANTHARIDIN *c.*; COLLODIIUM VESICANS, L. *Prep.* 1. (Tichborne.) Coarsely powdered cantharides, 6 oz., are placed loosely in a displacement apparatus (provided with a tap to regulate the flow), and treated with ether from methylated spirit, 13 fl. oz., and glacial acetic acid, 2 fl. oz., previously mixed together. After the fluid has passed through, it will be found that the *débris* has retained by absorption 7 fl. oz., which must be displaced by the gradual addition of methylated spirits of wine, 7 fl. oz. If properly managed, there is not the least danger of the admixture of the spirits with the percolated menstruum, as the animal substance of the flies swells considerably under the prolonged influence of the spirits of wine, so that the same bulk will be insufficient to quite displace the ether. The ethereal solution should be made to measure exactly 15 fl. oz. with a little spirit, and may then be converted into a collodion by the addition of pyroxylin, ½ oz.

Obs. The glacial acid plays a double part in this preparation. It dissolves the cantharidin, and at the same time gives to the collodion film the essential property of porosity. Ordinary collodion is useless as an excipient, for it produces a tough and contractile film, which really screens the skin from the action of the greater part of the blistering material.

2. (Misch.) Cantharidin, 15 grs.; pyroxylin, 20 grs.; rectified ether, 1½ oz.; acetic ether, ½ oz.; dissolve.

3. (Ettinger.) Ether of cantharides and collodion, equal parts.

Use. Vesicating collodion is used as an irritant. No. 1 was introduced in 1862, and has many advantages over the other two. Mr. Tichborne thus described the most effectual method of using it in the 'Pharm. Journ.':—"The part upon which the blister is to be raised should be painted with the vesicant to the desired extent, bearing in mind that the blister produced always extends to about one tenth of an inch beyond the margin of the space covered. Care should be taken to give a coating of considerable thickness, and to ensure this result the brush should be passed over and over again, until about ½ dr. has been used to the square inch, or less when operating upon a tender epidermis. It is desirable to place over the intended blister a piece of oil silk, or, what is still better, a piece of sheet gutta percha, somewhat larger than the surface painted, as this will stop the exhalations of the skin, and so render it moist and permeable. In ten minutes, or a quarter of an hour if the cuticle is hard, the collodion should be wiped off with a little cotton-wool moistened with ether, when the blister will almost instantly rise."

COLLOID. See DIALYSIS.

COLLYRIUM. [L.] In medicine and pharmacy, a topical remedy for diseases of the eye.

Formerly the term collyrium was applied to any medicament employed to restrain defluxions.

Colly'rium, Dry. *Syn.* EYE POWDER; **COLLYRIUM SICCUM**, L. *Prep.* 1. (Dupuytren.) White sugar, 1 dr.; red oxide of mercury, 10 grs.; oxide of zinc, 20 grs.; mix.

2. (Lagneau.) Sugar candy, 2 parts; nitrate of potassa, 1 part.

3. (Falconer.) Chloride of barium, 1 gr.; sugar candy, 1 dr.

4. (Radius.) Calomel and white sugar, of each, $\frac{1}{2}$ dr.; opium, 10 grs.

5. (Recamier.) Oxide of zinc and sugar candy, equal parts.

6. (Velpeau.) Trisnitrate of bismuth and sugar candy, equal parts.

7. (Wiseman.) Acetate of soda, 10 grs.; powdered opium, $\frac{1}{2}$ gr.; sugar candy, $\frac{1}{2}$ dr.

Obs. It is absolutely necessary that the ingredients in the above preparations should be reduced to an impalpable powder, by careful trituration in a wedgwood mortar. For use, a small pinch is placed in a quill or straw, and blown into the eye previously opened with the fingers. On the whole, they may be regarded as unnecessary preparations, and are unsafe, except in skilful hands.

Collyrium, Liquid. *Sc.* WATER (Eye).

Collyrium, Unctuous. See OINTMENT (Eye).

COLOCYNTH (-sint). *Syn.* (**COLOCYNTH PULP**, **COLOCYNTHIDIS PULPA**, B. P.) BITTER AP'PLE, BITTER GOURD, BITTER CUCUMBER, PEELED COLOCYNTH; **COLOQUINTIDA**, **COLOCYNTHIS** (B. P.), L. The decorticated fruit or pulp of the *Citrullus Colocynthis* (Schrad.—Ph. L.), or *Cucumis Colocynthis* (Linn.—Ph. E. & D.). It is an acrid, drastic purge and hydragogue, and cannot be given alone with safety; but, in combination with other substances, it forms some of our most useful cathartic medicines.

COLOCYNTHIN. *Syn.* **COLOCYNTHIUM**, L. The bitter, purgative principle of colocynth.

COLOPHENE. Formed by distilling oil of turpentine with concentrated sulphuric acid. A colourless, viscid, oily liquid; with a high boiling-point; and exhibiting a bluish tint by reflected light.

COLOPHONY. See RESIN.

COLOUR BLINDNESS. *Syn.* DALTONISM.

A curious defect of vision, from which the eye is incapable of distinguishing colours. It is of three kinds.—1. An inability to distinguish any colour properly so called, the person being only able to distinguish white and black, light and shade. 2. An inability to distinguish between the primary colours, red, blue, and yellow, or between these and the secondary or tertiary hues, such as green, purple, orange, and brown. 3. An inability to distinguish nicer shades and hues, as grays and neutral tints. The first form is rare; the second and third are common. Dr. George Wilson found that of 1154 persons examined by him in

Edinburgh, 65, or 1 in 177, were colour blind; of these, 21 confounded red with green, 19 brown with green, and 25 blue with green.

COL'OURING. *Syn.* BRANDY COLOURING, BREWER'S C., SPIRIT C., CARAMEL; **ESSEN'TIA BI'NA**, L. *Prep.* Brown sugar is melted in an iron vessel over the fire, until it grows black and bitter, stirring it well all the time, after which water is added, and it is boiled to a syrup. In the making of brandy colouring white sugar is more frequently used.

Obs. Some persons use lime-water to dissolve the burnt sugar. Care must be taken not to overburn it, as a greater quantity is thereby rendered insoluble. The heat should not exceed 430°, nor be less than about 400° Fahr. The process, for nice experiments, is best conducted in a bath of melted tin, to which a little bismuth has been added to reduce its melting-point to about 435°; a little powdered resin or charcoal or a little oil being put upon the surface of the metal, to prevent the oxidisation of the alloy. See CARAMEL.

COL'OURS. White light from the sun is of a compound nature, and may be decomposed into rays of different colours. Newton distinguished seven PRIMITIVE COLOURS, namely, indigo, blue, green, yellow, orange, and red. Sir D. Brewster is disposed to think that four of these colours are really compound, and that three, namely, blue, yellow, and red, alone deserve the name of primitive. The colours of natural objects are supposed to result from the power possessed by their surfaces of absorbing some of the coloured rays of light, while they reflect or transmit, as the case may be, the remainder of the rays. Thus, an object appears red because it absorbs or causes to disappear the yellow and blue rays composing the white light by which it is illuminated. Black and white are not colours, strictly speaking.

A body is said to be black when it absorbs or quenches a large proportion of all the rays of white light falling upon it. A body is said to be white when it receives the white light, and reflects all the rays with moderate strength. Gray may be regarded as a luminous black, or dark white. The names given to colours are far from being satisfactory, for although many thousand shades may be distinguished by a practised eye, it is a question whether there are fifty names which would convey the same idea of shade to any ten colourists in the world. The names taken from natural coloured objects, as indigo, violet, orange, lilac, amber, emerald, &c., are the least objectionable. M. Chevreul has devised an ingenious system of naming and classifying colours. He employs only 6 fundamental names, which are those of the three elementary colours, red, yellow, and blue; and of the three secondary colours, orange, green, and violet. By the direct union of the elementary and secondary colours, 6 tertiary colours are formed. He arranges the twelve colours in a circle, lik

the spokes of a wheel, commencing with the red, and going to the right, thus:—Red, red-orange, orange, yellow-orange, yellow, yellow-green, green, blue-green, blue, blue-violet, violet, red-violet. The chromatic circle is completed by placing 5 shades between the red and red-orange, 5 between the red-orange and orange; and so on between each of the other couples. This chromatic circle of 72 colours is not imaginary, but actually exists, composed of dyed wools. The shades are distinguished by numbers; thus there are red, 1 red, 2 red, 3 red, 4 red, and 5 red, &c. Each of the 72 shades has, moreover, 20 different degrees of depth, from the lightest that can be discerned from pure white to the most intense depth, approaching to brown and black. These degrees of depth are called tones or tints. The addition of these tones to the chromatic circle brings up the number of tints to 1440. To indicate any one of these tints, we have merely to write the number of the shade, and after it the number of the tone, as, for example, 3 blue-violet, 13 tone. By mixing each of the 1440 tints with gray or black, so as to darken it in different degrees, a total of 14,440 colours may be defined. This part of the system is generally regarded as unnecessary. Mr. O'Neill, in his valuable 'Dictionary of Calico Printing and Dyeing' (to which work we refer the reader for a full account of Chevreul's classification), gives a long list of colours and coloured bodies, which are pretty well defined in common language with the names of the colours, according to this ingenious system. We select from this list the following examples:—

Amber in mass=2 orange, 12 tone.
Amethyst=5 blue-violet, from 3 to 16 tone.

Blood, ox=1 red, 13 and 14 tones.

Butter=yellow-orange, 2 to 3 tone.

Carrot=orange, 7 tone.

Chocolate in cake=5 orange, 18 tone.

Emerald=2 green, 11 tone.

Green, apple=4 yellow-green, 8 tone.

Isabelle=1 yellow-orange.

Mauve=3 violet, 8 tone.

Red-lead=yellow-orange, 20 tone.

Ruby=red, 11 tone.

Yellow, canary=1 yellow, 6 tone.

For notices of DYES, PIGMENTS, &c., refer to the principal colours.

Colours, Complementary. *Syn.* ACCIDENTAL COLOURS. Colours are said to be complementary to each other which, by blending together, produce the perception of whiteness. According to Mayer, all colours are produced by the admixture of red, yellow, and blue light, in certain proportions; and by intercepting either one or more of these coloured rays in a beam of light, those which meet the eye will consist of the remaining coloured rays of the spectrum. Thus, by intercepting the red rays in a beam of white light, the remaining yellow and blue rays will produce a

green colour; by intercepting the blue rays, the remaining yellow and red will give an orange; and so on of other cases; so that red and green, blue and orange, are COMPLEMENTARY COLOURS. If we look for some time, with one eye, on a bright-coloured object, as a wafer, placed on a piece of paper, and subsequently turn the same eye to another part of the paper, a similarly shaped spot or mark will be seen, but the colour will vary, though it will be always the same under like circumstances. Thus, if the original spot or wafer be of a red colour, the imaginary one will be green; if black, it will be white; the imaginary colour being always complementary of that first gazed upon. The colour so perceived is often called an ACCIDENTAL COLOUR, to distinguish it from the real colour. It is a general maxim in design that "colours look brightest when near their complementary colours."

Colours, Drug-gists' Show. See SHOW BOTTLES.

Colours, Flame. See FIRES (Coloured).

COLTS'FOOT. This popular herb is the *Tussilago farfara* of Linnaeus. It is a demulcent bitter, and is slightly stomachic and tonic. It is much esteemed by the lower classes in coughs, shortness of breath, and other affections of the chest. The leaves form the basis of most of the British herb tobaccos, and have been recommended to be smoked in asthma and difficulty of breathing.—*Dose.* One or two wine-glassfuls of the tea or decoction (1 oz. to the pint) *ad libitum*.

COLUMBIC ACID. See TANTALIC ACID.

COLUMBIUM. See TANTALUM.

COMBINATION. In chemistry, the union of dissimilar substances. The great general laws which regulate all chemical combinations admit of being laid down in a manner at once simple and concise. The laws of COMBINATION BY WEIGHT are as follows:—

"1. All chemical compounds are definite in their nature, the ratio of their elements being constant.

"2. When any body is capable of uniting with a second in several proportions, these proportions bear a simple relation to each other.

"3. If a body, A, unite with other bodies, B, C, D, the quantities of B, C, D, which unite with A, represent the relations in which they unite among themselves, in the event of union taking place.

"4. The combining quantity of a compound is the sum of the combining quantities of its components." (Fownes.)

There is a remarkable relation between the specific gravity of a body in the gaseous state, and its chemical equivalent or combining proportion—a relation of such a kind that quantities by weight of the various gases, expressed by their equivalents, or, in other words, quantities by weight which combine occupy, under similar circumstances of pressure and tempera-

ture, either equal volumes or volumes bearing a simple proportion to each other. This relation accounts for the law of COMBINATION BY VOLUME discovered by Gay-Lussac, and thus expressed:—

When gases combine, chemical union invariably takes place, either between equal volumes or between volumes which bear a simple relation to each other.

Gerhardt assumes that equal volumes of the elementary gases and vapours, when compared under similar conditions of pressure and temperature, contain the same number of atoms. See AFFINITY, ATOMIC THEORY, EQUIVALENTS, &c.

CONCENTRATION. The volatilisation of part of a liquid in order to increase the strength of the remainder. The operation can only be performed on solutions of substances of greater fixity than the menstrua in which they are dissolved. Many of the liquid acids, solutions of the alkalies, &c., are concentrated by distilling off their water.

In *pharmacy*, the term CONCENTRATED is commonly applied to any liquid preparation possessing more than the usual strength. Thus, we have concentrated infusions, decoctions, liquors, solutions, tinctures, and essences, most of which are made of 8 times the common strength. This is generally effected by using 8 times the usual quantity of the ingredients, with a given portion of the menstruum, and operating by digestion or percolation; the latter being generally adopted when the articles are bulky. When the menstruum is water, a little spirit is added, to make the product keep. See DECOCTION, INFUSION, &c.

CONCRETE. A compact mass or cement, composed of pebbles, lime, and sand, employed in the foundations of buildings. The best proportions have been said to be—60 parts of coarse pebbles, 25 of rough sand, and 15 of lime; but Sempé recommends 80 parts of pebbles, 40 parts of river sand, and only 10 parts of lime. The pebbles for concrete should not exceed about $\frac{1}{2}$ lb. each in weight.

CONDIMENTS. Substances taken with the food, to season or improve its flavour, or to render it more wholesome or digestible. The principal condiments are COMMON SALT, VINEGAR, LEMON-JUICE, SPICES, AROMATIC HERBS, OIL, BUTTER, SUGAR, HONEY, and SAUCES. Most of these, in moderation, promote the appetite and digestion, but their excessive use tends to vitiate the gastric juice, and injure the stomach.

CONFECTION. *Syn.* CONFECTIO, L. Anything prepared with sugar; a sweetmeat, or candy. In *medicine*, the name is commonly applied to substances, usually pulverulent, mixed up to the consistence of a soft electuary, with powdered sugar, syrup, or honey. In the 'London Pharmacopœia' (1836 and 1851) both CONSERVES and ELECTUARIES are included under this head, though there ap-

pears to be some little distinction between them.

In the *preparation* of confections all the dry ingredients should be reduced to very fine powder, and passed through a sieve, not coarser than 80 holes to the inch; and the pulps and syrups used to mix them up should be perfectly homogeneous, and of a proper consistence. The mixture should be intimate and complete, in order that the characteristic constituents may be equally distributed throughout the mass. The consistence of the newly made confection should be sufficiently solid to prevent a separation of the ingredients, and yet soft enough to allow of it being easily swallowed without previous mastication.

Confections should be *preserved* in stone jars covered with writing paper, and placed in a cool and not too dry a situation. Without this precaution, they are apt to mould on the top. If at any time the mass ferments and swells up, the fermentative process may be arrested by placing the jar in a bath of boiling water, for an hour or two, or until the whole becomes pretty hot; when it should be removed from the heat, and stirred occasionally until cold. Should the sugar crystallise out of the confection, or 'candy,' as it is called, the same method may be followed. Or, the mass may be well rubbed in a mortar until the hard lumps of sugar are broken down, and a uniform consistence again produced. On the large scale it may be passed through the mill.

As *remedial agents*, the officinal confections possess little value, and are chiefly used as vehicles for the administration of more active medicines. See CONSERVES and ELECTUARIES.

Confection of A'corns. *Syn.* CONFECTIO SEMINUM QUERCUS, L. *Prep.* (Bories.) Powdered acorns, 3 oz.; red coral and catechu, of each, $1\frac{1}{2}$ oz.; confection of dog-rose, 10 oz.; syrup of red roses, q. s. to make a confection. —*Dose.* 1 dr., every 4 hours; in chronic diarrhoea, &c.

Confection of Almonds. *Syn.* ALMOND PASTE, CONSERVE OF ALMONDS; CONFECTIO AMYGDALÆ (Ph. L.), CONSERVA AMYGDALÆ-RUM (Ph. E.), CONFECTIO AMYGDALÆ-RUM (Ph. D. 1826), L. *Prep.* (Ph. L.) Sweet almonds, 8 oz.; white sugar, 4 oz.; powdered gum arabic, 1 oz.; macerate the almonds in cold water, then remove the skins, and beat them with the other ingredients until reduced to a smooth confection. The Ph. E. form is similar.

Uses, &c. To prepare EMULSION or MILK OF ALMONDS. A little of this paste or powder, triturated with a sufficient portion of water, and strained through a piece of calico, forms emulsion of almonds. "This confection will keep longer sound, if the almonds, first decorticated (blanched), dried, and rubbed into the finest powder, be mixed with the acacia and

sugar, separately powdered, and the mixed ingredients be kept in a well-stoppered bottle." (Ph. L.) The same effect may be arrived at by simply well drying the blanched almonds before mixing them with the gum and sugar. The addition of even a small quantity of water or syrup causes the confection "to become soon mouldy, or rancid, or both." (Brande.)

Confection of Alum. *Syn.* CONFECTIO ALUMINIS, L. *Prep.* 1. (St. B. H.) Alum (in fine powder), 1 dr.; conserve of roses, 6 drs.

2. (Foy.) Alum, 1 dr.; conserve of roses, 1 oz.—*Dose.* 1 dr., 2 or 3 times a day; in lead colic, and as an astringent in diarrhoea and other affections.

Confection, Aromatic. *Syn.* AROMATIC ELECTUARY; CONFECTIO AROMATICA (Ph. L. & D.), ELECTUARIUM AROMATICUM (Ph. E.), L. *Prep.* 1. (Ph. L.) Nutmegs, cinnamon, and hay-saffron, of each, 2 oz.; cloves, 1 oz.; cardamoms, $\frac{1}{2}$ oz.; prepared chalk, 16 oz.; white sugar, 2 lbs.; reduce the whole to a very fine powder, and keep it in a closed vessel. When wanted for use, mix it with water to the consistence of a confection.

2. (Ph. E.) Aromatic powder (Ph. E.), 1 part; syrup of orange peel, 2 parts; mix.

3. (Ph. D.) Aromatic powder and simple syrup, of each, 5 oz.; clarified honey, 2 oz.; powdered saffron, $\frac{1}{2}$ oz.; mix, and add, oil of cloves, 30 drops.

4. (Commercial).—*a.* Hay-saffron, cassia, and turmeric, of each, 4 oz.; cardamoms, 1 oz.; starch, 8 oz.; precipitated chalk, 2 lbs.; white sugar, 4 lbs.; oil of nutmeg, 2 drs.; oil of cloves, 3 drs.; reduce the dry ingredients to fine powder, and pass it through a sieve (80 holes); then add the oils, and after well mixing them in, pass the whole through a coarse sieve (about 40 holes to the inch), to ensure perfect admixture.

b. Hay-saffron, 4 oz.; turmeric, 3 oz.; powdered starch, 8 oz.; precipitated chalk, 2 lbs.; white sugar, 4 lbs.; oil of cloves and cassia, of each, 3 drs.; oil of nutmeg, 2 drs.; essence of cardamoms, 1 oz.; boil the saffron turmeric in 1 gallon of water, placed in a bright copper pan, for 10 minutes, then, without straining, add the chalk, starch, and sugar; mix well, and continue stirring until the mixture becomes quite stiff, then break it up, dry it thoroughly by the heat of a steam or water bath; next reduce it to fine powder, which must be passed through a fine sieve, as before; the oils and tincture are now to be added, and after being well mixed, and passed through a coarse sieve, it should be placed in a jar or bottle, and bunged up close. Very bright coloured.

Obs. In the wholesale trade this article is kept under two forms—one, in powder, as ordered by the College, and commonly called for distinction sake *PULVIS CONFECTIO-NIS AROMATICÆ*; the other, mixed up ready for

use. In preparing the latter, it is a common plan to make a strong infusion or decoction of the saffron, and to use it to mix up the other ingredients, adding the aromatics last. (See 4, *b.*) When the price of precipitated chalk is an objection to its use, prepared chalk may be used instead. There is much anxiety evinced by the wholesale druggists to prepare this confection of a rich colour, without an undue expenditure of saffron, which is generally economised on account of its costliness. This confection is cordial, stimulant, antacid, and carminative.—*Dose.* 10 to 60 grs., either as a bolus or stirred up with a glass of water; in diarrhoea, acidity of stomach, heartburn, and any like affection, if accompanied by looseness of the bowels. In diarrhoea, English cholera, and flatulent colic, $\frac{1}{4}$ gr. of powdered opium may be added to each dose.

Confection of Bark. *Syn.* CONFECTIO CINCHONÆ, L. *Prep.* 1. Yellow bark and white sugar, of each, 1 oz.; capsicum, 1 dr.; simple syrup, 4 oz.

2. (St. B. Hosp.) Yellow bark, 6 drs.; ginger, $\frac{1}{2}$ dr.; treacle, $3\frac{1}{2}$ oz.—*Dose.* 1 to 6 drs., where the use of bark is indicated.

Confection of Cassia. *Syn.* CONFECTIO CASSIÆ (Ph. L.), L. *Prep.* (Ph. L.) Prepared cassia, $\frac{1}{2}$ lb.; manna, 2 oz.; prepared tamarinds, 1 oz.; syrup of roses, 8 fl. oz.; mix with heat, and evaporate to a proper consistence.—*Dose.* 2 drs. to 6 drs.; or more, as a laxative.

Confection of Catechu. *Syn.* CONFECTIO CATECHU COMPOSITA (Ph. D.), L. *Prep.* (Ph. D.) Compound powder of catechu, 5 oz.; simple syrup, 5 fl. oz.—*Dose.* 10 grs. to 20 grs.; as an astringent, in diarrhoea, &c.; either alone or combined with chalk.

Confection of Copaiba. *Syn.* CONFECTIO COPAIBÆ, L. *Prep.* 1. (Berton.) Copaiba and powdered cubebs, of each, 2 oz.; alum, 1 oz.; opium, 5 grs.; mix well.

2. (Svedaur.) Turpentine, 1 oz.; copaiba, $\frac{1}{2}$ oz.; mix; add mucilage of gum arabic, 1 oz.; triturate to an emulsion, and further add, conserve of roses, 4 oz.

3. (Traill.) Copaiba, 2 oz.; oatmeal, q. s. to form an electuary; then add, conserve of roses, 1 oz.

4. (Voght.) Copaiba and powdered cubebs, of each, $4\frac{1}{2}$ drs.; yolk of 1 egg; conserve of roses, $\frac{1}{2}$ oz. All the above are excellent medicines in gonorrhoea.—*Dose.* 1 to 3 drs., three or four times a day, made into boluses, and covered with the fresh emptied skin of a prune before being swallowed; in gonorrhoea, gleet &c.

Confection of Cream of Tartar. *Syn.* CONFECTIO BITARTRATE OF POTASSA; CONFECTIO POTASSÆ BITARTRATIS, L. *Prep.* 1. Cream of tartar and powdered sugar, of each, 1 oz.; simple syrup, 2 oz.; 1 nutmeg, grated.—*Dose.* 2 drs. to 6 drs.

2. (St. B. Hosp.) Bitartrate of potassa and simple syrup, of each, 2 oz.; ginger, 1 dr.

—*Dose.* 1½ dr. to 5 drs. Both are laxatives well adapted for women and children.

Confection of Hemlock. *Syn.* CONFECTIO CO'NII, L. *Prep.* (Marshall Hall.) Fresh hemlock leaves beaten up with an equal weight of sugar.—*Dose.* 10 to 20 grs., as a bolus, 2 or 3 times daily, where the use of hemlock is indicated. The confection of other narcotic plants may be made in the same way.

Confection of Hips. *Syn.* CONSERVE OF HIPS, CONFECTION OF DOG-ROSE, CONSERVE OF D.-R.; CONFECTIO RO'SÆ CANINÆ (Ph. L.), CONSERVA RO'SÆ FRUCTUS (Ph. E.), L. *Prep.* 1. (B. P.) Hips, 1 part; refined sugar, 2 parts; heat the hips in a stone mortar, rub the pulp through a sieve, add the sugar, and mix thoroughly.—*Dose.* 60 grains or more.

2. (Ph. L.) Fruit of the dog-rose, without the seeds (carpels), 1 lb.; pound it to a pulp, add, gradually, powdered white sugar, 20 oz.; and beat them together until thoroughly incorporated.

3. (Ph. E.) Pulp of hips, 1 part; white sugar, 3 parts; as No. 1.

4. (Wholesale.) Pulped hips, 2 cwt.; fine white sugar, 3 cwt.; incorporate them without applying heat.

Obs. Both this and the confection of red roses have a brighter colour, if made without heat, or touching metallic vessels. On the small scale, it is generally made by beating the ingredients together in a marble mortar, but in large quantities by grinding in a mill. Great care must be taken to remove the seeds (carpels) with the hair surrounding them, before pulping the fruit, as they are apt, like the hairs of cowhage, when swallowed, to produce vomiting, itching about the anus, &c. This conserve is slightly laxative, and is principally used for forming pills. It is very apt to candy by keeping.

Confection of Ipecacuanha. *Syn.* CONFECTIO IPECACUANHÆ, L. *Prep.* (Bories.) Ipecacuanha, 12 grs.; sulphur, 20 grs.; orris root, 1 dr.; syrup of mallows and manna, of each, 2 oz.—*Dose.* A teaspoonful, 2 or 3 times daily; in whooping-cough, dyspnoea, &c.

Confection of Jalap. *Syn.* CONFECTIO JALAPÆ, C. J. COMPOSITA, L. *Prep.* (St. B. Hosp.) Jalap, 4 drs.; ginger, 1 dr.; bitartrate of potassa, 3 oz.; treacle, 5 oz.—*Dose.* 1 to 3 drs., as a purgative.

Confection of Mercury. *Syn.* CONFECTIO HYDRARGYRI, C. MERCURIÆ, L. *Prep.* 1. Stronger mercurial ointment (Ph. L.), 1 part; conserve of roses, 3 parts.

2. (Dr. D. Davis.) Mercury and manna, equal parts; treacle, q. s.; triturate until the globules of mercury disappear.

Dose, &c. The same as those of mercurial pill.

Confection of Nitre. *Syn.* CONFECTIO POTASSÆ NITRATIS, L. *Prep.* 1. Nitre, 1 part; confection of roses, 6 parts; oil of juniper, a few drops.

2. (St. B. Hosp.) As the last, without the juniper. Both are used in gonorrhoea.

Confection of Opium. *Syn.* CONFECTIO O'PII (B. P.), ELECTUARIUM O'PII (Ph. E.), L. *Prep.* 1. (B. P.) Compound powder of opium, 192 grs.; syrup, 1 oz.

2. (Ph. L.) Powdered opium, 6 drs.; long pepper, 1 oz.; ginger, 2 oz.; caraways, 3 oz.; tragacanth, 2 drs.; reduce to fine powder, and keep it in a closed vessel; for use, add to it by degrees, hot syrup, 16 fl. oz. (i. e., 3½ drs. of the powder to each fl. oz. of syrup). It contains 1 gr. of opium in every 36 grs.

3. (Ph. E.) Aromatic powder, 6 oz.; senega, 3 oz.; opium, diffused in a little sherry, ½ oz.; syrup of ginger, 1 lb. Contains 1 gr. of opium in every 43 grs.

Uses, &c. This confection is intended as a substitute for the once celebrated Mithridate, philonium, and theriaca of the old Pharmacopoeias. It is stimulant, anodyne, and narcotic.—*Dose.* 5 to 30 grs.; in flatulent colic and diarrhoea unaccompanied by fever.

Confection of Orange Flowers. *Syn.* CONFECTIO FLORUM AURANTII, L. *Prep.* 1. Orange flowers, 1 part; white sugar, 2 parts; beat together to a confection.

2. (Tadei.) Orange flowers, 1 part; simple syrup, 3 parts; evaporate to a proper consistence. Both are used as agreeable adjuncts or vehicles for other medicines. The first is the best article.

Confection of Orange Peel. *Syn.* CONFECTIO OF ORANGE, CONSERVE OF ORANGE PEEL; CONFECTIO AURANTII (Ph. L.), CONSERVA AURANTII (Ph. E.), CONSERVA AURANTIORUM (Ph. L. 1824), L. *Prep.* (Ph. L. and E.) External rind of the fresh orange, separated by rasping, 1 lb.; beat it in a stone mortar with a wooden pestle to a pulp, then add, white sugar, 3 lbs.; and beat them together until incorporated.

Uses, &c. This confection is an agreeable tonic and stomachic; it is much used as an adjunct to bitter and purgative powders, and as a vehicle for the sesquioxide of iron.

Confection of Pepper. *Syn.* CONFECTIO OF BLACK PEPPER, CONSERVE OF B. P.; WARD'S PASTE; CONFECTIO PIPERIS (B. P.), C. P. NIGRI (Ph. D. & Ph. L. 1836), ELECTUARIUM PIPERIS (Ph. E.), L. *Prep.* 1. (B. P.) Black pepper, in fine powder, 2 parts; caraway, in fine powder, 3 parts; clarified honey, 15 parts; triturate.—*Dose.* 60 to 120 grs.

2. (Ph. L.) Black pepper and elecampane, of each, 1 lb.; fennel, 3 lbs.; white sugar, 2 lbs.; reduce to a very fine powder, and keep it in a covered vessel; for use, add it, gradually, to honey, 2 lbs.; and beat the whole to a paste (i. e., 2 oz. of honey to each 7 oz. of powder).

3. (Ph. E.) As the last, but using liquorice powder instead of elecampane, and at once making a confection.

4. (Ph. D.) Black pepper and liquorice root, of each, ½ oz.; refined sugar, 1 oz.; oil of fennel, ½ fl. oz.; honey, 2 oz.; mix.—*Dose.* of each of the above, 1 to 3 drs., two or three times daily, for 3 or 4 months; in piles,

fistula, &c., unaccompanied with inflammatory symptoms. Or, it may be used as a suppository. It is intended as a substitute for the once celebrated nostrum, 'Ward's Paste for the Piles.'

Confection of Peppermint. *Syn.* CONFECTIO MEN'THE PIPERITÆ, L. Green peppermint, 4 oz.; white sugar, 12 oz. Anti-emetic and anti-flatulent; in colic, diarrhoea, &c.; in the form of a bolus, or made into a mixture.

Confection of Resin. *Syn.* CONFECTIO RESINÆ, L. *Prep.* (Dr. Watson.) Powdered resin, 1 oz.; balsam of copaiba, $\frac{1}{2}$ oz.; honey, 5 oz.—*Dose.* 1 to 3 drs.; in piles and gleet. It is best combined with a little confection of orange peel, which effectually covers the taste of the copaiba.

Confection of Ro'ses. *Syn.* CONFECTIO RO'SÆ (Ph. L. & D.), CONSERVA RO'SÆ (Ph. E.), CONFECTIO RO'SÆ GAL'LICÆ (B. P.), CONSERVA R. G. (Ph. L. 1824), L. *Prep.* 1. (B. P.) Fresh red-rose petals, 1 lb.; white sugar, 3 lbs.; mix as confection of hips.

2. (Ph. E.) Fresh petals, 1 part; sugar, 2 parts.

3. (Ph. D.)—*a.* Fresh petals, 3 oz.; sugar, 8 oz. Or—

b. Dried petals, 1 oz.; water, 2 fl. oz.; macerate for 2 hours; then add refined sugar, 8 oz.; and beat to a mass, as before.

Obs. It is astringent and tonic, but is principally used as an elegant vehicle for more active medicines. It keeps well, and does not candy like confection of hips.—*Dose.* 1 to 2 drs., eaten off a spoon, either alone or combined with chalk; in slight cases of diarrhoea, vomiting in pregnancy, &c. See CONSERVE.

Confection of Rue. *Syn.* CONFECTIO RUTÆ (Ph. L.), L. *Prep.* (Ph. L.) Fresh rue (bruised), caraways, and laurel berries, of each, $1\frac{1}{2}$ oz.; prepared sagapenum, $\frac{1}{2}$ oz.; black pepper, 2 drs.; honey, 16 oz.; water, q. s.; rub the dry ingredients to a fine powder, then add, gradually, the sagapenum, previously dissolved in the water and honey over a slow fire, and mix well. In the Ph. L. 1836, dried rue was ordered. Carminative and antispasmodic. In flatulent colic, and in the convulsions of children, when there is no inflammation.—*Dose.* 15 to 60 grs.; either by the mouth, or made into an enema with gruel.

Confection of Scammony. *Syn.* CONFECTIO SCAMMONII (B. P.), ELECTUARIIUM SCAMMONII (Ph. D.), *Prep.* (B. P.) Scammony, in fine powder, 24 parts; ginger, in fine powder, 12 parts; oil of caraway, 1 part; oil of cloves, $\frac{1}{2}$ part; syrup, 24 parts; clarified honey, 12 parts; rub the powders with the syrup and the honey into a uniform mass, then add the oils, and mix.—*Dose.* 10 grs. to 30 grs.; as a warm cathartic, and in worms, &c.

Confection of Sen'na. *Syn.* LENITIVE ELECTUARY, ELECTUARY OF SENNA; CONFECTIO SENNÆ (Ph. L. & D.), ELECTUARIIUM SENNÆ (Ph. E.), L. *Prep.* 1. Senna, 8 oz.; cori-

anders, 4 oz.; rub them together, and by a sieve separate 10 oz. of the mixed powder; also boil figs, 1 lb., and fresh liquorice, bruised, 3 oz., in water, 3 pints, until reduced to one half; press, strain, and evaporate the strained liquor in a water bath to 24 fl. oz.; then add sugar, 2 $\frac{1}{2}$ lbs.; dissolve, and further add, prepared tamarinds, cassia, and prunes, of each, $\frac{1}{2}$ lb.; remove from the heat, and when the whole has considerably cooled, add the sifted powder, by degrees, and stir until the whole is thoroughly incorporated.

2. (Ph. E.) Senna, 8 oz.; corianders, 4 oz.; liquorice root, 3 oz.; figs and pulp of prunes, of each, 1 lb.; white sugar, 2 $\frac{1}{2}$ lbs.; water, 3 $\frac{1}{2}$ pints.

3. (Ph. D.) Senna leaves, in fine powder, 2 oz.; corianders (in fine powder), 1 oz.; oil of caraway, $\frac{1}{2}$ dr.; mix, and add them to pulp of prunes, 5 oz.; pulp of tamarinds, 2 oz.; brown sugar, 8 oz.; water, 2 fl. oz.; previously brought to a smooth paste by the heat of a water bath.

Uses, &c. Confection of senna is a gentle and pleasant purgative, and well adapted for persons suffering from piles, and as a laxative during pregnancy. The dose is 1 dr. to $\frac{1}{2}$ oz., taken at bedtime or early in the morning.

Obs. There is no one pharmacopœial preparation which it is more difficult to obtain of good quality than confection of senna. The absolute cost of an article prepared according to the directions of the Colleges, is greater than the price at which many wholesale houses are vending the drug. Dr. Paris very truly remarks that, "the directions of the Pharmacopœia are very rarely followed." Considerable quantities are manufactured, into which unsound and spoilt apples enter as a principal ingredient; whilst the substitution of jalap for the whole, or a portion of the senna, is a very common practice. We have seen the following forms employed in the trade.

4. Powdered senna, pulp of tamarinds, cassia, and prunes, of each, $1\frac{1}{2}$ lb.; powdered corianders, $\frac{1}{2}$ lb.; Spanish juice, $\frac{1}{2}$ lb.; simple syrup, 12 lbs.

5. As the above, but omitting the cassia pulp, and adding 2 lbs. more tamarind pulp. Both these articles are labelled "P. L." and sent out as genuine, and that when no competition as to price exists. The cheaper article is made as follows:—

6. Common prunes and tamarinds, of each, 16 lbs.; treacle, $\frac{1}{2}$ cwt.; species (a compound of senna dust and small senna, mixed with 3 lbs. of coriander seeds, and strengthened with jalap; all ground to a fine powder), 18 $\frac{1}{2}$ lbs. To this is frequently added, of rotten or inferior apples, $\frac{1}{2}$ cwt., which are pulped with the prunes and tamarinds. This article is commonly labelled "CONF. SENNÆ VER." by its manufacturer.

Confection of Sponge. *Syn.* ELECTUARY OF BURN'T SPONGE; CONFECTIO SPONGIÆ, C. S. US'LE, L. *Prep.* 1. Burnt sponge, 3 parts; confection of orange peel and hips, of each, 1 part; simple syrup, q. s.

2. (St. B. Hosp.) Burnt sponge, made into a confection with syrup of orange peel. The first form produces the most agreeable confection.—*Dose*, of either, $\frac{1}{2}$ dr. to 2 drs., twice or thrice daily; in scrofula, &c.

Confection of Steel. *Prep.* 1. CONFECTIO FERRI SESQUIOXIDI, L.—*a.* From confection of orange and sesquioxide of iron (Ph. L.), of each, 2 oz.; white sugar, 3 oz.; syrup, $1\frac{1}{2}$ oz.; mix.—*Dose*, 1 dr. to 3 drs.

b. (St. B. Hosp.) Sesquioxide of iron, 1 oz.; treacle, q. s.—*Dose*, $\frac{1}{2}$ dr. to 1 dr. Both are given in the usual cases wherein iron is indicated; especially in anæmia, chlorosis, and amenorrhœa.

2. (CONFECTIO FERRI TARTARIZATI, —St. B. Hosp.) Cream of tartar, $1\frac{1}{2}$ oz.; tartrate of iron, 2 drs.; ginger, 1 dr.; treacle, $2\frac{1}{2}$ oz., or q. s.—*Dose*, 1 dr. to 2 drs., 2 or 3 times daily.

Confection of Sulphur. *Syn.* BRIMSTONE AND TREACLE; CONFECTIO SULPHURIS, L. *Prep.* 1. Sublimed sulphur, 2 oz.; treacle, 4 oz.—*Dose*. A spoonful night and morning for a week or longer, as an alterative or purifier of the blood; in skin diseases, &c.

2. (St. B. Hosp.) Precipitated sulphur, 1 oz.; cream of tartar, 2 drs.; honey or treacle, 2 oz. As the last.

3. (B. P.) Sublimed sulphur, 4 oz.; cream of tartar, 1 oz.; syrup of orange peel, 4 fl. oz.—*Dose*, 1 to 2 drs.; as a laxative, in piles, gonorrhœa, &c.

Confection of Tin. *Syn.* CONFECTIO STANNI, L. *Prep.* (Hosp. Form.) Powdered tin, 1 oz.; confection of roses, 2 oz.; mix.—*Dose*, 2 to 4 drs., every morning; in worms.

Confection of Turpentine. *Syn.* CONFECTIO TEREBINTHINÆ, L. *Prep.* (B. P.) Oil of turpentine, 1 fl. oz.; liquorice powder, 1 oz.; triturate together, then add clarified honey, 2 oz.—*Dose and use*, as the last.

Confection of Worm-seed. *Syn.* CONFECTIO CINÆ, C. s. CINÆ, L. *Prep.* 1. (Ph. Slesvico-Holsat. 1831, and Ph. Suec. 1845.) Worm-seed, 2 oz.; heat it in a pan over a gentle fire, add white sugar, boiled to a low candy height, 4 oz.; and stir together until they become dry; then pick out those seeds which are covered with sugar, and repeat the process with the others.

2. Powdered worm-seed and syrup of orange peel, equal parts.—*Dose*, 1 to 2 drs., night and morning, followed by a brisk purge; in worms.

CONFECTIONERY. See CANDIES, DROPS, LOZENGES, SUGAR, &c.

CONGELATION. The conversion of a substance from the fluid to the solid state by the abstraction of heat. See ICE and REFRIGERATION.

CONGLUTINUM (Bracy Clarke's). Sulphate of zinc (white vitriol), 4 oz.; dissolved in water, 1 pint. Used as an astringent lotion in veterinary practice, and, much diluted with water (a dessert-spoonful to $\frac{1}{2}$ pint or more of water), as a collyrium in chronic inflammation of the eyes.

CONIA. $C_8H_{15}O$. *Syn.* CO'NINE, CON'INE. An alkaloid, discovered by Gieseke in hemlock. It exists in every part of the plant, but is present in the largest quantity in the seed.

Prep. (Gieger.) The seeds of hemlock, or their alcoholic extract, is distilled with water and potassa. The conia passes over into the receiver, and floats on the top of the water which also contains a little conine in solution. It is purified in the way directed for the volatile bases. (See ALKALOID.) When the alcoholic extract is employed, about half its weight of potassa should be used.

Prop., &c. Pure conia is an oily looking liquid, smelling intensely of hemlock, or rather of a combination of the odours of tobacco and mice; volatile at common temperatures; reddens turmeric; boils at about 340° Fahr., but readily distils over with water at 212° ; sp. gr. .89; with the acids it forms salts, some of which are crystallisable. 6 lbs. of fresh and 9 lbs. of dried seeds yielded 1 oz. of conia. (Gieger.) 40 lbs. of the ripe but green seeds yielded $2\frac{1}{2}$ oz. of hydrated conia. (Christison.)

Conia is remarkably poisonous. 1 drop, placed in the eye of a rabbit, killed it in 9 minutes; 5 drops, poured into the throat of a dog, killed it in less than a minute. It has been employed in some convulsive and spasmodic diseases, but is now seldom used medicinally. "The plaintive cries, the contortions, and the rigidity of the limbs, which have always preceded death (caused by conia), leave no doubt as to the cruel pains which this kind of poisoning brings on." (Boutron-Chalard and Henry.) The treatment may be that recommended under ACONITE and HEMLOCK.

CONSERVE. *Syn.* CONSERVA, L. Recent vegetable matter, as flowers, herbs, roots, fruit, and seed, beaten with powdered sugar to the consistence of a stiff paste, so as to preserve them, as nearly as possible, in their natural freshness. Conserves are made both by the confectioner and the druggist; by the first, as SWEETMEATS; by the other, chiefly as vehicles for more active medicines. The London College of Physicians now includes both conserves and electuaries under the general head of CONFECTIONS. The term appears, however, in some cases, scarcely appropriate. The word confection has a more general application, and implies any sweetmeat or composition in which sugar is the principal ingredient. See CONFECTION and ELECTUARY.

Conserve of Acétate of Potassa. *Syn.* CONSERVA POTASSÆ ACETATIS, L. *Prep.* (Bories.) Acetate of potassa, $\frac{1}{2}$ oz.; sulphate of soda, 1 dr.; juices of scurvy grass, fumitory, and dandelion, of each, 2 oz. (reduced to one half by gentle evaporation?); sugar, q. s. to make a conserve. A teaspoonful, 2 or 3 times daily, as a diuretic aperient; in obstruction of the bowels, &c.

Conserve of Almonds. See CONFECTIONS.
Conserve of Angelica. *Syn.* CONSERVA

ANGELICÆ, L. *Prep.* (Giordano.) Fresh angelica root, 2 parts; water, 16 parts; macerate for a few hours, clarify the liquor, add sugar, 3 parts; cook the root in the syrup, and preserve it in this state (confection), or dry it (to a candy). *Used* as an agreeable tonic, stomachic, and carminative.

Conserve, Antiscorbutic. *Syn.* CONSERVA ANTISCORBUTICA, L. *Prep.* (Selle.) Horseradish, water-cress, and water-trefoil, orange-juice, and radish-juice, equal parts; powdered white sugar, q. s. to make a conserve. In scurvy, &c.

Conserve of A'rum. *Syn.* CONSERVA A'RRI, C. A. MACULATI, L. *Prep.* From fresh arum tubers (cuckow-pint or wake-robin), $\frac{1}{2}$ lb.; sugar, 2 $\frac{1}{2}$ lbs. As a diuretic and attenuant in dropsy, or as an expectorant in chronic coughs. —*Dose.* $\frac{1}{2}$ teaspoonful, gradually increased.

Conserve of Broom. *Syn.* CONSERVA SCOPARIUM, L. *Prep.* (Van Mons.) Broom flowers, 1 part; sugar, 2 parts.—*Dose.* $\frac{1}{2}$ to 2 teaspoonfuls, 2 or 3 times a day; in dropsy, gout, rheumatism, &c.

Conserve of Hips. See CONFECTION.

Conserve of Lavender. *Syn.* CONSERVA LAVENDULÆ, L. Lavender flowers, 1 part; powdered lump sugar, 3 parts; beaten together to a smooth paste. *Used* to sweeten the breath. In a similar way conserves are made from various other leaves and flowers; but mostly with only twice their weight of sugar, when they are not very odorous or active.

Conserve of Lem'on Peel. *Syn.* CONSERVA LIMONIS, C. L. CORTICIS, L. As CONFECTION OF ORANGE PEEL.

Conserve of Mal'ows. *Syn.* CONSERVA MALVÆ, L. From the flowers, as CONSERVE OF LAVENDER.

Conserve of Or'ange Peel. See CONFECTION.

Conserve of Pepp'ermint. See CONFECTION.

Conserve of Rose'mary. *Syn.* CONSERVA ROSMARI'NI, L. As CONSERVE OF LAVENDER.

Conserve of Roses. 1. See CONFECTION.

2. (ACIDULATED CONSERVE OF ROSES. CONSERVA ROSÆ ACIDA, L.) *Prep.* (Hosp. F.) Confection of roses and powdered gum, of each, 1 oz.; sulphuric acid, 1 dr. to 1 $\frac{1}{2}$ dr.; (diluted with water, 2 drs. An excellent substitute for tamarinds.

Conserve of Sav'in. *Syn.* CONSERVA SASSAPARILLÆ, L. *Prep.* (Ph. Han.) Fresh savin, 1 part; sugar, 2 parts. As an emmenagogue; in amenorrhœa, &c. Three parts of sugar make a better conserve.

Conserve of Scurvy Grass. *Syn.* CONSERVA COTYLEDONIS, C. C. HORTENSIS, L. *Prep.* (Aust. 1836.) Fresh scurvy grass, 1 lb.; sugar, 3 lbs. Stimulant and antiscorbutic.

Conserve of Sea Worm'wood. *Syn.* CONSERVA ASINTHII MARITIMI, L. *Prep.* (Ph. Han.) From sea wormwood, as the last. Cholic bitter and vermifuge; in dys-

pepsia. *Syn.* CONSERVA ASINTHII MARITIMI, L. *Prep.* (Ph. L. 1788.) From the pulp of the fruit, 1 part; sugar, 3 parts. Astringent. Useful in simple diarrhœa, &c.; either alone or combined with chalk.

Conserve of Squills. *Syn.* CONSERVA SCILLÆ, L. *Prep.* (Ph. L. 1788.) Fresh squills, 1 oz.; sugar, 5 oz. Diuretic, attenuant, and expectorant; in dropsy, chronic coughs, &c.—*Dose.* 10 to 20 grs.

Conserve of Tam'arinds. *Syn.* CONSERVA TAMARINDORUM, L. *Prep.* (P. Cod.) Tamarind pulp, 2 oz.; white sugar, 3 oz.; evaporate by the heat of a water bath to the consistence of honey.

Conserve of Vi'olets. *Syn.* CONSERVA VIOLÆ, C. V. ODORATÆ, L. *Prep.* (Soubeiran.) Flowers, 1 part; sugar, 3 parts; beat to a paste. Demulcent and laxative; used as a purge for infants, and by ladies to perfume the breath.

Conserve of Wa'ter-cress. *Syn.* CONSERVA NASTURII, L. *Prep.* (Ph. Græca, 1837.) From fresh water-cresses, as the last. In scurvy; taken *ad libitum*.

Conserve of Worm'wood. See CONSERVE OF SEA WORMWOOD.

CONSTIPATION. *Syn.* CONSTIPATIO, OBSTIPATIO, L. Surgeons distinguish between costiveness and constipation. The first applies to that condition of the body in which the bowels act tardily, and in which the fæces are abnormally and inconveniently indurated; the last implies the absence of the proper alvine evacuations. The one rapidly undermines the health; the other destroys life in a period varying from a few days to 3 or 4 weeks. In popular language, however, the words are frequently used synonymously. The use of bread containing alum, and water containing much lime (very hard water), and the want of sufficient exercise, are common causes of constipation.

Treatment. When the affection is merely accidental or occasional, a dose of some aperient or cathartic is the only treatment necessary; but when it is habitual it calls for further attention. Great benefit may generally be secured by adopting a diet free from astringents, and consisting of a large portion of green vegetables and ripe fruit; particularly avoiding the use of over-cooked, salted, or dried animal food. Brown bread may be eaten, as it acts as a gentle laxative, from the bran it contains. The occasional use of aperient and emollient enemata may be had recourse to; but their habitual administration, as well as that of purgative medicines generally, by the mouth, is not to be recommended. The bowels, accustomed to the continual use of stimulants, act but languidly or scarcely at all without their application. In females, especially of the higher classes, the want of proper exercise is commonly the chief cause of this affection. With such persons, a short walk, two or three times daily, will often do wonders, particularly if a little ripe fruit, a few raisins or tamarinds, or,

Conserve of Sloes. *Syn.* CONSERVA PRUNÆ

still better, 2 or 3 drum figs, be occasionally eaten. In some cases of obstinate constipation a cold-water dressing, placed over the pit of the stomach or the abdomen, will cause the bowels to act in the course of an hour or two. When the inactivity of the bowels arises from a deficiency of bile (one of the most common causes), no remedy is more natural, or more effective, than inspissated ox-gall. In cases complicated with nervous, hypochondriacal, or hysterical affections, in chlorosis, dyspepsia, depraved appetite, and numerous other ailments, this remedy frequently succeeds, after the most active articles of the materia medica have been tried in vain.

In the treatment of the constipation of infants, castor-oil ($\frac{1}{2}$ teaspoonful occasionally), or manna ($\frac{1}{4}$ to $\frac{1}{2}$ oz., sucked at will), may be given. The introduction (very gently) of a little slip of writing paper, parsley stalk, or suet, is a method sometimes adopted successfully by nurses. Friction on the stomach and bowels with the warm hand, or a piece of soft flannel, should also be employed. See GALL, PURGATIVE, &c.

CONSUMPTION. See PHTHISIS.

CONTA'GION. See DISINFECTANT.

CONTU'SION. A *hum*, or injury to the flesh, such as might be caused by a blunt instrument or by a fall, without breach or apparent wound. For *treatment*, see BRUISE.

COPAI'BA. *Syn.* COPAI'VA, COPAIBA BALSAM, CAPIV'I, BALSAM OF CAPIV'I; COPAI'BA (Ph. L. E. & D.), L.; BAUME DE COPAHU, Fr.; COBAIVA BALSAM, Ger. "The oleo-resin, of a brown colour, obtained by incision from the trunk of *Copaifera multijuga*." (B.P.) Most of the balsam of commerce is obtained from Para and Maranhao. It is packed in casks containing from 1 to $1\frac{1}{2}$ cwt. each, or in large bottles, or in cylindrical tin boxes.

Prop., Purific., &c. Copaiba, though usually called a 'balsam,' is not correctly so named, as it contains no benzoic or cinnamic acid. It is correctly described in the B. P. as an 'oleo-resin.' Considerable variation exists in the colour, odour, consistence, and transparency, as well as in the proportion of oil and resin, yielded by different samples, scarcely any two of which exactly agree. The sp. gr. varies from .950 to .996. Brazilian copaiba is thin, clear, and pale; whilst the West Indian variety is thick, golden yellow, less transparent, and has a less agreeable and somewhat terebinthinate smell. Some varieties are opaque, and continue so unless filtered. This is often a most troublesome operation. The opacity generally arises from the presence of water, which it retains with great tenacity. The following is the plan we have found to answer on the large scale:—Place the casks upon their ends in a warm situation, and leave them so for 10 days or a fortnight, or longer, if convenient. They may then be tapped a little above the bottom, when the contents of some of them will generally be found quite trans-

parent, and may be drawn off and vatted, care being taken to avoid shaking up the bottom. The copaiba that remains foul must be filtered through one or more long Canton flannel bags, sunk in the bottom of a tin cistern, placed over a suitable receiver, in a similar way to that adopted for oils; a few pounds of coarsely powdered charcoal being mixed up with the first 5 or 6 gallons thrown in. This will rapidly fill up the pores of the bag, and make the balsam soon flow clear and pale. The "bottoms" of the casks, containing the water and impurities, may be poured into a large can or jar, and allowed to settle for a few days, when the copaiba may be poured off the top and filtered. A sudden change of temperature will frequently turn a transparent sample of this article opaque or milky; it is not, therefore, deemed fit to send out by the wholesale trade, unless it stands this test. To ascertain this point, a common practice is to fill a small bottle with the copaiba, and to leave it out of doors all night in an exposed situation.

Pur., Tests, &c. This substance is frequently adulterated; indeed, fully one half that sold for copaiba does not contain 10% of the genuine balsam. This is particularly the case with that sold in capsules, at low prices, in the shops. Pure balsam of copaiba may be recognised by the following characters:—

1. (Ph. E.) It is transparent; free of turpentine odour when heated; soluble in 2 parts of alcohol; and dissolves one fourth of its weight of carbonate of magnesia with the aid of a gentle heat, and continues translucent.

2. (Chevallier.) A drop of the balsam, placed on a piece of unsized paper, and heated until all the essential oil is expelled, forms a semi-transparent, well-defined spot; but if the balsam has been adulterated with a fatty oil, it is surrounded by an oily areola.

3. (Planche.) $2\frac{1}{2}$ parts of balsam shaken with 1 part of solution of ammonia, sp. gr. .965, forms a mixture which becomes clear and transparent in a few moments, and may be heated to 212° Fahr. without becoming opaque.

4. (Vigne.) Boiled with 50 times its weight of water for 1 hour, it should lose at least half its weight.

5. (Adder.) By agitating the suspected sample with a lye of caustic soda, and setting the mixture aside to repose, the balsam after a time rises to the surface, and the fatty oil present (if any) forms a soapy, thick mass below.

6. ('Journ. de Pharm.,' 1842.) Pure copaiba may be adulterated with 50 per cent. of a fat oil (nut, almond, or castor oil), without it ceasing to give a clear solution with 2 parts of alcohol; but it combines badly with magnesia and ammonia. Excess of alcohol, however, separates the oil in all cases. The best test for detecting the fat oils is the use of

pure alcohol, to which some caustic potash has been added.

Uses, &c. Balsam of copaiba is considered detersive, vulnerary, diuretic, and astringent; and appears to possess a sort of specific power over diseases of the mucous membranes of the urino-genital organs. It is hence a favorite remedy in gonorrhoea, as soon as the first inflammatory symptoms have subsided, antiphlogistic and soothing measures being previously adopted.—*Dose.* 20 to 60 drops on sugar, floating on water, or made into an emulsion with yolk of egg or gum arabic, 3 or 4 times daily, if the stomach will bear it. The addition of a few drops of sweet spirits of nitre and laudanum have been recommended, to allay the nausea. By adding 1 dr. of oil of orange (*ol. aurantii*) to each oz. of the balsam, its flavour becomes far from disagreeable, and it sits well upon the stomach. Copaiba is also given in capsules and pills. See CAPSULES, EMULSION, OIL, PILLS, &c.

Obs. Numerous preparations of this article are sold under such names as 'soluble copaiba,' 'specific solution,' 'salt of copaiba,' &c.; none of these appear to possess equal activity and certainty of operation to the natural balsam. As the whole virtue of copaiba as a medicine depends on the essential oil it contains, the value of any of these preparations may be estimated by the quantity of that article which is found in them. In the case of the first two articles above named, the quantity is very small indeed, and in the last it is wholly deficient.

The following forms are current in the trade for the reduction (adulteration) of balsam of capivi:—

1. Balsam of copaiba, 4 lbs.; castor oil, 3 lbs.; mix well.
2. Balsam, 7 lbs.; castor oil, 4 lbs.; yellow resin, 2 lbs.
3. Equal parts of balsam of copaiba and Canada balsam.
4. To the last add, Venice turpentine, 1 lb.
5. Balsams of Canada and copaiba, and nut or castor oil, equal parts.
6. Copaiba, 7 lbs.; nut oil, 3 lbs.; yellow resin, 2 lbs.; Canada balsam, 1 lb. *Used* to fill the cheap capsules; and to sell in the lower parts of London and in the manufacturing districts. See also FACTITIOUS COPAIBA (*below*).

Copaiba, Factitious. *Syn.* COPAIBA FACTITIA, BAL'SAMUM COPAIBÆ FACTITIUM, L. *Prep.* 1. Castor oil (warm), 7 quarts; copaiba bottoms, 1 quart; mix, and filter through lannel.

2. Castor oil, 1 gal.; yellow resin, 3 lbs.; Canada balsam, 2 lbs.; oil of juniper, 2 oz.; 1 of savin, 1 oz.; essences of orange and mon, of each, $\frac{1}{2}$ oz.; powdered benzoin, 1 oz.; melt the resin with the castor oil and benzoin, and when nearly cold add the essences.

3. Canada balsam, 9 lbs.; castor oil, 7 lbs.; yellow resin, 1 lb.; Venice turpentine, 2 lbs.;

oils of rosemary, juniper, and savin, of each, 1 dr.; essential oil of almonds, 20 drops.

4. Canada balsam, 3 lbs.; Venice turpentine, 1 lb.; oils of fennel, juniper, and savin, of each, q. s.

Used chiefly to fill capsules. It is readily distinguished from balsam of copaiba by the proper tests. (See *above*.) Train oil or nut oil is frequently substituted for the castor oil.

Copaiba and Ka'li. *Syn.* COPAIBA CUM POTASSÂ, L. *Prep.* Carbonate of potassa and water, of each, equal parts; dissolve, and add, gradually, transparent balsam of copaiba, until the fluid, at first milky, turns quite clear. Resembles miscible copaiba (see *below*).

Copaiba, Miscible. *Prep.* From balsam of copaiba (pure and transparent), mixed with half its volume of solution of potassa made of double the strength ordered in the B. P.

Obs. As different samples of copaiba often require slightly different quantities of the solution of potassa, it is best to mix the two gradually and cautiously together. Should the mixture be opaque, a little more of one or other of the ingredients, as the case may be, will render it clear. No heat must be used. This article is miscible with water, with which it forms a kind of milk; and from containing all the volatile oil of the copaiba, is a very valuable preparation. Its activity is considered equal to that of the balsam itself, and it is given in similar doses.

Copaiba, Soluble. *Syn.* COPAIBA SOLUBILIS, L. *Prep.* 1. Heat miscible copaiba in an earthen, glass, or bright-tinned copper vessel, to nearly the boiling-point, pour it while still hot into a separator, cover it up, and allow it to cool very slowly. After a few days, draw off the clear portion from a cock or hole placed at or near the bottom of the vessel, observing to reject the first few drops which pass through, and to stop the stream before any of the floating oil (*oleum copaibæ*) reaches the orifice. A very little concentrated liquor of potassa, added before applying the heat, renders it more soluble. Thick, transparent, soluble in pure water, and resembles the natural balsam in appearance.

2. Balsam of copaiba and solution of potassa (B. P.), equal parts, by volume; mix, boil for a few minutes, and then proceed as before. Thinner than the last.

Prop. Less powerful than miscible copaiba, but it sits better on the stomach, and is about four times as strong as specific solution of copaiba. See SOLUTION.

Copaiba, Resin of. *Syn.* COPAIBA RESINOSA, L. The residue left after the process of distilling the oil of copaiba from the balsam. It consists principally of copaic acid. It has been recommended for gonorrhoea, but is nearly inert, even in $\frac{1}{2}$ oz. or $\frac{3}{4}$ oz. doses. See OIL.

Copaiba, Salt of. *Syn.* SAL COPAIBÆ, L. There are two preparations sold under this name; the one, crude copaic acid; the other,

copaibate of an alkali. Neither of them possesses the valuable properties of copaiba, which reside almost entirely in its essential oil. "We have taken the 'sal copaiba,' and have watched its action on others, but have not been able to perceive any good effects to result from its administration." (Cooley.)

COPAL'IC ACID. *Syn.* CAPIV'IC ACID, YELLOW RESIN OF COPAIBA. An amber-coloured, brittle, semi-crystalline, resinous substance, obtained from resin of copaiba, soluble in alcohol, rectified spirit, ether, and oils, reddens litmus paper, and forms salts with the bases, called copaibates.

COPAL. *Syn.* COPAL', GUM COPAL. A resinous substance, which exudes spontaneously from various trees belonging to the genera *Hymenaea*, *Guibourtia*, and *Trachylobium*. The varieties commonly met with in commerce are East Indian copal, or anime, which is the produce of *Hymenaea Courbaril*, and West Indian copal, obtained from numerous species.

Prop. When of good quality, it is too hard to be scratched by the nail, has a conchoidal fracture, and a sp. gr. ranging from 1.059 to 1.072. Unlike other resins, it is dissolved with difficulty by alcohol and essential oils; and this property, combined with its extreme hardness, renders it very valuable for making varnishes. See VARNISH.

COPPER. *Cu.* *Syn.* CU'PRUM, L.; CUIVRE, Fr.; KUPFER, Ger.

Sources. Metallic copper (native copper) is found in many parts of the globe, diffused in isolated particles in the form of thin laminae, in loose grains intermixed with quartz (copper sand, copper barilla), in dendritic pieces, and in solid blocks, occasionally of many tons weight. The richest deposits of native copper are those of Lake Superior, in North America. More frequently and more abundantly it occurs as an ore, e. g. red oxide, black oxide, green carbonate of copper or mal'achite, blue carbonate of copper, vitreous sulphide of copper, purple copper, copper pyrites, or yellow copper ore, with sulphur, antimony, or arsenic, and other metals (true gray copper ore or fah'lerz), as an impure hydrated silicate (chrys'ocolla), and as an impure hydrated oxychloride (atac'amite). The most abundant and important ore is copper pyrites. It is principally obtained from the mines of Cornwall, Devonshire, and Cuba. The carbonates of copper are now largely imported from Australia, the metal produced by smelting them is generally of the best quality.

Prep. We will not attempt to give a minute description of the various complex processes by which the reduction of copper from its ores is effected, but will merely give an outline of the common or Welsh process. This process includes six distinct operations, as follows:—
1. The ore (copper and iron pyrites), containing from 8 to 10% of copper, is roasted in a reverberatory furnace, called a 'calciner,' by which

much of the sulphide of iron is converted into oxide. 2. The calcined ore is melted with 'metal slag' (a product of a subsequent operation—No. 3), in a melting furnace called the 'ore furnace.' The products are a regulus, termed 'coarse metal,' containing about 35% of copper, and 'ore-furnace slag,' which is thrown away. Much of the iron, and the whole of the so-called earthy matter of the ore, are thus separated, as slag. 3. The coarse metal, having been granulated by causing it to flow from the furnace into water, is calcined with free access of air in a calciner, and a considerable amount of sulphur is expelled. 4. The calcined, granulated, coarse metal is melted, with the addition of matters rich in oxides of copper, namely, 'roaster' and 'refinery slugs' (from the two remaining operations, Nos. 5 and 6, respectively), and native carbonates of copper, or ores containing oxide of copper. The products are a regulus, termed 'metal,' which contains about 75% of copper, and metal slag (see No. 2). The metal should be in the state of 'white metal,' compact and brittle, with a feeble metallic lustre and a dark bluish-gray colour. It is tapped off into sand moulds. 5. The pigs of regulus obtained by the last operation are roasted in a furnace through which air passes. The temperature is so regulated that the regulus may be melted in from 6 to 8 hours. The slag is skimmed off, and after a time the heat is lowered, to allow the regulus to solidify. It is again melted and tapped into sand moulds, the product being called 'blister copper.' 6. This, the last operation, is termed 'refining.' From 6 to 8 tons of blister copper, in pigs, are melted in a furnace, and kept exposed for about 15 hours to the oxidising influence of the air. The slag is skimmed off through the end opening. When the oxidation has been sufficiently prolonged, anti-acite or free-burning coal, as pure as possible, is thrown upon the surface of the metal, and after a short time the thick end of a long birch or oak pole is plunged into the molten mass. This part of the operation is termed 'poling.' The wood in contact with the copper is rapidly decomposed; much gas is evolved, which causes the metal to be splashed about, and every part of it to be exposed to the reducing action of the coal. When the refiner finds the metal to be at the state of 'tough pitch,' the pole is taken out, and the coal pushed back from the end opening, through which the copper is then ladled out as quickly as possible, and cast into suitable moulds. For full details of this and other processes, the reader is referred to Dr. Percy's work on 'Metallurgy.'

In the laboratory, copper is commonly employed under the following forms:—

1. **BEAM-SHOT COPPER.** Produced by simply lading the melted copper from the refining furnace into hot water. In small lumps like peas and beans; hence its name. Used to make alloys, solutions, &c.

2. **ELECTROTYPE COPPER.** A very pure

form, obtained by decomposing sulphate of copper in an electrolytic apparatus. It does not contain lead, whereas most varieties of commercial copper do contain that metal.

3. **FEATHER-SHOT COPPER, GRANULATED C.** Produced by lading file refined copper from the furnace into cold water. In small pieces, with a feathered edge. Used to make calamine, brass, solution of copper, &c.

4. **COPPER IN PLATES OR FOIL.** Those of commerce (best, annealed) are generally employed.

5. **COPPER IN POWDER.**—*a.* A solution of sulphate of copper is heated to the boiling-point, and precipitated with distilled zinc; the precipitated copper is then separated from the adherent zinc by dilute sulphuric acid, washed with water, and dried by exposure to a moderate temperature.

Prop., &c. Copper has a brilliant yellowish-red colour, a nauseous, styptic taste, and emits a disagreeable odour when rubbed; is very malleable and ductile; unchanged in dry air; in damp air it soon becomes covered with a greenish rust (carbonate of copper); slightly soluble in dilute sulphuric and hydrochloric acid; freely soluble in boiling oil of vitriol (sulphurous anhydride being evolved); dilute nitric acid dissolves it readily with copious evolution of nitric oxide; heated to redness in the air, it rapidly becomes covered with a black scale (oxide); it fuses at a full red heat; its crystals are either octahedra or dodecahedra; sp. gr. 8.8 to 8.96; it forms numerous compounds (alloys and salts) with other bodies, all of which are more or less poisonous; its salts are either blue or green, and most of them (when neutral) are soluble in water.

Tests. Metallic copper may be recognised by the above properties; its oxides, salts, &c., by the following characters and reactions:—The solutions of copper possess a blue or green colour, which they retain even when considerably diluted with water:—With caustic potassa they give a light-blue, bulky precipitate, turning blackish-brown or black on boiling the liquid:—Ammonia and carbonate of ammonium produce a bluish-white precipitate, soluble in excess, yielding a rich deep-blue solution:—The carbonates of potassium give a like precipitate, insoluble in excess:—Ferrocyanide of potassium gives a reddish-brown precipitate:—Sulphuretted hydrogen and sulphhydrate of ammonium give blackish-brown or black ones:—A polished rod of iron, on immersion in an acidulated solution, quickly becomes coated with metallic copper.

Estim., &c. Copper is generally **WEIGHED** under the form of black oxide, but sometimes as pure metal:—By throwing it down from its solution by pure potassa, after which it must be carefully collected, washed, dried, ignited in a platinum crucible, and weighed therein as soon as it is cold. Every 5 parts of the ignited precipitate (oxide) represents 4 parts of copper

(nearly); or, more accurately, every 39.7 parts are equal to 31.7 of pure metallic copper:—By immersing a piece of polished steel in the solution, and weighing the resulting precipitate of the copper (see *above*). Less delicate than the preceding.

Copper can be separated from the other metals by means of the following processes:—

From lead. By adding sulphuric acid to the nitric solution, and evaporating to dryness, when water digested on the residuum will dissolve out the sulphate of copper, but leave the sulphate of lead behind. From this solution the oxide of copper may be thrown down as before.

From tin. By digestion with hot nitric acid, which dissolves out the tin.

From zinc. By sulphuretted hydrogen, which throws down the sulphide of copper from an acid solution.

From silver. By digesting it in the state of filings or powder in a solution of chloride of zinc, which dissolves the first, but leaves the last unchanged.

Copper may be separated, in a state of great purity, from **ANTIMONY, ARSENIC, BISMUTH, LEAD, IRON, TIN, ZINC, &c.**, as it exists in bell-metal, brass, bronze, gun-metal, mosaic gold, and other commercial alloys, by fusing it in a crucible for about half an hour, along with copper scales (black oxide) and ground bottle-glass, or other like flux. The pure metal is found at the bottom of the crucible, whilst the impurities are either volatilised or dissolved in the flux. The proportions for refining commercial copper are, metal, 10 parts; copper scales and bottle-glass, of each, 1 part. The Society of Arts conceived this process to be so valuable, that they presented one of their gold medals to its inventor, Mr. Lewis Thompson.

Uses, &c. The ordinary uses of copper are well known. In *medicine*, 3 or 4 grs. of the filings or powder were formerly given in rheumatism, and to prevent hydrophobia. Some of its salts are still used as astringents, emetics, and caustics. Its alloys are of great value. With zinc it forms **BRASS**; with tin, **BRONZE**, **BELL-METAL**, **GUN-METAL**, and **SPECULUM-METAL**. **WHITE COPPER** is formed by the addition of metallic arsenic, and **GERMAN SILVER** is a mixture of nickel, zinc, and copper.

• *Ant.* Copper in the metallic state is almost inert, but all its compounds are poisonous. The antidotes are—the white of egg, milk, or flour, mixed with water. The hydrate, sulphides of iron, iron filings, and ferrocyanide of potassium have also been strongly recommended, and are exhibited in the same way. Sugar is likewise highly spoken of as an antidote. In all cases a strong emetic should be first given.

Obs. Culinary and pharmaceutical vessels are very commonly made of copper, but too much caution cannot be exercised in their employment. Acid syrups, vegetable juices,

aqueous extracts, soups, stews, &c., prepared in copper saucepans, or boilers, receive a metallic contamination proportional to the length of time they are exposed to the action of the metal. Such vessels are frequently tinned, for the purpose of protecting the copper from contact with their contents, but this film of tin is necessarily very thin, and soon becomes imperfect by constant use. When copper vessels are allowed to remain wet or dirty, or, more especially, greasy, a poisonous green rust forms upon the surface, somewhat similar to verdigris. If articles are prepared in them in this state, serious consequences may ensue. Cases of poisoning from this cause are frequently met with, and instances of vomiting following the use of such articles are almost of daily occurrence, without the reason being suspected. We have occasionally seen confections and extracts, prepared in copper pans, deposit a coating of that metal upon the knives used to stir them. The ashes of the inspissated juices of fresh vegetables, and especially the pulps of fruit, prepared in vessels of this metal, have exhibited the presence of copper on the application of chemical tests. Ketchup is frequently rendered poisonous in this way. The most wholesome material for culinary utensils is thin sheet iron, or tinned iron-plate (TIN), which is very durable if kept clean and dry when not in use. Copper vessels of every kind should be cleaned out, immediately before use, even though they may not appear to require it, and on no account should they be employed for any fluids that are the least acidulous, or that may have to remain long in them.

Copper, Neutral Acetate of. $\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2$. *Syn.* NORMAL CUPRIC ACETATE, ACETATE OF COPPER, CRYSTALLISED VERDIGRIS. *Prep.* Dissolve common verdigris or cupric hydrate in hot acetic acid, so as to form a highly concentrated solution; filter, and place in a cool situation to crystallise.

Prop. Beautiful dark, bluish-green prisms, which dissolve in 14 parts of cold and 5 parts of boiling water.

Copper, Basic Acetates of. *Syn.* BASIC CUPRIC ACETATES, SUB-ACETATES OF COPPER. Common verdigris is a mixture of several basic acetates which have a green or blue colour. One of these (SESQUIBASIC ACETATE) is obtained by digesting powdered verdigris in tepid water, filtering, and leaving the soluble part to spontaneous evaporation. It may also be obtained in a state of purity by adding liquor of ammonia in small portions to a boiling concentrated solution of the neutral acetate till the precipitate is just redissolved, and leaving the solution to cool. It forms a blue, crystalline mass, but little soluble in cold water. The green, insoluble residue of the verdigris, after treatment with tepid water, contains another acetate (TRIBASIC ACETATE); this may be formed by digesting neutral acetate of copper with the hydrated oxide. A third salt (DIBASIC ACETATE, BLUE VERDIGRIS) is prepared

on a large scale in France by exposing copper to the air in contact with fermenting wine-lees.

Copper, Ammo'nio-sulphate of. *Syn.* SULPHATE OF CUPRAMMONIUM, CUPRO-SULPHATE OF AMMONIA; CUPRI AMMONIO-NIO-SULPHAS, L.; CUTVRE AMMONIACAL, Fr.; KUPFER SALMIAK, Ger. *Prep.* Sulphate of copper, 1 oz.; sesquicarbonate of ammonium, $1\frac{1}{2}$ oz.; rub together until carbonic acid ceases to be evolved, then wrap it in bibulous paper, and dry it in the air.

Pur. Pulverulent; dark blue; at an intense heat it is changed into oxide of copper, at first sesquicarbonate of ammonia, and, afterwards, sulphate of ammonia, being thrown off. It is soluble in water to a splendid purple-blue solution, from which the salt is precipitated by alcohol in blue crystals. This solution has the peculiar property of dissolving CELLULOSE (cotton, paper, &c.). The cellulose may be precipitated from the solution in colourless flakes by the addition of acids.

Uses, &c. It is occasionally employed in *pyrotechny*. In *medicine*, it has been given in chorea, epilepsy, hysteria, &c., but is now principally used as an injection, as a wash for foul ulcers, and as a collyrium, in opacity of the cornea.—*Dose.* $\frac{1}{4}$ gr., gradually increased to 5 grs., twice a day. Great care must be taken in drying, as it is apt not only to lose a large portion of its weight, but to become of an inferior colour. Both the ingredients should be separately reduced to powder before mixing them.

Copper, Ar'senite of. $\text{Cu}(\text{AsO}_2)_2$. See GREEN PIGMENTS (Scheele's Green).

Copper, Carbonate of. CuCO_3 . *Syn.* DIBASIC CARBONATE OF COPPER, DICARBONATE OF C.; CUPRI CARBONAS, L. *Prep.* Add carbonate of soda in excess to a solution of sulphate of copper, and warm the mixture till the pale-blue, flocculent precipitate becomes sandy and assumes a green tint. *Used* as a pigment. See GREEN PIGMENTS and VERDITER.

Obs. As prepared above, the carbonate contains 2 equivalents of water. The beautiful green mineral, MAL'ACHITE, has a similar composition, but contains only 1 equiv. of water. Another carbonate (TRIBASIC C., BLUE C.), occurs as a natural ore in large, transparent crystals, of the most intense blue; it has not yet been artificially imitated.

Cuprous Chloride. CuCl . *Syn.* DICHLORIDE OF COPPER, SUBCHLORIDE OF COPPER. *Prep.* By exposing the neutral chloride of copper to the action of heat.

Prop. White; fusible; slightly soluble in water; and decomposed by exposure to the air.

Copper, Chloride of. CuCl_2 . *Syn.* NEUTRAL CHLORIDE OF COPPER. *Prep.* From copper scales or black oxide of copper dissolved in hydrochloric acid, and the solution evaporated and crystallised.

Prop., &c. Green, acicular crystals; deli-

quescent; soluble in alcohol, the flame of which it colours green. When gently heated, it loses water, and assumes the form of a yellowish-brown powder (ANHYDROUS COPRIC CHLORIDE, or CHLORIDE OF COPPER); at a high temperature it loses half its chlorine, and becomes converted into cuprous chloride.

Cupric Iodide. Cu_2I_2 . *Syn.* IODIDE OF COPPER, DI'IODIDE OF COPPER; CU'PRI IODI'DUM, L. *Prep.* By adding iodide of potassium to a solution of sulphate of copper, and washing out with alcohol the free iodine from the precipitate formed. A greenish-white precipitate.

(Commercial.) To a solution of sulphate of copper, 1 part, and protosulphate of iron, 3 parts, add a solution of iodide of potassium, and wash and dry the precipitate. This is the preparation commonly known in trade by the name of 'iodide of copper.'

Cupric Nitrate. $\text{Cu}(\text{NO}_3)_2$. *Syn.* NITRATE OF COPPER; CU'PRI NITRAS, L. *Prep.* By dissolving the copper in dilute nitric acid to saturation; evaporating to dryness; redissolving in distilled water; filtering, evaporating, and allowing to crystallise; or from black oxide of copper and nitric acid in the same manner.

Prop., Uses, &c. *Deep-blue prismatic crystals, very soluble in water and deliquescent, soluble in alcohol. Generally used in medicine externally, in injections, or as a caustic, but sometimes given internally, dissolved in mucilaginous liquids.—*Dose.* $\frac{1}{8}$ to $\frac{1}{4}$ gr.

Cuprous Oxide. Cu_2O . *Syn.* RED OXIDE OF COPPER, DINOX'IDE, SUBOXIDE; CU'PRI SUBOX'YDUM, L. *Prep.* Add grape sugar to a solution of sulphate or acetate of copper; then further add caustic potassa, in excess; the blue solution heated to ebullition deposits the sub-oxide, which must then be collected, washed, and dried.

A solution of cane sugar, 27 parts, in water, 60 parts, is poured over hydrated oxide of copper (weighed in the compressed and still moist state), 9 parts; a solution of caustic potassa, 18 parts, in water, 60 parts, is then added, and the whole mass well agitated together at the ordinary temperature, and strained through linen. If the dark-blue filtrate is next heated (continually stirring), over a water bath, anhydrous cuprous oxide is disengaged, and the liquor becomes nearly colourless.

Prop., Uses, &c. A superb red powder, with a metallic lustre. It often occurs in beautiful transparent, ruby-red crystals, associated with other ores of copper, and can be obtained in this state by artificial means. It is used as a pigment and a bronze, and as a stain for glass and enamels, to which it gives a rich red colour. By heat it is converted into the black oxide. With ammonia it forms a colourless solution, which rapidly becomes blue from the action of the air.

Cupric Oxide. CuO . *Syn.* OX'IDE OF COPPER, BLACK OXIDE, PROTOXIDE; CU'PRI PROTOX'YDUM. *Prep.* By heating the nitrate or carbonate of copper to redness. When it ceases

to lose weight the conversion is completed, and the oxide appears as a heavy, black powder.

By heating in the air the hydrated oxide thrown down from solutions of copper by pure potassa.

By adding caustic potassa, in excess, to a solution of a cupric salt, and heating the whole to a boiling-point; the precipitate is then collected, washed and dried. A heavy, dark-brown powder.

Uses, &c. Protoxide of copper is unchanged by heat, unless combustible matter is present, when it readily parts with its oxygen; hence its general use in ORGANIC ANALYSIS as a source of that element. It communicates a beautiful green colour to glass and enamels. With the acids it produces the ordinary salts of copper.

Cupric Sulphate. $\text{CuSO}_4 \cdot 5\text{aq}$. *Syn.* SULPHATE OF COPPER, BLUE COPPERAS, B. VITRIOL; CU'PRI SUL'PHAS, L.; SULFATE DE CUIVRE, Fr.; KUPFER VITRIOL, Ger.; NEELA TOOTIA, Hind. *Prep.* (Commercial.) The sulphate of copper of commerce is obtained by the oxidation of native sulphide of copper (COPPER PYRITES); by the joint action of air, heat, and moisture, the copper is converted into an oxide, and the sulphur into sulphuric acid. The resulting salt is washed out, and the solution evaporated and crystallised. The water found in and issuing from copper mines often furnishes such a solution ready to the hands of the manufacturers. A large quantity of sulphate of copper is also obtained as a secondary product in the refining of silver, and is occasionally prepared by dissolving in sulphuric acid an oxychloride of copper, made for the purpose, by exposing sheets of copper to the joint action of air and hydrochloric acid.

• (Pure.) By the direct solution of the metal, or preferably, of its oxide or carbonate, in sulphuric acid, or by purifying the commercial salt by recrystallisation, &c.

Prop., Uses, &c. Fine blue crystals, slightly efflorescent, having an intensely styptic and metallic taste. By heat the blue salt loses its water of crystallisation, and becomes a white, anhydrous powder. It dissolves in 4 parts of water at 60° Fahr., and in 2 parts at 212°; is insoluble in alcohol and ether; and is decomposed at an intense heat into protoxide of copper, sulphurous acid, and oxygen. It has been used to prevent the dry rot in timber, and in dyeing. It is largely employed as a source of metallic copper in the ELECTROTYPING. Grain is steeped in a weak solution of it by the farmer, to prevent the 'smut.' As a medicine, it is employed chiefly as a styptic (in solution) and caustic (in substance) to destroy 'proud flesh;' and, less frequently, as an astringent or tonic (from $\frac{1}{4}$ gr. to 2 grs.), and an emetic (3 or 4 grs. to 10 or 12 grs.). It is exceedingly poisonous.

COPPERAS. This is a generic name for the CRUDE METALLIC SULPHATES. When used

without a qualifying adjective, it generally means sulphate of iron.

Copperas, Blue. Crude sulphate of copper. See **COPPER** (*above*).

Copperas, Calcined. From green copperas, heated in an unglazed earthen pot until it becomes white and dry. Used as an astringent and 'drier,' and in making ink and dyeing.

Copperas, Green. *Syn.* **COPPERAS.** Crude sulphate of iron. See **IRON**.

Copperas, White. Crude sulphate of zinc. See **ZINC**.

COPPERING. Iron may be covered with a thin film of copper by merely immersing it (previously scoured clean) in an acidulated solution of sulphate of copper, after which it must be rinsed in clean water. This film soon rubs off, but still it lasts long enough to deceive the travelling tinker's customers, who imagine that their copper kettles are properly repaired. Metals may be conveniently coated with compact copper to any desired thickness by means of voltaic electricity. See **ELECTROTYPE**.

COPROLITE. *Syn.* **DUNGSTONE, FOSSIL MANURE.** This mineral is the petrified dung of carnivorous reptiles. (Buckland.) Coprolites are found in all the secondary and tertiary strata. They contain a considerable proportion of phosphate of lime, for which reason they are largely employed in the manufacture of artificial manures. They form the bases of **Lawes' SUPERPHOSPHATE OF COPROLITE MANURE**. The nodules, after being washed, are ground to powder in a mill, and mixed with an equal weight of oil of vitriol.

COPTIS TEETA. (*Ind. Ph.*) *Syn.* **COPTIS, or MISHMI TITA.** *Hab.* Mishmel mountains, east of Assam. *Official part.* The dried root (*Coptidis Radix*), imported into Bengal from Assam, in small rattan baskets, each containing from 1 to 2 ounces of the drug. This consists of pieces of a woody rhizome, of the thickness of a small goose-quill and from 1 to 2 inches in length, often contracted at one extremity into a short woody stem; the surface is usually rough, irregular, more or less annulated, and marked with the remains of rootlets in the shape of short spiny points. Externally, yellowish-brown; internally, much brighter, frequently of a golden-yellow colour, exhibiting on fracture a radiated structure. Taste, persistently bitter, and when chewed tinges the saliva yellow. Contains neither tannic nor gallic acid, but abounds with a yellow, bitter principle, soluble in water and alcohol.—*Prop.* Pure bitter tonic.—*Therapeutic uses.* In debility, convalescence after fevers, and other debilitating diseases, atonic dyspepsia, and in mild forms of intermittent fevers.—*Dose.* 10 to 15 grs. of the powdered root, thrice daily.

Tincture of Coptis (*Tinctura Coptidis*). Take of coptis root, in coarse powder, 2½ oz.; proof spirits, 2 pints. Macerate for 7 days in a closed vessel, with occasional agitation; strain,

press, filter, and add sufficient proof spirit to make 1 pint.—*Dose.* ½ to 2 fl. oz.

Infusion of Coptis (*Infusum Coptidis*). Take of coptis root, in coarse powder, 5 drs.; boiling water, 1 pint. Infuse in a covered vessel for 2 hours, and strain.—*Dose.* 1 to 2 fl. oz., thrice daily.

CORAL. *Syn.* **CORAL'LUM, L.** The comprehensive term for all calcareous or stony structures secreted by the marine asteroid polypes, or zoophytes. The **RED CORAL** of commerce, which is so largely employed for beads, ear-rings, and other ornaments, may be described as the internal skeleton of *Coralium rubrum*.

Coral, Red (*Factitious*). *Syn.* **CORAL'LUM RUBRUM FACTITUM, L.** Prepared chalk, coloured with a little sesquioxide of iron or rose pink, and passed through a sieve. Sold by the druggists for powdered coral.

Coral, Prepared Red. *Syn.* **CORAL'LUM RUBRUM PREPARATUM.** Levigated coral was formerly used in medicine as an antacid or absorbent, and is still occasionally employed as a dentifrice. It consists almost entirely of carbonate of lime, coloured with red oxide of iron, and possesses no advantage over good chalk. It is prepared in a similar manner as chalk.

CORDIALS. *Syn.* **CARDIACA, L.** Warm, stimulating, restorative medicines, that tend to raise the spirits and promote the circulation. The principal cordial medicines are noticed under the heads **TINCTURE** and **SYRUP**. See also **PATENT MEDICINES**.

Cordials. Aromatised and sweetened spirits used as beverages. See **LIQUEUR**.

CORIAN'DER. *Syn.* (**CORIANDEUR FRUIT, CORIANDEI FRUCTUS, B. P.**); **CORIANDERS, C. SEED; CORIANDRUM** (*Ph. L. E. & D.*), *L.* "The ripe fruit of the *Coriandrum sativum*, dried." (*B. P.*) Coriander is chiefly used by confectioners and distillers as a flavouring ingredient. In the East it is much employed as a condiment, being an ingredient in **CUREY POWDER**. It is aromatic, carminative, and stimulant; and more effectually covers the taste of senna than any other substance.—*Dose.* 20 to 60 grs.; chiefly used as a corrective or adjuvant in compound medicines.

CORK. The outer bark of the *Quercus Suber* or *cork oak*, a tree common in southern France, Italy and Spain. The bark obtained from the younger branches of the same tree is employed for tanning. See **ALCOBACCO**.

Cork. A stopple or plug for a bottle or jar cut from the above substance. The common practice of employing inferior corks for the purpose of stopping the mouths of bottles is often productive of considerable loss, from the air being only partially excluded, and the contents suffering in consequence. Many a large bin of valuable wine has become, from this cause, in less than a year, little better than sour 'Cape.' Chemical preparations often suffer from a similar cause. The best

corks are those called 'velvet corks,' and of these the finest qualities are imported from France. No pains should be spared to obtain sound and soft cork for connecting the combustion- and drying-tubes used in organic analysis.

Several attempts have been made to introduce cork-cutting by machinery, but they have hitherto failed to supersede hand labour.

Cork-bo'rer. A thin brass tube, filed to a cutting edge, used for piercing holes through corks. Several tubes of different sizes, which fit into each other, are generally sold together. This simple and convenient instrument was introduced into the laboratory by Dr. Mohr.

CORN. *Syn.* **CLAVUS**, L. A horny induration of the skin, with a central nucleus, very sensitive at the base. The common cause of corns is continued pressure over the projection of the bones, from tight or stiff boots or shoes. They are of two kinds, hard and soft. The first grow on the exposed portions of the joints; the last, between the toes.

Preven. This consists in keeping the feet clean, by frequent ablution with warm water, and in the use of easy, soft boots and shoes. Without the latter precaution, corns will generally return, even after they appear to have been perfectly removed.

Treatment. After soaking the feet in warm water for a few minutes, pare the corns as close as possible with a sharp knife, taking care not to make them bleed. They may now be touched over with a little lunar caustic, or nitric acid, or a little concentrated acetic acid or aromatic vinegar. The last two do not stain the skin. The first is used by merely rubbing it on the corns, previously slightly moistened with water; the others, by moistening the corns with them, by means of a small strip of wood, or, preferably, a rod of glass; due care being taken not to allow the liquid to touch the neighbouring parts. This treatment, adopted every 3 or 4 days for 10 days or a fortnight, accompanied by the use of soft, loose shoes, will generally effect a cure. It has been recommended to remove large corns by ligatures of silk, applied as close to their base as possible, and tightened daily until they drop off; but this plan is tedious, and often inconvenient, and is not always successful. Another mode of extirpation is, the application of a small blister, which will frequently raise them with the skin out of their beds. In this case the exposed surface must be dressed with a little simple ointment. Soft corns may be removed by applying ivy leaf, previously soaked in strong vinegar, changing the piece every morning; or by placing a dressing of soap cerate, spread on a bit of lint or old rag, between the toes. One of the simplest and best remedies for hard corns, and which has received the sanction of high medical authority, is to wear upon the toe or part

affected a small, circular piece of soft leather, or, still better, a piece of amadou, spread with diachylon, or some other emollient plaster, and having a hole cut in the centre, corresponding to the size of the corn. (Sir B. Brodie.) By this means the pressure of the boot or shoe is equalised, and the apex of the corn protected from injury. The following are among the most useful of the **POPULAR REMEDIES FOR CORNS** :—

Corns, Caustic for. *Prep.* From tincture of iodine and chloride of antimony, of each, 1 dr.; iodide of iron, 3 grs.; mix. It is applied with a camel-hair brush, after paring the corn. 2 to 4 applications are said to effect a cure.

Obs. Most of the remedies noticed below really act as caustics.

Corns, Lotion for. *Prep.* 1. A solution of sal-ammoniac, 1 part; in proof spirit, 4 parts.

2. A concentrated aqueous solution of sulphate of copper. To be applied night and morning.

Corn Plasters. *Prep.* 1. From white diachylon, 3 parts; yellow resin, 2 parts; verdigris, 1 part; melted together, and spread on leather.

2. From galbanum plaster, 1 oz.; verdigris, 1 dr.; as the last.

3. From resin plaster, 2 oz.; black pitch, 1 oz.; verdigris and sal-ammoniac, of each, $\frac{1}{2}$ dr.

4. To the last add powdered opium, 1 dr. Recommended to allay pain, &c.

5. (W. Cooley.) A piece of spread adhesive plaster is placed upon a table, and a piece of card paper having a round hole cut in it the size of the central portion of the corn is laid upon it; the exposed part is then softened by holding a piece of heated iron for a second or two near it; the card paper is then instantly removed, and nitrate of silver, in fine powder, is sprinkled over the part which has been warmed. As soon as the whole is cold, the loose powder is shaken off, and the plaster is ready for use. Very cleanly and convenient. Two or three applications seldom fail to effect a cure.

6. (**MECHANICAL CORN PLASTERS.**) From common adhesive plaster spread on buckskin, amadou, or vulcanised India rubber, cut into pieces, and a circular hole corresponding to the size of the corn punched in each.

Corn Solvent. *Prep.* 1. Carbonate of potassa or pearlsh, contained in an open jar or bottle, set in a damp place, until it deliquesces into an oil-like liquid (oil of tartar). Applied by means of a feather, or a small piece of rag dipped in it is bound on the corn.

2. Hydrate of potassa, 1 dr.; rectified spirit, 1 oz.; dissolve. As No. 1.

3. Carbonate of potassa, with smalts, ochre, or bole, q. s. to give it the required colour. It must be kept dry, in a well-corked bottle. A pinch is placed on the corn, and confined by means of adhesive plaster or rag.

4. Carbonate of soda, 1 oz., finely powdered.

and mixed with lard, $\frac{1}{2}$ oz. Applied on linen rag every night.

5. (Sir H. Davy's.) Carbonate of potassa, 2 parts; salt of sorrel, 1 part; each in fine powder; mix, and place a small quantity on the corn for four or five successive nights, binding it on with a rag.

Obs. Care must be taken, in all cases, to pare the corn moderately close before applying the remedy; but in no case should any of the above be applied to a raw surface.

Corns, Pommade' for. *Prep.* 1. Powdered verdigris, 1 dr.; savine ointment, 7 drs.

2. Dried carbonate of soda, 3 drs.; lard, 5 drs.; verdigris or smalts, q. s. to give a slight tinge of green or blue. Applied on a piece of rag.

CORRO'SIVE SUBLIMATE. See MERCURY. **CORUNDUM.** See EMERY.

COSMETICS. *Syn.* COSMETICA, L.; COSMETIQUES, Fr. External applications employed for the purpose of preserving or restoring personal beauty. The term is generally understood to refer to substances applied to the cuticle, to improve the colour and clearness of the complexion; but some writers have included under this head every topical application used with the like intention. Hence cosmetics may be divided into—CUTANEOUS COSMETICS, or those applied to the skin; HAIR COSMETICS, or such as are employed to promote the growth and beauty of the hair; and TEETH COSMETICS, or such as are used to cleanse and beautify the teeth. See BALDNESS, COSMETIQUE, DENTIFRICE, DEPILATORY, HAIR-DYE, POMMADE, TOOTH POWDER, &c.

COSMETIQUE. [Fr.] Hard pomatum, formed into a cake or stick for the toilet. It is sometimes coloured black or brown, the pigments being added in the state of an impalpable powder.

1. (BLACK—COSMETIQUE NOIR.) From good lard, 5 parts; wax, 2 parts; (or, Hard pomatum, 7 parts;) melt, stir in levigated ivory black, 2 parts; and pour it into moulds of tinfoil; which are afterwards to be placed in paper sheaths.

2. (BROWN—COSMETIQUE BRUN.) As the last, but using levigated amber for 'plain brown,' and levigated terra di Sienna for 'auburn' and 'chestnut.'

3. (WHITE, OR PLAIN—COSMETIQUE BLANC.) The same, without colouring matter.

Obs. They are generally scented with musk, ambergris, or cassia.

Use. The above are used to colour moustaches, eyebrows, whiskers, &c., as well as to keep the hair in its place. The labels on the packets before us have—"pour fixer et lisser les cheveux." The application must be renewed daily, as the cosmetique is gradually removed by friction, and perfectly so by soap and water.

COTARNINE. A crystallisable substance obtained from the mother-liquors of opianic

acid. It is basic, very soluble, and bitter. Hydrochlorate of cotarnine is soluble and crystalline.

COT'TON. *Syn.* GOSSYPIUM, L. The cotton of which textile fabrics are made consists of hairs covering the seeds of certain plants belonging to the natural order *Malvaceæ*, or the Mallow family. Our commercial cotton appears to be derived from four distinct species, viz.:—

Gossypium arboreum. The tree cotton, an Indian species. Unlike the other cotton plants, it has the dimensions of a small tree. The cotton-hairs are remarkably soft and silky, and are woven by the natives into very fine muslin, used for turbans by the privileged classes only.

Gossypium Barbadense. The 'Barbadoes' or 'Bourbon cotton plant.' This is the species which yields all our best cotton. In the small American islands which fringe the coast from Charlestown to Savannah, this plant has produced the celebrated 'sea-island cotton,' which is unrivalled for the length of its 'staple,' its strength, and silkiness.

Gossypium herbaceum. The common cotton-plant of India. It produces the Surat cotton of commerce.

Gossypium Peruvianum or *acuminatum.* A species supposed to be indigenous to America. It furnishes the South American varieties of cotton, as Pernambuco, Peruvian, Maranhão, and Brazilian.

Identif. See LINEN.

Dyeing. The fibres of cotton have nearly the same affinity for mordants and the colouring matter of dyed stuffs as linen, and may be treated in the same manner. See DYEING, LINEN, &c.

COTTON, GUN. See PYROXYLIN.

COUGH. *Syn.* TUS'SIS, L. The sudden and violent expulsion of air from the lungs. It is generally symptomatic of other affections, but is sometimes idiopathic, or a primary disease. Many cases of cough depend upon the extension of catarrh to the trachea and bronchiæ, which thus become loaded with mucus or phlegm, which they endeavour to throw off by the convulsive effort called coughing. In some cases it is caused by a vitiation and inspissation of the secretions, arising from the imperfect action of the absorbents; this is the common cause of the dry cough of old people. Idiopathic cough is not considered dangerous in itself, or while running its regular course, but it is often productive of most serious consequences, by superinducing the inflammation of some organ, or laying the foundation of phthisis.

Cough is sometimes attended by copious expectoration, and at other times exists without any; it has hence been distinguished into moist or mucous cough, and dry cough.

Treatment. That of common catarrhal cough consists in allaying the irritation as much as possible, by demulcents and expectorants, as

mucilaginous drinks and lozenges, which act upon the glottis, and sympathetically upon the trachea and bronchiæ. Among the first may be mentioned, almond milk, barley water, refined Spanish juice, gum arabic, and a mixture of the last two made into lozenges; among the second, the most innocent and convenient is ipecacuanha, in the shape of lozenges, 2 or 3 of which may be sucked whenever the cough is troublesome. A light diet should be adopted, the bowels kept slightly relaxed by the use of gentle aperients, and a mild and equable temperature sought as much as possible. When this plan does not succeed, recourse may be had to an emetic, followed by small doses of Dover's powders, and extract or tincture of henbane, or squill pill. When a cough is troublesome at night, and unattended with fever, a small dose of laudanum, or tincture of henbane, taken on going to rest, will generally procure sleep. In the treatment of dry cough, the more stimulating expectorants are useful, as garlic, ammoniacum, styrax, and benzoin, combined with narcotics and sedatives, as henbane, hemlock, and opium. A diaphoretic opiate is also very useful, especially in the cough of old people. See DRAUGHT, EMULSION, MIXTURE, PILLS, &c.

COUMARIN (kôö-). *Syn.* CUMARIN. The odorous principle of the fruit or bean of *Dipteryx odorata* (tonquin bean). It exists in several other plants, as *Melilotus officinalis*, *Asperula odorata*, and *Anthoxanthum odoratum*.

Prep. From the sliced tonquin beans, by macerating in hot alcohol; straining through cloth, and distilling off the greater part of the spirit. The syrupy residue deposits, on standing, crystals of COUMARIN, which must be purified from fat oil by pressure, and then crystallised from hot water.

Prop. Slender, brilliant, colourless needles; fusible at 122° Fahr., and distilling at a higher temperature without decomposition. It has a fragrant odour and burning taste; it is very slightly soluble in cold water, more freely in hot water, and also in alcohol.

COUNTER-IRRITANTS. In medicine and pharmacy, substances applied to the surface of the body to establish a secondary morbid action, with the view of relieving one already existing. In painful and spasmodic affections, as neuralgia, spasms, and cramp; in rheumatism, lumbago, swelled and painful joints; in headache, sore throat, sprains, languid glandular tumours, and many other cases, this class of medicines often proves extremely valuable. The counter-irritants which are best known are blisters, mustard poultices, hartshorn-and-oil, and liniment of ammonia.

COURT PLASTER. See PLASTER.

COW DUNG. This substance was formerly employed in large quantities by the calico printers. Recently, a mixture of sulphate, carbonate, and phosphate of lime and soda, with British gum or bran, has been successfully

tested as a substitute for it, and has the advantage of cleanliness and economy.

COWHAGE. *See* COWITCH; МУСУНА (Ph. L. E. & D.). *See* "The hairs of the fruit *Mucuna pruriens*" (Ph. L.). "The hairs from the pods" (Ph. E.). "The hairy down" (Ph. D.). It occasions violent itching when it comes in contact with the skin, which can only be allayed by a solution of green vitriol, or by oil. It is frequently administered as a vermifuge, made into a confection, by scraping the hair off a pod into treacle, syrup, or honey, for a morning dose, which is repeated for 3 or 4 successive days, followed by a brisk purge. It acts more effectually if its administration has been preceded by a gentle emetic.

COWS. See DAIRY.

CRAB. See SHELL-FISH.

CRACK'NELS. Small, brittle cakes or biscuits, made by first boiling and then baking paste. *Prep.* To flour, 1 pint, add a little grated nutmeg, the yolks of 2 eggs, 2 or 3 spoonfuls of rose-water, and cold water, q. s. to make a paste; then roll in butter, $\frac{1}{2}$ lb., and make it into shapes. In one hour put them into a kettle of boiling water, and boil them until they swim, then throw them into cold water; take them out, and when dry, bake them on tins. Those of the shops contain less butter, and the rose-water is omitted.

CRACK'NUTS. Thin and sweet cakes or wafers. *Prep.* 1. Flour, 1 lb.; sugar, $\frac{1}{2}$ lb.; melted butter, $\frac{1}{2}$ lb.; 6 or 7 eggs, well beaten; make a paste with a glassful of raisin wine and a little water; add carraways, roll it out as thin as paper, cut it into shapes with a tumbler, wash the pieces with the white of egg, and dust them over with powdered sugar.

2. As the last, but using $\frac{1}{2}$ lb. more flour.

• **CRAMP.** See SPASMS.

CRAPE is cleaned by rinsing it in ox-gall and water, to remove the dirt; afterwards in pure water, to remove the gall; and lastly, in a little gum-water, to stiffen and crisp it. It is then clapped between the hands until dry.

CRAY-FISH. See SHELL-FISH.

CRAY'ONS. Colouring substances made up into small cylinders or any other convenient form for use in writing or drawing.

Crayons, Drawing. *Prep.* 1. Spermaceti, 3 oz.; boiling water, 1 pint; agitate together till they form a species of emulsion; add bone ash, 1 lb. (or more, previously reduced to an impalpable powder), and colouring-matter, q. s. to give the proper tint; reduce the whole to a perfectly homogeneous paste, and form it into crayons.

2. Pipeclay and the finest prepared chalk, equal parts; or pipeclay alone, q. s.; colouring, a sufficient quantity; make them into a paste with pale mild ale.

3. White curd or Castile soap, cut into thin shavings, 1 oz.; boiling water 1 pint; dissolve, and when cold, add gradually as much rectified spirit of wine as will render the liquid

barely transparent. With this fluid make equal parts of the finest elutriated clay and chalk into a stiff paste, adding colouring matter, q. s., as before. For common qualities, the spirit of wine may be omitted, but the mass will then dry more slowly.

4. Curd soap, $1\frac{1}{2}$ oz.; gum arabic, $\frac{1}{2}$ oz.; boiling water, $1\frac{1}{4}$ pint; dissolve, and use it as the last. General Lomet uses a similar mixture to work up the softest varieties of hematite, with which he thus forms superior red crayon.

5. (Process of the Brothers Joel, of Paris.) Shell-lac, 3 parts; spirit of wine, 4 parts; oil of turpentine, 2 parts; dissolve; add pure clay, 6 parts; colouring matter, q. s.; form the mass into crayons, and dry them by a stove heat.

6. Pale shell-lac, 5 parts; wood naphtha, 12 parts; dissolve, and with this fluid mix up the colouring powder, previously stirred up with an equal weight of fine pale-blue clay; dry by a stove heat, as before. When this process is well managed, it produces crayons equal to those of the best Parisian houses.

Obs. The composition may be formed into crayons by simply rolling it on a slab; but to ensure their solidity the manufacturers generally employ a metallic cylinder of 2 or 3 inches in diameter, with one end open and the other firmly secured to a perforated plate, having holes of the same size as the intended crayons. The crayon composition, in the state of a stiff paste or dough, is introduced into the open end, and is forced down and through the holes, by means of a small plug or piston, that exactly fits the inside of the cylinder, and which is driven by the equable motion of a small screw. The pieces that pass through the holes are then cut into lengths and dried.

The substances employed as colouring matters for crayons are very numerous, and their choice offers a wide field for the skill and fancy of the artist. The pigment having been selected, it may be reduced to any shade or tint by admixture with other pigments, and by 'dilution' with a proper quantity of elutriated or prepared chalk. As, however, crayon colours do not admit of being mixed together at the time of using them, like liquid colours, it is usual to make 3 to 6 different shades of each colour, so as to enable the artist at once to produce any effect he chooses.

CRAYONS, BLACK. From prepared black-lead, ivory-black, lamp-black, &c. Black chalk and charcoal are frequently made into crayons by simply sawing them into suitably sized pieces. They may then be put into a pipkin of melted wax, and allowed to macerate for an hour; after which they should be taken out, drained, and laid on a piece of blotting-paper to dry. Drawings made with these crayons are very permanent, and if warmed slightly on the wrong side, the lines will adhere, and become almost as durable as ink.

CRAYONS, BLUE. From indigo, smalts, Prussian blue, verditer, &c.

CRAYONS, BROWN. From umber (raw and burnt), terra di Sienna (raw and burnt), Cullen's earth, brown ochre, &c.; and some peculiar shades, from a mixture of black, carmine, and either of the above colours.

CRAYONS, GREEN. From a mixture of king's yellow, or yellow ochre, with blues.

CRAYONS, PURPLE. From any of the more brilliant blues, mixed with carmine, lake, or vermillion.

CRAYONS, RED. From carmine, carminated lakes, vermillion, hematite, and any of the earthy or mineral colours commonly used as pigments. Crayons of red chalk may be prepared in the manner pointed out for crayons of black chalk.

CRAYONS, WHITE. From pure clay and chalk.

CRAYONS, YELLOW. From king's yellow, Naples yellow, orpiment, yellow ochre, &c.

Crayons, Lithographic. *Prep.* 1. Tallow-soap, 7 parts; white wax, 6 parts; melt by a gentle heat, and add lamp-black, 1 part; keep it melted, with constant stirring, for 20 or 30 minutes, then let it cool a little, and cast it into moulds.

2. White wax, 4 parts; shell-lac and hard tallow soap, of each, 2 parts; lamp-black, 1 part; as last.

3. Spermaceti, white wax, and hard tallow-soap, of each, equal parts; lamp-black, q. s. to colour.

Obs. Some makers melt the soap, wax, and lamp-black, in an iron-ladle, over a brisk fire, and allow the mixture to blaze for a few seconds before adding the shell-lac, which is no sooner thoroughly incorporated than the heat is increased until the mass again kindles, when it is at once removed from the fire and stirred until it is cool enough to be poured into the moulds. This method leads to trouble and loss, without any corresponding advantage. These crayons are used to draw designs on lithographic stones.

Crayons for Writing on Glass. *Prep.* 1. From French chalk cut into suitable pieces. Marks made with these crayons, when obscured or rubbed out, may be several times revived by simply breathing on the glass.

2. (Brunquelle.) Spermaceti, 4 parts, tallow, 3 parts, wax, 2 parts, are melted together in a cup; and red lead, 6 parts, and carbonate of potassa (in fine powder), 1 part, stirred in; the mass is kept melted and stirred for about half an hour longer, then poured into glass moulds (tubes) of the thickness of a common pencil, and cooled as rapidly as possible. The mass may be screwed up and down in the tube, and cut to a point with a knife. A crayon is thus obtained which will readily write upon clean, dry glass.

CREAM. *Syn.* CREAM, C. LACTIS, FLOS LACTIS, L. The oleaginous portion of milk, which collects in a thin stratum upon the surface, when that fluid is left undisturbed for some time. By violent agitation, as in the

diaphoretic.—*Therapeutic uses.* Analogous to those of squill.

Juice of Crinum (*Succus Crini; Infusum Crini*, Beng. Ph.). Take of the fresh root of crinum, $\frac{1}{2}$ an ounce; cold water, 2 ounces. Bruise the root in a stone mortar, gradually adding the water. Strain, with pressure, through calico.—*Dose.* From 2 to 4 fluid drachms, every twenty minutes, until the desired effect is produced.

Syrup of Crinum (*Syrupus Crini*). Take of the fresh root of crinum, sliced, 8 ounces; boiling water, 1 pint; refined sugar, 1 pound. Macerate the root in the water for two hours, bruise in a mortar, press through calico, add the sugar, and dissolve with the aid of gentle heat.—*Dose.* About 2 fluid drachms, repeated as required. Used as a nauseant and emetic for children.

CROTON OIL. *Syn.* OLEUM CROTO'NIS (B. P.), O. TIGLIU (Ph. L. & D.), L. The "oil expressed from the seeds of *Croton tiglium*" or *purging croton*. This oil is a drastic purgative, and a powerful local irritant and rubefacient. Rubbed on the skin, it produces a pustular eruption, and frequently purges. In this way (diluted with thrice its weight of olive oil) it is occasionally used as a counter-irritant.—*Dose* (as a purge). 1 to 2 drops; in obstinate constipation, lead colic, &c.

CROUP. *Syn.* CYNAN'CHE LARYN'GEA, C. SUFFOCA'TIVA, C. TRACHEA'LIS, L. An inflammatory disease affecting the larynx and trachea.

Symp. A permanently laborious and suffocative breathing, accompanied by wheezing, cough, a peculiar shrillness of the voice, and more or less expectoration of purulent matter, which continually threatens suffocation. There are two varieties, acute croup and chronic croup. The latter is very rare.

Treat. Bleeding by leeches or cupping, over the region of the trachea, should be immediately had recourse to, when the symptoms are urgent; or violent local irritants, as pieces of lint dipped in strong acetic acid, or blisters, may be applied to the same part. In weakly subjects of irritable constitution, bleeding should be avoided. Dr. Larroque recommends repeated vomiting, in the croup of children; and M. Marotte and M. Boudet have adopted this plan with great success. The treatment consists in making the patient attacked with croup vomit a great number of times within the day, so as to detach the pseudo-membrane from the larynx nearly as fast as it is formed. For this purpose, M. Marotte employs one or other of the following formulae.

1. Tartar emetic, $1\frac{1}{2}$ gr.; syrup of ipecacuanha, 1 oz.; water 2 oz.

2. Impure emetine, 3 grs.; syrup of ipecacuanha and water, of each, $1\frac{1}{2}$ oz.

These draughts are administered by spoonfuls every two minutes, until there has been

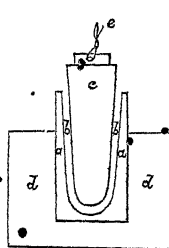

a sufficient number of vomitings. In this manner he says he has been always able to make the patient expectorate a certain quantity of false membrane. This treatment is accompanied by the use of small doses of calomel, leeches to the throat, and blisters to the nape of the neck; but it is the opinion of M. Marotte that the vomitings alone effect the cure. Out of 25 cases that occurred at the Hôpital des Enfants, the only authenticated case of cure among all these was effected by emetics. (M. Boudet.)

The croup is a very dangerous disease, and medical aid should be immediately sought wherever it can be procured. It is principally confined to infancy, or to children under 9 years of age; but occasionally attacks adults. One of our early friends, a young medical practitioner of great promise, died of it, prematurely, after only about 20 hours' illness.

CRUCIBLE. *Syn.* MELTING POT; CRUCIBULUM, L.; CREUSET, Fr. A vessel used by metallurgists and chemists for holding substances whilst they are exposed to a high temperature. The crucibles commonly used for fusing metals are formed of clay, or a mixture of plumbago and clay. For certain purposes, crucibles of platinum, gold, silver, iron, porcelain, and lime, are employed.

✓ **Crucibles, Earth'en.** *Syn.* CLAY CRUCIBLES. From fire-clay, mixed with silica, coke, burnt clay, or other infusible matter.

Manuf. The materials, having been ground and kneaded, are generally moulded by hand upon a wooden block of the shape of the cavity of the crucible. Another method of shaping a crucible consists in ramming the ingredients into a suitable mould, formed of steel or gun-metal. (See engr.)

a a, External steel mould.

b b, Clay or composition for forming the crucible.

c, Internal steel mould.

d d, Wooden stand.

e, Cord or chain to withdraw the internal mould or plug.

Small crucibles are sometimes formed by pouring 'slip,' that is, clay mixed with sufficient water to give it the consistence of cream, into porous moulds, made of a species of stucco. A series of these moulds are placed upon a table and filled with the semifluid composition. By the time the whole (say 50 or 60) are filled, the 'slip' may be poured out of the one first filled, leaving only a very small quantity behind to give the requisite thickness to the bottom. The second and third may then be treated in the same way, until the whole number have been attended to. In

each mould a perfect crucible is formed, by the abstraction of the water of that portion of the 'slip' in immediate contact with the stucco, and the crucible is either thicker or thinner in proportion to the time this absorbent action has been allowed to go on. 70 or 80 crucibles may thus be easily made in less than 15 minutes. The moulds and their contents are next placed in a stove or slow oven. In a short time, from the contraction of the clay in drying, the crucibles may be removed, and the moulds, as soon as they have become dry, may be again filled; by care they will last for years.

Earthen crucibles are used both in the burnt and unburnt state. Small crucibles are generally kiln-burnt before they are used, but the large Stourbridge clay 'casting-pots,' which are extensively employed in brass foundries, are never previously burnt.

The following kinds of earthen crucibles are much used in the arts:—

Crucibles, Cornish. From Teignmouth clay, 1 part; Poole clay, 1 part; sand from St. Agnes's Beacon, Cornwall, 2 parts. When smaller and less refractory crucibles are needed, the same mixture is employed, with the addition of an eighth part of China clay, or Kaolinite from St. Austell. These crucibles are generally made round, and of two sizes, of which one fits into the other; the larger being 3 inches in diameter at the top, and 3½ inches high outside measure. They are coarse in grain, and of a grayish-white colour, spotted with dark specks. They are always kiln-burnt. Of all crucibles, none are more generally useful for metallurgical experiments.

Crucibles, Hessian. From a mixture of equal weights of Almerode clay and sand. They are generally triangular in shape, so that the melted metal may be conveniently poured out from each corner. They are usually sold in 'nests' of six crucibles, fitting one in another. In the character of their body, and in composition and qualities, they closely resemble the Cornish.

Crucibles, London. From a very refractory clay. They have a reddish-brown colour, and are close in grain. They are exceedingly useful in assaying, as they resist the action of fused oxide of lead much better than most clay crucibles. Being very liable to crack, they require to be used with care.

WHITE FLUXING-POTS. From a peculiar kind of foreign clay. They are manufactured by the Patent Plumbago Crucible Company, and are much esteemed by metallurgists, being well moulded and very refractory. They have a smooth surface, and withstand the action of fluxes satisfactorily.

Crucibles, Stourbridge-clay. From Stourbridge clay, 4 parts; burnt clay, obtained by pounding and grinding old glass pots, 2 parts; pipeclay and coke-powder, of each, 2 parts.

Anstey's Patent. From Stourbridge clay 2 parts; hard gas-coke (previously ground and sifted through a sieve of ⅛th-inch mesh), 1 part.

Obs. These crucibles of Stourbridge clay are made large enough to hold forty pounds or more of melted brass. They are only dried, and not baked. For use, they are warmed, placed on the furnace, bottom upwards, the burning coke gradually heaped round them, and the firing continued until they acquire a full red heat. They are then quickly taken out of the furnace, and put in again with the mouth upwards. If placed in the furnace with the mouth upwards at first, they are sure to crack. After they have been once used, and allowed to become cold, they are worthless.

Crucibles, Platinum. These are indispensable instruments in the laboratory of the analytical chemist. They are chiefly employed in the ignition of precipitates, and in the fusion of silicates with carbonated alkalies to render them soluble, a preliminary step to their analysis. The most ordinary form of the platinum crucible is that of a cup with a flat bottom. They are always provided with lids, which are sometimes so constructed that they may be used, when separated from the crucibles, as capsules for ignitions and evaporations. Platinum crucibles are not acted on by carbonated alkalies at a high temperature, but they are liable to be seriously damaged by the caustic alkalies. Precipitates of the more reducible metals must never be ignited in these crucibles, as the reduction of the metals would infallibly destroy the vessels.

Crucibles, Gold, are exceedingly useful for many operations, on account of the way which they stand caustic and carbonated alkalies, and nitric acid, which destroy platinum or silver crucibles respectively. Their drawbacks are their great expense and ready fusibility.

Crucibles, Silver. These are much used for fusions of alkalies, being much less acted on than platinum crucibles, and also for water analyses, from their cheapness and light weight. They are easily destroyed, however, by acids.

Crucibles, Plumbago. *Syn.* GRAPHITE C., BLACKLEAD C., BLUE POTS. From graphite, ground and sifted, mixed with sufficient refractory clay to render it plastic. They are shaped by hand on an ordinary potter's wheel, or by moulds of metal like that figured above under the head of **EARTHEN CRUCIBLES**.

Prop., &c. Good blacklead crucibles, even when of the largest size, support the greatest and most sudden alternations of temperature without cracking, and may be used after repeated heating and cooling. Their surface, within as well as without, may be made very smooth, so that particles of melted metal will not hang about the sides. They are now almost universally used for melting the precious metals.

Crucibles, Porcelain. These beautiful vea-

sels are now made in Germany and France of all shapes and sizes. They are formed of the most exquisitely white, thin, and hard porcelain, which does not crack when heated, and which is but little acted on by the most energetic chemical reagents. For some operations they supersede platinum crucibles, particularly in the ignition of the precipitates of the more reducible metals. They do not retain colouring matter, and are not porous. Their covers are excellently adapted for delicate cases of testing, the whiteness of the porcelain showing the changes of colour in a single drop of liquid most distinctly.

Crucibles, Iron. Used chiefly for preparing common reagents, as sulphide of iron, calcic chloride, &c., and also for preparing pure caustic potassa from the nitrate.

CRUMPET. A sort of muffin or tea-cake, very light and spongy. *Prep.* From flour, 2 lbs., made into a dough with warm milk-and-water, adding a little salt, 3 eggs (well beaten), and 3 teaspoonfuls of yeast, mixed to the consistence of thick batter; after standing before the fire for a short time, to rise, it is poured into buttered tins, and baked slowly to a fine yellow. For the table, crumpets are toasted lightly on both sides, buttered, piled on a hot dish, and cut into halves.

CRUST. The paste with which pies, tarts, &c., are made, or covered.

1. (FINE.) From flour, 1 lb.; sugar $\frac{1}{4}$ lb.; melted butter, $\frac{1}{2}$ lb.; 3 eggs; milk, q. s. Requires little baking.

2. (RAISED CRUST, FOR MEAT PIES, &c.) As the last, but using 6 oz. of lard for the butter, and 2 instead of 3 eggs.

3. (SHORT.) From flour, 1 lb.; butter and sugar, of each, 2 oz.; eggs, 2 in no.; made into a stiff paste.

Obs. The quality is improved if the whole or a portion of the butter is employed in the way directed under PUFF PASTE. For further information hereon, consult the cookery books of Acton, Beeton, Rundell, and Soyer.

CRYOPHORUS. See REFRIGERATION.

CRYSTAL. A solid body, having a regular geometrical form. The plane surfaces by which a crystal is bounded are termed faces; these intersect in straight lines or edges; and these again meet in points, and form angles. The axis of a crystal is an imaginary line passing through its centre, and terminating either in the middle of two faces or of two edges, or in two angles; and axes terminating in similar parts of a crystal are named similar axes. When the axes of a crystal are properly chosen, and placed in a right position, the various faces are observed to group themselves in a regular and beautiful manner around these axes, and to be all so related to them as to compose a connected mass produced according to definite laws. The multitudinous forms of crystals have been distributed by mineralogists and chemists into six primary classes or systems, distinguishable

from one another by the relative positions and lengths of the three axes about which the planes or faces are arranged; while the different figures of any particular system are distinguishable by the arrangement of the planes in respect to the axes. Thus, the cube or hexahedron, the rhombic dodecahedron, and the octahedron, all belong to the regular system, which is characterised by 3 equal axes cutting one another at right angles. But in the cube each plane cuts 1 axis, and is parallel to 2 axes; in the dodecahedron each plane cuts 2 axes, and is parallel to a third; while in the octahedron each plane cuts the 3 axes. The names and definitions of the six crystalline systems are given below:—

- | | | |
|---|---|-----------------------------------|
| 1. REGULAR SYSTEM. | { | The 3 axes equal and rectangular. |
| 2. SQUARE PRISMATIC S.
2 equal axes. | | { |
| 3. RIGHT PRISMATIC S.
All unequal. | { | |
| 4. RHOMBOHEDRAL S. | | { |
| 5. OBLIQUE PRISMATIC S.
1 axis rectangular to 2. | { | |
| 6. DOUBLY O. P. S.
None rectangular. | | |

CRYSTALLISATION. The act or process by which crystals are formed. The frequent reference to this subject in the pages of this work, and the constant employment of the process of crystallisation in the manufacture of salts, &c., in the laboratory, seem to point out the necessity of a few explanatory remarks thereon under this head. When fluid substances are suffered to pass with adequate slowness to the solid state, or when solutions of solids are slowly concentrated by evaporation, or the solvent powers of the menstruum, gradually lessened by cooling, the ultimate particles of matter frequently so arrange themselves as to form regular geometrical bodies, familiarly known by the name of crystals. This wonderful property, which is possessed by a great variety of substances in the mineral kingdom, and by nearly all saline bodies, is resorted to for many useful and important purposes in the chemical arts. It is by means of crystallisation that the majority of salts are obtained in a state of purity; for in the act of passing into the crystalline state, the foreign substances with which they are united are left behind in the mother-liquor.

Salts are crystallised, either by allowing their hot and saturated solutions to cool slowly, or by simply evaporating the menstrua as long as crystals form. In the first case, the liquid is commonly evaporated until a pellicle appears on the surface, when the vessel is set aside in some sheltered situation until cold, at which time the crystals are collected, and the process repeated for fresh crystals. In the second,

case, the crystals are usually removed from the liquid as soon as they are deposited. The first method is adopted for those salts that are considerably more soluble in hot than in cold water, as carbonate of soda, Epsom salts, &c.; the last method, for those that possess nearly equal solubility in both cases, and also for many salts which are not required in handsome crystals; thus common salt and chromate of potash are crystallised in this way. Many of the alkaloids, and their salts, are obtained in crystals, by allowing their solutions (generally alcoholic or ethereal) to evaporate spontaneously. By repeating the processes of solution and crystallisation two or three times with the same body, the crystals obtained by the last operation will usually be found to be quite pure.

Many solids may be readily obtained in a crystalline state by melting them, and allowing them to cool very slowly. Thus, iodide of sulphur is crystallised by melting it in a flask placed in a salt-water bath, and allowing it to remain in the water until the whole becomes cold. Sulphur and many metals are crystallised by pouring them, in a state of fusion, into a hot vessel, having a plug in the bottom, which is withdrawn as, soon as the surface becomes cool, when the liquid portion runs out, and leaves the under surface in the form of a mass of agglomerated crystals. Perfectly pure wax, stearine, and spermaceti, have a very pleasing appearance when treated in this way.

CRYSTALLOID. See DIALYSIS.

CU'BEBIN. A peculiar substance obtained from cubeba.

Prep. From cubeba (from which the oil has been expelled by distillation), by digestion in alcohol, evaporating the resulting tincture to one fourth, filtering, and then evaporating the remaining fluid almost to dryness. The residuum is left in a cold place until it assumes a semi-crystalline appearance, when it is thrown on a filter, and the fluid portion (the 'cubebine' of M. Cassola) allowed to drain off. In 24 hours, the substance left on the filter is dissolved in 4 times its weight of boiling alcohol (sp. gr. .90), the solution allowed to deposit its undissolved resin (still maintaining it near the boiling temperature), after which the clear portion is decanted. The crystals deposited as the liquid cools are cubebin. It is purified by redissolving it in boiling concentrated alcohol, and the addition of a little boiling water, and animal charcoal, when long, white needles will be deposited, if the solution is allowed to cool very slowly.

Prop., &c. It is insoluble in water, and nearly so in cold alcohol, but very soluble in boiling alcohol. It strikes a fine crimson colour with sulphuric acid, which remains unaltered for some hours; a property which distinguishes it from piperin. Its physiological action has been but little studied. According to Dr. Görrer, this for the most part resembles that of cubeba.

CU'BEBS. *S'atent.* From Stourbridge clay (B. P. & U.)rd gas-coke (previously ground). The immature rough a sieve of $\frac{1}{8}$ -inch mesh), *cubeba* or *Cul* stimulant, stored crucibles of Stourbridge clay other peppers large enough to hold forty pounds appear to possess brass. They are only dried, the urino-genital organ use, they are warmed, in affections of the bladder: bottom upwards, the and in gleet and leucorrhœa, round them, the early and inflammatory still they acquire a rhœa, in piles, &c. They may quickly taken water, milk, or bitter ale. again with the

CU'CUMBER. The fruit of a furnace with *sativus* (Linn.). Used as a salad are sure to It is somewhat indigestible, but when used, and dressed, with plenty of oil, it may be eaten without the slightest fear of evil consequences. The practice of pouring off the natural juice extracted from the cucumber by salt cannot be too strongly condemned. See ELATERIUM.

CU'DBEAR. *Syn.* PERSIO. A dye-stuff obtained from *Lecanora tartarea* and other lichens, by a process nearly similar to that used in making ARCHIL. The lichen is watered with stale urine or other ammoniacal liquor, and suffered to ferment for 3 or 4 weeks, after which the whole is poured into a flat vessel, and exposed to the air until the urinous smell has disappeared, and it has assumed a violet colour. It is then ground to powder. Its use is confined to a few cases of silk dyeing, where it is employed to yield shades of ruby and maroon; upon wool it gives deep-red shades. The colours produced by it are very fugitive. Like archil, there are two varieties of this dye-stuff—BLUE CUDBEAR and RED CUDBEAR. See ARCHIL.

CULM. In *mineralogy*, a slaty kind of ANTHRACITE, occurring in Wales and North Devon. The term is also applied to any impure, shaly kind of coal.

CU'MARIN. See COUMARIN.

CU'MIN. *Syn.* CYMINI SEMINA, CYMINUM, L. The fruit (seed) of *Cuminum cyminum*. It is carminative and aromatic, like the caraway and anise. See PLASTER.

CU'MINOL. A colourless, transparent oil, of powerful odour. It exists with CYMOL in oil of CUMIN. See CUMIC ACID and CYMOL.

CU'MOL. See CUMIC ACID.

CU'PELLATION. The process of assaying gold and silver and their alloys by means of the CUPEL. See ASSAYING.

CUP'PING. This method of topical bleeding is performed as follows:—

The skin being softened by means of a sponge and warm water, and the hair and other extraneous substances being previously removed, one of the small bell-like glasses (CUPPING-GLASSES; CUCURBITULE), having the air contained in it rarified by being passed over the flame of a spirit-lamp, is immediately applied to the part. From the formation of a partial vacuum beneath the cup, the pressure

of the air on the surrounding surface causes that portion immediately under the cup to swell, and the vessels to become turgid. When this has taken place, the cup is removed, and several incisions are instantly made by means of a scarificator, an instrument containing numerous lancets, which, by means of a spring, ticula, a number of incisions at the same moment of the depth of these incisions being regulated by means of a screw which protrudes or retracts the lancets, according to the vascularity of the part, or the quantity of blood to be removed. The cupping-glass is now again applied. When a sufficient quantity of blood

collected in the cup, it is removed by common procedure the nail of one of the fingers under the upper edge, by which means, air being allowed to enter, the cup becomes detached. The part being washed with warm water to remove any clots of blood, another cup is applied as before, and the operation continued until a sufficient quantity of blood is withdrawn. Sometimes, especially when applied to the scalp, the cups fill so rapidly with blood as to become detached almost immediately on being applied. This method of local bleeding is frequently called 'CUPPING WITH SCARIFICATIONS.'

When cupping-glasses are applied without the use of the lancet or scarificator, the operation is called 'DRY CUPPING,' and is much used to cause a speedy irritation of the skin and reaction, for the relief of oppressive breathing, local pains, &c. To obtain the full benefit from this operation, the cups should be suffered to remain upon the part until they cause an exudation of a small quantity of serum, or a considerable amount of irritation of the part. Dry cupping has been found extremely beneficial in poisoned wounds; as it acts not only by abstracting the poison, but also, by the pressure the glasses exercise on and around the part, in preventing the absorption of it.

Obs. For the operation of cupping, a basin of hot water, sponges, and clean, soft towels, should be provided. In clumsy hands, cupping is occasionally a severe and painful operation; but this is not the case with the skilful operator. A good cupper does not exhaust much of the air in the cup before applying it, but simply passes its mouth rapidly over the flame of the lamp. When it is held over the flame even for a few seconds, the compression of the edge of the cup upon the skin is so great, that it checks the flow of the blood to the scarified part. A good cupper also removes the cups without spilling the contents, and completes the whole operation quickly and neatly. There are, however, few persons, who are not professional cuppers, who are sufficiently expert to exhaust the air in the cup by means of the common lamp; although it is by far the best. A good plan is to rarify the air in the cup by means of a small cone of paper, dipped in spirits of wine, or strong brandy;

this is ignited and thrown in the cup, which is instantly to be applied to the proper spot. Where cupping-glasses and the scarificator are not to be had, wine-glasses, or any very small tumblers, may be substituted for the first; and small incisions by means of a thumb lancet will answer the purpose of the other.

The cicatrices of the scarifications leave permanent marks on the skin; on which account, when blood is to be drawn from the head or neck, the glasses should be applied behind the ears, and a portion of hair removed in such a manner that the part may be covered by what remains.

A most convenient cupping apparatus is manufactured by Mr. Bigg, the eminent surgical-instrument maker of Leicester Square, consisting of cups and an exhausting syringe, so arranged that the use of the spirit-lamp is rendered unnecessary, and the operation of cupping may be performed nearly as expertly by an inexperienced nurse as by the most accomplished professional operator. It is invaluable in places remote from town.

CURARINE. The vegeto-alkaline base of curara, urari, woorara, woorali, or wourali, the arrow-poison of Central America.

CUECUMIN. The yellow colouring matter of turmeric, obtained by digesting the alcoholic extract of the powder in ether, and evaporating the clear ethereal solution to dryness. A brownish-yellow mass, yielding a bright-yellow powder. It is scarcely soluble in water, but very soluble in both alcohol and ether. Boracic and hydrochloric acids reddened it; alkalies turn it reddish brown.

CURED. Coagulated casein. See CHEESE.

CURRENTANTS. The currants of our garden are varieties of the *Ribes rubrum* and *Ribes nigrum*. (Linn.) The first includes RED CURRENTANTS and WHITE CURRENTANTS; the fruit of both of which are gently acidulous, cooling, and wholesome. The juice makes excellent wine. The fruit of the last (BLACK CURRENTANTS, QUINCY-BERRIES) is aperitive, and has been used in calculous affections; the juice is made into wine, jellies, jams, lozenges, &c. The young leaves are used as a substitute for tea; one or two buds, or half a small leaf, impart to black tea the flavour and fragrance of green. The currants of the grocers (ZANTE CURRENTANTS) are a small variety of dried grapes.

CURRY. *Syn.* CURRIE. A noted dish in Indian cookery, much esteemed throughout the East. Curries are simply stews, of which rice usually forms a characteristic ingredient, highly flavoured with fried onions and curry powder, to which sliced apples and lemon juice are sometimes added. They are made from every variety of fish, meat, poultry, game, &c., according to the fancy of the parties.

Cur'ry Powder. *Prep.* (Kitchener.) From coriander-seed, $\frac{1}{2}$ lb.; turmeric, $\frac{1}{2}$ lb.; cinnamon-seed, 2 oz.; cayenne, $\frac{1}{2}$ oz.; mustard, 1 oz.; ground ginger, 1 oz.; allspice, $\frac{1}{2}$ oz.; fenugreek-seed, 2 oz.; all dried thoroughly,

pounded in a mortar, rubbed through a sieve, and mixed together.

Obs. The above must be regarded as merely a substitute for Indian curry powder, which contains many ingredients not to be obtained in England. It should be kept in a bottle closely corked or stoppered. The curry powder sold at the present time consists of coriander seed, turmeric, cayenne, fenugreek-seed, and a large proportion of sago-flour.

CUSCONINE. See **ARICINE**.

CUSPARIA. *Syn.* **CUSPARIA BARK (B.P.)**, **ANGOSTURA B.**; **CORTEX ANGOSTURÆ**, **C. CUSPARIÆ**, **CUSPARIA** (Ph. L. & E.), **L.** "The bark of *Galipea cusparia*" (Ph. L.), or *Galipea officinalis* (Ph. E.). A valuable drug, imported directly or indirectly from South America.—*Dose.* 10 grs. to 30 grs., as a tonic, stomachic, and febrifuge, in similar cases to those in which **CASCARILLA**, **CALUMBA**, and **CINCHONA**, are commonly given.

Angostura or *cusparia* bark has fallen into comparative disuse, in consequence of *nuxvomica* or false *angostura* bark having formerly, in several instances, been mistaken for it, and administered with fatal results. The leading characteristics of these two barks have been pointed out by M. Gibourt, and are as follows:—

Characters.	False Angostura.	True Angostura.
<i>Form</i> . . .	Thick, rugous, rolled upon itself. Edges cut perpendicularly.	Flat or rolled up, little wrinkled, edges beveled.
<i>Colour</i> . . .	Brown, or greenish-yellow, presenting protuberances or excrescences, produced by the great development of the corky layer, which has a still more yellow colour.	Grayish-yellow.
<i>Taste</i> . . .	Very bitter	Bitter.
<i>Reaction with Nitric Acid.</i>	Red colour when dropped upon the bark.	Yellow colour.

CUSPARIN. *Syn.* **ANGOSTURIN**, **ANGOSTURÆ**. The bitter principle of *Cusparia* bark. It is neutral; crystallises in tetrahedrons; is easily fusible; soluble in rectified spirits, in acids, and in alkaline solutions. It is precipitated of a whitish colour by tincture of galls.

CUSTARD. A composition of milk, or cream, and eggs, sweetened with sugar, and variously flavoured. Custards may be cooked either in the oven or stew-pan.

Prep. 1. (Soyer.) Milk (boiling), 1 pint; sugar, 2 oz.; thin yellow peel of half a lemon; mix, and set it aside for a short time; then

take eggs, 4 in no., beat them well in a basin; add, gradually, the milk (not too hot), pass the mixture through a colander or sieve, and fill the custard cups with it; these are then to be placed over the fire in a stew-pan, containing about one inch of hot water, and left there for 12 minutes, or till sufficiently set. The above is for **PLAIN CUSTARDS**; but it forms a good basis to receive any of the usual flavouring ingredients, as fresh or stewed fruit, peels, essences, orange-flower-water, brandy or other spirits, &c.

2. (Rundell.) As the last, but using cream instead of milk, or equal parts of the two, with 2 additional eggs. Very rich; like the last, any suitable flavouring matter may be added to it.

3. (**ALMOND CUSTARDS**,—Rundell.) As either of the above, adding blanched sweet almonds, 4 oz.; bitter do., 6 in no.; beaten to a smooth paste.

4. (**BAKED CUSTARDS**,—Rundell.) From cream, 1 pint, with 4 eggs; flavour with mace, nutmeg, and cinnamon, and add a little white wine, rose-water, and sugar; bake in cups.

5. (**COFFEE CUSTARDS**,—Soyer.) Hot milk and strong-made coffee, of each, $\frac{1}{2}$ pint; sugar, 2 oz.; dissolve, and add it, gradually, to 4 eggs (well beaten), and proceed as in No. 1. Chocolate custards and cocoa custards are made in the same way.

6. (**COLD CUSTARD, for invalids**,—Dewees.) 1 egg; sugar, a table-spoonful; beat well together; and add, gradually, constantly stirring, cold water, $\frac{1}{2}$ pint; rose-water, 2 tea-spoonfuls; and a little grated nutmeg. An agreeable and nutritious demulcent. A wine-glassful every 2 or 3 hours, or *ad libitum*.

7. (**LEMON CUSTARDS**,—Rundell.)—*a.* As No. 1 (nearly), using a little more lemon peel. In the same way orange custards are made, but using orange peel.

b. From candied lemon peel and lump sugar, of each, 2 oz., beaten in a mortar quite fine, and added to either No. 1 or No. 2. Orange and citron custards may be made in the same manner. A little orange-flower-water, or marsala, or sherry, may be also added at pleasure. They are best baked.

8. (**ORANGE CUSTARDS**.) As above, No. 7, *a* and *b*.

9. (**RICE CUSTARDS**,—Rundell.) Boil $\frac{1}{2}$ a cupful of the best ground rice in a pint of milk until dissolved, then mix it with a quart of cream; flavour with nutmeg, mace, and a little brandy, and put it into a cup, or a dish.

CUTCH. See **CATECHU**.

CUTTLE-FISH. The bone of the *Sepia officinalis* of Linneus, or common cuttle-fish (**CUTTLE-FISH BONE**; **OS SEPIÆ**), is used by the law-stationers to erase ink-marks from paper and parchment, an application familiar to most schoolboys of the present generation. Reduced to powder (**PULVIS SEPIÆ**), it forms a valuable dentifrice and polishing powder.

and is used for forming the moulds for small silver castings.

CUTS. These are incised wounds of greater or less extent, and must be treated accordingly. The divided parts should be drawn close together, and held so with small pieces of strapping or adhesive plaster stretched across the wound. If the part is covered with blood, it should be first wiped with a damp sponge. When the wound is large, and it is much exposed, a good method is to sew the parts up. The application of a little creasote or a spirituous solution of creasote, will generally stop local bleeding, provided it is applied to the clean extremities of the wounded vessels. A good way is to place a piece of lint, moistened with creasote, on the wound, previously wiped clean, or to pour a drop or two of that liquid on it. An excellent method is to cover the part with a film of collodion. Friar's balsam, quick-drying copal varnish, tincture of galls, copperas water, black ink, &c., are popular remedies applied in the same way. A bit of the fur plucked from a black beaver hat is an excellent remedy to stop the bleeding from a cut produced by the razor in shaving. A cobweb is said to possess the same property.

CYANATE. *Syn.* CYANAS, L. A salt in which the hydrogen of cyanic acid is replaced by a metal or other basic radical.

CYANIC ACID. HCNO. *Syn.* ACIDUM CYANICUM, L. *Prop.* 1. Cyanuric acid, deprived of its water of crystallisation, is distilled in a retort, and the product collected in a well-cooled receiver.

2. (Liebig.) A current of sulphuretted hydrogen gas is passed through water in which cyanate of silver is diffused, the process being suspended before all the cyanate of silver is decomposed.

Prop., &c. Cyanic acid is a limpid, colourless liquid; it reddens litmus; is sour to the taste; possesses a modified sulphurous odour, similar to that which is always perceived when any of its salts are decomposed by an acid; it forms salts with the bases, called CYANATES; when in contact with water, it suffers decomposition in a few hours, and is converted into bicarbonate of ammonia; it cannot be preserved for any time, as shortly after its preparation it spontaneously passes into a white, opaque, solid mass, to which the name CYANAMIDE has been given. By distillation, this new substance is reconverted into cyanic acid.

CYANIDE. *Syn.* CYANURET; CYANIDUM, CYANURETUM, L. The compound formed by the union of cyanogen with a metal or other radical. See CYANOGEN, HYDROCYANIC ACID, and the respective bases.

Cyanide, Alkaline. *Syn.* CRUDE CYANIDE OF POTASSIUM AND SODIUM. *Prop.* (R. Wagner.) Dry ferrocyanide of potassium, 4 parts, dry carbonate of soda, 1 part, are melted together in an iron crucible at a red heat, and

continually stirred until the iron rod comes out covered with a white crust, when the heat is withdrawn, and after a few moments' repose the supernatant liquid portion is poured out on a clean iron slab. This crude mixed cyanide is quite as useful as the more expensive one of Liebig, and is equally fit for technical applications, as electrotyping, gilding, silvering, &c. See CYANIDE OF POTASSIUM.

CYANINE. A base discovered by Mr. G. Williams in CHINOLINE BLUE. See *below*.

Cyanine, Iodide of. *Syn.* CHIN'OLINE BLUE. The action of iodide of amyl upon chinoline gives rise to iodide of amylchinoline. Addition of excess of soda to an aqueous solution of this iodide produces a black resinous precipitate, which dissolves in alcohol with a magnificent blue colour. This precipitate is the IODIDE OF CYANINE, OR CHINOLINE BLUE. Many attempts have been made to use it in dyeing; they have, however, failed on account of the instability of the colour.

CYANOGEN. CN or Cy. A highly important compound radical or quasi element, discovered by M. Gay Lussac in 1815.

Best obtained by carefully igniting dry cyanide of mercury in a small retort, and collecting the gas over mercury.

Prop., &c. A colourless gas, possessing a pungent and peculiar odour, resembling that of peach-kernels or prussic acid; under a pressure of about 4 atmospheres, at a temperature of 45°, it assumes the liquid form (Faraday), and this fluid again becomes gaseous on withdrawal of the pressure; water absorbs nearly 5 times its bulk of cyanogen at 60° Fahr., and alcohol about 23 times its volume; with hydrogen it forms hydrocyanic acid, and with the metals a most interesting and important class of bodies called cyanides or cyanurets; when kindled, it burns with a beautiful purple flame, carbonic acid and nitrogen being evolved. *Sp. gr.* 1.806. See HYDROCYANIC ACID, &c.

Forms a bromide and iodide when the cyanide of mercury is distilled with bromine or iodine, and which are colourless, volatile, highly poisonous solids; and two isomeric chlorides, one a very volatile liquid, prepared by passing chlorine over moist cyanide of mercury, and the other in white volatile needles, prepared by exposing aqueous hydrocyanic acid to chlorine in sunshine.

CYANURIC ACID. $H_3C_3N_3O_3$. *Syn.* PYROCYANURIC ACID†. A peculiar acid, discovered by Scheele. It is a product of the decomposition of the soluble cyanates by dilute acids, or of urea by heat, &c.

CYDER. See CIDER.

CYDONINE. The peculiar gum of quince seed. It resembles bassorin in most of its properties.

CYMIDINE. An oily base, homologous with aniline, obtained by the action of iron filings and acetic acid on nitro-cymid.

CYMOL. A peculiar hydrocarbon found in oil of cumin, in admixture with cuminol. The two bodies are separable in a great measure by distillation, cymol being the most volatile portion of the oil.

CYNAPINE. An alkaloid obtained from *Ethusa cynapium*, or *fool's parsley*. It possesses no practical interest.

CYSTINE. $C_3NH_2SO_2$. *Syn.* Cystic oxide. Obtained from cystic oxide calculi (in powder) by digestion in solution of ammonia. By spontaneous evaporation the ammoniacal solution deposits small, colourless crystals of cystic oxide. It forms a saline compound with hydrochloric acid, and is decomposed by the strong alkalies.

CYTISINE. A purgative bitter principle, extracted from the *Cytisus Laburnum* (Linn.), or common laburnum, and some other plants.

DAGUERRE'OTYPE. See PHOTOGRAPHY.

DAHLIA DYE (däle-'y'ä). The shade of colour which is commonly termed 'dahlia' is a reddish lilac. It is produced by combining a blue or purple with red when a compound colour is used. Upon wool and silk it can be obtained directly by means of archil or cudbear, either alone or 'blued' by a small quantity of sulphate of indigo. Upon cotton indifferent shades of dahlia are obtained by macerating in sumac liquor, working in tin solution, and dyeing in logwood mixed with some red wood.

DAHLINE. A species of fecula obtained from the tubers of the dahlia. It is identical with inuline. It is not employed in the arts.

DAIRY. The place where milk is kept, and cheese and butter made. The best situation for a dairy is on the north side of the dwelling-house, in order that it may be sheltered from the sun during the heat of the day. Ample means should be provided to ensure ventilation, and at the same time to exclude flies and other insects. The temperature should be preserved, as much as possible, in an equable state, ranging from 45° to 55° Fahr. To lessen the influence of external variations of temperature, the walls should be double, or of considerable thickness, and the windows provided with shutters or doors. In summer the heat may be lessened by sprinkling water on the floor, which will produce considerable cold by its evaporation. Dairies built of mud or 'cob' are preferred in the West of England; and this preference arises from the uniform temperature they maintain, on account of the great thickness of the walls, and their being very bad conductors of heat. In large dairy-farms, where butter and cheese are made, the dairy is generally a separate building, and divided into 3 or 4 apartments; one of which is called the 'milk-room'; a second, the 'churning-room'; a third, the 'cheese-room,' containing the cheese-press, &c.; and a fourth, the

'drying-room,' where the cheeses are placed to dry and harden. To these may be added a scullery, furnished with boiler, water, &c., for scalding and cleaning the dairy utensils.

Cleanliness is very essential in all the operations of the dairy, and in none more so than in the milking of the cows. The hands and arms of the milkmaid should be kept scrupulously clean, and should be well washed with soap and water after touching the udder of a sick cow, as without this precaution the sores may be conveyed to the healthy ones. The milk-cans should be scalded out daily, and, as well as all the other dairy utensils, should be kept clean and dry. Before placing the milk on the shelves of the dairy, it should be strained through a hair sieve or a searce covered with clean cheese-cloth, as by this precaution any stray hairs that may have fallen into the milk-pail will be taken out.

The average produce of a milch cow, supplied with good pasturage, is about 3 gallons daily from Lady-day to Michaelmas, and from that time to February about 1 gallon daily. Cows of good breed will be profitable milkers, to 14 or 15 years of age, if well fed. See BUTTER, CHEESE, CREAM, &c.

DAMASCUS BLADES. See STEEL.

DAMP, under any form, should be avoided! A humid atmosphere or situation is one of the commonest causes of agues, asthmas, rheumatism, and numerous other diseases.

Damp Linen is very injurious, and should be especially avoided. In travelling, when it is expected that the bed has not been properly aired, a good plan is to sleep between the blankets. To ascertain this point, the bed may be warmed, and a cold, dry, glass tumbler, immediately afterwards introduced between the sheets, in an inverted position. After it has remained a few seconds, it should be examined, when, if it is found dry, and undimmed by steam, it may be fairly presumed that the bed is well aired; but if the reverse should be the case, it should be avoided. When it is impossible to prevent the use of damp linen, as articles of dress, the best way to obviate any ill effects is to keep constantly in motion, and avoid remaining near the fire, or in a warm apartment, or in a draught of cold air, until sufficient time has elapsed to allow of the escape of the moisture. The effect of evaporation is the reduction of the temperature of the body; hence the depressing action of damp linen.

Damp Walls. Ivy planted against the south wall of a house is said to exclude dampness. If a wall is already damp, ivy planted against it will, when grown up, cause it to become dry, provided the brickwork is sound, and the dampness does not arise from moisture attracted upwards from the foundation. Sometimes, when ivy is propagated from flowering branches, it will not adhere to a wall at all; the way to get over this difficulty is to cut it back to near the surface of the ground. The young wood

which will then form will take hold and cling immediately to almost anything.

DAM'SON. A species of small black plum, much used in the preparation of tarts, &c. Damsons are rather apt to disagree with delicate stomachs, and also to affect the bowels. See PLUM.

DANCING. The practice of dancing as an amusement or exercise must be almost as old as the human race itself. Yet, notwithstanding its antiquity and prevalence amongst all nations, both barbarous and refined, the propriety and advantages of its cultivation are of a very questionable character. In a hygienic point of view it can claim no preference, as an exercise, over the more simple ones of walking and running; whilst, from the associations it frequently induces, and the heated and confined atmosphere in which its votaries commonly assemble to indulge in it, it becomes the fertile parent of immorality and consumption. A celebrated cyclopædist has, perhaps, harshly, but truthfully, defined dancing to be "a silly amusement for the idle and thoughtless."

DANDELION. *Syn.* PISS-A-BED; TARAXACUM (Ph. L. E. & D.), L. A common British plant of the natural order *Compositæ*. It is known among botanists by the names *Taraxacum officinale*, *T. dens leonis*, and *Leontodon taraxacum* (Linn.). Its root (*Taraxaci Radix*, P.) is employed in medicine, being diuretic and tonic. It is roasted and used as coffee, and when mixed with an equal weight of foreign coffee constitutes the article once so much puffed under the name of 'dandelion coffee.' A similar mixture prepared with chocolate forms the 'dandelion chocolate' of the shops. The blanched leaves are used in salads, and the inspissated juice, extract, and decoction, are employed in medicine, and are considered as detergent, aperitive, and deobstruent. Ground roasted dandelion root cannot now be sold under the name of 'dandelion coffee' or mixed with coffee unless it has previously paid the chicory duty. See DECOCTION, EXTRACT, &c.

DAN'ELL'S BATTERY. See VOLTAIC ELECTRICITY.

DAPHNIN. A peculiar bitter principle, discovered by Vauquelin in the *Daphne mezereum* or *mezerion*. It is procured by separating the resin from the alcoholic tincture of the bark by evaporation; afterwards, diluting the residue with water, filtering, and adding acetate of lead. A yellow substance falls down, which, when decomposed by sulphuretted hydrogen, yields daphnin, under the form of small, colourless, transparent, radiated needles. It is bitter; volatile; sparingly soluble in cold water; freely soluble in hot water, and in alcohol and ether. It possesses basic properties. See MEZEREON.

DATU'RA. *Syn.* THORN-APPLE; STRAMONIUM (Ph. L. E. & D.), L. A genus of plants belonging to the *nightshade order*, or '*Atro-*

paceæ.' The species *Datura Stramonium* is an important medicinal plant, the leaves and seeds being officinal in B. P. It is anodyne and sedative, but not hypnotic, though it will often induce sleep by relieving pain. It affects the constitution in much the same way as belladonna.—*Dose.* 1 to 4 or 5 grs., in asthma, gout, headache, neuralgic and rheumatic pains, &c. In spasmodic asthma smoking the leaf often gives instantaneous relief, but must be exhibited with care, as the whole plant is intensely poisonous. No antidote is known. Another species, namely, *Datura tabula*, is now preferred for cigars or cigarettes. Cigars are made from *Datura Stramonium* more frequently than from *Datura tabula*. They are recommended for asthma. See ASTHMA, CIGARS (Stramonium), DATURIA (below).

DATU'RIA. *Syn.* DATU'RINE, DATURIN'A, HYOSCYAMINE. An organic alkali, discovered by Geiger and Hesse in *Datura Stramonium* or thorn apple. It occurs also in *Hyoscyamus niger* or henbane. It is best obtained from the seeds. Daturia dissolves in 280 parts of cold and 72 parts of boiling water; it is very soluble in alcohol, less so in ether. It tastes bitter, dilates the pupil strongly, and is very poisonous. It may be sublimed unaltered, and may be obtained in prismatic crystals by the addition of water to its alcoholic solution. With the acids it forms salts, which are mostly crystallisable.

DEAF'NESS. An imperfection or absence of the sense of hearing. When deafness is present in infancy and childhood, it is accompanied with dumbness, or imperfect articulation, in consequence of the impossibility of conveying a knowledge of the sounds necessary for the exercise of the imitative faculty of speech. Deafness frequently arises from some imperfection or obstruction of the passage leading to the membrane of the tympanum or drum of the ear. In some cases this passage is totally occluded by a membrane, or some malformation of the tube, which may frequently be removed by a surgical operation. Even instances of partial obliteration of this passage have occurred, which have been successfully treated. The researches of Mr. Yearsley have established the fact, that enlarged tonsils are a very common cause of deafness; and when such is the case, their excision will generally effect a cure. To this form of the affection Mr. Yearsley applies the term 'throat deafness.' Another cause of deafness is the presence of foreign bodies in the aural passages, or the accumulation of hardened wax. In these cases the best treatment is to inject warm water into the ear by means of a proper syringe. When deafness arises from imperfection of the tympanum or drum of the ear, the effects of the application of the artificial membrana tympani invented by Mr. Yearsley (moistened cotton wool) are generally immediate and truly wonderful. By its aid persons

previously so deaf as to be incapable of bearing their share in conversation have been enabled to hear an ordinary whisper. Insects may be destroyed by pouring a spoonful of warm olive oil, or camphorated oil, into the ear over night, retaining it there until the next morning by means of a piece of cotton wool, when it may be washed out with a little mild soap and warm water. When there is a deficiency of the natural secretion of wax, or a dryness of the aural passage, mild oleaginous stimulants may be employed. For this purpose a little olive or almond oil, to which a few drops of oil of turpentine, oil of juniper, or camphor liniment, have been added, may be used with advantage. A piece of cotton wool moistened with glycerine is an excellent application in such cases. When deafness is accompanied with continued acute pain, or a discharge of purulent matter, inflammation of the tympanum, or some other portion of the internal ear, probably exists, and medical advice should be sought as soon as possible. The deafness that frequently accompanies a violent cold is generally caused by obstructions in the Eustachian tubes, and goes off as soon as the secretions return to a healthy state. In some forms of deafness blisters behind the ears are useful. A clove of garlic wrapped in cotton or gauze, or a few drops of the juice introduced into the ear, is extremely efficacious in nervous deafness. When imperfect hearing depends upon obtundity of the auditory nerve, or an extensive obliteration or malformation of the internal ear, it scarcely admits of cure.

Deafness, Taylor's Remedy for. *Prep.* From oil of almonds, 1 lb.; garlic, bruised, 2 oz.; alkanet root, $\frac{1}{2}$ oz.; digest for a week, and strain. A little is poured into the ear in deafness.

DEATH. In cases of sudden death intervention should be deferred till signs of putrefaction begin to appear, especially when no gradation of disease has preceded, as in cases of apoplexy, hysterics, external injuries, drowning, suffocation, &c. No sooner has breathing apparently ceased, and the visage assumed a ghastly or a death-like hue, than the patient, after his eyes are closed, is too often hurried into a coffin, and the body, scarcely yet cold, is precipitated into the grave. So extremely fallacious are the signs of death, that the semblance has been frequently mistaken for the reality. By prompt means and judicious treatment, many persons, when in such a condition, have been happily restored to their families and friends. The effects of sound upon animal life is astonishing. The beat of a drum, for instance, has had a very beneficial effect upon persons in a state of suspended animation. At one time, a scream, extorted by grief, proved the means of resuscitating a person who was supposed to be dead, and who had exhibited the usual recent marks of the extinction of life. In cases of catalepsy or trance, having the sem-

blance of death, the action of the lungs and heart continues, though in a nearly imperceptible degree. By placing a cold mirror or piece of highly polished metal immediately over the mouth of the patient, symptoms of moisture will appear upon the surface if the most feeble respiration takes place.

DEBILITY. *Syn.* DEBILITAS, L. Weakness; languor; feebleness. When this arises from a diseased action of the stomach, the occasional use of mild aperients, followed by bitters and tonics, may be had recourse to. When from a general laxity of the solids, and there are no symptoms of fever, nor a tendency of blood to the head, a course of chalybeates generally proves advantageous. See ANÆMIA, ATROPHY, &c.

DECANTATION. The operation of pouring or drawing off the clear portion of a liquid from the impurities or grosser matter that has subsided. It is commonly performed, either by gently inclining the vessel, or by the use of a syphon or pump. In the laboratory it is much resorted to in the purification of precipitates, or other similar operations, where repeated edulcoration or washing is required, for which purpose it is preferable to filtration, from being less troublesome and more economical. In these cases, after a sufficient time having been allowed for the subsidence of the precipitate or powder, or for the clearing of the supernatant fluid, the latter is decanted, and its place supplied by a fresh portion of water, which, after sufficient agitation, is similarly treated, and the whole operation repeated as often as necessary.

DECANTERS. There is often much difficulty experienced in cleaning decanters, especially after port wine has stood in them for some time. The best way is to wash them out with a little pearlsh and warm water, adding a spoonful or two of fresh-slaked lime, if necessary. To facilitate the action of the fluid against the sides of the glass, a few small cinders or pieces of raw potato may be used. A spoonful of strong oil of vitriol will also rapidly remove any kind of dirt from glass bottles. Decanters which have become furred by holding hard water may be cleaned with a spoonful of hydrochloric acid ('spirits of salt') diluted with 3 or 4 times its weight of water. See STOPPERS.

DECARBONISATION. This operation performed on cast iron, to convert it into soft iron. The articles to be decarbonised are packed in finely powdered hæmatite, a native oxide of iron, to which iron filings are often added, and exposed for some time to strong red heat, by which the excess of carbon is abstracted or burnt out. The process somewhat resembles annealing or cementation.

DECAY. See EREMACAUSIS.

DECIMALS. *Syn.* DECIMAL FRACTIONS. Fractions which have for their denominator 10, or some power of ten; as 100, 1000, &c.; the number of ciphers in the denominator

being always equal to the number of figures in the numerator. Thus, $\cdot 2$, $\cdot 25$, $\cdot 125$, respectively represent $\frac{2}{10}$, $\frac{25}{100}$, $\frac{125}{1000}$. The denominator of decimals is never written, the dot placed before the first figure of the numerator expressing its value. Ciphers placed on the right hand of a decimal fraction do not alter its value; for $\cdot 5$, $\cdot 50$, $\cdot 500$, are each equal to $\frac{5}{10}$; but ciphers placed on the left hand of a decimal diminish its value in a tenfold proportion; thus, $\cdot 3$, $\cdot 03$, $\cdot 003$, respectively answer to the common fractions $\frac{3}{10}$, $\frac{3}{100}$, and $\frac{3}{1000}$. Every figure on the left hand side of the dot or decimal sign is a whole number.

ADDITION AND SUBTRACTION OF DECIMALS are performed in the same manner as with common numbers, care being taken to place the numbers under each other according to their several values; as, tens under tens, hundreds under hundreds, &c.

MULTIPLICATION OF DECIMALS is performed in precisely the same manner as with whole numbers, merely pointing off as many figures in the product as there are decimals in the multiplier and multiplicand put together.

DIVISION OF DECIMALS. As the last, but pointing off as many figures in the quotient as the decimal places in the dividend exceed those of the divisor. If there are not figures enough in the quotient, the deficiency must be supplied by prefixing left-hand ciphers. Ciphers are also added to the right hand of the dividend, or to a remainder, when there are more figures in the divisor than in the dividend, by which the quotient may be carried on to any extent.

A vulgar fraction is reduced to a decimal by dividing the numerator (increased sufficiently with ciphers) by the denominator. Thus, $\frac{3}{4} = \cdot 75$, $\frac{1}{8} = \cdot 125$, &c.

The value of a decimal, of any denomination, is found by multiplying it by the number of parts in the next less denomination, and cutting off as many places to the right hand as there are decimals, and so on until the terms are exhausted. Thus, $\cdot 634$ oz. =

$$\begin{array}{r} \cdot 634 \\ \times 8 \\ \hline 5 \cdot 072 \text{ drachms.} \\ 60 \\ \hline 4 \cdot 320 \text{ grains.} \end{array}$$

$\cdot 5$ drs. $4\frac{1}{2}$ grs. (nearly).

The constant use of decimals in the laboratory, in the surveys of the Excise, and in numerous chemical calculations, induces us to press the subject on the attention of operatives and others of neglected education. An attentive perusal of the above, and a few hours' application, will make the matter familiar to them.

DECOCTION. *Syn.* **DECOCTUM**, L. An aqueous solution of the active principles of any substance obtained by boiling; also the process of preparing such solutions.

The effect of decoction in water differs greatly from that of infusion. At the temperature of 212° Fahr., the essential oils and aromatic principles of vegetables are dissipated or decomposed; while by infusion in hot water, in covered vessels, they remain for the most part uninjured. The solvent powers of boiling water are, however, much greater than those of hot water; and many vegetable principles scarcely acted on by the one are freely soluble in the other. This is the case with many of the alkaloids, on which the medicinal virtues of several vegetables depend. On the other hand, the solutions of many substances, though more readily made by boiling, are speedily weakened or rendered inert by ebullition, in consequence of the active principles being either volatilised along with the steam, or oxidised or decomposed by exposure to the atmosphere. This is particularly the case with substances abounding in extractive or astringent matter. When the medicinal properties of vegetables are volatile, or are injured by a strong heat, infusion should be had recourse to, in preference to boiling; but when a solution of the fixed constituents is alone sought, decoction is preferable.

The substances employed for making decoctions should be well bruised, or reduced to a very coarse powder, or, if fresh and soft, they should be sliced small. In the former case, any very fine powder or adhering dust should be removed with a sieve, as its presence tends to make the product thick and disagreeable, and also more troublesome to strain. The vessel in which the ebullition is conducted should be furnished with an accurately fitting cover, the better to exclude the air; and the application of the heat should be so conducted that the fluid may be kept simmering, or only gently boiling, as violent boiling is not only quite unnecessary, but absolutely injurious to the quality of the product. In every case the liquor should be strained whilst hot, but not boiling, and the best method of doing this is to employ a fine hair sieve, or a coarse flannel bag. In general, it is found that, as decoctions cool, a sediment is formed, in consequence of the boiling water dissolving a larger portion of vegetable matter than it can retain in solution when cold. This deposit for the most part consists of the active principles of the solution, and, unless when otherwise ordered, should be mingled with the clear liquid by agitation, when the decoction enters into extemporaneous compositions, or when the dose is taken.

The length of time occupied by the ebullition is another point demanding some attention. Long boiling is in no case necessary, and should be avoided, especially in decoctions prepared from aromatic vegetables, or those abounding in extractive. The Colleges, in such cases, direct the ingredients "to be boiled for a short time," or "for 10 minutes," or they limit the period of the ebullition by stating

the quantity that must be volatilised, as—"boil to a pint, and strain." The last method is generally employed for those substances that do not suffer by lengthened boiling.

In preparing compound decoctions, those ingredients should be boiled first which least readily give up their active principles to the menstruum, and those which most readily part with them should be added afterwards. In many cases it is proper simply to infuse the more aromatic substances in the hot decoction of the other ingredients, by which means their volatile principles will be the better preserved.

Distilled water, or perfectly clean rain water, should alone be used for decoctions, extracts, and infusions. Spring and river water, from containing lime, have much less solvent power.

The aqueous solutions of organic matter, from the nature of their constituents, rapidly ferment or putrefy, at the ordinary temperature of the atmosphere. Neither decoctions nor infusions are fit to be used in dispensing, unless made the same day. They should, consequently, be only prepared in small quantities at a time, and any unconsumed portion should be rejected, as it would be imprudent for the dispenser to risk his own reputation, and the welfare of the patient, by employing an article of dubious quality.

It has of late years become a general practice for the wholesale houses to vend preparations under the name of 'Concentrated Decoctions,' which, with the exception of the compound decoction of aloes, are stated to be of 8 times the pharmacopoeial strength; so that one drachm of these liquids added to seven drachms of water, forms extemporaneous decoctions, professedly resembling those of the pharmacopoeia. The decoction of aloes is made of only four times the usual strength, as the nature of its composition would not permit of further concentration. Such preparations are, however, very imperfect substitutes for the freshly made decoctions. The extreme difficulty of forming concentrated solutions of vegetable matter with bulky ingredients, too often leads to the omission of a portion of the materials, or to the practice of concentrating the liquid by long evaporation. In the first case, the strength is, of course, less than it should be; and in the second, the quality is injured, and perhaps the preparation is rendered nearly inert by the lengthened exposure to heat, and the consequent volatilisation or decomposition of its active constituents. The common practice of adding a considerable portion of spirit to these preparations, which is absolutely necessary to preserve them, is also objectionable, as, in many of the cases in which decoctions are prescribed, this article, even in small quantities, exerts a prejudicial action. Some concentrated decoctions have been recently offered for sale which do not contain alcohol, being preserved by the addition of sulphurous acid, or sulphite of lime.

Decoction of Aloes. *Syn.* COMPOUND D. OF A., BALSAM OF LIFE; BAUME DE VIE Fr.; DECOCTUM AL/OES (Ph. E.), D. A. CO. 751-TUM (B. P. & Ph. D.), L. *Prep.* 1. (B. P.) Extract of liquorice, 1 oz.; extract of socotrine aloes, powdered myrrh, and saffron, of each, 1½ dr.; carbonate of potassa, 1 dr.; tincture of cardamoms, 8 ozs.; water, a sufficiency. Coarsely powder the extract of aloes and myrrh, and put them, together with the carbonate of potash and extract of liquorice, into a covered vessel, with a pint of distilled water; boil gently for five minutes, then add the saffron; let the vessel with contents cool, then add the tincture of cardamoms, and, covering the vessels closely, allow the ingredients to macerate two hours, finally strain through flannel, pouring as much distilled water over the contents of the strainer as will make the product measure 30 oz.

2. (Ph. E.) Aloes, myrrh, and saffron, of each, 1 dr.; extract of liquorice, ½ oz.; carbonate of potassa, 40 grs.; water, 16 fl. oz.; boil to 12 fl. oz.; strain, and add of compound tincture of cardamoms, 4 fl. oz.

3. (Ph. D.) As No. 1 (nearly), but using hepatic aloes.

A warm cathartic.—*Dose.* ½ to 1½ oz.; in habitual costiveness, dyspepsia, jaundice, &c.

Obs. By boiling the saffron as ordered by the Dublin and Edinburgh Colleges, nearly the whole of its fragrance is dissipated. A better plan is to macerate it in the tincture for a few days, previously to adding the latter to the decoction of the other ingredients. After the tincture has been strained off from the saffron, the latter may be washed with a little water, to remove any adhering colour and odour, and this may be added to the decoction. The addition of the tincture produces a deposit of mucilaginous and feculent matter, which has been dissolved out of the liquorice, for which reason some houses omit the latter altogether, and supply its place with an equal quantity of sugar or treacle, and a little colouring. By this method the liquid, after being once obtained clear, will continue so for any length of time.

4. (Wholesale.) Solazzi juice, 1½ lb.; kali (carbonate of potassa), 4 oz.; hepatic aloes, 5½ oz.; myrrh (small), 5 oz.; water, 4½ galls; boil to 3 galls, strain through flannel, cool, and add, of compound tincture of cardamoms, 10 pints; previously digested for 10 days on saffron, 2½ oz.; mix well, and add, essential oil of nutmeg, 15 drops; oils of cassia and caraway, of each, 10 drops; and oils of cloves and pimento, of each, 5 drops; in a week decant the clear portion from the sediment, and preserve it in a cool place.

5. (Concentrated; D. A. CONCENTRATUM, L.)—a. Lump sugar, 8 oz.; colouring, ½ pint; carbonate of potash, 2 oz.; aloes, 3½ oz.; myrrh and saffron, of each, 2½ oz.; compound tincture of cardamoms, ½ a gal.; water, 3 pints; boil the first five in the water, until reduced to nearly one half; cool, and add the

tincture, previously digested for a week, on the saffron; and proceed as above. 14 oz. of extract of liquorice may be used instead of the sugar and colouring.

b. Aloes, myrrh, liquorice, and potassa (all in powder), and saffron, as last; compound tincture of cardamoms, 5½ pints; digest a fortnight, and filter. In this way a very odorous and beautiful preparation is produced, which has been much admired. The above are said to possess four times the strength of the College preparation.

Decoction, Anticolic. *Syn.* ANTICOLIC AP'OEZEM, DEGLAND'S COLIC MIXTURE; APOZ'EMA ANTICOL'ICUM, L. *Prep.* Senna leaves, 2 oz.; boiling water, 1 pint; simmer gently to 16 fl. oz.; press out the liquor, add sulphate of soda, 1 oz., syrup of buckthorn, 2 oz., and strain through flannel. *Used* by glassfuls in lead colic, or after poisoning by lead.

Decoction, Antidartrous. Decoction of Bitter Sweet (see *below*).

Decoction of Arnica. *Syn.* DECOCTUM ARNICE, L. *Prep.* 1. (Swediaur.) Flowers of *Arnica montana*, 1 oz.; water, 3 pints; boil to a quart; filter, and add of syrup of ginger, 3 oz.—*Dose.* 1 to 2 fl. oz., every two or three hours; in aphonia, paralysis of the voluntary muscles, rheumatism, &c.; and as a substitute for bark, in putrid fever, agues, &c.

2. (Ph. Cast. Aust., 1841.) Arnica root, 2 drs.; water, 9 oz.; boil to 6 oz., and strain.—*Dose.* 1 oz.; as the last.

Decoction, Astringent. *Syn.* DECOCTUM ASTRINGENS, L. *Prep.* (Swediaur.) Oak-bark, pomegranate peel, and tormentil root, of each, 2 drs.; water and milk, of each, 1 lb.; boil 12 minutes, add of cinnamon, 2 drs.; boil 2 or 3 minutes longer, and strain.—*Dose.* A wine-glassful.

Decoction of Bark. *Syn.* DECOCTION OF CINCHONA; DECOCTUM CINCHONÆ, L. *Prep.* 1. Ph. L.:—*a.* (D. OF YELLOW B.; D. CINCHONÆ, B. P.) Yellow cinchona or calisaya bark (bruised), 1½ oz.; distilled water, 1 pint; boil for 10 minutes in a lightly covered vessel; when cold, strain and pour on the marc sufficient water to make up 1 pint.

b. (D. OF PALE B.; D. C. PALLIDÆ, Ph. L.) From pale cinchona or loxa bark, as above (*a.*).

c. (D. OF RED B.; D. C. RUBRÆ, Ph. L.) From red bark, as above (*a.*).

2. (Ph. E.) Brown, gray, yellow, or red cinchona (bruised), 1 oz.; water, 24 fl. oz.; boil for 10 minutes; when cold, filter the liquor, and evaporate it to 16 fl. oz.

3. (Ph. D.) From pale or loxa bark, similar to the 'Decoction cinchonæ pallidæ' of Ph. L. (1. *b.*, above).

Dose, &c. 1 to 2 fl. oz., 3 or 4 times daily, as a tonic, stomachic, and febrifuge, when the stomach will not bear the administration of bark in powder; in fevers, dyspepsia, convalescence, &c. The plan recommended by the Edinburgh College, of filtering the decoction when cold, is absurd. According to Soubeiran,

146 grs. of the deposit thus removed contained 86 grs. soluble in alcohol, and rich in the cinchona alkaloids. This liquid should, therefore, be well shaken before pouring it out for use, instead of being filtered. The addition of a few drops of either sulphuric or hydrochloric acid to the water greatly increases its solvent power, and also, consequently, the medicinal value of this preparation. (See *below*.)

Decoction of Bark (Acidulated). *Syn.* DECOCTUM CINCHONÆ ACIDULATUM, L. *Prep.*

1. To the water for any one of the above, add dilute sulphuric acid, 1½ fl. dr.; boil 10 minutes, and strain whilst hot.

2. (Sir J. Wylie.) Cinchona bark, 1 oz.; water, 16 fl. oz.; diluted sulphuric acid, 1 dr.; as last.

Decoction of Bark (Factitious). *Syn.* DECOCTUM CINCHONÆ FACTITIUM, L. *Prep.* (Ph. Bor.) Willow bark and horse-chestnut bark, of each, ½ oz.; calamus root and cloves, of each, ¼ oz.; water, 16 fl. oz.; boil to one half. *Used* as a substitute for decoction of cinchona bark, but is vastly inferior.

Decoction of Bark and Serpentry. *Syn.* DECOCTUM CINCHONÆ CUM SERPENTARIÆ, L. *Prep.* (Sir J. Pringle.) Peruvian bark, 3 drs.; water, 1 pint; boil to one half, and infuse in the hot decoction, serpentaria root, 3 drs. As a diaphoretic stimulant, and tonic, in fevers, and as a gargle in sore throat.

Decoction of Barley. *Syn.* BARLEY-WATER; DECOCTUM HORDEI (B. P.), L. *Prep.* 1. (B. P.) Pearl barley, 1 oz. (washed clean); boil for twenty minutes in 15 oz. of water, and strain.

2. (Ph. D.) Similar to above. (See *Obs. below*.)

Decoction of Barley (Compound). *Syn.* PECTORAL DECOCTION, FE'VER DRINK; DECOCTUM PECTORALE, PTISANA COMMUNIS, DEC. HORDEI COMPOSITUM (Ph. L.), MISTURA HORDEI (Ph. E.), L. *Prep.* 1. (Ph. L.) Decoction of barley (simple), 1 quart; figs (sliced) and raisins (stoned), of each, 2½ oz.; fresh liquorice (sliced), 5 drs.; water, 1 pint; boil to a quart, and strain.

2. (Ph. E.) Pearl barley, 2½ oz.; water, 4½ pints; boil to 3 pints; add figs and raisins, of each, 2½ oz.; liquorice root, 5 drs.; water, 1 pint; and boil to 2 pints, as before.

Obs. The above are used as demulcents in fevers, phthisis, strangury, &c., taken *ad libitum*. They are slightly laxative, and when this would be an objection to their use, a few drops of laudanum may be added. Mixed with an equal quantity of decoction of bark, barley-water forms an excellent gargle in cynanche maligna (ulcerated sore throat), and, with a like quantity of milk and a little sugar, a good substitute for the breast in dry nursing infants. It is, also, often acidulated with lemon juice or sulphuric acid, and sweetened (Decoction hordei acidulatum). Gum arabic, 4 drs., and nitre, 1 dr., to each pint, is a common addition in gonorrhœa. Cream of tartar,

1 dr., is occasionally added to render it more aperient.

Decoction, Bitter. *Syn.* DECOCTUM AMARUM, L. *Prep.* 1. Dried tops of lesser centaury and wormwood, and leaves of germander, of each, 3 drs.; water, $1\frac{1}{2}$ pint; boil to a pint.

2. Gentian root, $\frac{1}{2}$ oz.; water $1\frac{1}{2}$ pint; boil 10 minutes, take out the root, slice it, and add it again to the decoction with dried orange peel, $\frac{1}{2}$ oz.; boil to 1 pint, and strain.

Decoction of Bitter Sweet. *Syn.* ANTIDARTROUS APOZEM; APOZEMA DULCAMA'RE, L. *Prep.* (Trousseau and Reveille.) Dulcamara, 1 dr.; water, 16 oz.; boil to 9 oz., and strain. To be taken in three doses during the day. Every other day the quantity is to be increased until 12 drs. or even 2 oz. are taken daily, "so that the patient may begin to feel dryness of the throat, and some disorder of vision and digestion;" and "continue at this quantity for several weeks in succession." In obstinate skin diseases. See DECOCTION OF DULCAMARA.

Decoction of Blue Cardinal Flowers. *Syn.* DECOCTUM LOBELIÆ, D. L. SYPHILITICÆ, L. *Prep.* 1. (P. Cod.) Root of *Lobelia syphilitica*, 1 handful; water, 12 lbs.; boil to 7 lbs., and strain.

2. (Swediaur.) Dried root, 5 oz.; water, 12 lbs.; as last. Alterative, purgative, and diuretic.

Obs. This decoction was strongly recommended by Swediaur in certain complaints. He gave half a pint, at first, twice daily, and afterwards 4 times a day, unless it acted too strongly on the bowels, when the frequency of the dose was diminished, or it was discontinued for 3 or 4 days, and then had recourse to again, until the cure was effected.

Decoction of Bran. *Syn.* DECOCTUM FRURIS, L. *Prep.* 1. From bran, $\frac{1}{2}$ lb.; water, $1\frac{1}{2}$ pint; boil to a pint. In diabetes; and sweetened with sugar, as a demulcent and laxative in cough and sore throat.

2. Bran, 1 quart; water, $1\frac{1}{2}$ gal.; boil 5 minutes, and add cold water, q. s. to bring it to the proper temperature. As an emollient foot-bath.

Decoction of Broom. *Syn.* DECOCTUM SPARTII CACUMINUM; D. SCOPARI (Ph. D.), L. *Prep.* (Ph. D.) Broom-tops (dried), $\frac{1}{2}$ oz.; water, $\frac{1}{2}$ pint; boil 10 minutes, and strain. (See below.)

Decoction of Broom (Compound). *Syn.* DECOCTUM SPARTII CACUMINUM C., D. SCOPARI (Ph. E.), D. s. COMPOSITUM (Ph. L.), L. *Prep.* 1. (Ph. L.) Tops of broom (recent and dried), juniper berries (bruised), dandelion root (bruised), of each, $\frac{1}{2}$ oz.; distilled water, $1\frac{1}{2}$ pint; boil to a pint, and strain.

2. (Ph. E.) Tops of broom and juniper, of each, $\frac{1}{2}$ oz.; cream of tartar, $2\frac{1}{2}$ drs.; water, $1\frac{1}{2}$ pint; boil to a pint, as last. The above are diuretic and laxative.—*Dose.* $\frac{1}{2}$ to 1 wine-glassful, 3 or 4 times a day; in dropsy, especially of the belly (ASCITES).

Decoction of Burdock. *Syn.* DECOCTUM ARCTII, D. BARDANÆ, L. *Prep.* 1. Bardana root, 6 oz.; water, 5 pints; boil to 3 pints, and strain.

2. (Wood.) Dried root, 2 oz.; water, 3 pints; boil to 2 pints, and strain. As an alterative; a pint, or more, daily, in all those cases in which sarsaparilla is recommended.

Decoction of Cabbage-tree Bark. DECOCTUM GEOFFROYÆ (Ph. E. 1817), D. G. INERMIS (Ph. D. 1826). *Prep.* (Ph. D.) Bark of the cabbage tree (bruised), 1 oz.; water, 1 quart; boil to a pint, and strain. Cathartic, narcotic, and anthelmintic.—*Dose.* 2 to 4 table-spoonfuls, for an adult; 1 to 2 teaspoonfuls, for a child, followed by demulcents and castor oil; in worms, &c.

Decoction of Calumba (Compound). *Syn.* DECOCTUM CALUMBÆ COMPOSITUM, L. *Prep.* (Ph. U. S. 1831.) Calumba and quassia, of each, 2 drs.; orange peel, 1 dr.; rhubarb, 20 grs.; carbonate of potassa, 30 grs.; water, 20 fl. oz.; boil to 16 fl. oz., strain, and, when cold, add of compound tincture of lavender, $\frac{1}{2}$ fl. oz. Bitter, tonic, and stomachic.—*Dose.* 1 to 2 table-spoonfuls, 3 or 4 times daily.

Decoction of Ceylon Moss. *Syn.* DECOCTUM FUCCI AMYLACELI, D. FLOCCARIÆ CANDIDÆ, L. *Prep.* From Ceylon moss, 2 drs.; water, milk, or whey, 1 pint; boil to 16 fl. oz., and strain. It may be sweetened and flavoured. In irritation of the mucous membranes and in phthisis.

Decoction of Chamomile. *Syn.* DECOCTUM ANTHEMIDIS, D. CHAMÆMELI, L. From chamomiles, 1 oz.; boiling water, 1 pint; digest for 10 minutes, simmer gently for 2 or 3 minutes longer, and strain with pressure. (See below.)

Decoction of Chamomile (Compound). *Syn.* DECOCTUM CHAMÆMELI COMPOSITUM, L. *Prep.* (Ph. D. 1826.) Chamomile flowers (dried), $\frac{1}{2}$ oz.; fennel seed, 2 drs.; water, 16 oz.; boil a short time, and strain. Both the above are bitter, stomachic, and tonic; the last is vermifuge. They are chiefly used as fomentations and clysters.

Decoction of Chiretta. *Syn.* DECOCTUM CHIRAYTÆ, L. *Prep.* From chiretta or chy-rata, 5 drs.; water, 1 pint; boil 8 or 10 minutes and strain.—*Dose.* $\frac{1}{2}$ to 1 wine-glassful, 2 or 3 times daily, as a stomachic tonic; in flatulency and acidity, especially in the dyspepsia of gouty persons.

Decoction of Cincho'na. See DECOCTION OF BARK.

Decoction of Col'ocynth. *Syn.* DECOCTUM COLOCYNTHIDIS, L. *Prep.* (Ph. Bat.) Colocynth pulp, 1 dr.; water, 8 oz.; boil 10 minutes, and when quite cold, add of syrup of orange peel, 1 oz.; sulphuric ether, 1 dr.—*Dose.* 2 to 6 drs., 2 or 3 times a day; in dropsy, &c.

Decoction of Colts'foot. *Syn.* DECOCTUM TUSSILAGINIS, L. *Prep.* (Pereira.) Fresh leaves of coltsfoot, 2 oz. (or, flowers, 1 oz.);

water, 2 pints; boil to a pint and strain. A popular remedy in chronic coughs and chest diseases. It is emollient and demulcent.—*Dose*, $\frac{1}{2}$ a teacupful, *ad libitum*. (See *below*.)

Decoction of Coltsfoot (Compound). *Syn.* DECOCTUM TUSSILAGINIS COMPOSITUM, L. *Prep.* (Taddei.) Coltsfoot flowers, 6 oz.; figs, raisins, and jujubes, of each, 2 oz.; water, 12 pints; boil down to 4 pints; add liquorice root, 2 oz.; again boil, and strain. As the last.

Common Decoction. See DECOCTION OF MALLOWS.

Decoction of Cor'sican Moss. *Syn.* DECOCTUM HELMINTHOCORII, L. *Prep.* From the moss, 5 drs.; water, $1\frac{1}{2}$ pint; boil to a pint.—*Dose*. A wine-glassful, three times a day; as a vermifuge. In 1822, Mr. Farr brought it forward as a remedy for cancer.

Decoction of Cotton Root. *Syn.* DECOCTUM GOSYPII, L. *Prep.* (Dr. Bouchelle.) Inner part of the root of the cotton plant, 4 oz.; water, 1 quart; boil to a pint.—*Dose*. A wine-glassful, occasionally, as an emmenagogue; or, every 30 or 40 minutes, to produce uterine contractions, for which purpose it is said to be as effectual as ergot of rye.

Decoction of Dandelion. *Syn.* DECOCTUM TARAXACI (B. P.), L. *Prep.* 1. (B. P.) Fresh dandelion root (bruised), 1 oz.; water, $1\frac{1}{2}$ pint; boil to a pint, and strain.

2. (Ph. E.) Herb and root (fresh), 7 oz.; water, 1 quart; boil to a pint. Aperient, stomachic, and tonic.—*Dose*. 1 to 2 fl. oz., or more, 2 or 3 times daily.

Diaphoretic Decoction. *Syn.* DECOCTUM DIAPHORETICUM, L. Decoction of bark, 1 pint; liquor of acetate of ammonia, 4 oz.; aromatic confection, 1 oz.—*Dose*. 2 or 3 table-spoonfuls every 3 hours.

Decoction of Dog-grass. *Syn.* DECOCTUM GRAMINIS, L.; PTISANE CHIENDENT, Fr. *Prep.* From dog-grass root (*Triticum repens*), 1 oz.; liquorice root, $\frac{1}{2}$ oz.; water, 1 quart; boil 20 minutes, and strain. Aperient and pectoral; by cupfuls, *ad libitum*. (See *below*.)

Decoction of Dog-grass (Ioduret'ed). *Syn.* DECOCTUM GRAMINIS IODURETUM, L. *Prep.* (Magendie.) Decoction of dog-grass, 32 fl. oz.; syrup of peppermint, 2 oz.; iodide of potassium, $\frac{1}{2}$ dr.; mix. By cupfuls, *ad libitum*.

Decoction of Dog-wood. • *Syn.* DECOCTUM CORNUS FLORIDÆ, L. *Prep.* (Ph. U. S.) Dog-wood bark (bruised), 1 oz.; water, 1 pint; boil 10 minutes, and strain whilst hot. Tonic and astringent; recommended as a substitute for bark.—*Dose*. A wine-glassful.

Decoction of Dulcamara. *Syn.* DECOCTION OF BITTER SWEET, D. OF WOODY NIGHTSHADE; DECOCTUM DULCAMARÆ (Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Woody nightshade or bitter sweet (the new shoots), 10 drs.; water, $1\frac{1}{2}$ pint; boil to a pint, and strain.

2. (Ph. E.) Dulcamara (chopped small), 1 oz.; water, 24 fl. oz.; boil to a pint, and strain.

3. (Ph. D.) Twigs of woody nightshade, 1 oz.; water, 1 pint; boil 10 minutes in a covered vessel, and strain. It should measure about 16 fl. oz. Alternative, diaphoretic, and diuretic.—*Dose*. A wine-glassful, or more, 2 or 3 times a day; in chronic coughs and chronic skin diseases, and in most of those cases wherein sarsaparilla proves useful. See DECOCTION OF BITTER SWEET, also *below*.

Decoction of Dulcamara (Compound). *Syn.* DECOCTUM DULCAMARÆ COMPOSITUM, L. *Prep.* 1. (Augustin.) Dulcamara (bitter sweet), 4 drs.; burdock root, liquorice root, sassafras chips, and guaiacum wood, of each, 2 drs.; water, 2 lbs.; boil to 16 fl. oz., and strain.—*Dose*. 1 to 2 wine-glassfuls, 2 or 3 times a day.

2. (Foy.) As the last, but using dulcamara, 2 oz.—*Dose*. $\frac{1}{2}$ to 1 wine-glassful; in similar cases to those in which the simple decoction is given; especially in chronic rheumatism and venereal affections.

Decoction of El'der Bark. *Syn.* DECOCTUM SAMBU'CI, D. S. CORTICIS, L. *Prep.* 1. (Sydenham.) Inner bark of elder, 1 oz.; water and milk, of each, 1 pint; boil to one half, and strain.

2. (Collier.) Bark, 1 oz.; water, 16 fl. oz.; boil to $\frac{1}{2}$ pint, and strain.

3. (Pereira.) Bark, 1 oz.; water, 1 quart; boil to one half.—*Dose*. One wine-glassful 2 or 3 times a day; as an aperient and resolvent in various chronic disorders, in dropsy, and in certain cutaneous affections; or, 2 wine-glassfuls, as before, as a hydragogue cathartic in dropsies.

Decoction of Elecampane. *Syn.* DECOCTUM HELENII, D. INULÆ, L. *Prep.* (Ph. U. S.) Elecampane root, $\frac{1}{2}$ oz.; water, 1 pint; boil a few minutes, and strain. Tonic and expectorant, and, in some cases, diuretic and diaphoretic.—*Dose*. A wine-glassful every hour or two. (See *below*.)

Decoction of Elecampane (Compound). *Syn.* DECOCTUM HELENII COMPOSITUM, D. INULÆ C., L. *Prep.* (Rotier.) Elecampane, 1 oz.; hyssop and ground ivy, of each, 2 drs.; water, 1 pint; boil 15 minutes, strain, and add of honey, 2 oz.—*Dose*. 1 to 3 table-spoonfuls; as the last.

Decoction of Elm Bark. *Syn.* DECOCTUM ULMI (B. P.), L. *Prep.* Elm bark (cut in small pieces), 1 oz.; distilled water, 16 oz.; boil to 8 oz., and strain.—*Dose*. 2 to 4 oz., three or four times a day, as a cheap substitute for sarsaparilla in scaly skin diseases. (See *below*.)

Decoction of Elm Bark (Compound). *Syn.* DECOCTUM ULMI COMPOSITUM, I. *Prep.* (Jeffrey.) Simple decoction of elm bark, 8 pints; liquorice root, sassafras, and guaiacum chips, of each, 1 oz.; mezereon root, 3 drs.; boil for one hour, and strain. More active than the last.

Decoction of Ergot. *Syn.* DECOCTUM ERGOTÆ, D. SCLÆ'LLIS CORNU'UTI, L. *Prep.* (Pereira.) Ergot of rye (bruised), 1 dr.; water,

6 fl. oz.; boil 10 minutes, and strain.—*Dose.* One third, at intervals of half an hour, until the whole is taken; as a purgative.

Decoction of Fern Root. *Syn.* DECOCTUM FILICIS; D. RADICIS F. *L. Prep.* (Dr. Wood.) Dried fern-root, 1 oz.; water, 1 pint; boil to 16 fl. oz., and strain. By wine-glassfuls, fasting, until it excites slight nausea; as a vermifuge, more particularly for tapeworm.

Decoction of Figs. *Syn.* DECOCTUM FICI, *L. Prep.* (Cadet.) Figs (chopped), 1 oz.; water, 1 pint; boil, and strain. Demulcent and pectoral; taken *ad libitum*. (See *below*.)

Decoction of Figs (Compound). *Syn.* DECOCTUM FICI COMPOSITUM, *L. Prep.* (Foy.) Figs and raisins (chopped), of each, 2 oz.; liquorice root, $\frac{1}{2}$ oz.; boiling water, 1 quart; boil 15 minutes, and strain. As the last.

Decoction for Enemas. *Syn.* DECOCTUM PRO ENEMATE, *L.* Barley-water, or thin gruel, is commonly used under this name. See DECOCTION OF MALLOWs, &c.

Decoction for Fomentations. *Syn.* DECOCTUM PRO FOMENTO, *L. Prep.* (Ph. L. 1788.) Dried leaves of southernwood, tops of sea wormwood, and chamomile flowers, of each, 1 oz.; laurel or bay leaves (dried), $\frac{1}{2}$ oz.; water, 1 pint, boil a few minutes, and strain.

Decoction of Galls. *Syn.* DECOCTUM GALLE, (Ph. L.) *Prep.* From galls (bruised), $2\frac{1}{2}$ oz.; water, 1 quart; boiled to one half, and strained. As an astringent, fomentation, enema, or injection, in prolapsus ani, piles, and leucorrhœa.

Decoction of Guaiacum. *Syn.* DECOCTUM GUAIACI (Ph. E.), D. G. COMPOSITUM (Ph. D. 1826), *L. Prep.* 1. (Ph. E.) Guaiacum shavings, 3 oz.; raisins (chopped), 2 oz.; water, 8 pints; simmer down to 5 pints, adding towards the end, sassafras (rasped or sliced), and liquorice root (bruised), of each, 1 oz.

2. (Ph. D.) Guaiacum wood, 3 oz.; sassafras, 10 drs.; liquorice root, $2\frac{1}{2}$ oz.; water, 10 pints; as the last; to strain 5 pints.

Obs. The above form the once celebrated 'Decoction of the Woods.'—*Dose.* A teacupful, 3 or 4 times daily, or oftener, in chronic rheumatism, cutaneous diseases, after a course of mercury, &c. Although its virtues are of a very dubious kind, there is no doubt that it frequently does good, especially when persevered in with a sudorific regimen.

Decoction of Mairy Horehound. *Syn.* DECOCTUM BALLOTE LANATE, *L. Prep.* (Rehmann.) Siberian or woolly horehound (Balloita), $1\frac{1}{2}$ oz.; water, 1 quart; boil to one half.—*Dose.* A tumblerful, or more, twice a day; in rheumatic, gouty, and dropsical affections, especially the latter. See DECOCTION OF HOREHOUND.

Decoction of Hart's horn. See MIXTURES.

Decoction of Hellebore. 1. (DECOCTION OF BLACK HELLEBORE; DECOCTUM HELLEBORI NIGRI, *L.*) *Prep.* 1. (A. T. Thomson.) Black hellebore root, 2 drs.; water, 1 pint; boil 15 minutes.—*Dose.* 1 fl. oz., every 4 hours; in

dropsy, worms, chronic skin diseases, &c., occurring in non-irritable habits.

2. (DECOCTION OF WHITE HELLEBORE; DECOCTUM VERATRI, Ph. L. & D.) *Prep.* (Ph. L. 1836.) White hellebore (bruised), 10 drs.; water, 1 quart; boil to a pint, and when cold, add of rectified spirit, 3 fl. oz. Used as a lotion in itch, lepra, psoriasis, scald-head, &c.; and to destroy pediculi. In most cases it should be diluted with water, and should never be applied to the unsound skin.

Decoction of Horehound. *Syn.* COMPOUND DECOCTION OF HOREHOUND; DECOCTUM MARRUBII COMPOSITUM, *L. Prep.* (Dr. R. E. Griffith.) Dried horehound (*Marrubium vulgare*), 1 oz.; liquorice root and flax seed (bruised), of each, $\frac{1}{2}$ oz.; boiling water, $1\frac{1}{2}$ pint; macerate for 3 or 4 hours (boil a minute), and strain. An excellent demulcent and pectoral.—*Dose.* 1 to 2 fl. oz., as required, in coughs, &c.

Decoction of Horse-chestnut Bark. *Syn.* DECOCTUM HIPPOCASTANEE, *L. Prep.* (Dr. Wood.) Horse-chestnut bark (coarsely powdered), 10 drs.; water, 1 pint; boil 10 minutes, and strain. Used for decoction of cinchona bark. A little liquorice root is frequently added. (See *below*.)

Decoction of Horse-chestnut Bark (Compound). *Syn.* DECOCTUM HIPPOCASTANEE COMPOSITUM, *L. Prep.* 1. (Phœbus.) Horse-chestnut bark, $1\frac{1}{2}$ oz.; water, 18 fl. oz.; boil to one half, strain, and when quite cold, add of sulphuric ether, 1 to 2 drs.; syrup of orange peel, 1 oz. To be used during the intermission of an ague, in wine-glassfuls at a time.

2. (Spielman.) Horse-chestnut bark and willow bark, of each, $\frac{1}{2}$ oz.; calamus aromaticus and root of water avens, of each, 2 drs.; water, 16 fl. oz.; boil to one half. As the last.

Decoction of Iceland Moss. *Syn.* DECOCTION OF LIVERWORT; DECOCTUM CETRABEE (Ph. L.); D. LICHENIS ISLANDICI (Ph. D.); D. LICHENIS (Ph. L. 1824). *Prep.* 1. (Ph. L.) Liverwort (Iceland moss), 5 drs.; water, $1\frac{1}{2}$ pint; boil to a pint, and strain.

2. (Ph. D.) Iceland moss, 1 oz.; water, $1\frac{1}{2}$ pint; boil for 10 minutes in a covered vessel, and strain. Nutritious, demulcent, pectoral, and tonic.—*Dose.* 1 to 4 fl. oz., every 3 or 4 hours; in chronic affections of the chest and stomach, especially pulmonary consumption, old coughs, dyspepsia, chronic diarrhœa, and dysentery. It may be flavoured and sweetened; milk is frequently added to it. The bitter matter may be removed by steeping the moss for some time in pretty warm water, or in cold water to which a very little carbonate of potash has been added. Without this is done, it is intensely bitter and nauseous.

Decoction of Indian Ba'el. *Syn.* DECOCTION OF EGLE MARMELOS; DECOCTUM BAEL, *L.* From the dried unripe fruit of *Egle marmelos* (Indian bael), 2 oz.; water, 1 pint; boil to one

third, and strain.—*Dose*. 2 fl. oz. two or three times a day; in dysentery, diarrhoea, and English cholera.

Decoction of Indian Pink. *Syn.* DECOCTUM SPIGELLE, L. *Prep.* Indian pink root, 5 drs.; water, 1 pint; boil 5 minutes; add senna, 4 drs.; digest 15 minutes, strain, and add of manna, 1 oz.—*Dose*. A small teacupful, 3 times a day, for an adult; $\frac{1}{2}$ oz. to 1 oz., or less, for children; as an anthelmintic purge.

Decoction of Indian Sarsaparilla. *Syn.* DECOCTUM HEMEDUSMI, L. *Prep.* (Pereira.) Root of Indian sarsaparilla (*Hemedesmus Indicus*), 2 oz.; water $1\frac{1}{2}$ pint; boil to a pint. Diuretic, alterative, and tonic.—*Dose*. By wine-glassfuls, as decoction of sarsaparilla.

Decoction of Irish Moss. *Syn.* DECOCTUM CHONDRI. *Prep.* (Pereira.) Carrageen or Irish moss, 1 oz.; macerate in lukewarm water for 10 minutes, take it out and drain it, and then boil it in water (or milk), 3 pints, for 15 minutes, and strain through linen.

Obs. If twice the above weight of moss is employed, a mucilage (*mucilago chondri*) is produced, which may be flavoured with lemon juice, spices, &c., and forms a most nutritious article of spoon diet. It is taken in the same cases as decoction of Iceland moss; and is frequently employed in cookery, as a substitute for animal jelly, in the preparation of blanc-manges, soups, &c.

Decoction of I'singlass. See LISBON DIET DRINK.

Decoction of Ju'niper Berries (Compound). *Syn.* DECOCTUM JUNIPERI COMPOSITUM, L. *Prep.* (St. B. Hosp.) Juniper berries 2 oz.; cream of tartar, 3 drs.; water, 4 pints; boil to a quart, strain, and add compound spirit of juniper, 2 fl. oz. Diuretic.—*Dose*. 2 or 3 wine-glassfuls, 3 times a day, warm.

Decoction of Lin'seed (Compound). *Syn.* DECOCTUM LINI COMPOSITUM (Ph. D.), L. *Prep.* (Ph. D.) Linseed, 1 oz.; liquorice root (bruised), $\frac{1}{2}$ oz.; water, $1\frac{1}{2}$ pint; boil for 10 minutes in a covered vessel, and strain whilst hot. Emollient and demulcent.—*Dose*. A wine-glassful *ad libitum*; in gonorrhoea, dysentery, pulmonary affections, &c. It may be flavoured with lemon peel, and sweetened. See INFUSIONS.

Decoction of Liquorice. *Syn.* DECOCTUM GLYCYRRHIZÆ, L. *Prep.* (Ph. D. 1826.) Liquorice root (sliced), $1\frac{1}{2}$ oz.; water, 16 fl. oz.; boil 10 minutes and strain. A mild demulcent; it is taken either alone, by wine-glassfuls, or is used as a vehicle for more active remedies.

Decoction, Lisbon. See LISBON DIET DRINK.

Decoction of Liverwort. See DECOCTION OF ICELAND MOSS.

Decoction of Log'wood. *Syn.* DECOCTUM HÆMATOXILI (Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Logwood chips, 10 drs.; water, $1\frac{1}{2}$ pint; boil to a pint, and strain.

2. (Ph. E.) Logwood, 1 oz.; water, 1 pint;

boil to 10 fl. oz., adding towards the last, cinnamon (in powder), 1 dr.

3. (Ph. D.) Logwood, 1 oz.; water, $\frac{1}{2}$ pint. Astringent and tonic.—*Dose*. 1 table-spoonful to a wine-glassful; in diarrhoea, as required.

Decoction of Mad'der. *Syn.* DECOCTUM RUBRÆ, D. R. TINCTORIÆ, L. *Prep.* 1. (Dewees.) Powdered madder, 1 oz.; boiling water, 1 pint; simmer for 15 minutes, and add of cloves (bruised), 1 dr.; when cold, strain.—*Dose*. A wine-glassful, 2 or 3 times daily; in amenorrhoea, chlorosis, &c.; or every 3 hours, a short time previous to the expected menstrual discharge.

2. (W. Cooley.) To the last add ammonio-citrate of iron, 3 drs.

3. (St. Marie.) Powdered madder, $\frac{1}{2}$ oz.; hops, 1 dr.; English walnut leaves, 3 drs.; water, 1 quart; boil to $1\frac{1}{2}$ pint, strain, and when cold, add of tincture of tartrate of iron, 1 dr.—*Dose*. 2 fl. oz., night and morning; in scrofula, &c.

Decoction of Mal'low's. *Syn.* COMMON DECOCTION; DECOCTUM COMMUNE, D. PRO ENEMA'TE (Ph. L. 1787), D. MALVÆ COMPOSITUM (Ph. L. 1836), L. *Prep.* (Ph. L. 1836.) Common mallows (dried), 1 oz.; chamomile flowers (dried), $\frac{1}{2}$ oz.; water, 1 pint; boil 15 minutes, and strain. Used chiefly for fomentations and enemas.

Decoction of Malt. *Syn.* DECOCTUM BIVINÆ, D. BYNÆ, D. MALTI, L. *Prep.* (Swediaur.) Ground malt, 3 oz.; water, 1 quart; boil to a pint, and strain. An oz. of syrup of lemons, or of saffron, may be added to the cold decoction; or, a little liquorice root, with the malt. Demulcent and laxative. A cupful *ad libitum*. Infusion of malt (sweet wort) is a more convenient and elegant preparation.

Decoction of Marshmal'low. *Syn.* DECOCTUM ALTHÆÆ (Ph. D. 1826 and Ph. E. 1813), L. *Prep.* (Ph. D. 1826.) Dried root and herb of marshmallow, 4 oz.; raisins (stoned), 2 oz.; water, 7 pints (wine measure); boil down to 5 pints, strain, allow it to deposit the sediment and decant the clear liquid. Demulcent.—*Dose*. A cupful *ad libitum*, in coughs, colds, calculous affections, and other discharges of the urinary organs. See MIXTURES.

Decoction of Mat'ico. *Syn.* DECOCTUM MATICIS, L. *Prep.* (Dr. Jeffreys.) Matico leaves, 1 oz.; water, 1 pint; boil 12 minutes, and strain. Astringent.—*Dose*. $\frac{1}{2}$ fl. oz., 2 or 3 times a day; in hæmorrhagic and other discharges.

Decoction, Mercu'rial. *Syn.* DECOCTUM HYDRARGYRI, D. MERCURIALE, L. *Prep.* 1. Quicksilver, 4 oz.; water, 1 pint; boil in a glass or earthen vessel for an hour, adding water to replace that lost by evaporation.—*Dose*. A teacupful.
